Seriousness: ER VISIT, EXTENDED HOSPITAL STAY, SERIOUS

MedDRA PT Drug exposure during pregnancy, Premature baby, Premature labour

Symptom Text: Information has been received from a physician, for the pregnancy registry for GARDASIL concerning a 15 year old female who on an unspecified date was vaccinated with a first dose of GARDASIL (route and administrating site not reported). In March 2008, the patient was vaccinated with a second dose of GARDASIL (route and administrating site not reported). The patient became pregnant during the GARDASIL series. On approximately 01-JUL-2008 the patient was attempting to get clearance from her physician for a sport physical. The physician insisted on a pregnancy test which was positive. On approximately 07-JUL-2008 the patient delivered and the infant was born at 32 weeks gestation. The infant was placed on a respirator in the Neonatal Intensive Care Unit. Additional information has been requested.

MedDRA PT Paralysis

Symptom Text: Information has been received from a physician concerning her daughter an 18 year old female who on an unspecified date was vaccinated with GARDASIL. The patient experienced temporary paralysis and was hospitalized. Subsequently, the patient recovered from temporary paralysis. The reporter felt that temporary paralysis was related to therapy with GARDASIL. Temporary paralysis was considered to be disabling. Additional information has been requested.

MedDRA PT Convulsion, Dizziness, Loss of consciousness, Muscle twitching, Pallor

Symptom Text: Information has been received from a physician concerning a 16 year old female who on 09-JUL-2008 was vaccinated with a second dose of GARDASIL (lot# 657872/0515U) (route and administrating site not reported). There was no concomitant medication. After receiving the GARDASIL the patient was going to receive a tuberculin purified protein derivative. Right before the patient was going to receive the tuberculin purified protein derivative she passed out and twitched/convulsed for about thirty seconds, when the patient came to she was very dizzy and pale/white. The physician reported that when the patient came to they gave her water and the patient stayed for 15 minutes. She got color back in her face, she was fine and left the office. The physician reported that they did not end up giving the tuberculin purified protein derivative to the patient at all. When the patient received the first dose of GARDASIL she was fine. Upon internal review the twitching/convulsing was considered to be an other important medical event. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Paraesthesia, Peroneal nerve palsy, Vaccine positive rechallenge

Symptom Text: Information has been received from an internist concerning a 15 year old female who on 21-AUG-2007 was vaccinated with a first dose of GARDASIL (batch# not reported) and was well tolerated. On 30-OCT-2007 the patient received a second dose of GARDASIL (batch# NE29660, lot# 654740/0859F). About 6 months after the second vaccination, approximately April 2007 and prior to the third dose, the patient had experienced a short episode of paresthesia in the leg which had resolved. On 07-MAY-2008 the patient received a third dose (batch# NNH15190/lot# 1114U) intramuscularly into the deltoid muscle. On 23-MAY-2008 the patient developed paresthesia in the face and leg and experienced peroneal paralysis. On 26-JUN-2008, MRI was performed but the results were pending at the time of reporting. The patient had not recovered. The reporter considered paralysis peroneal, paresthesia foot, paresthesia lower limb and facial paresthesia to be other important medical events. Other business partner numbers included: E2008-06192. Additional information is not available.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Caesarean section, Drug exposure during pregnancy, Foetal distress syndrome, Oligohydramnios

Symptom Text: Information has been received as part of a pregnancy registry from a nurse practitioner concerning a 19 year old female with no prior pregnancies and a history of low grade squamous intraepithelial lesion (LSIL) with a colposcopy and atypical squamous cells of undetermined significance (ASCUS) in May 2007 with her last pap smear who on 28-JUN-2007 was vaccinated with a first dose of GARDASIL (Lot# 657868/0523U). The patient was treated with FLAGYL from 14-JUN-2007 to 21-JUN-2007 for bacterial vaginosis. The nurse reported that the patient was pregnant when she received her first dose of GARDASIL. The patient's last menstrual period (LMP) was 08-MAY-2007 and her estimated date of delivery (EDD) was 12-FEB-2008. No other symptoms were noted. Follow up information has been received from a health professional from the obstetrician's office who reported that on 06-MAR-2008 at 39 weeks estimated gestational age, the patient was induced due to oligohydraminos (amniotic fluid index (AFI) not available). The patient had subsequent non-reassuring fetal heart rate (FHR) tracing which resulted in a primary cesarean section. The patient delivered a healthy and normal male weighing 3065 grams with apgar scores of 8/9. The reporter noted that the patient and the baby were fine at the postpartum visit. Upon internal review, the patient's non-reassuring fetal heart rate resulting in a cesarean section is considered to be an other important medical event. Additional information is not expected.

Other Meds: FLAGYL, 500 mg

Lab Data: beta-human chorionic, 07?/??/07, positive

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Amniotic cavity infection, Caesarean section, Drug exposure during pregnancy, Live birth

Symptom Text: Information has been received from the Merck Pregnancy Registry via a physician concerning a 16 year old female who in May 2007 was vaccinated with a second dose of GARDASIL. Subsequently, the physician reported that the patient did not know she was pregnant and may have been two months pregnant at the time of the vaccination with GARDASIL. Unspecified medical attention was sought. Follow up information has been received from a nurse who reported that on 19-MAR-2008, the patient delivered a live female by cesarean section. There was a "complicating amniotic infection". The patient was seen by home nursing care after the cesarean section. The nurse could not verify if the delivery was full term, and had no further information. Additional information has been requested.

MedDRA PT Feeling of body temperature change, Headache, Inappropriate schedule of drug administration, Sensation of heaviness

Symptom Text: Information has been received from a consumer concerning her granddaughter a 16 year old female patient with no allergies and a history of seizures who in approximately November 2007, was vaccinated with the first dose of GARDASIL vaccine (yeast) (lot number, route and site of administration not reported). In June 2008 the patient was vaccinated accidently with the fourth dose of GARDASIL vaccine (yeast) 0.5 ml (lot number, route and site of administration not reported) by nurse at office. Concomitant therapy included oxcarbazepine (TRILEPTAL) and therapy unspecified for birth control. On 19-JUN-2008 the patient experienced headaches, a feeling as if her muscles were heavy and hot and cold flash. The patient's headaches and a feeling as if her muscles are heavy and hot and cold flash persisted. The patient sought medical attention. Additional information has been requested.

Other Meds: therapy unspecified, TRILEPTAL

MedDRA PT Confusional state, Convulsion, Heart rate increased, Hypertension, Inappropriate schedule of drug administration, Loss of consciousness

Symptom Text: 6 days after receiving the 2nd Gardasil vaccine, I had a seizure and was rushed to St. Vincent's hospital. Before the seizure, I did not have any signs or symptoms of anything wrong. I went to school and work as usual up until the event. The seizure took place around 3:00 on June 30, 2008. After receiving treatment (oxygen) from the EMTs, I regained consciousness and was very confused. In the emergency room, I had unusually high blood pressure and rapid heart beat. I was admitted to St. Vincent's hospital (Manhattan) where I had a blood test, EEG, MRI, saw a cardiologist, and received a heart monitor. All tests came back normal, therefore no treatment/medication was administered by my Neurologist.

Other Meds: None

Lab Data: At the request of the attending Neurologist, I had an MRI, heart monitor, blood test, EEG and saw a cardiologist. Upcoming tests include following up with cardiologist and a sleep deprived EEG test per Neurologist recommendation.

Seriousness: ER VISIT, HOSPITALIZED, LIFE THREATENING, SERIOUS

MedDRA PT Confusional state, Convulsion, Heart rate increased, Hypertension, Inappropriate schedule of drug administration, Loss of consciousness, Oxygen supplementation

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. A 28 year old female patient with no medical history reported and no known drug allergies who on 24-JUN-2008, was vaccinated with her second dose of GARDASIL (Lot # not reported) into the left arm. There was no concomitant medication. On 30-JUN-2008, 6 days after receiving the second dose, the patient had a seizure and was rushed to the hospital. Before the seizure, the patient did not have any signs or symptoms of anything wrong. The patient went to school and work as usual up until the event. The seizure took place around 1500 PM on 30-JUN-2008. After receiving treatment (oxygen) from the EMTs, the patient regained consciousness and was very confused. In the emergency room, the patient had unusually high blood pressure and rapid heart beat. The patient was admitted to the hospital where the patient has a blood test. Electroencephalogram (EEG), Magnetic Resonance Imaging (MRI), saw a cardiologist and received a heart monitor. All test came back normal, therefore no treatment/medication was administered by my neurologist. Upcoming test include following up with cardiologist and a sleep Electroencephalogram (EEG) test per neurologist recommendation. The listing also indicated that one or more of the events was life-threatening. This was originally reported by a consumer. VAERS ID # 319459. No further information is available.

MedDRA PT Contraception, Monoparesis, Pain in extremity

Symptom Text: Information has been received from a gynaecologist concerning a 19 year old female who on 17-JUN-2008 was vaccinated with a first dose of GARDASIL (lot # 1068U; batch number NG42070) IM into the left upper arm on 17-JUN-2008. Concomitant therapy included hormonal contraceptives (unspecified) for systemic use. The patient developed painful monoparesis in the left arm one week post vaccination. The patient was hospitalized from 04-JUL-2008 to 07-JUL-2008. In hospital suspicion of neuritis of brachial plexus with monoparesis of the left arm was diagnosed. Clinical examination revealed weakness of elevation and abduction of the left arm (power degree 4). The MRI and CSF showed normal results. The symptoms were treated with PREDNISOLON and NEXIUM and the symptoms resolved completely within 2 days. The patient was discharged from the hospital completely recovered. The treatment with PREDNISOLON was stopped step by step after discharge. File closed. No further information was available. The other business partners included are: E2008-06375.

Other Meds: hormonal contraceptives (unspecified)

MedDRA PT Musculoskeletal stiffness, Partial seizures, Staring, Unresponsive to stimuli

Symptom Text: Information has been received from a Licensed Practical Nurse (L.P.N.) concerning a 16 year old female patient who on 25-APR-2008 was vaccinated with a first dose of GARDASIL. The nurse reported that patient who was receiving the injection sat up staring ahead. She was not blinking in response to nurse's waving in front of her face. The nurse realized that the patient's arms were stiff. The nurse reported that patient experienced a "focal seizure". She called back and indicated that patient did have an focal seizure. Outcome was unknown. Upon internal review "focal seizure" was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Hemianopia, Multiple sclerosis, Post lumbar puncture syndrome, Visual disturbance

Symptom Text: information has been received from a health authority concerning a 21 year old female who received a third dose of GARDASIL via intramuscular route on 15-MAY-2008. First and second doses had been administered in December 2007 and February 2008 respectively. Early in May 2008, the patient complained of visual disorders with hemianopia at right side. On an unspecified date, she was hospitalized for explorations. MRI found small nodular pictures of white substance evoking multiple sclerosis according to the specialist. Lumbar puncture was performed but results were unknown. Fundus occulis was normal, there was no papillitis. Multiple sclerosis check-up was performed results pending. In mid-June i.e. approximately one and half month after beginning of disorders, ocular effects were resolving. The patient was still hospitalized for post lumbar puncture syndrome. Other business partner numbers included E2008-06370. Additional information has been requested.

MedDRA PT Death, Dizziness, Fatigue

Symptom Text: CT received her third shot of Gardasil (hpv virus prevention shot) on 6/03/08. On following days, CT complained of feeling tired and faint at times. CT left home on 6/12/08 to return to college and job on campus. She was living with peers in off campus housing. She worked last on 6/19, had dinner with housemates, watched a movie and all went to bed about 10:30 pm. She never came out of her room again alive after that. When she did not appear, housemates assumed she had gone away for the weekend. However, when she did not report to work on 6/23/08, housemates went into her room and found her dead in bed. Autopsy showed she was dead for at least 36 hours prior to being found, but can give no exact date or time of death. It is believed to have been between 6/ 20 and 6/22/08, probably the earlier date.

Other Meds: none

Lab Data: Initial autopsy was performed on 6/24. CT reported to appear to be "healthy". No signs of trauma or foul play. No obvious signs of cause of death. More tests pending.

History: none except allergy to Cefzil and Augmentin which are antibiotics

Seriousness: DIED, LIFE THREATENING, SERIOUS

MedDRA PT Death, Fatigue, Splenitis, Viral infection

Symptom Text: Information has been received from a physician concerning a 21 year old female with a penicillin allergy and an unremarkable medical history, who on 22-AUG-2007 was vaccinated with the first dose of GARDASIL (lot # 0469U), 0.5 mL intramuscular administration. On 20-NOV-2007, the patient was vaccinated with the second dose of GARDASIL (lot # 654540/1209U), 0.5 mL intramuscular administration. On 03-JUN-2008, she was vaccinated with the third dose of GARDASIL (lot # 0053X), 0.5 mL intramuscular administration. There was no concomitant therapy. On 20-JUN-2008, the patient was found dead in her bed. She had been dead for 48 hours. The patient had complained of fatigue prior to her death. The patient's mother contacted the physician via telephone. The autopsy performed in June 2008 was negative with evidence of inflammation around her spleen caused by a viral infection. The cause of death was inflammation of spleen caused by a virus. The physician considered the events to be life threatening. A lot check has been initiated. Additional information has been requested.

MedDRA PT Death

Symptom Text: I celebrated my 21st birthday in November 2007. I did not live to see my 22nd. Suddenly, unexpectedly, and inexplicably, I died in bed in June. After an extensive autopsy, the cause of death is still a mystery. My family wants to know what happened to me. My family has concerns about the HPV vaccine, GARDASIL, which I had received only days before my death. They are researching the Vaccine Adverse Event Reporting System for accounts of such deaths. Can you help us find answers...above is one case report. This vaccine is a scam. It does not protect women. It causes infertility, spontaneous abortions, Guillain Barre syndrome. Cardiac impairment and or death, it cause HPV in some! The vaccine industry will be exposed because we the public will not be used and abused by vaccine industry any longer! The CDC and FDA should not be in charge of the VAERS data base when they are promoting their poison in the first place. VAERS is guilty of cover-ups and under reporting. Only 1-10% of victims are reported. That means there are hundreds of HPV vaccine victims not 27 as VAERS suggests! By withholding and suppressing informed consent from people the Pharma industry is violating Constitutional and Civil Rights of the victims. Enough of peddling poison to cull the population and make Pharma rich and further the CDC/other agencies Agenda.

Other Meds:

Lab Data: Autopsies of deceased victims of HPV shot are indisputable. GARDASIL caused death. Sudden disability of victims of HPV shot prove HPV shot caused illness.

History: Healthy girls and young women with no history collapse and die from HPV vaccine. It is the vaccine causing the deaths, illnesses. It is not coincidental. We were told Vioxx was safe too and it killed and crippled many people. As a health professional I am speaking from experience. Vaccines do not prevent disease but they do cause disease. Advances in nutrition, hygiene, availabilit

MedDRA PT Activities of daily living impaired, Crying, Depression, Inappropriate schedule of drug administration, Thinking abnormal

Symptom Text: On February 21st of 2008 I received my first hpv and first hepatitis b vaccines and was told to come back in one month for my 2nd hepatiits b shot and then the following month I'd receive my 2nd hpv shot. So on the 27th of March I recieved what I though to be my second hepatitis b shot. With in days I had dropped into a very bad depression. I was crying all the time, could hardly function and had no idea what was causing all of this. I wanted to die and I didn't know why it got so bad I started to call help lines and tried to decide if I should see about getting some medical help. It was the worst I have ever felt in my life, I felt completely out of control. Finally after about 3 weeks of what I can only describe as hell, I started to feel a little better, then I received a bill I was being charged for my 2nd hpv shot not my 2nd hepatitis b! After talking to my mother and putting dates and everything together I believe that my deep depression was soley caused by receiving my 2nd hpv shot a month sooner than I'd expected. We immediatly made an appointment with the clinic to discuss there huge error. They refused to admit any mistake on their part due to that fact that the recommended time inbetween dosing on the hpv serious had change. They would only admit that they should have also given me the 2nd hepitis b shot as well as the 2nd hpv shot I'd received. No one told me that day that the plan had changed that I would be recieving the 2nd hpv shot a month sooner than planned. Not only do I think the clinic was inapt in their communicating my course of treatment but I believe that the 2nd hpv shot sent me into at least 3 weeks of severe depression that with out the help and support of my family and a close friend I don't know if I'd have made it through on my own. After thinking about everything I feel it is my responsiblitiy to tell you the reaction that I had from my 2nd shot, in hopes that maybe others have come forward and it will stop anyone else in the futre from suffering the same horrible side effect.I had

MedDRA PT Alopecia, Asthenia, Catheter placement, Erythema, Impaired work ability, Injection site cellulitis, Oedema peripheral, Renal failure acute, Sepsis, Skin infection, Tenderness, Weight increased

Symptom Text: Information has been received in a newspaper article received from a 23 year old female with a family history of cervical cancer who in 2008 was vaccinated with the third dose of GARDASIL. The patient advised that she had no side effects from the first two doses of GARDASIL. Subsequently after the third dose, the patient's arm became very tender, and the next day the arm started to swell, was extremely red, like a burn. The following day the patient's arm had swollen to double its normal size. The patient was admitted to hospital and was initially diagnosed with cellulitis (infection of the skin) at the injection site. The patient advised that she went downhill dramatically. The patient developed acute renal failure and had to have a catheter inserted. She was placed on massive amounts of antibiotics but was not responding. The patient advised that within days, she went from a minor infection in the skin to major problems. The patient advised that her kidneys shut down and she put on 15 kg practically overnight. The patient also developed septicemia and the specialist in intensive care placed their dialysis unit on standby. After four days, the patient's hair started to fall out but her body finally began to respond to the antibiotics. One week later, they took her off her intravenous fluids and medications and was discharged from hospital. She was instructed to come back every couple of days for blood tests, ultrasounds, etc. The patient advised that the doctors said that what happened to her was not from vaccination with GARDASIL and that it was extremely rare and unusual. The patient did not return to full time work until three months later. Subsequently the patient recovered from the cellulitis at injection site, hair falling out, red arm, like a burn, swollen arm, acute renal failure, septicemia and weight increase of up to 15 kg. but still has soreness in her arm and not much strength. Additional information is not expected.

MedDRA PT Coordination abnormal, Dyspnoea, Fatigue, Gait disturbance, Hemiplegia, Impaired work ability, Muscular weakness, Pain, Pleurisy, Syncope

Symptom Text: Information has been received from a 25 year old female as part of a business agreement (manufacturer control # GARD 2008 07 07 001) who on 14-APR-2008 was vaccinated with the first dose of GARDASIL. On 16-APR-2008 (48 hours after the first dose) the patient developed paralysis on her left side and had serious difficulty breathing, to the point of fainting. On 28-APR-2008 (2 weeks later) the patient was still unable to breathe without intense pain and was admitted to hospital. The patient was diagnosed with an inflamed lung lining (pleurisy) but they did not know why her left lung had become inflamed. The patient advised that she also developed extreme fatigue, muscle weakness, difficulty walking and uncoordination, all lasting approximately 1 1/2 months. The patient had various tests which did not come up with any virus. The patient advised that she needed a month off work and at the time of reporting she was still recovering from her other symptoms. The patient believed that the GARDASIL "triggered Guillain-Barre syndrome" although this diagnosis was not confirmed. Upon internal medical review the adverse event of paralysis on left side was considered to be an other important medical event. Additional information has been requested.

Symptom Text: Information has been received from a health professional via CSF as part of a business agreement (manufacturer control # GARD 2007 12 21 003) concerning an 18 year old primipara female who on 31-JUL-2007 was vaccinated with the first dose of GARDASIL (invalid Batch # NE58880). On 10-SEP-2007 the patient was vaccinated with the second dose of GARDASIL (invalid Batch # NE58880). On 13-DEC-2007 the patient was inadvertently vaccinated with the third dose of GARDASIL (Lot # 658275/0784U, Batch # J3206, Expiry date 22-MAR2010) while pregnant (gestation unknown). No adverse symptoms were experienced at the time of reporting on 21-DEC-2007. Follow-up information has been received from a completed First Encounter Questionnaire. The date of the patient's last menstrual period was unknown. The patient's pregnancy was confirmed by a urine test. The estimated delivery date is 16-APR-2008 as per the ultrasound. On 07-JUL-2008 a completed "Use in Pregnancy - Pregnancy Outcome Questionnaire" was received from the reporting health professional. It was unknown whether the patient had any diagnostic tests or if the patient had taken any prescription drugs during her pregnancy. It was also unknown whether the patient had any infections/illnesses during her pregnancy, as the patient's pregnancy was not disclosed. On 12-APR-2008, the patient had a liveborn normal female infant at 39+3 weeks from her last menstrual period. The infant did not have any congenital anomalies and weighed at 3175 grams. The infant is slow to feed. Information received on 07-JUL-2008 contained the following adverse experiences: assaulted at 22/40 and developed liver haematoma and hemoperitonium which resolved. Upon internal review, assaulted at 22/40 was considered an other important medical event. Additional information is not expected.

MedDRA PT Drug exposure during pregnancy

Symptom Text: Information has been received from the Merck pregnancy registry for GARDASIL from a physician concerning a 21 year old female who on 05-DEC-2007 was vaccinated with her first dose of 0.5 ml GARDASIL (Lot #659437/1266U) intramuscularly and the patient was pregnant. There was no concomitant medication. LMP was 13-NOV-2007 and on 18-DEC-2007 a pregnancy test was performed and results were positive. The physician reported that the patient became pregnant after her first dose of GARDASIL. No other symptoms were reported. Followup phone call information was obtained from a physician who reported that the patient had not continued in his care and may have terminated the pregnancy. No further information was available. Upon internal review elective termination was considered to be an other important medical event. Additional information has been requested.

MedDRA PT Abdominal pain, Dyslipidaemia, Hypertriglyceridaemia, Inflammation, Iron deficiency anaemia, Malnutrition, Obesity, Pancreatitis acute, Pyrexia

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act concerning a 16 year old female with low blood who on 23-MAY-2008 completed the series of GARDASIL (lot number 660391/0063X). Concomitant therapy included ORTHO EVRA and ZOMIG. The patient was hospitalized for 5 days, from 02-JUL-2008 to 07-JUL-2008, for severe, first-ever pancreatitis. The diagnosis was Acute pancreatitis possibly secondary to hypertriglyceridaemia. The patient also experienced mild iron deficiency anemia, obesity, protein malnutrition, fevers, elevated inflammatory markers, dyslipidaemia and complained of one day history of severe abdominal pain. On 04-AUG-2008 records received showed the following laboratory test, white blood cell count: 21.1, erythrocyte sedimentation rate: 55, f serum cholesterol test: 223, serum triglyceride test: 260, serum high-density lipoprotein cholesterol test: 62, serum low-density lipoprotein cholesterol test: 109, blood hemoglobin test: 12.5, blood chemistry: normal, hepatic function tests: elevated, serum amylase test: 112, white blood cell count: 20,000, pancreatic abdominal computed axial tomography consistent with pancreatitis. The patients was recovering from elevated inflammatory markers. The patient's older sister had pancreatitis at roughly the same age and was recently diagnosed with pancreatitis and diabetes mellitus. Mild iron deficiency anaemia, acute pancreatitis, severe abdominal pain, dyslipidaemia, hypertriglyceridaemia, elevated inflammatory markers, protein malnutrition, obesity and fever were considered to be immediately life-threatening. The original reporting source was not provided. The VAERS ID # is 319654-1. A standard lot check investigation was performed. All in-process quality checks for the lot # 660391/0063X were satisfactory. In addition, an expanded lot check investigation was performed. The testing performed on the batch prior to release met all release specifications. The lot met the requirements and wa

MedDRA PT Erythema, Hypoaesthesia, Pain in extremity, Paraesthesia

Symptom Text: Patient developed left arm numbness, tingling, pain and redness from above elbow to mid-forearm. Pt says that it constantly hurts, is worse with movement. Symptoms are unchanged over past few months. No injuries. Pt saw PCP ortho and neurologist about this. They thought she could have had cellulitis, tendonitis, carpal tunnel, blood clot, or nerve damage, but nothing determined.

Other Meds:

Lab Data: Pt states she was told EMG was normal and labs normal except slightly elevated ESR.

History: Bird breeder's lung disease in past year. PSH 11/07 tonsils and adenoids, septoplasty, turbinoplasty.

Prex Illness: None

MedDRA PT Depression, Drug exposure during pregnancy

Symptom Text: Initial and follow up information has been received through the Merck pregnancy registry from a physician concerning an 18 year old female with asthma, an obstetrical history of a prior pregnancy electively terminated in the first trimester, and a medical history of Chlamydia (2004), vulvar intraepithelial neoplasia (VIN III) (treated October 2006) and Cervical intraepithelial neoplasia (CINI), who on 12-OCT-2006 was vaccinated in the left arm with the first dose of GARDASIL (Lot # 653735/0688F) and on 07-DEC-2006 was vaccinated in the left arm with the second dose of GARDASIL (Lot # 654540/1161F). Concomitant therapy included ADDERALL, CELEXA, CATAPRESS, montelukast sodium (MSD), ZOLOFT, and CALAN. Subsequently, the patient informed her physician that she was pregnant. The date of the LMP was 30-DEC-2006 (previously reported as approximately 26-DEC-2006), with an estimated date of delivery of 02-OCT-2007. The patient sought unspecified medical attention. In approximately December 2006 the patient experienced depression. On 03-OCT-2007 the patient delivered a healthy, normal male infant, birthweight 3523 grams and 53.3 cm in length. Apgar score of 3/8/9, taken at 1/5/ and 10 minutes. No further information is available.

Other Meds: ADDERALL XR; CELEXA; CATAPRES; SINGULAIR; ZOLOFT; CALAN

Lab Data: ultrasound, 02/20/07 - no results reported; ultrasound, 05/15/07 - within normal limits; ultrasound, 07/16/07 - within normal limits; serum alpha-fetoprotein, 07/16/07 - normal limits - integrated screen

History: Chlamydia infection; Attention deficit disorder; Vulval intraepithelial neoplasia; Cervical intraepithelial neoplasia

MedDRA PT Injection site pain

Symptom Text: Initial and follow up information has been received from a medical assistant and the patient's mother, concerning her daughter with no known drug allergies or past medical history, who in approximately, October 2006, was vaccinated, intramuscularly with the first dose of GARDASIL. In approximately, February 2007, the patient was vaccinated, intramuscularly with the second dose GARDASIL and on 06-MAR-2007, the patient was vaccinated, intramuscularly with third dose GARDASIL. The specific dates for the first and second dose were not available. Concomitant therapy included an unspecified allergy medication. The patient's mother reported that after the first dose, the patient experienced tenderness in her arm at the injection site. Unspecified medical attention was sought. No product quality complaint was involved. Additional information has requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Drug exposure during pregnancy, Premature labour, Vomiting

Symptom Text: Initial and follow up information has been received through the Merck pregnancy registry for GARDASIL via an obstetrician and a 20 year old white female on methadone maintainence for opiate abuse with a history of an adverse drug reaction to REGLAN, herion abuse, panic attacks, frequent urinary tract infections, pyelonephritis (2002, normal urology on follow up) and one previous pregnancy with first trimester spontaneous abortion. On 23-JAN-2007, she was vaccinated with a first dose of (Lot#655165/1425F). On 27-MAR-2007, she was vaccinated with a second dose of GARDASIL (Lot#655503/0012U). Concomitant therapy include methadone HCl 80 mg daily. Last menstrual period was 30-MAR-2007 (previously reported as LMP 05-APR-2007) and estimated dates of delivery was 04-JAN-2008. On approximately 31-MAY-2007, the patient was informed that she was pregnant. Subsequently, the patient experienced hyperemesis and was treated with ZOFRAN 8 mg prn and TIGAN 300 mg prn. On 07-AUG-2007 the patient had an ultrasound at 18-20 weeks with a result within normal limits. On approximately 01-DEC-2007, the patient's pregnancy was complicated by preterm labor at 35 weeks. On 05-DEC-2007 urine drug screen results were positive for methadone and opiates. On 13-DEC-2007, at 36 6/7 weeks from LMP the patient had a "technically, a pre-term delivery" with a 6 lb. 11 oz. male infant. Apgar score was 9/9. The outcome of the hyperemesis, pre-term labor and pre-term delivery were unknown. Additional information is not expected.

Other Meds: methadone hydrochloride 80 mg

Lab Data: ultrasound, 08/07/07, WNL - 18-20 weeks; beta-human chorionic, 05/31?/07 - positive; Apgar score, 12/13/07, 9/9; urine drug screen, 12/05/07 - positive for methadone and opiates

History: Adverse drug reaction; Urinary tract infection; Pyelonephritis; Opioid abuse; Panic attack; Abortion spontaneous; Pregnancy

MedDRA PT Drug exposure during pregnancy

Symptom Text: Information has been received from a physician concerning a 17 year old female patient, with asthma and drug hypersensitivities to ibuprofen and BACTRIM, who in January 2007, was vaccinated with the first dose of GARDASIL. Concomitant therapy included DEPO-PRVERA and pre-natal vitamins (started on 24-MAY-2007). On approximately 07-JAN-2007, the patient had her LMP. On 12-APR-2007, the patient was vaccinated with the second dose GARDASIL (Lot# 657621/0387U), with the patient reported as "20 weeks gestation" (estimated date of delivery on 14-OCT-2007). There were no problems reported. On 18-MAY-2007, the patient's pregnancy was confirmed by a pregnancy test. On 24-MAY-2007, 04-JUN-2007 and 07-JUL-2007 the patient had an ultrasound for fetal dates and growth. It also revealed left pyelectasis. On 07-SEP-2007, an ultrasound confirmed that the left pyelectasis had resolved. There were no previous pregnancies, deliveries or spontaneous abortions. On 08-OCT-2007, the patient gave birth to a healthy and normal baby boy. He weighed between 6 to 7.5 lbs. and his apgar score was reported as 8/9. The patient was 38 weeks and 2 days from her last menstrual period. There were no congenital anomalies reported. It was reported that all was fine. Additional information is not expected.

Other Meds: DEPO-PROVERA; vitamins (unspecified)

Lab Data: ultrasound, 05/24/07; ultrasound, 07/27/07; ultrasound, 09/07/07 - Left pyelectasis

MedDRA PT Drug exposure during pregnancy

Symptom Text: Information has been received for the Merck Pregnancy Registry for the GARDASIL via a medical assistant concerning a 15 year old female with no pertinent medical history who on 15-MAY-2007 was vaccinated intramuscularly with the first 0.5 ml dose of the GARDASIL (Lot # 656051/0244U). Concomitant therapy included PROTONIX, PROZAC, magnesium supplement (unspecified), SEROQUEL and ZONEGRAN. A blood HCG test was performed on 15-MAY-2007 and was negative. The blood HCG test was repeated on 31-MAY-2007 and was positive. An ultrasound was performed on approximately 15-JUN-2007 which showed that the patient is approximately 4.5 to 6.5 weeks pregnant. The patient's last menstrual period was approximately 17-May-2007 and the estimated due date was 21-Feb-2008. The reporter stated that "the patient will not be having a therapeutic abortion." Follow up information has been received from a health professional at the pediatrician's office and from a registered nurse at the obstetrician's office, concerning the outcome of the pregnancy. There were no complications or illnesses during the patient's pregnancy. The health professional and the nurse reported that on 27-JAN-2008, the patient gave birth to a healthy and normal male infant, apgar: 8/1; weight: (3668gms), 8lbs 1oz; length 21; and head circumference: 14. The health professional noted that the infant had no congenital anomalies. The baby however experienced respiratory distress and fever during delivery. No further information was provided. Additional information was provided. Additional information is not expected.

Other Meds: PROZAC; magnesium (unspecified); PROTONIX; SEROQUEL; ZONEGRAN

Lab Data: ultrasound, 06/15?/07 - patient was 4.5 to 6.5 weeks pregnant; beta-human chorionic, 05/15/07 - negative; beta-human chorionic, 05/31/07 - positive;

MedDRA PT Drug exposure during pregnancy

Symptom Text: Initial and follow up information has been received from a retired certified medical assistant, who is also the mother of the patient and a member of the certified nurse midwife's office, for the Pregnancy Registry for GARDASIL, concerning a 16 year old female with allergies to sulfa antibiotics and prior history of smoking. On 27-FEB-2007, the patient was vaccinated with her first dose of GARDASIL (Lot #, 654702/00110). On 02-MAY-2007, the patient was vaccinated with her second dose of GARDASIL (Lot # 657617/0384U). On 28-AUG-2007, the patient was vaccinated with her third dose of GARDASIL (Lot # 658556/1060U). Concomitant therapy included TANDEM OB. On 25-SEP-2007 it was reported that the patient was 8 weeks and 6 days pregnant. On 25-SEP-2007, 10-DEC-2007, 10-APR-2008 and on 18-APR-2008 the patient had an ultrasound due to large for gestational age and right testicle hydrocele. On 26-NOV-2007 the patient had an elective serum alpha-fetoprotein test. The patient sought unspecified medical attention in the office. It was reported that on an unspecified date the patient had unspecified blood work and a urine pregnancy test. "As far as the delivery went everything was fine" (no further information was provided). The patient delivered a normal male infant on 04-MAY-2008, weighing 8 pounds and 15 ounces. It was reported that the baby experienced fetal distress during labor and delivery. There were no congenital anomalies, complications or abnormalities. It was reported that the mother experienced a 50 plus pound weight gain. On 04-JUN-2008, the patient went to the office for her postpartum visit (not otherwise specified). On 11-JUL-2008, the infants pediatrician was contacted regarding whether or not the baby had any right testicular hydrocele (earlier identified on a sonogram). He said that after doing several exams on the infant there was no hydrocele noted. It was also reported that he had no access to the prenatal ultrasound reports and was not aware of these findings. Additional information is not expected.

Other Meds: TANDEM OB

MedDRA PT Drug exposure during pregnancy

Symptom Text: Initial and follow up information has bee received from a physician, through the Merck pregnancy registry and from a 26 year old female consumer with no known allergies and no pertinent medical history, who in May 2007 was vaccinated with her first dose of GARDASIL (lot #0210U), and on 22-JUL-207 was vaccinated with her second dose of GARDASIL (lot #0469U). There was no concomitant medication. The patient reported that in September 2007 she was currently 2 months pregnant. Follow up information received from the physician indicated the date of the patient's LMP was 26-JUL-2007, and the estimated date of delivery was 01-MAY-2008. No further details were provided. Follow up information has been received from a medical assistant who reported that on 08-APR-2008 the patient had a normal vaginal delivery of a healthy and normal infant born at 36 5/7 weeks estimated gestational age, pre-term. There was no complications for the baby. Additional information is not expected.

MedDRA PT Drug exposure during pregnancy, Polyhydramnios

Symptom Text: Initial and follow up information has been received from a nurse and a certified nurse midwife for the Pregnancy Registry for GARDASIL concerning a 15 year old female who on 03-AUG-007 was vaccinated with the first dose of GARDASIL (Lot #, site and route not reported). Concomitant therapy included vaccination with the meningococcal vaccine (unspecified). Subsequently, it was determined that the patient was pregnant (LMP 15-Apr-2007). The patient sought unspecified medical attention. On 25-NOV-2007, '(also reported as 32 weeks gestation), the patient was sent for a amniotic fluid index (AFI) and the prenatal sonogram found that the patient had polyhydramnios. No numeric AFI was reported. On 20-JAN-2008, the patient delivered vaginally at term with "massive polyhydramnios". She delivered a healthy, and normal baby weighing 7 lbs, 6 oz. Both the mother and baby are doing well. Additional information is not expected.

Other Meds:

Lab Data: ultrasound, 11/25/07 - polyhydramnios; serum beta-human - positive

MedDRA PT Drug exposure during pregnancy, Gestational diabetes, Polyhydramnios, Pre-eclampsia

Symptom Text: Information has been received from a registered nurse through the Merck pregnancy registry concerning an 18 year old female with a family history of diabetes mellitus and familial risk factor (gestational diabetes mellitus, and pre-eclampsia in patient's mother), who on 14-SEP-2007 was vaccinated with her first dose of 0.5 mL GARDASIL (lot #658554/0928U). The patient is now 8 weeks pregnant with last menstrual period 04-Sep-2007 and an estimated due date of 11-JUN-2008. There is no information about the vaccine because it was given at another office. The patient sought medical attention with an exam in the office. Follow up information has been received from the obstetrician/gynaecologist who reported that on 08-JAN-2008, the patient underwent an ultrasound indicated for gestational diabetes mellitus (GDM) and polyhydraminos which showed polyhydraminos. She also had a serum alpha-fetaprotein test, indicated for (GDM) and polyhydraminos, which was negative. On 31-MAR-2008, 09-MAY-2008, 15-MAY-2008 and 30-MAY-2008 the patient underwent ultrasounds indicated for (GDM) and polyhydraminos, all showed polyhydraminos, but otherwise normal. A 35 glucose tolerance test done during the pregnancy was abnormal -1. Gestational diabetes was diagnosed (date not reported). The treatment for the gestational diabetes mellitus included insulin NPH BID and insulin regular daily. The physician reported that the patient underwent several neonatal stress tests (dates not specified) which were normal and reactive. The patient also experienced pre-eclampsia during her pregnancy (date not specified). The physician reported that on 06-JUN-2008, at 38 5/7 weeks from last menstrual period, the patient delivered a normal male infant with apgar: 9/9, weight: 7lbs 11ozs, length: 21 inches, and head circumference: 37 cm. The infant had mild jaundice. Additional is not expected.

MedDRA PT Chlamydial infection, Drug exposure during pregnancy

Symptom Text: Information has been received as part of a pregnancy registry from a registered nurse concerning a 16 year old white female who on 17-AUG-2007, was vaccinated with her first dose of GARDASIL (lot# 658490/0802U), intramuscularly. On 18-OCT-2007 the patient received her second dose of GARDASIL (lot #658556/1060U), intramuscularly. The patient was given two doses of GARDASIL while she was pregnant. It was reported that on 27-NOV-2007 patient was treated 500 mg (two tablets) of ZITHROMAX for chlamydia. She was also started on prenatal vitamins on October 2007 1 tablet daily for pregnancy. No adverse events were reported. On 21-NOV-2007 the patient had a routine ultrasound that showed single IUC, 13 weeks and 5 days. The patient's last menstrual period was estimated to be 15-AUG-2007, " mid August" and her estimated date of delivery is 23-May-2008. In follow up telephone call the nurse reported that the patient delivered a healthy and normal infant on 12-MAY-2008 weighing 8 lb 1 oz "8-1" with apgars of 9/10. The baby's length was 20 inches long. No problem was reported. Additional information is not available.

Other Meds: meningococcal vaccine

MedDRA PT Anaemia, Chlamydial infection, Drug exposure during pregnancy, Dyspepsia, Gastrooesophageal reflux disease, Upper respiratory tract infection

Symptom Text: Initial and follow up information has been received through the Merck pregnancy registry for GARDASIL from a Registered Nurse concerning an 18 year old female who in August 2007 was vaccinated with a first dose of GARDASIL. On 08-NOV-2007 the patient was vaccinated with a second dose of GARDASIL and was pregnant. There was no concomitant medication and diagnostic laboratory tests included Complete Blood Count (CBC), Human immunodeficiency (HIV), rubella, Hepatitis B, and antibody type and screen. No results were given. The GARDASIL was given by another physician at another office. The patient experienced chlamydia and upper respiratory infection during her pregnancy (dates unknown). Since 27-NOV-2007 the patient has been prescribed pre-natal vitamins. On 17-DEC-2007 the patient experienced heartburn and was treated with PREVACID and had a maternal serum alpha fetoprotein survery (MSAFP) and the result of the test was negative. On 21-DEC-2007 the patient experienced gastroesophageal reflux disease and was treated with PREVACID. On 18-JAN-2008 the patient had an ultrasound for anatomical survey and the result of the test was unremarkable and within limits. On 17-MAR-2008 the patient experienced anemia and was treated with REPLIVA 21/7). On 25-MAY-2008 the patient delivered a normal, healthy female baby weighing 7 pounds and 14 ounces and length was 20.5 inches. At the time of the report the outcome of the heartburn, gastroesophageal reflux disease, anemia, chlamydia and upper respiratory disease were unknown. Additional information has been requested.

Other Meds:

Lab Data: diagnostic laboratory - HIV test - no results given; diagnostic laboratory - antibody type and screen - no results given; ultrasound, 01/18/08 - unremarkable anatomical survey for pregnancy-WNL; complete blood cell - no results given; serum

MedDRA PT Drug exposure during pregnancy, Gastrooesophageal reflux disease, Haemorrhage, Urinary tract infection

Symptom Text: Information has been received for the Pregnancy Registry of GARDASIL from a Registered Nurse (R.N.) concerning an 18 year old female patient who on 10-MAY-2007 was vaccinated with a dose of GARDASIL (lot # 654389/0961F). In follow up information from the doctor's office it was reported that on 02-OCT-2007 patient had ultrasound (19 weekd pregnancy) for bleeding and result was within normal limit. On 22-OCT-2007 she had a amniocenticsis (at 21weeks pregnancy) and the result was within normal limit. On 23-JAN-2008 she was treated for gastric esophageal reflux disease (GERD) with PRILOSEC twice a day and with KEFLEX twice a day for urinary tract infection. On an unspecified day patient was started with prenatal vitamins. The office learnt about the pregnancy when patient went to the office on 26-JUL-2007. In a follow up telephone call and from the follow up information from the doctor's office it was reported that patient's last menstrual period (LMP) was on 27-MAY-2007 and she delivered a normal male baby on 21-FEB-2008. The apgar score for the baby was 9/9. The baby weighed 7 lb 8 oz. The nurse stated that the baby was "fine". No other information was provided. Additional information is not expected.

Other Meds: Unknown

Lab Data: ultrasound, 10/02/07 - Done in 19 weeks for bleeding (within normal); amniocentesis, 10/22/07 - 21 week routine fetal screen (within normal); Apgar score, 02/21/08, 9/9

MedDRA PT Skin warm, Somnolence

Symptom Text: Information has been received from a Pharmacist (R.Ph.) concerning a "young lady" who on 09-JUN-2008 was vaccinated with a first dose of GARDASIL (lot # not reported). There was no concomitant medication. The Pharmacist reported that the "young lady received her first dose of GARDASIL at the physician's office around 10 am this morning and slept from around 12 noon to about 4:15 PM". She was awakened by her mother as recommended by the pharmacist to check her status. It was reported that "she felt a little warm". The patient sought medical attention by contacting the pharmacist. The patient's present status was reported as "sleepy". Additional information has been requested.

MedDRA PT Chest pain, Headache, Musculoskeletal pain, Neck pain, No reaction on previous exposure to drug, Tension headache

Symptom Text: Information has been received from a physician and from Emergency room medical records concerning a 16 year old female with no pre-existing allergies or medial condition, who on 24-APR-2007 was vaccinated intramuscularly into left deltoid with the first dose of GARDASIL (lot# not reported) and on 10-JUN-2008 was vaccinated with the second dose of GARDASIL (lot # 656051/0244U). On 12-JUN-2008 the patient went to the emergency room and had complaints of headache to the right temporal area, described as constant. The symptoms were aggravated by standing or laying for too long. The patient had right neck pain into her shoulder. Examination was positive for right trapezius, pain at rest, pain with movement. The symptoms began two days ago. Chest pain was also noted (onset not reported). The emergency room report noted that there was no dizziness, fever, nausea, paresthesis, sinus congestion, vision changes, vomiting. The severity of the pain in the emergency department was a "10" out of "10." The patient had not had any similar episode in the past. Physical examination in the emergency room showed that the patient was oriented to person, place, time and her mentation was appropriate for stated age. She had excellent breath sounds in all fields with symmetrical chest wall movement and no wheezing, rales of rhonchi. Her heart sounds were normal with no murmurs, rubs or gallop. Vital signs included: B/P 130/93; pulse 81; respirations 18; temperature 98.7 and pulse oximeter 96& on room air. Impression was tension headache. In the emergency room the patient was given MOTRIN 800 mg orally and FLEXERIL 10 mg orally. Her symptoms improved and she was discharged to home in stable condition with instructions on headache, tension muscle contraction headache. Discharged medications included prescriptions for PHENERGAN (twelve) tablets 25 mg, 1 every 6 hours as needed for nausea; TORADOL 1O mg (twelve) tablets, 2 tablets by mouth to start then 1 tablet every 6 hours as needed. She was to follow up with her physician in 2-3 days.

Other Meds: Unknown

Lab Data: blood pressure, 06/12/08, 130/9; pulse oximetry, 06/12/08, 96%; cardiac monitoring, 06/12/08 - Pulse 81 and repeat pulse 82; temperature measurement, 06/12/08, 98.7

MedDRA PT Injection site induration

Symptom Text: Information has been received from a certified medical assistant concerning a 17 year old female with a history of penicillin allergy who on 27-FEB-2008 was vaccinated with IM with the first dose of GARDASIL (658556/1060U). On 23-APR-2008 the patient was vaccinated IM in the right deltoid with the second dose of GARDASIL (659962/1740U). The medical assistant reports that the patient developed a "knot" at the injection site at an unspecified time period after receiving the second dose. The patient phoned the physician's office on 10-JUN-2008 to report the adverse symptom. No other symptoms or treatments were reported and no other information is available. The patient's "knot" at the injection site has persisted. This is a consolidation of two reports concerning the same patient. Additional information has been requested.

MedDRA PT Cardiac arrest, Convulsion, Death, Fall, Mydriasis, Pulmonary congestion, Pulmonary oedema, Pulse absent, Pupil fixed, Respiration abnormal, Syncope, Unresponsive to stimuli, Ventricular fibrillation, Visceral congestion

Symptom Text: Information has been received from a certified medical assistant concerning a 14 year old female who was vaccinated with a first dose of GARDASIL and experienced syncope. She was taken to an emergency room and released. The patient was vaccinated with a second dose of GARDASIL (unspecified time). Subsequently, the patient experienced her first seizure (unspecified time) and was taken to the emergency room (no further details provided). The patient was vaccinated with a third dose of GARDASIL at 15 years old. Approximately 27-JUN-2008, two weeks after the third dose, the patient developed a complication. She was taken to the hospital by ambulance but passed away during the transport from an unknown cause. The physician has asked the mother for the autopsy report. The reporting medical assistant considered the syncope, seizure and "a complication" were considered to be immediately life-threatening and disabling. Additional information has been requested. 2/13/09 Autopsy report received. COD: Seizure Disorder. Summary Diagnoses: Clinical history of seizure disorder. Pulmonary congestion and edema. Passive visceral congestion. 2/20/2009 ER received from CDC. Pt presented to ER via EMS following witnessed seizure activity with fall from standing. Upon EMS arrival pt had agonal respirations and was pulseless in V-fib at 650. Upon arrival in ER unresponsive, pupils fixed and dilated, no cardiac activity. Resuscitation unsuccessful and pt expired.

MedDRA PT Aura, Dysarthria, Headache, Hemiplegia, Immediate post-injection reaction, Migraine, Nausea, Photophobia

Symptom Text: Information has been received from a nurse concerning a 14 year old female who on 15-MAY-2007 was vaccinated with her first dose of GARDASIL. There was no other vaccination to the patient on that day. On 15-MAY-2007, immediately post vaccination, the patient developed slurred speech for 10 minutes, paralysis of left side for 30 to 40 minutes and a migraine. Subsequently, the patient recovered from the events. Unspecified medical attention was sought. Upon internal review, hemiplegia was determined to be an other important medical event. Additional information has been requested. 8/13/08-records received for DOS 8/15/07-neurology clinic visit for evaluation of two spells associated with headache as well as third severe headache in past 3 months. First spell occurred in June of 2007 when her speech became slurred and developed ;numbness or loss of sensation in entire left lower extremity followed by entire left upper extremity. Speech problem resolved within 10 minutes and loss of sensation persisted for 30 minutes and as this was resolving developed a severe headache over left temple migrated to right temple. Felt like bright light burning directly into left side of head, severe photophobia, vomiting and severely nauseous. Evaluated in ED with head CT which was unremarkable. The next episode occurred in July with no speech problems, only sensation loss in left leg and foot and arm. Fell asleep for 2 hours and up awakening no sensory abnormalities. Seen in ED and repeat CT scan. Two weeks prior to this office visit had significant headache and sensory symptoms. PE normal. Consistent with classic migraine with aura.

Other Meds: Unknown

Lab Data: Unknown 8/13/08-records received- head CT which was unremarkable.

History: Unknown 8/13/08-records received-Family history of migraines. Seasonal allergies.

MedDRA PT Asthenia, Body temperature increased, Immediate post-injection reaction, Musculoskeletal pain, No reaction on previous exposure to drug, Paraesthesia, Pyrexia, Urticaria, Vomiting

Symptom Text: Information has been received from a physician concerning his 19 year old daughter with no medical history and no drug allergies, who on 06-JUL-2008 was vaccinated intramuscularly into the left deltoid muscle with the third 0.5 mL dose of GARDASIL. There was no concomitant medication. On 06-JUL-2008, immediately after the injection, the patient experienced severe pain of the left shoulder, tingling of the left fingers, and a feeling of weakness of the left hand. She then developed localized hives on the left upper arm, a low grade temperature and vomited once. On 07-JUL-2008 the hives, fever and vomiting were resolved, but the pain and tingling persisted. At the time of this report, the outcome of the weakness of the left hand was unknown. It was reported that the first dose of GARDASIL was given in January 2008, and that the patient did not experience any problems after receiving the first or second doses of GARDASIL. No product quality complaint was involved. The reporting physician considered the severe pain of the left shoulder and the tingling of the left fingers to be disabling. Additional information has been requested.

MedDRA PT Asthenia, Back pain, Diplopia, Disturbance in attention, Dysarthria, Gait disturbance, Headache, Hyperacusis, Influenza, Meningism, Mental impairment, No reaction on previous exposure to drug, Photosensitivity reaction, Vision blurred

Symptom Text: Initial and follow up information has been received from a physician concerning a 19 year old female with a history of relapsing infections who on 30-JAN-2008 was vaccinated intramuscularly into the upper left arm with her third dose of GARDASIL (Lot # and site not reported). Two days post vaccination the patient complained about headache and asthenia. She was admitted to the hospital for diagnostics (not further specified) and recovered completely within about 1 week. The first and second vaccinations with GARDASIL (Dates, Lot #s, route and sites not reported) were well tolerated. No additional information was provided. In follow up it was reported that on 30-JAN-2008 (also reported as "same day"), she developed meningeal irritation, double and blurred vision, concentration disorder, noise- and photosensitivity, a "dull feeling in head", articulation problems, gait disorder, headache, asthenia and back pain. On 31-Jan-2008 she was admitted to the hospital for diagnostics. Virus diagnostics revealed low-positive antibodies for Influenza B virus. Other virus infections were ruled out. Meningeal irritation due to influenza B virus infection was assumed. A postvaccinal reaction was discussed. A lumbar puncture was performed (normal results) and meningitis could be ruled out. Cranial MRI, abdominal sonography, ECG and neurological examinations showed normal results. Therapy was carried out with unspecified infusions and analgesics. The patient fully recovered and was discharged from the hospital on 06-FEB-2008 (exact duration of symptoms not reported). The file is closed. Other business partner numbers include: E2008-04957. No further information is available.

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a 25 year old female healthcare worker with no medical history or known drug allergies who on 02-FEB-2007 was vaccinated with a first dose of GARDASIL. There was no concomitant medication. The patient stated that she would not complete the vaccine series because she was 4 weeks pregnant. A pregnancy test was performed. The patient's expected delivery date was 19-OCT-2007. The patient sought unspecified medical attention. On approximately 17-MAR-2008, at approximately nine weeks, the patient reported that she had terminated the pregnancy. She did not provide a reason. She reported that she had no complications and was doing well. No product quality complaint was involved. Upon internal review terminated pregnancy was considered to be an other important medical event. Additional information is not expected.

Seriousness: LIFE THREATENING, SERIOUS

MedDRA PT Biopsy cervix abnormal, Cervix carcinoma, Smear cervix abnormal, Surgery

Symptom Text: I was diagnosis with Cervical Cancer in April 2008. I have gotten a routine thin pap test each year for the last 8 years. February 2008 was my first abnormal pap smear in my lifetime. I received the GARDASIL shot in June of 2006 after hearing and reading about its approval by the FDA. I was the first patient my doctor ever gave the HPV vaccination to. I received all three of the shots and completed the HPV vaccination in November of 2006; each given by my doctor. I had my annual pap smear in February of 2007, and like each pap smear before, it came back negative. When my February 2008 pap smear cam back positive my doctor then did a biopsy which came back with high-grade cells and warranted a Leep procedure. The Leep was performed at a local hospital on March 14, 2008. The pathology results from the Leep came back and showed that within a year of my last normal pap smear and 15 months from the completion of the GARDASIL HPV vaccination, I had full blown cervical cancer. On May 6th of 2008 I had my second surgery, a Cone Biopsy of my cervix by Dr., an oncologist at Cancer Center. My second surgery was performed at another hospital. I will now have to see my Oncologist every three months and wait to see, not 'if', but 'when', my cervical cancer returns. My oncologist would like to do a hysterectomy at this time, but as a 26-year-old who has always wanted children, I have chosen to wait as long as possible before removing my reproductive organs. As a very health conscious and responsible person, I have always researched health care issues and been good to my body. Thinking it was in my best interest of my health and well being, I received the GARDASIL shot in June 2006. It was discovered in March of 2008, followed by my first abnormal pap smear, that I have two of the four HPV strains, 16 and 18, that the shot is suppose to prevent, as well as prevent the onset of HPV symptoms. I now have cervical cancer and I am left wondering what role the GARDASIL HPV vaccination played in the hasty onset of my onset. I wish I ha

MedDRA PT Drug exposure during pregnancy, No reaction on previous exposure to drug, Rash

Symptom Text: Information has been received from a 19 year old female for the Pregnancy Registry for GARDASIL vaccine (yeast) with an allergic reaction to antibiotics (cephalexin (KEFLEX)) who in March 2008, was vaccinated with her first dose of GARDASIL vaccine (yeast) (lot# not reported). There was no concomitant medication. The patient received the second dose of GARDASIL vaccine (yeast) (lot# not reported) on an unspecified date and was pregnant. The patient's LMP was 01-APR-2008. The day after receiving the second dose of GARDASIL vaccine (yeast), the patient experienced a rash and went to the physician's office. At this time, a urine pregnancy test was conducted and it was positive. The patient's outcome for the rash and pregnancy were not reported. Additional information has been requested.

Other Meds: None

Lab Data: urine beta-human - positive

History: LMP = 4/1/2008, Allergic reaction to antibiotics

MedDRA PT Injection site pain, Injection site swelling

Symptom Text: Initial information and follow up has been received from a physician's assistant and registered nurse concerning a white 16 year old female who on 13-DEC-2007 was vaccinated intramuscularly in the deltoid with her first dose of GARDASIL vaccine (yeast) (lot# 655154/1210U). There was no concomitant medication. On 03-JUN-2008 the mother informed the physician that the daughter experienced pain and swelling at the injection site on 13-DEC-2007. The patient was not seen as a result of this occurrence and has not decided not to continue the dosing series. Subsequently, the patient recovered from the pain and swelling at the injection site after 2 days. Additional information has been requested.

MedDRA PT Asthenia, Injection site discomfort, Nausea, Pain, Vomiting

Symptom Text: Information has been received from a licensed practical nurse concerning a 22 year old female with no allergies, who on 09-AUG-2007 was vaccinated with a first dose of GARDASIL vaccine (lot#, and route not reported). There was no concomitant medication. On 17-Jan-2008, the patient was vaccinated with the second dose of GARDASIL vaccine (lot# 655237/1287U) (route not reported). In the evening of 17-JAN-2008, the patient experienced nausea, body aches, vomiting, and weakness. On 18-JAN-2008, the patient had mild discomfort at the injection site and also vomited in the morning. The reporter noted that the patient's symptoms lasted fro a day and on half and them resolved. On 21-MAR-2008, the patient returned to the office for another vaccination, but the vaccination was not administered due to the adverse reaction on 17-JAN-2008. The office was still deciding if they would administer another dose of GARDASIL vaccine. No other information was available. Additional information has been requested.

MedDRA PT Drug exposure during pregnancy

Symptom Text: Information has been received from a consumer for the Pregnancy Registry for GARDASIL vaccine (yeast) concerning herself, a 21 year old female, who in November 2007, was vaccinated with her third dose of GARDASIL vaccine (yeast) (lot # unspecified) and realized she was pregnant. Dates and lot numbers of the previous 2 doses were not reported. There was no concomitant medication. Unspecified medical attention was sought. Approximately in April 2008 the 7th month sonogram was performed (date not reported), and the physician noticed that the baby had an echogenic bowel. After this was found, on unspecified date the patient had amincentesis performed and the results were reported as "everything was normal". The patient reported that at the time of this report she was 34 weeks pregnant (estimated LMP is 17-Oct-2007). No further information was provided. No further information is available.

Other Meds: None

Lab Data: ultrasound - 04/01?/08 - baby had echogenic bowel, amniocentesis - 04?/??/08 - "normal"

History: LMP = 10/17/2007

MedDRA PT Loss of consciousness, Vaccine positive rechallenge

Symptom Text: Information has been received from a physician concerning the 16 year old daughter of his receptionist, with polycystic kidney who in August 2007, was vaccinated with the first dose of GARDASIL vaccine (yeast). Concomitant therapy included hormonal contraceptives (unspecified). In August 2007, on an unspecified date, after receiving GARDASIL vaccine (yeast) by injection, the patient experienced "passing out." She received her second dose of GARDASIL vaccine (yeast) on an unreported date in October 2007. Her hormonal contraceptives were discontinued in November 2007. The patient was not given the third dose of GARDASIL vaccine (yeast). She sought unspecified medical attention and had a stress test and an electroencephalogram (EEG) performed, no results were provided. At the time of reporting the patient was still experiencing "passing out." Additional information has been requested.

Other Meds: hormonal contraceptives

Lab Data: electroencephalography - results not reported, cardiac exercise - results not reported

MedDRA PT Drug exposure during pregnancy

Symptom Text: Information has been received from a registered nurse (RN) through a Merck pregnancy registry concerning a 13 year old female with attention deficit/hyperactivity disorder and no known drug allergies and a history of being a rape victim who on 15-OCT-2007 was vaccinated intramuscularly in the right deltoid with a first 0.5 ml dose of GARDASIL vaccine (yeast) (Lot #655849/0263U). On the same day the patient also received concomitant vaccinations of meningococcal ACYW conj vaccine (dip toxoid) (MENACTRA), hepatitis A virus vaccine (manufacturer unknown) and influenza virus vaccine (unspecified). The patient was in her menstrual cycle at the time of vaccination. On 15-JUN-2008 the patient had a normal live birth, female child. Unspecified medical was sought. Additional information has been requested.

MedDRA PT Rash, Rash papular, Skin discolouration

Symptom Text: Information has been received from a mother concerning her 18 year old daughter who "sometime" in June 2007, was vaccinated with a first dose of GARDASIL vaccine (yeast). "Sometime" in July 2007 she was vaccinated with a second dose of GARDASIL vaccine (yeast). There was no concomitant medications. "Sometime" in October 2007 she was vaccinated with a third dose of GARDASIL vaccine (yeast). In the beginning of October 2007, the patient started to break out in rash on the front of her body and by the end of October she started to develop little bumps on her whole stomach. In December 2007 the bumps spread to her back from her chest down to her stomach. The bumps turned into open sores that were a little larger than a pencil tip but did get to the size of an eraser on a pencil. The sores healed and the patient "has brown spots on her body where the rash had been." The patient was seen and treated by a dermatologist. The patient had a biopsy (results not reported). The patient was treated with a cream (unspecified by reporter). The cream had faded the spots a "little bit" but the patient "still has the marks." At the time of the report the patient was recovering. Additional information has been requested.

MedDRA PT Syncope

Symptom Text: Information has been received from a nurse concerning an 18 year old female with no known drug reactions or allergies who on an unspecified date was vaccinated with the first dose of GARDASIL vaccine (yeast). Concomitant therapy included meningococcal ACYW conj vaccine (dip toxoid) (MENACTRA) (Sanofi Pasteur). The patient fainted 10 minutes after receiving her first dose of GARDASIL vaccine (yeast). There were no injuries. She was walking fairly soon after fainting. She did not say if she will discontinue the series. Unknown medical attention was sought with the doctor. Patient recovered on an unspecified date. Additional information has been requested.

MedDRA PT Human papilloma virus test positive

Symptom Text: Information has been received from a medical assistant concerning a 15 year old female with no known drug reactions or allergies who was vaccinated with a dose of GARDASIL vaccine (yeast) and now has tested positive for high risk HPV DNA and has an abnormal Pap test. The patient received at least one and possibly two vaccinations with GARDASIL vaccine (yeast) prior to the abnormal Pap and HPV DNA test on 27-MAY-2008. The vaccination with GARDASIL vaccine (yeast) were not administered at the office in the case. The patient had never had an abnormal Pap or positive HPV DNA test in the past. It was unknown whether the patient sought medical attention. Patient outcome was not reported. Additional information has been requested.

MedDRA PT Concussion, Fall, Immediate post-injection reaction, Syncope

Symptom Text: Information has been received from a consumer concerning her 16 year old daughter with a history of "small septal defect" and no drug reactions/allergies who on 20-JUN-2008 was vaccinated intramuscularly in the right arm with first dose of GARDASIL vaccine (yeast) (lot # unspecified). Concomitant therapy included hormonal contraceptives (unspecified). It was reported that the patient fainted and fell off exam table seconds post vaccination. Upon further examination by physician, the patient was determined to have a concussion. Unspecified medical attention was sought. It was reported that the patient was getting worse and the physician will be scheduling CT scan if symptoms won't subside. At the time of this report the patient has not recovered from her experiences. No further information is available.

MedDRA PT Central nervous system lesion, Malaise, Mydriasis, Optic neuritis, Syncope

Symptom Text: Information has been received from a healthcare worker concerning her 18 year old daughter with irritable bowel and a history of attention deficit disorder who on unspecified date was vaccinated with a first dose of GARDASIL vaccine (yeast) (lot number, injection site and route not reported). The patient felt sick after the vaccination. On an unspecified date, the patient was vaccinated with a second dose of GARDASIL vaccine (yeast) by intramuscular injection (lot number and injection site not reported). Concomitant therapy included amphetamine aspartate/amphetamineS04/dex (ADDERALL TABLETS) and birth control pill. On 07-JUN-2007 the patient experienced faint and shortly afterwards she developed a problem with her eye; it became dilated more than the other. The caller took her daughter to an optometrist who performed some tests that came back abnormal and determined it was optic neuritis. The caller went to other specialists to find out if it was MS related and the patient had an MRI done which came back abnormal and showed 11 to 14 lesions on her brain, spine tap came back negative. A MS specialist did not feel it was MS however suggested not receiving the 3rd dose and determined it was probably a response to the vaccine. The patient's optic neuritis persisted. The caller also mentioned that her daughter also had a behavioral problem on Periaction when she was little. Additional information has been requested.

Other Meds: ADDERALL TABLETS, hormonal contraceptives

Lab Data: magnetic resonance - abnormal, computed axial, spinal tap - negative

MedDRA PT Rash generalised

Symptom Text: Information has been received from a medical assistant concerning a 25 year old female who on 23-JUN-2008 was vaccinated with a first dose of GARDASIL VACCINE 0.5 mL IM. The patient started getting a rash on her arms, but not around the injection site. On 25-JUN-2008, the patient called the office to report that the rash was all over her body and progressing. BENADRYL was recommended to the patient to treat the rash; however she reported that it did not seem to help. The patient was scheduled to be seen in the office on 26-JUN-2008 for an unrelated reason (sonogram). The patient's rash persisted. Additional information has been requested.

MedDRA PT Abdominal pain lower, Body temperature increased, Menorrhagia, Muscle spasms, Oral contraception, Ovarian cyst, Syncope, Thrombosis

Symptom Text: Information has been received from a female concerning her 13 year old granddaughter with no pertinent medical history and no history of drug reactions or allergies who on unspecified dates was vaccinated with the complete series of GARDASIL. There was no concomitant medication. Subsequently, in April 2008, the patient experienced severe pain on the bottom of her stomach on both sides and she was having blood clots. Because of these symptoms, the patient was hospitalized for 4 days. The patient also developed cyst. Ultrasound was performed (results not reported). As of 16-JUL-2008, the patient was at home but still complaining about severe pain in the lower part of her stomach and still has blood clots. This is one of three reports from the same source. (WAES: 0807USA03551 and 0807USA03552). Additional information has been requested. 8/21/08-ER records for DOS 4/2-4/4/08-presented with C/O abdominal pain and cramping. Menses began 3-4 days prior. Pale diaphoretic. Impression:abdominal pain, syncope. Temperature elevated. Urine culture E. coli. Seen in OB/GYN office 4/8/08-C/O continuous bleeding and abdominal pain. Follicular cyst of ovary. 6/4/08-continues to have heavy bleeding with cramps.Prescribed Ortho Nuvum 1/35. Seen on 7/15/08-last period without problems no longer taking birth control pills. Office did not administer Gadasil to client.

MedDRA PT Convulsion, Fall, Musculoskeletal stiffness, No reaction on previous exposure to drug, Tremor, Urinary incontinence

Symptom Text: Information has been received from a nurse concerning a 16 year old female who on unspecified dates was vaccinated with the first and second doses of GARDASIL. The first and second doses did not cause symptoms. On 16-JUL-2008 the patient was vaccinated with the third dose of GARDASIL. Concomitant therapy included VAQTA (manufacturer unknown). The patient experienced "seizure-like symptoms within 30 seconds of her third dose". The symptoms were falling on a table, mild shaking including her legs, hand stiffening and urinating on herself. On an unspecified date the patient was recovered. The patient saw the doctor and sought unspecified medical attention. Upon internal review seizure-like symptoms were considered to be other important medical event. Additional information has been requested.

MedDRA PT Swelling face, Vaccine positive rechallenge

Symptom Text: Information has been received from a physician concerning a 24 year old old female who on 06-MAR-2008 was vaccinated with a first dose of GARDASIL vaccine (lot # not reported). On 06-MAR-2008, the patient was vaccinated intramuscularly with a second dose of GARDASIL vaccine (lot # not reported). The physician reported that "the patient received two doses of GARDASIL vaccine and experienced swelling of her jaw the night of vaccine both times. The 1st dose was given when she was 24 year sold and the 2nd dose was given when she was 25 years old. The swelling resolved in a few days without treatment for both instances." The patient sought unspecified medical attention during an office visit. No other details were reported by the physician. Additional information has been requested. Follow-up information was received from a physician, concerning the now 25 year old white female patient with no previous medical history and pre-existing allergies reported. The physician reported that on 06-MAY-2008, the patient was vaccinated with the second dose of GARDASIL. The next morning the patient had noted swelling and tenderness of right jaw. The patient were to the reporter's office later on 07-MAY-2008, and still had mild fullness at right jaw area, but no mass or oro-pharyogeal swelling. Left deltoid injection site was not swollen. Swelling jaw improved during the course of the day. The patient indicated similar swelling of jaw "a few days after" her first dose of GARDASIL. In both cases, swelling resolved spontaneously. Additional information has been requested.

MedDRA PT Drug exposure during pregnancy, Muscle spasms

Symptom Text: Information has been received through the Merck pregnancy registry from a 26 year old female with no history of drug reactions or allergies and a history of light cramping when menstrual period starts who in November 2007 was vaccinated with the first dose of GARDASIL vaccine and in January 2008 was vaccinated with the second dose of GARDSIL vaccine. About 2 weeks ago (on approximately 12-JUN-2008), the patient experienced cramping, which is "stronger than the usual light cramping" she had before her period starts." This cramping did not fade away, but is "off and on." On 25-JUN-2008, the patient was vaccinated with the third dose of GARDASIL vaccine 0.5 mL (lot 655327/1287U). There was no concomitant medication. On 26-JUN-2008, the patient found out that she was pregnant by a pregnancy test. On 26-JUN-2008, the patient was approximately five weeks gestation. Last menstrual period was approximately 20-MAY-2008, estimated due date 24-FEB-2009. She will not get any more doses. The patient's cramping persisted. The patient sought medical attention with a telephone call. No further information is available.

MedDRA PT Back pain, Dysuria, Inappropriate schedule of drug administration, Incorrect route of drug administration, Malaise, Pyelonephritis acute, Pyrexia

Symptom Text: Information has been received from a health professional concerning a 39 year old female with hypothyroidism who on 25-MAY-2008 was vaccinated with the first dose of GARDASIL (lot number not reported) without any adverse events. On 25-JUN-2008 was administered the second dose of GARDASIL (lot # 0569U; batch # NG39340) in the buttocks. On 07-Jun-2008, laboratory evaluation revealed white blood cell count 7,040; blood neutrophil count 69%; blood lymphocyte count 16%; and blood monocyte count 13%. On 25-JUN-2008, after vaccine administration, the patient started with general malaise. On 30-JUN-2008, the patient began to have lumbar pain, the patient went to the hospital where she was diagnosed with lumbago, the patient was given analgesics to treat lumbar pain. By 01-JUL-2008, the patient presented a high fever (39 C). She was hospitalized on 3-JUL-2008, where she was diagnoed with an acute right side pyelonephritis and febrile syndrome. On 03-JUL-2008, laboratory evaluation on admission revealed red blood cell count 4,700,000; hemoglobin test 15.1; hematocrit 41.2; white blood cell count 11,800; neutrophil count 87.4%; lymphocyte count 4.9%; monocyte count 6.9%; platelet count 229,000; serum glucose test 94; blood urea test 17.8; serum creatinine test 0.9; serum sodium test 136; serum potassium 4.3; serum C-reactive protein test 2.2. On 03-JUL-2008, urine tests revealed: urine culture Isolated bacteriae, urocultive: mixed flora; red blood cell count 11-20; and white blood cell count 50-100. On 07-JUL-2008, his urinalysis was normal. Per hospital discharge report received on 11-JUL-2008 the patient, a 39 year old female was hospitalized through the emergency room, with clinical symptoms that had been going on for 6 days after being administered the second dose of vaccine. The symptoms were lumbar pain on the right side, that ceased after treatment with analgesics, but later on reappeared accompanied with fever (39C), dysuria and general malaise. According to the hospital report, the patient was firstly treated with

MedDRA PT Dizziness, Hypoaesthesia, No reaction on previous exposure to drug

Symptom Text: Information has been received from a health authority concerning a 14 year old female who on 24-APR-2007, was vaccinated with the first dose of GARDASIL (LOT # 1314F and BATCH # NF12410), intramuscular administered and was well tolerated. On 17-JUN-2007, was vaccinated with the second dose of GARDASIL and was well tolerated. On 15-NOV-2007, was vaccinated with the third dose of GARDASIL (LOT # 0253U and BATCH # NF58540), intramuscular administered into the left upper arm. In March 2008, the patient experienced numbness of fingers II-V up to the metacarpophalangeal joints of the left hand. On 18-MAY-2008, the patient experienced dizziness. She was hospitalized for diagnostics. Borreliosis, multiple sclerosis, transverse myelitis, disturbance of the static sense and "cardiac causes" were ruled out. At the time of the report dizziness had improved, but has not recovered. The patient's numbness of fingers II-V up to the metacarpophalangeal joints of the left hand outcome was not reported. Numbness of fingers II-V up to the metacarpophalangeal joints of the left hand and dizziness were considered to be an other important medical events. MedDRA PT Adenovirus infection, Dizziness, Headache, Meningism, Nausea, Pharyngeal erythema, Pyrexia, Syncope, Tonsillitis, Vomiting

Symptom Text: Information has been received from a paediatrician concerning a 14 year old female who on 22-NOV-2007 was vaccinated with the first dose of GARDASIL (lot # 1518F; batch NF27880). This dose was well tolerated. On 05-FEB-2008, she received the second dose of GARDASIL (lot # 0467U; batch NG14300) intramuscular administration, into the deltoid muscle. On 06-FEB-2008 the patient experienced headache, nausea, vomiting (once), dizziness, fever up to 39.4 C and syncope. The patient was hospitalized the same day because meningitis the course of the febrile infection was suspected. By discharge summary it was reported that the patient showed meningism but CSF was normal. Additionally, she had a red pharynx and tonsils. Adenovirus infection of the upper respiratory tract was diagnosed. Laboratory tests included: Adenovirus serum immunoglobulin M (IgM) test = 13 U and serum immunoglobulin G (IgG) test = 24 U; serum C-reactive protein test = 5.9 mg/l; cerebrospinal fluid = Normal; serum Borrelia burgdorferi antibody test = Negative; X-ray of the paranasal sinuses and the lung = Normal. The patient recovered and was discharged from hospital on 10-FEB-2008. Case closed. Other business partner numbers included: E200806392. No further information is available.

MedDRA PT Smear cervix abnormal

Symptom Text: Information has been received regarding a case in litigation. An X-ray technician reported that her colleague with no relevant medical history or allergies in October 2007, was vaccinated with a first dose of GARDASIL vaccine (yeast) (lot number, injection site and route not reported). In November 2007, the patient was vaccinated with a second dose of GARDASIL vaccine (yeast) (lot number, injection site and route not reported). Concomitant therapy included ethinyl estradiol (+) etonogestrel (NUVARING). In February 2008, also reported as soon after third dose, the patient had a positive PAP with abnormal cells. The patient sought unspecified medical attention. The patient's positive PAP with abnormal cells persisted. This is case 2 of 2. Additional information has been requested.

Seriousness: PERMANENT DISABILITY, SERIOUS

MedDRA PT Arthralgia, Erythema, Fatigue, Fluid retention, Insomnia, Joint swelling, Musculoskeletal stiffness, Polyarthritis, Weight increased

Symptom Text: Approximately 3 weeks after receiving vaccine, began to rapidly retain fluid and have swollen joints. Very tired. Before seeking medical attention gained approximately 15-20 lbs of fluid. Went for blood work to administering facility, several batches of tests. Was referred to rhematologist, began prednisone. Again, many batches of tests, no conclusive diagnosis. Advised vaccine company of reaction, was told not fault of vaccine. Still undiagnosed, going to clinic August 22. Taking Plaquenil now, and very high doses of motrin with little to no effect. Do not have RA antibodies or other factors, only high inflam. levels. 8/4/08-records received-presented on 2/4/08-C/O pain and swelling in joints which began 2 weeks after Gardasil injection on 12/4/07-noted minimal myalgias and arthralgias and in January 2008 significant pain right wrist, hands, elbows, shoulders, ankles and knees. Morning stiffness and 24 pound weight gain with puffiness around ankle. C/O fatigue, poor sleep secondary to pain. PE: erythema over PIP and MCP, joint swelling. Impression:acute onset inflammatory polyarthritis involving small joints of hands, wrists, feet and ankles. Arthralgia in knees, elbows and shoulders. 2/13/08-Stiffness improved, 8 pound weight loss. 4/7/08-Stiffness much less intense, minimal swelling, tapering steroids. Assessment self limited arthritis resolving slowly. Viral illness versus poststrep inflammatory polyarthritis versus a more chronic process such as rheumatoid arthritis or other autoimmune diseases.

Other Meds: zyrtec, nuva ring, topical duac and tazorac at time of vaccine

Lab Data: Every blood test possible related to rhematology, xrays, etc. 8/4/08-records received-Labs elevated AST at 40, ALT elevated at 51, rheumatoid factor negative. H and H 12.9 and 37.2. ANA negative.

History: allergic to sulfa 8/4/08-records received-PMH:anemia, eczema, acne. Right knee surgery with patellar replacement. Birth control pills. Allergic to sulfa.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Convulsion, Drug exposure during pregnancy, Eclampsia, Inappropriate schedule of drug administration, Live birth

Symptom Text: Initial and follow up information has been received from a medical assistant and a physician through the Merck Pregnancy Registry for GARDASIL concerning a 16 year old female with no previous pregnancies and no significant past medical history who on 31-Jan-2007, 03-Apr-2007 and 25-Oct-2007 was vaccinated intramuscularly with first, second and third 0.5ml doses, respectively, of GARDASIL (lot #s: 653937/0637U, 654389/0961F, 658560/1062U) while pregnant. The patient's last menstrual period (LMP) was 15-AUG-2007 with an estimated delivery date of 15-MAY-2008. The patient took prenatal vitamins (unspecified) one daily from October 2007 to May 2008. On 10-JAN-2008 and 14-MAY-2008 the patient underwent routine ultrasound which were normal per patient. On 15-MAY-2008 at 40-41 weeks from the LMP, the patient delivered a normal liveborn male, weighing 7lbs, 4 ozs., length: 21 in; head circumference: 14 in. On approximately 15-MAY-2008, after delivery the patient experienced "eclampsia-seizure xl". Upon internal review, the patient's "eclampsia-seizure" was considered to be an other important medical event. Additional information is not expected.

MedDRA PT Convulsion, Syncope

Symptom Text: Information has been received from the mother of a 17 year old female with no known drug allergies and no pertinent medical history, who in February 2008 was vaccinated with the second dose of GARDASIL (lot # not provided), 0.5 mL intramuscularly. There was no concomitant therapy. The mother reported that on 14-JUL-2008, her daughter fainted and convulsed after receiving GARDASIL. The patient sought unspecified medical attention. No lab diagnostics studies were performed. The patient recovered on 14-JUL-2008. Upon internal review, convulsions was considered to be an other important medical event. No further information is available as the mother declined to give her physician's information.

MedDRA PT Abdominal pain, Back pain, Foreign body trauma, Headache, Vertigo, Vomiting

Symptom Text: Information has been received from a physician concerning a 19 year old female with vertigo, headache and on 20-APR-2008, the patient swallowed ring in tongue who on 21-APR-2008, was vaccinated with GARDASIL (LOT # 659964/1978U), 0.5ml, IM. Concomitant therapy included ORTHO TRI-CYCLEN LO) and Tdap. On 05-MAY-2008, the patient experienced vomiting, abdominal pain and back pain. The mother of the patient called office for medical attention. Emergency room did blood work and Computerized Axial Tomography scans (CAT), results not reported. On an unspecified date, the patient experienced a possible urine infection. On 22-MAY-2008, the patient recovered from vomiting, abdominal pain and back pain. The outcome of the possible urine infection was not reported. The physician felt that the vomiting, abdominal pain, back pain, and urine infection were disabling and other important medical events. The physician felt that the possible urine infection was serious (other important medical event) because the patient needed unspecified antibiotics for the possible urine infection. Additional information has been requested.

MedDRA PT Drug exposure during pregnancy, Foetal disorder

Symptom Text: Information has been received from a certified medical assistant concerning a 16 year old female with morphine allergy and no relevant medical history who was vaccinated with GARDASIL during the first trimester of her pregnancy. The vaccine was provided at another location. Dose, route of administration and lot number were not provided. There was no concomitant medication. Ultrasounds, fetal echo, pulmonary function tests were performed and no results were provided. Prenatal testing revealed that the fetus had multiple skeletal abnormalities (dysplasias) and was not expected to survive after delivery. The patient contacted the physician to seek unspecified medical attention. Additional information has been requested.

MedDRA PT Fall, Headache, Impaired work ability, Neck pain, Syncope

Symptom Text: Information has been received regarding a case in litigation from a nurse concerning a 22 year old female who on an unspecified date was vaccinated with a first dose of GARDASIL (lot number, injection site and route not reported). On 05-JUN-2008 the patient was vaccinated with a second dose of GARDASIL (lot number 659182/1757U) by intramuscular injection (injection site not reported). A minute or two later, the patient fainted and fell off the table. Ice was applied to her head, blood pressure was taken and she was sent to the Emergency Room. She had a computed tomography of her neck which was negative. She was given an unnamed medication for pain in head and neck. The patient took three days off from work. The patient taking three days off from work was considered disabling. Additional information has been requested.

MedDRA PT Fall, Hypoaesthesia, Loss of consciousness, Muscle fatigue, Paraesthesia, Syncope

Symptom Text: Information has been received from a registered nurse (R.N.) concerning her 15 year old daughter with no pertinent medical history, drug reactions or allergies who "three months ago", on approximately 18-APR-2008 was vaccinated with a dose of GARDASIL. There was no concomitant medication. "Approximately two months ago", in approximately May 2008, the patient began to experience numbness and tingling in her hands. On 16-JUL-2008 the patient experienced two episodes of syncope during which she lost consciousness and hit the floor. On 17-JUL-2008 the patient noted that all of her muscles felt tired. Allergy tests were performed (results not provided). At the time of the report, the patient's event persisted. The patient did not seek medical attention. The reporter considered numbness and tingling in hands, syncope and muscles tired to be immediately life-threatening. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Asthenia, Hypoaesthesia, Paralysis

Symptom Text: Information has been received from a gynecologist and nurse concerning the nurse's 17 year old, vegan (since 1 year), daughter with neurodermatitis and allergies who on 08-AUG-2007 was vaccinated with her first dose of GARDASIL (lot# 1475F, batch #NF37120), into the upper arm. The second dose of GARDASIL, (lot # 1536F, batch # NG01520), was given on 04-OCT-2007, into the upper arm. The first and second doses of GARDASIL were well tolerated and no adverse effect occurred for both vaccinations. Concomitant therapy included hormonal contraceptives (unspecified). The third dose of GARDASIL, (lot # 0513U, batch#NG16040), route not reported was given on 31-JAN-2008, into the upper arm. Subsequently, the patient complained about numbness feeling in one foot. Neurological examination was without pathological findings. The mother discussed a possible circulation disorder because of intake of hormonal contraceptives and veganism. Follow-up information was reported by the gynaecologist that 5 months post vaccination (approximately 30-JUN-2008), the patient developed paralysis of the left foot with loss of strength of elevator toes. Electroneurography (ENG) showed changes (not specified). cat (CT) scan was planned. Symptoms were ongoing at the time of reporting. The reporter considered paralysis and asthenia to be other important medical events. This is a consolidation of two reports concerning the same patient. Other business partner numbers included: E008-05546. No further information is available.

Other Meds: hormonal contraceptives (unspecified)

Lab Data: electroneurography, changes (not specified)

Seriousness: EXTENDED HOSPITAL STAY, HOSPITALIZED, LIFE THREATENING, SERIOUS

MedDRA PT Brain oedema, Dysarthria, Encephalitis, Headache, Lethargy

Symptom Text: Information has been received from a registered nurse concerning a 13 year old female patient who on 16-JUN-2008 was vaccinated with the first dose of GARDASIL (Lot # 660387/1967U) IM. There was no concomitant medication. On 30-JUN-2008 the patient experienced headache, lethargy, slurred speech and brain swelling. The patient was diagnosed with acute cerebellitis (cerebellar encephalitis). The patient took an overseas trip when these symptoms occurred and was hospitalized. The patient will be on IV Acyclovir for 3 weeks and has been on Dexamethasone but is being weaned off. The patient was on acetazolamide and that was subsequently discontinued. The patient will be on ceftriaxone for 2 weeks and doxycycline for 28 days. The patient was considered to be recovering. The plan by the hospital was to discharge the patient on 17-JUN-2008 and have her on a flight back home by 19-JUL-2008 and to be directly admitted to a pediatric hospital. Lab Diagnostics studies performed were 3 MRIs to monitor brain swelling, serology for Lyme's disease IGG, mycoplasma IGM, mumps IGG and IGM, rubella IGG and IGM, varicella IGG and IGM, parvovirus IGG and IGM, HSV IGG and IGM, however not results were reported. Acute cerebellitis was considered to be immediately life-threatening. The patient sought medical attention, called the physician's office. Follow-up information was received which reported that on 19-JUL-2008, the patient was admitted to the hospital. The patient was subsequently discharged from the hospital on 22-JUL-2008. It was reported that the patient was sent home with a PICC line for antibiotics for the next several weeks. The registered nurse stated that the patient was stable. The registered nurse reported that the physician felt that the patient's Encephalitis was related to GARDASIL (Lot # 660387/1967U) vaccination. Additional information has been requested.

Seriousness: ER VISIT, EXTENDED HOSPITAL STAY, HOSPITALIZED, LIFE THREATENING, SERIOUS

MedDRA PT Ataxia, Decreased appetite, Depressed level of consciousness, Dysarthria, Encephalitis, Fatigue, Gait disturbance, Headache

Symptom Text: Information has been received from a registered nurse concerning a 13 year old female with herpes who on 12-JUN-2008 was vaccinated with a first 0.5 ml dose of GARDASIL by intramuscular injection (lot number and injection site not reported). Concomitant therapy included ceftriaxone sodium, acyclovir and doxycycline. Subsequently the patient experienced headache and fatigue. The patient left and on 30-JUN-2008, her condition dramatically worsened. The patient was stumbling around and slurring her words. She was admitted to the hospital on 30-JUN-2008 and diagnosed with cerebritis. She remained an inpatient until 18-JUL-2008 and returned. On 19-JUL-2008, th patient was admitted to the hospital. She remained in hospital and then was discharge with a percutaneously inserted central venous catheters (PICC) line. The patient was tested for lime disease (result not specified). The diagnosis was acute disseminated encephalitis. According to the reporter, headache, fatigue, stumbling around, slurring her words, cerebritis and acute disseminated encephalitis were considered to be immediately life-threatening and caused hospitalization. Additional information has been requested. 08/29/2008 MR received for DOS 7/19-21/2008 with DX: Acute cerebellitis. Pt presented to foreign hospital 7/5/08 with onset of slurred speech and ataxia following several day hx of H/A, decreased appetitite, decreased interaction and exhaustion beginning 6/30/08. Pt admitted to for 2 weeks prior to transfer. When well enough to travel, returned home for remainder of tx. ID consult with impression: Acute cerebellitis ? viral, ?post-vaccine, ?2' to infection. Pt tx with abx, antivirals and steroids. PICC line placed for tx. By d/c walking unaided, with normal speech.

Other Meds: Acyclovir; Ceftriaxone sodium; Doxycycline

Lab Data: diagnostic laboratory, lime disease tests. Labs and Diagnostics: MRI brain abnormal, repeat 7/20/0 WNL. Mycoplasma IgM (+) initially, now 437. CBC with WBCs 16.01. Blood cx (-). Q-fever, EBV, Lyme all (-).

Seriousness: EXTENDED HOSPITAL STAY, HOSPITALIZED, SERIOUS

MedDRA PT Ataxia, Blood cyanide, Blood lead, Demyelination, Dysarthria, Headache, Malaise, Mental impairment, Skin lesion, Somnolence, Speech disorder, Vasculitis

Symptom Text: Information has been received from a physician concerning a 13 year old female who on 20-JUN-2008 was vaccinated with GARDASIL. Approximately two weeks after vaccination with GARDASIL, the patient travelled to another country. Approximately two weeks prior to travelling to another country, the patient had attended a picnic in a wooded area and one of the other people at the picnic had developed a skin lesion and was commenced on antibiotic treatment for Lyme disease. Subsequently, on 25-JUN-2008 the patient experienced headache, ataxia, dysarthria, malaise, mental impairment and somnolence and on 05-JUL-2008 she was hospitalised. The report description was as follows: "Five days of intermittent headache, 5 days of malaise, 2 days of dysarthria and ataxia, drowsiness, slow mentation. Never febrile, no rash, purely cerebellar signs, no bulbar signs, speech is dysarthric and very slow with poverty of words. There is no dysphasia". The patient had no significant medical history. Laboratory tests results were as follows (dates of tests and units not specified): C-Reactive protein - <3; white blood cells and differential were normal; creatinine and liver function tests were all normal; haemoglobin - 128; platelets - 223. On 05-JUL-2008 a magnetic resonance imaging scan showed features corresponding most closely with cerebellitis (cerebellar encephalitis). No associated cerebral encephalitis. Mass effect protruding inferior cerebellar tonsillar ectopia. No hydrocephalus. On 07-JUL-2008 an MRI showed acute cerebellitis. The differential diagnosis is quite wide and includes lead and cyanide toxicity, demyelination, vasculitis, childhood viral illnesses and a manifestion of acute disseminated encephalomyelitis. The patient was discussed with a paediatric neurologist. Treatment was as follows: "She was commenced on acyclovir, dexamethasone 4mg every six hours since 05-JUL-2008 and added on 07-JUL-2008 were ceftriaxone 2g twice daily (for Lyme disease) and ampicillin 2g every four hours (for Listeria, seems

Other Meds: Unknown

Lab Data: magnetic resonance, 07/05/08, features correspond most closely with cerebellitis; magnetic resonance, 07/07/08, acute cerebellitis; WBC count, ?/?/08, white blood cells and differential normal; hemoglobin, ?/?/08, 128; hepatic function test

MedDRA PT Oedema peripheral, Swelling face

Symptom Text: Initial report received on 22 July 2008 from a health professional. A 14-year-old female patient (Initials not provided), with "unknown" past medical history, had received on an unspecified date, a dose of ADACEL vaccine, MENACTRA vaccine and GARDASIL vaccine (manufacturer MERCK). The lot numbers, routes and sites of administration were not provided for any of the vaccines. At an unspecified amount of time later, after receiving the three vaccines, the patient was described as "blowing up like a balloon" with swelling of the face and legs. The patient was admitted to the hospital (date not specified); however, treatments received and diagnostic tests performed were not provided. At the time of this report, the recovery status of the patient was "unknown."

MedDRA PT Anal haemorrhage, Anogenital warts, Proctalgia

Symptom Text: Information has been received from a physician concerning a 17 year old female with pollen allergy who in approximately 2007 was vaccinated with two doses of GARDASIL. On 10-JUN-2008, the patient was taken to the ER with a complaint of anal pain and bleeding starting about 1-2 weeks before the ER visit. The patient was diagnosed with severe anal warts. On an unspecified date, the patient had a PAP test performed (results not provided). Out patient surgery was done with good results. The patient missed school as a result of the surgery. On an unknown date the patient recovered. The reporting physician considered the severe anal warts to be disabling and an other important medical event. The physician noted the mother of the patient believed that her daughter's anal warts were caused by GARDASIL. Additional information has been requested.

MedDRA PT Dizziness, Eye rolling, Loss of consciousness, No reaction on previous exposure to drug

Symptom Text: Information has been received from a health professional concerning her daughter, a 21 year old female who in January 2008, was vaccinated with the first dose of GARDASIL (Lot # and Batch # not reported), on her left deltoid by intramuscular route without any reactions. On approximately 21-MAR-2008, the patient was vaccinated with the second dose of GARDASIL (Lot # and Batch # not reported) on the deltoid by intramuscular route. It was reported that after vaccine administration the patient started feeling dizzy and then suffered an episode of loss of consciousness with the rolling of eyes back into her head. According to the reporter this event lasted for a few seconds, after which the patient recovered. The patient continued feeling dizzy until next morning. No medications were administered to treat event, as the patient recovered quickly. At this time, no other information has been reported. Case is closed. Other business numbers included: E2008-06942. No further information is available.

MedDRA PT Reaction to previous exposure to any vaccine

Symptom Text: I just know a "possible" reaction. Above child's "friend" came to clinic today. She stated that above child had a reaction to HPV vaccine. Nurse called mother, mother said child was fine. Then when nurse questioned further, mother stated child had a facial problem after HPV #2. Nurse then asked mother if that had happened with vaccine #2 why didn't the mother tell us before vaccine #3 on 5-6-08. There is a question sheet initialed by nurse that child had no reactions to vaccines before. I spoke to mother today, she said she will come tomorrow at 9AM and I hope to get the complete story at that time. I then plan to report about on a VAERS form and to notify all supervisors, PBH and the county. (See above note written today in slot 10-29-07). I obtained lot # from computer for HPV #1, lot was (1425F). It was given 10-30-07. I was off. Nurse was covering clinic. I initialed nurse's initials with MMC. After on that dates line RN. 7-24-08 Mother did not come to clinic on 7-24-08 therefore I called VAERS and completed attached form.

Other Meds: None

Lab Data: Per phone call to mother, child went to hospital.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a nurse practitioner for the Pregnancy Registry for GARDASIL concerning a 16 year old female with no medical history, and no drug reactions/allergies, who on 09-APR-2008 was vaccinated intramuscularly with her first 0.5ml dose of GARDASIL (lot# 659964/1978U) while pregnant. It was reported that the patient was "9 weeks pregnant on 22-May-2008" (estimated LMP = 19-Mar-2008). The patient has no symptoms. Unspecified medical attention was sought by calling the office. No further information available. In follow-up information it was reported that date of last menstrual period was 19-MAR-2008 and the estimated delivery date was 24-DEC-2008. On 16-JUN-2008 the patient had an elective termination of pregnancy. It was reported that LMP was 19-MAR-2008, so the patient was approximately 13 weeks. It was unknown if the products of conception were examined and it was unknown if the fetus is normal. Upon internal review elective termination was determined to be an other important medical event. Additional information is not expected.

MedDRA PT Caesarean section, Drug exposure during pregnancy, Labour complication

Symptom Text: Information has been received from a licensed practical nurse concerning a 16 year old female with allergy to codeine and no pertinent medical history who on 17-SEP-2007 was vaccinated with GARDASIL (lot#: 658558/1061U) 0.5ml IM. Concomitant therapy included ALDOMET. Subsequently, she became pregnant. Her LMP was 10-SEP-2007. The estimated due date was 16-JUN-2008. The patient delivered a baby on 20-JUN-2008. She had a cesarean section because of "failure to descend". The delivery was successful. A cervical smear (PAP smear) was performed (results not reported). The patient was seen by a physician. Upon internal review, failure to descend, the indication for cesarean section, was considered to be an other important medical event. Additional information has been requested.

MedDRA PT Aphthous stomatitis, Gingival swelling, Gingivitis ulcerative

Symptom Text: Information has been received from a nurse concerning a her daughter 19 year old with "allergic sulfa" and no pertinent medical history who on 18-JUN-2008 was vaccinated with a first dose of GARDASIL. Concomitant therapy included TRI-CYCLEN and montelukast sodium (MSD). The nurse reported that her daughter developed swelling of the gums and cankers sores in the mouth following vaccination with GARDASIL. The daughter's gums swelled and she developed cankers sores 4 days after the first vaccination with GARDASIL. The daughter was treated by a dentist for the gum swelling and cankers sores. The gum swelling was characterized as necrotizing gingivitis. The canker sores developed over a period of 5 days and totaled 7. The gum swelling and canker sores made it hard to eat and the daughter did not eat any solid food for one week. Swelling of the gums and cankers sores in the mouth and necrotizing gingivitis was considered to be disabling. No lab diagnostics were performed. On 06-JUL-2008 the patient recovered. There was no product quality complaint. Additional information has been requested. 8/11/08-records received for DOS 6/28/08 college physical exam normal no complaints.

MedDRA PT Musculoskeletal stiffness, Polyarthritis

Symptom Text: Information has been received from a Health Authority (BGAR2008/103) concerning a 15 year old female who on unreported dates was vaccinated with the first and second dose of GARDASIL without any adverse event. On 20-JUN-2008, the patient was vaccinated with the third dose of GARDASIL via intramuscular route (lot number and route and administration unknown). On 23-JUN-2008, the patient experienced a stiff neck during 1 day (cessation date: 24-JUN-2008) and acute polyarthritis. At the time of the report the patient was recovering from polyarthritis. Some lab test were performed and the relevant Test/Laboratory data included: Serum C-reactive protein (CRP)=0.2, Erythrocyte sedimentation rate (sed)=9; Enterovirus polymerase chain reaction (PCR): Negative; Viral serology: negative. Stiff neck and acute polyarthritis were considered as other important medical event. Other business partner numbers included: E2008-05708. No additional information is available.

Other Meds: Unknown

Lab Data: Diagnostic laboratory test, viral serology negative; Diagnostic laboratory test, WBC, 71; Enterovirus PCR, negative; Serum C-reactive protein, 0.2; Erythrocyte sedimentation rate, 9

MedDRA PT Arthralgia, Arthritis, Facial paresis, Musculoskeletal discomfort, Musculoskeletal pain

Symptom Text: Information has been received from a patient's mother concerning her daughter (age not reported) who on 11-SEP-2007 was vaccinated with the second dose of GARDASIL (Lot # 1475F, Batch # NF37120, route and site not reported). In September 2007 (exact date not reported), the patient experienced shoulder pain. Arthritis was diagnosed by a physician. In October 2007 and December 2007 pain in the knee and the left hip, in the fingers and toes followed. X-ray and rheumatological investigation showed normal results. Despite ongoing arthritis, on 08-JAN-2008, the patient was vaccinated with the third dose of GARDASIL (Lot # 0277, Batch # NG00020, route and site not reported). In April 2008, the patient developed left facial paresis and was hospitalized for 13 days. MRI and lumbar puncture were normal. Thereafter facial paresis meanwhile resolved but reoccurred in June 2008. The patient was again hospitalized for 12 days. CSF showed a non-specific inflammation. At the time of the reporting, the patient was not recovered. The mother turned to several doctors and asked whether the symptoms could be side effects of the GARDASIL vaccination, the treating physicians however did not confirm this suggestion. It is to be noted that the patient was vaccinated with the first dose of GARDASIL (Lot# 655671/1024F, Batch # NE51790, route and site not reported) and no adverse effect occurred. Other business partner numbers included: E2008-06673. Additional information has been requested.

Symptom Text: Information has been received from a dentist concerning her 21 year old daughter with a medical history of mononucleosis and sulfonamide allergy who in July 2007, was vaccinated with a first dose of GARDASIL (lot # 658094/0524U). The patient received a second and third dose of GARDASIL (lot # 659439/1267U). Concomitant therapy included montelukast sodium (MSD), (dose, duration and indication not reported) and NUVARING. After received all 3 doses the patient experienced arthritis symptoms, tiredness, weight loss, general achy feeling (neck and jaw pain), tingling in her arms and hands, and dizziness. The reporter also stated that she had inflammation in the cartridge in her chest. She was at some point diagnosed with labyrinthitis. Her physician prescribed her some steroids and other non steroidal medication (unspecified which ones) and she felts a little better and was able to go back to school. The reporter also mentioned that after each dose the patient experienced minor problems like dizziness, nausea and temperature but did not have joint pain until after the third dose. The patient had blood work, urine tests, thyroid tests, serum antinuclear antibodies tests (ANA), RA and x rays, everything came back normal. The patient sought unspecified medical attention. At the time of this report the patient had not recovered. Additional information has been requested.

Other Meds: NUVARING; SINGULAIR

Lab Data: diagnostic laboratory - normal; X - ray - normal; hematology - normal; urinalysis - normal; thyroid function test - normal; serum ANA - normal

MedDRA PT Dyskinesia, Mydriasis

Symptom Text: Immediately after receiving the 5th shot, patient's body slouched over while in sitting position. When attempting to lay her down on her back, her arms and legs began a jerking movement, head turned to the right and pupils dilated. Episode lasted 3-5 seconds. Patient didn't remember the episode when asked. Physician was called into room and patient was assessed by doctor. Patient was observed for 30 minutes, and had full recovery by the time she left the clinic.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Dizziness, Inappropriate schedule of drug administration, Presyncope

Symptom Text: I completed my series of the GARADASIL vaccines last month. I have no idea if I am having a side effect from the vaccine but over the last 3 weeks I have been having the occasional dizzy spells. I have never had an actual syncopal episode, just the near syncopal episodes. I am an ER nurse and am familiar with the fact that many people try to relate medical problems to sides effects of their medications. I know that many people have reported unusual symptoms after receiving GARDASIL so I thought I would mention my near syncopal episodes although they may not be related. I have never had any serious medical or health problems though. I did have a thorough lab work up back in January after I turned 30, and my lab work was perfect. I have not had any labs tests done since then.

Other Meds:

Lab Data:

History: NKDA. Not pregnant. No medical problems. I take a multivitamin but no other medications. I have one D&C when I was 25 years old and one LEEP done in April this year. No major surgeries.

MedDRA PT Disorientation, Face injury, Fall, Mouth injury, Oxygen supplementation, Syncope, Tooth fracture

Symptom Text: Information has been received from a physician concerning a 13 year old female with no pertinent medical history and no history of drug reaction or allergies who three to four weeks ago (on approximately 26-JUN-2008 to 03-JUL-2008) was vaccinated with MENACTRA, then she received the first dose of GARDASIL (lot#: 660391/0063X). Immediately after the GARDASIL injection, she fainted. She hit her nose on a foot stool connected to the exam bed. Oxygen was started, blood pressure and oximetry were within normal range. She did not recall where she was but knew her name. She was transported to the hospital by ambulance where an X-ray of nose was negative. She also hit her lip and cracked one tooth. She was later seen by a dentist and the tooth was cemented. The reporter's office called the patient 24 hours later and she was oriented and remembered the situation in the office. Subsequently, the patient recovered. The reporter considered fainting and cracking one tooth to be other important medical events. Additional information has been requested.

MedDRA PT Arthralgia, Convulsion, Dizziness, Fatigue, Orthostatic hypotension, Tremor, Vision blurred

Symptom Text: Information has been received from a physician concerning a 16 year old female with no pertinent medical history and no history of drug reactions or allergies who on 18-JUN-2007 was vaccinated with the first dose of GARDASIL and on 10-JUN-2008 was vaccinated with the second dose of GARDASIL. On 10-JUN-2008 the patient was also given MENACTRA. Ten days after the second dose of GARDASIL (on 20-JUN-2008) the patient experienced joint pain and fatigue. Seventeen days after the second dose of GARDASIL (on 27-JUN-2008) the patient had a seizure. No adverse events reported after the first dose of GARDASIL was given. The patient sought medical attention by calling the physician's office. The physician reported that she noticed that patients who are given GARDASIL and MENACTRA usually have more side effects. She further stated she would not be administering the two vaccines together from now on. Upon internal review, seizure was considered to be an other important medical event. Additional information has been requested. 8/12/08-records received for DOS 6/27/08-Syncope. Presented after 1 episode found on floor with legs shaking. Vision blurred. Now continues with fatigue and dizziness. Impression: syncopal event induced seizures due to orthostatic hypotension.

MedDRA PT Death, Fatigue, Injection site pain, Viral infection

Symptom Text: Information has been received from a physician concerning a 22 year old female who on an unspecified date was vaccinated with her third dose of GARDASIL. Subsequently the patient experienced soreness at the injection site and fatigue. The outcome of soreness at the injection site and fatigue was not reported. Two months after receiving her third dose of GARDASIL, the patient died. The cause of death was "viral insult to the heart". Unspecified medical attention was sought. Follow-up information was received via telephone call from the physician. The patient was a family member. She did not have the vaccination dates or lot numbers since she did not give them. The physician reported that the patient's mother thought that the patient died related to GARDASIL. She did not have the cause of death. The physician refused to provide patient information, information was gave to the coroner. The physician considered "viral insult to the heart" to be immediately life-threatening and disabling. Additional information has been requested.

MedDRA PT Confusional state, Disorientation, Gait disturbance, Hallucination, visual, Irritability, Nervous system disorder, Personality change, Retrograde amnesia, Sensorimotor disorder, Somnolence

Symptom Text: Initial and follow-up information has been received from a pediatrician concerning a 14 year old female with pollen allergy who on 17-MAR-2008 was vaccinated with the first dose of GARDASIL intramuscular into the upper arm, which was well tolerated. On 13-MAY-2008 was vaccinated with the second dose of GARDASIL intramuscular into the upper arm. On 04-JUN-2008 the patient experienced neurological into the upper arm. On 04-JUN-2008 the patient experienced neurological and sensoriomotor disorder including somnolence, personality change, gait instability, disorientation. The patient was hospitalized and received LORAZEPAM 0.7 mg. There were no inflammatory signs and EEG was normal and she recovered after two days. Information from the hospital form 04-JUN-2008 to 06-JUN-0208 was provided, which reported that after the patient's presentation to the outpatient department due to personality changes, the patient was decelerated, whiny and confused with visual hallucinations. Laboratory findings show benzodiazepine in urinary drug screening. Toxicology established LORAZEPAM of 0.18 ng/ml (therapeutic range: (0.08-0.25 ng/ml). The following day the patient was awake and orientated but retrograde amnesia persisted. An intake of LORAZEPAM was denied by the patient and the benzodiazepine level could not explain the remarkable clinical symptoms and the retrograde amnesia of the patient on the day of admission. The suggestion of the physicians to refer the patient to a child psychiatrist was rejected by the mother. The patient was discharged on 06-JUN-2008. The mother was advised of the necessity of further clinical diagnostics in an outpatient department. Other business partner numbers included: E2008-05763. Additional information has been requested.

MedDRA PT Blister, Dysgeusia, Facial paresis

Symptom Text: Information has been received from a general practitioner concerning a 22 year old female, with no relevant medical history reported, who on 15-MAY-2008 was vaccinated with the first dose of GARDASIL (lot # not reported) into the deltoid muscle. On 30-JUN-2008, she presented at the physician with vesicles on the tongue. Herpes virus infection was suspected (not confirmed). On 08-JUL-2008, she presented again with signs of facial paresis right (not specified). On 09-JUL-2008, she was admitted to hospital. The patient reported about taste disorder of the right half of the tongue ("bitter taste") having started 1,5 weeks before hospitalization, a "strange feeling" of the right half of the face. She couldn't close her right eye completely and during tooth brushing water run out on her mouth. Cerebral MRI showed inflammatory signs in the course of the right facial nerve. CFS showed normal results. Diagnosis of incomplete facial paresis right was established. Herpes virus IgM titres were negative. Prophylactic therapy with Aciclovir I.V. was initiated, but discontinued due to intolerance to this drug. Thereafter the patient was treated with prednisone. Logopedic therapy as carried out. On-17-jul-2008, the patient was discharged from hospital. She recovered completely (exact duration of symptoms not reported). A role of the vaccine was not discussed by the hospital physicians. Other business partners number included: E2008-06951. Additional information has been requested.

Other Meds: Unknown

MedDRA PT Convulsion, Eye rolling, Somnolence, Tremor

Symptom Text: Information has been received from a medical assistant concerning a 12 year old female with no pertinent medical history, drug reactions or allergies who in the morning of 23-JUL-2008 was vaccinated intramuscularly with a first dose of GARDASIL (Lot #63/0067X). In the afternoon of 23-JUL-2008, the patient was found by her sister on her bed having a seizure. The patient was taken to the emergency room. On the same day the patient recovered from seizure and was released from the emergency room. It was reported that vaccination with GARDASIL was discontinued. Follow-up information was received via telephone call on 28-JUL-2008 from the medical assistant. She did not know if the patient ate before or after the vaccination. She stated that the seizure occurred at night time. The patient went to the emergency room at a children's hospital. Diagnostic test and treatment from the hospital was not available. The patient was referred to a neurologist but there was no information from that appointment yet. The patient was suppose to return to the office after the neurology consult, but an appointment had not been scheduled. Upon internal review, seizure was determined to be an other important medical event. Additional information has been requested. 8/11/08-records received-presented to ED 7/24/08-C/O seizure like activity this evening, arms shaking and eyes rolling in back of head. Drowsy. DX: Seizure.

MedDRA PT Convulsion, Dizziness, Immediate post-injection reaction, Tonic clonic movements, Unresponsive to stimuli

Symptom Text: Information has been received from a physician concerning a 17 year old white female student with a history of syncope (February 2006), who after a check-up on 20-MAY-2008 was vaccinated with the first dose of GARDASIL (lot # 660387/1967U) into her left deltoid (route not reported). After vaccine was administered, the patient experienced dizziness then had a seizure with tonic movements. She was unresponsive 30-45 seconds then returned to baseline. After 10-15 minutes, the patient went to the waiting room. While talking to her, she stated "I can't hear you" and had another seizure lasting approximately 10-15 seconds. 911 was called. The patient was transferred to the emergency room (ER) via ambulance. She recovered and was referred to neurology. No testing was done in the ER. The patient was seen and discharged by the hospital's ER physician. Upon internal review, seizure with tonic movements and seizure were considered to be other important medical events. Additional information has been requested.

MedDRA PT Dyspnoea, Injection site pain, Injection site swelling, Oxygen saturation, Pallor, Presyncope

Symptom Text: About 17 minutes after the HPV vaccine administered, patient felt uncomfortable in the arm beneath her injection. She then said her arm mildly hurt and thought it looked swollen. Patient then felt it was hard to breathe. She became pale. She was close to fainting. After about 5 minutes she stated it felt better. Initial O2 sats were 99-100 d. She rested for 20 minutes and drank some mountain dew and was able to go home without difficulty.

Seriousness: ER VISIT, EXTENDED HOSPITAL STAY, HOSPITALIZED, SERIOUS

MedDRA PT Bacterial infection, Infectious mononucleosis, Movement disorder, Pain in extremity, Screaming, Splenomegaly

Symptom Text: Information has been received from a mother concerning her daughter, with no pertinent medical history and no drug reactions/allergies who on an unspecified date was vaccinated with the first dose of GARDASIL and on 27-JUN-2008 was vaccinated with the second dose of GARDASIL. There was no concomitant medication. The mother reported that the same night (on 27-JUN-2008) her daughter received the second dose of GARDASIL she began to develop leg pain. By 02-JUL-2008 the pain worsened and her daughter was screaming and could not move her legs. She was taken to the office of the Physician Assistant. Unknown blood work was done and she was diagnosed as having a "blood bacterial infection". she was given 2 double strength TORADOL for pain. Blood tests revealed that she had mononucleosis which had not been reported previously recognized with an enlarged spleen. She was taken to the ER and then admitted to the hospital where she received potassium and unspecified antibiotics. She was discharged on 03-JUL-2008 and prescribed MOTRIN and antibiotics. At the time of the reporting she was recovering. Additional information has been requested.

MedDRA PT Central nervous system lesion, Headache, Paraesthesia

Symptom Text: Information was obtained on request by the Company from the agency via a Public Case Detail Form concerning a 16 year old female with a history of vague episode of paraesthesia (2004) who on 27-AUG-2007 was vaccinated with the first dose of GARDASIL (Lot No. 655743/0313U, Batch No. J1022, Expiry date, 08-AUG-2009). On 25-OCT-2007, she was vaccinated with the second dose of GARDASIL (Lot No. 657874/0582U, Batch No. J2299, Expiry date 26-FEB-2010). On approximately 18-FEB-2008, she was vaccinated with the third dose of GARDASIL (Lot No. 658214/0734U, Batch No. J2895, Expiry date 13-MAR-2010). On 20-FEB-2008 the patient experienced headache, central nervous system lesion and paraesthesia. It was described that approximately 2 days post vaccination with the third dose of the vaccine, the patient developed headache then 2 days later developed spinal sensory syndrome and paraesthesia. The patient was referred to a neurologist who identified particularly aggressive multiple lesions. On 20-JUN-2008, the patient's outcome was unknown. The agency considered that headache, central nervous system lesion and paraesthesia were possibly related to therapy with GARDASIL. The original reporting source was not provided. The agency considered the events to be serious for the following reason: medically significant. Additional information is not expected.

MedDRA PT Blister, Dysgeusia, Facial paresis, Feeling abnormal, Tongue disorder

Symptom Text: Information has been received from a general practitioner concerning a 22 year old female who on 15-MAY-2008 was vaccinated with her first dose of GARDASIL IM. On 30-JUN-2008 the patient presented at the physician with vesicles on the tongue. Herpes virus infection was suspected (not confirmed). On 08-Jul-08 she presented again with signs of facial paresis right (not specified). She was admitted to hospital on 09-JUN-08. The patient reported about taste disorder of the right half of the tongue ("bitter taste") having started about 1.5 weeks before hospitalization, a "strange feeling" of the right half of her face. She couldn't close her right eye completely and during tooth brushing water ran out of her mouth. Cerebral MRI showed inflammatory signs in the course of the right facial nerve. CSF showed normal results. Diagnosis of incomplete facial paresis right was established. Herpes virus IgM titres were negative. HSV and VZV IgG titres were positive in blood and "borderline" positive in CSF. Prophylactic therapy with Acyclovir I.V. was initiated, but discontinued due to intolerance to this drug. Thereafter the patient was treated with prednisone. Logopedic therapy was carried out. The patient was discharged from hospital on 17-Jul-2008. She recovered completely (exact duration of symptoms not reported). A role of the vaccine was not discussed by the hospital physicians. Other business partner numbers include E2008-06951. Additional information is expected.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Asthenia, Hyperhidrosis, Loss of consciousness, Malaise, Nausea, Pallor, Syncope, Tonic clonic movements

Symptom Text: Information has been received from a local health authority (Reference number MA20081115) concerning a 14 year old female, with no relevant medical history, who on 25-JUN-2008 was vaccinated with the first dose of GARDASIL, (Lot #, Batch # not reported) via intramuscular. On 25-JUN-2008, 10 minutes after receiving the vaccination, the patient experienced syncope with loss of consciousness, malaise, tonic clonic movements, nausea, pallor, sweating and asthenia. On 25-JUN-2008, she was admitted in paediatrics emergency service, but there was no hospitalization. She had recovered without any sequelae within a few minutes. There was no post-critical status, no hypotonia, no confusion and no disorientation. Clinical examination was normal. Electrocardiogram and electroencephalography were also normal. Syncope with loss of consciousness, malaise, tonic clonic movements, nausea, pallor, sweating and asthenia were considered to be other important medical events. Other business partner numbers included: E2008-07113. Additional information has been requested.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Eating disorder, Gastritis, Gastrointestinal disorder, Nausea, Peripheral vascular disorder, Vomiting, Weight decreased

Symptom Text: Information has been received from a gynaecologist concerning a 15 year old female who in December 2007 was vaccinated with the first dose of GARDASIL (lot # not reported). Toleration was not reported. In February 2008, the patient received the second dose of GARDASIL (lot # not reported), intramuscular administration into her deltoid muscle. After the second vaccination, the patient experienced gastrointestinal and eating disorders and weight loss of 5 kg. She also experienced nausea, vomiting, and a peripheral circulatory disorder. Gynaecological examination and sonography of abdomen were normal. The patient was referred to a consultant for internal medicine. She was hospitalized on an unspecified date. According to the family physician, mild gastritis was diagnosed. The complaints were ongoing at the time of reporting. Other business partner numbers included: E2008-06318. No further information is available.

MedDRA PT Condition aggravated, Facial paresis, No reaction on previous exposure to drug

Symptom Text: Information has been received from a patient's mother that her daughter (age not reported) with arthritis who on 10-JUL-2007 was vaccinated with the first dose of GARDASIL (lot number 655671/1024F, batch number NE51790) which was well tolerated. On 11-SEP-2008, the patient was vaccinated with the second dose of GARDASIL (lot number 1475F, batch number NF37120), and experienced arthritis after that. On 08-JAN-2008, the patient was vaccinated with the third dose of GARDASIL (lot number 0277U, batch number NG00020) despite ongoing arthritis (see case E2008-07128). In April 2008, the patient developed left facial paresis and was hospitalized for 13 days. MRI and CSF results were normal. Facial paresis resolved but relapsed in JUN-2008. The patient was again hospitalized for 12 days. This time, CSF showed non-specific inflammation. At the time of reporting, the patient was not recovered. The mother turned to several doctors and asked whether the symptoms could be side effects of the HPV vaccine, the treating physicians however did not confirm this suggestion. The other business partner numbers included: E2008-06673.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Convulsion, Fall, Laceration, Muscle twitching, Sluggishness, Unresponsive to stimuli

Symptom Text: Approximately 1 minute after vaccination, patient fell forward onto floor and severed lip. Immediately began to twitch. Patient appeared to be having seizure-like movements similar to absence seizure. She was not verbally responsive however, patient was breathing spontaneously. The patient was moved from the floor into a chair after 5 minutes and was able to maintain eye contact. It took her approximately 10 minutes to respond verbally to her mother's commands. The patient and parent were in the examination room more than 30 minutes after the incident, however patient remained sluggish.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Disturbance in attention, Dizziness, Feeling abnormal, Head discomfort, Headache, Heart rate increased, Hypoaesthesia, Hypoaesthesia facial, Migraine, Paraesthesia, Swelling, Thinking abnormal, Vaccine positive rechallenge, Visual disturbance

Symptom Text: A day or two after receiving the first Gardasil shot, I experienced a headache on the left side of my head, concentrated in the mid-to-frontal lobe. The headache improved a bit with over-the-counter medication. About two weeks after receiving the shot, I was sitting in class when all of a sudden my right hand went numb and a portion of my right lip and chin. It was very difficult to comprehend the instructor and I could not spell any of the notes I was taking down. The episode lasted only about 10 to 15 minutes. After this episode, I continued to have the headaches-it felt like the left side of my head was heavy and full. The left part of my neck and scalp were also enlarged. After this, I went to my primary care physician, not thinking that the shot and headache were related. The headaches alarmed me because in the past I had headaches very rarely, and never a migraine. My physician diagnosed me with migraines and gave me a prescription medication for tension headaches. She said that if the medication did not work, I should get a CT scan of my head. In the next three months I continued having the headaches-they came on in episodes: first I would start to not think as clear and my hands and arms would sometimes start tingling or feeling numb. During a few of the episodes there were changes in the vision of my right eye-blurs of color. I would take the migraine medicine and the symptoms improved within an hour. I also had a rapid heart rate, and when I worked out, often felt dizzy. A weird effect: when I drank coffee, the headache would become severe- I used to drink at least two cups of coffee a day with out much effect. In March, I received a second Gardasil shot and the severe headache returned as in the first time and I was very dizzy and a bit faint (I realize that some of these minor side effects are listed in the Gardasil info pamphlet). I decided to get the CT scan and the results were normal. I felt reassured by these results and the fact that the symptoms improved over the next few month

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Confusional state, Convulsion, Disorientation, Epilepsy, Fall, Gaze palsy, Musculoskeletal stiffness, Postictal state, Tongue biting, Tremor, Urinary incontinence

Symptom Text: Allison received the series of Gardasil vaccines beginning 6/07. The second vaccine was administered 9/5/07. Ten days following Allison had a seizure for the first time in her life. There is no family history of seizures. Allison was taken to the hospital, had a follow up appointment with her pediatrician and referred to a neurologist (Dr. Inglese). Testing completed at that time was within normal expectations. A second seizure occurred in January '08. After additional testing recommended by another neurologist in the same practice (Dr. Sosa), Allison has now been diagnosed with a seizure disorder and is taking medication to prevent the seizures from reoccurring. The Gardasil vaccine was the only difference from her normal routine and without the family history of seizures, I question the vaccine. 8/19/2008 MR received from consulting neurologist including ER record from 9/15/2007 and OVs to 6/18/2008 with DX: Primary Generalized Epilepsy. Pt had 1st seizure 9/15/2007. Pt's eyes glassed over and pt developed full body shaking and stiffening. Pt fell off couch, bit tongue and was incontinent of urine. PE WNL except bite on tongue. DX: Seizure-new onset. Neuro consult 9/20/07 notes equivocal EEG, but will not start meds at this time. 2nd seizure 1/17/2008 lasting 2-3 minutes with post ictal confusion and disorientation. Started on anti-seizure med. F/U 2/22/08 now dx with generalized epilepsy, most likely juvenile myoclonic epilepsy without myoclonus. F/u 6/18/08 no further seizures.

Other Meds: none at the time of the vaccine or seizure

Lab Data: CT Scan, EEG, Ambulatory EEG, MRI, blood and urine samples. Labs and Diagnostics: EEG abnormal. Head CT unremarkable. CBC and Chemistries WNL. MRI brain WNL with inflammatory changes c/w chronic sinusitis in L frontal and ethmoid sinuses.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Convulsion, Grand mal convulsion

Symptom Text: My daughter is 16 yrs old and on Feb 27, 2008 had her first HPV vaccine and the second one April 24, 08. On June 14-08 I heard my dog barking in the living room I went to see what he was barking at and I found my daughter lying on the carpet having a seizure. At the time this was happening I did not know she was having a seizure because she doesn't have a history of seizure problems. I thought my daughter was dying in my arms of course I dialed 911 and she was taken to the Emergency room. We have under gone several tests CAT scan, EEG, MRI, spinal tap, blood work and currently seeing a neurologist. The test have came back all negative and now she has to take medicine for epilepsy. The first medicine the ER put her on was phenytoin sodium. Now she is taking Keppra., I had ask her primary doctor if there could be some connection to having taking the HPV vaccine her answer was that there has been no evidence or research to prove that the HPV vaccine can cause seizures. The doctor also said she probably has epilepsy. Wow this has been my daughter's doctor since she was 5 yrs old. My daughter is an outgoing teenager who has plans to graduate from high school and go on to a 4 year college. She is active in sports and plays the violin. I would definitely like to know why the medical field will not even consider that the HPV vaccine may have cause the complications. 11/19/08 MR received from PCP which include neuro consult. Seen 6/16/08 in F/u for ER visit 6/14/08 with DX: Seizure/Probable Epilepsy. Started on phenytoin in ER. Seen 7/10/08, now on Keppra. Seen for brownish scaley macules on back, chest, neck. Dx: Seizure d/o. Tinea versicolor. Seen 7/14/08 for c/o back pain. PE (+) for decreased ROM upon flexion. Dx: Muscle spasm. Neuro consult dated 6/24/08 for eval of generalized tonic-clonic seizure on 6/14/08 and another on the morning of the exam. No memory of event. Headache and tiredness after. PE WNL. Sent for MRI. 12/2/08 Additional records received from Neuro. No new codes.

MedDRA PT Tongue paralysis, Vaccine positive rechallenge

Symptom Text: Information has been received from a physician (reference # RA-026-2008) concerning a 15 year old female who on an unspecified date in February 2008, was vaccinated with the first dose of GARDASIL (lot # not reported) intramuscularly. The patient had tongue paralysis after this dose on an unspecified date in FEB-2008. On an unspecified date in APR-2008, the patient received the second dose of GARDASIL (lot # not reported) intramuscularly, site of injection not reported. On an unspecified date after vaccination the patient had tongue paralysis. The patient was submitted to a neurological examination with electroencephalogram (EEG). It was reported that she had recovered on an unspecified date. Additional information received reported that upon a phone conversation with the parent, the EEG was normal. Neurological exam was normal. The physician considered the event as not related to the vaccine. According to the physician the adverse event was associated with the patient's fear of needles and medical intervention in general, leading psychological factor triggering this event. The third dose of GARDASIL was scheduled. Upon internal review tongue paralysis was considered to be an other important medical event. Other business partner numbers include E2008-05126. Additional information was not available.

MedDRA PT Altered state of consciousness, Convulsion, Headache, Leukoencephalomyelitis, Personality change

Symptom Text: Information was obtained on request by the Company from the agency via a Public Case Detail Form concerning a 21 year old female with a history of relapsing-remitting multiple sclerosis with two episodes of diplopia in October 2004 and February 2007, who on 01-AUG-2007 was vaccinated with the first dose of GARDASIL. On 01-OCT-2007 the patient was vaccinated with the second dose of GARDASIL. On 02-NOV-2007 the patient developed leukoencephalomyelitis and was hospitalised. It was described that the patient developed acute disseminated encephalomyelitis (ADEM) with rapid onset of personality change, headache, generalised seizure and altered conscious state. Magnetic Resonance Imaging (MRI) was done which showed confluent carotid enhancing white matter lesions. The patient was treated with 5 day intravenous methylprednisolone and oral steroid trial. At the time of reporting to the agency on 18-JUL-2008, the patient had recovered from the leukoencephalomyelitis. The agency considered that leukoencephalomyelitis was possibly related to therapy with GARDASIL. The original reporting source was not provided. Additional information is not expected.

MedDRA PT Kidney fibrosis, Kidney transplant rejection, Lymphocytic infiltration, Nephritis interstitial, No reaction on previous exposure to drug, Tubulointerstitial nephritis

Symptom Text: Information has been received from a health authority (HA ref no. PEI2008010664), concerning an 18 year old female patient, who underwent renal transplantation in 2005, was vaccinated with the third dose of GARDASIL (Batch #NF37120) into the left upper arm (route not reported) on 28-SEP-2007. Beginning July 2008, the patient developed interstitial nephritis (transplant kidney). The patient was hospitalized. Laboratory testing revealed the following values at peak on 08-JUL-2008: Urea 170mg/dL (normal: 10-50), creatinine 5.19 mg/dL (normal <1.20) and CRP 21.9 mg/L (normal 0.0-5.0). An acute transplant rejection was also considered by the reporter and is also consistent with the result of the renal biopsy was provided (performed on 10-JUL-2008). The pathologist found extensive plasma-lymphocytic infiltrates, mild eosinophila, interstitial edema and signs of multifocal tubulitis. Mild interstitial fibrosis was seen. The pathologist diagnosed acute rejection type 1 B according to the Banff classification (2005). There was no sign for a vascular transplant rejection. The final outcome was not reported. the first dose of GARDASIL (Batch #NE24240 and Lot #654884/0902F) and the second dose of GARDASIL (Batch #NE51790 and Lot #655671/1024F) were given IM into the left upper arm on 26-MAR-2007 and 25-JUN-2007, respectively, without problems. This case is closed. Other business partner numbers included: E200807013. No further information is available.

Symptom Text: Information has been received from a general practitioner concerning an adolescent female who was vaccinated with the first dose of GARDASIL which was well tolerated. The patient was vaccinated with the second dose of GARDASIL (lot #, route, injection site not reported) several months ago. After vaccination, exact onset not reported, the patient developed unspecified vision disorder, diffuse neck pain and headache. The patient was hospitalized. Lumbar puncture was carried out, Guillain-Barre syndrome was excluded. "Increased inflammation parameters" in CSF were detected. The outcome was not reported. Other business partner number include: E2008-07140. Additional information has been requested.

Other Meds: Unknown

Lab Data: diagnostic laboratory test, increased inflammation parameters in CSF

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Abdominal pain upper, Activities of daily living impaired, Arthralgia, Dizziness, Fatigue, Joint stiffness, Juvenile arthritis, Oedema peripheral, Osteopenia, Pain in extremity, Pyrexia, Soft tissue disorder

Symptom Text: Pt had severe fatigue, fever, stomach aches, dizziness. She missed 20 days of school in 2007/2008 during her 3 series of shots. In March 2008, she was diagnosed with Juvenile Rheumatoid Arthritis, which can be set off by a live virus. She had symptoms through all 3 shots until March of 2008. 8/15/08 Reviewed PCP medical records of 9/1994-5/2008. FINAL DX: polyarticular juvenile inflammatory arthritis. Records reveal patient experienced usual state of good health on 7/23/2007. Next office note is for 3/6/08 for bilateral hand pain she had for 4-5 mo. Had been seeing podiatrist for ankle pain that patient experienced for several months. Exam at that time revealed diffuse fusiform swelling symetrically of both hands esp in PIP joints of fingers. Referred to rheumatologist & consultant records included. Symptoms at that time included pain & stiffness in multiple joints incl hands, wrists & ankles w/stiffness esp bad in mornings. Started on methotrexate. Referred for second opinion which is also included. Missed 20 days of school due to current symptoms. Agreed w/diagnosis. Increased meds & referred to PT/OT. Returned to initial rheumatologist for continued f/u. Minimal improvement & started Humira & serial labs.

Other Meds:

Lab Data: LABS: RF (-). ESR 34 (H), CRP 1.2 (H). X-rays of hands revealed soft tissue swelling & osteopenia.

History: None PMH: Eczema. Family hx RA, psoriasis, Crohn's disease & kidney stones.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Asthenia, Blindness, Convulsion, Disorientation, Fatigue, Headache, Immediate post-injection reaction, Nausea, Pallor, Syncope

Symptom Text: Information has been received from an unspecified source ("someone who is not part of the clinic") concerning a 15 year old (reported by the source as a 16 year old) female who was vaccinated at the clinic with GARDASIL. The unspecified source told the Company representative that it was reported on television that the patient experienced "fainting and seizure like movements" after receiving GARDASIL. The unspecified source recounted the news report stating the patient was supervised in the office after the vaccine was given for about an hour and was released to home. The patient had "splitting headache" and "fatigue" that persisted for about one week after the fainting incident. According to the archived television program, the patient was a healthy, athletic 15 year old who in approximately July 2008 was taken to the clinic by her mother for a routine physical. As part of her exam, she was offered GARDASIL. When the mother asked about the side effects, she was told only about possible redness and soreness. Almost immediately after getting the vaccination, something went very wrong. The patient stood up and couldn't see anything. She fainted and began having seizure like motions. For several moments, the patient was thrashing on the examining room floor. When she woke up, the patient didn't know where and who she was. She was very pale. At first the clinic staff had her sit on the ground, and then eventually had her sit on the table. The patient then became nauseous. After more than two hours, the patient was sent home. Her parents were afraid to let her sleep. It took five days for the patient to get over the migraine-like headaches and debilitating loss of energy. The Company representative attempted to contact the clinic for follow up, but was unable to get anyone to verify the incident. Upon internal review, seizure was considered to be an other important medical event. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Asthenia, Diplopia, Hypoaesthesia facial, Monoparesis, Myelitis transverse, Nausea, Vomiting

Symptom Text: Information was obtained on request by the Company from the agency concerning a 16 year old female who had received a total of 3 doses of GARDASIL (not all vaccination dates were reported). Her first 2 vaccinations included one given on 10-MAY-2007 (Lot No. 655742/0138U, Batch No. J0798, Expiry date 07-AUG-2009). On 06-SEP-2007, she was vaccinated with her third dose of GARDASIL (Lot No. 655742/0138U, Batch No. J0799, Expiry date 07-AUG-2009). On 12-SEP-2007 the patient experienced asthenia (described as left leg weakness), myelitis transverse (described as incomplete transverse myelitis), diplopia, hypoaesthesia facial (described as facial numbness), monoparesis, nausea and vomiting. At the time of reporting to the agency on 10-JUL-2007, the outcome of asthenia, myelitis transverse, diplopia, hypoaesthesia facial, monoparesis, nausea and vomiting was unknown. The agency considered that asthenia, myelitis transverse, diplopia, hypoaesthesia facial, monoparesis, nausea and vomiting were possibly related to therapy with GARDASIL. The original reporting source was not provided. The agency considered the events of asthenia, myelitis transverse, diplopia, hypoaesthesia facial, monoparesis, nausea and vomiting to be serious for the following reason: medically significant. Additional information is not expected.

MedDRA PT Anxiety disorder, Condition aggravated, Hallucination, auditory, Headache, Nocturnal fear

Symptom Text: Information has been received from a licensed practical nurse as told to her by the patient's mother concerning a 12 year old female with no known drug allergies and a history of headaches, who on 12-JUN-2008 was vaccinated with the first dose of GARDASIL (lot # 654272/0073X), 0.5 mL, IM into her left deltoid. On approximately 19-JUN-2008, the patient developed the following behavioral symptoms: increase in the frequency of headaches, auditory hallucinations and fear of sleeping in the dark. The patient was hospitalized for an unspecified period of time and treated with unspecified medication. She continued taking medication to relieve the behavioral symptoms. No other symptoms or treatment reported. At the time of reporting, the patient was recovering. Additional information has been requested. 8/28/08-records received for DOS 7/17-7/19/08-DC DX:Anxiety disorder (NOS). Admitted with C/O having images in her head of people killing her. She was not seeing the them but they were images in her head. Tends to be a worrier. Strong family history of anxiety with panic attacks. Admitted for observation and participation in group therapy.

MedDRA PT Abortion spontaneous, Blood test, Drug exposure during pregnancy, Ultrasound scan

Symptom Text: Information has been received from a consumer for the pregnancy registry for GARDASIL, concerning her 18 year old daughter who in February 2008, was vaccinated with the first dose of GARDASIL 0.5 ml for HPV prophylaxis. Concomitant therapy included nadolol. On an unspecified date, the physician was unaware the patient was pregnant and vaccinated her with the second dose of GARDASIL. The consumer reported that on approximately 23-JUN-2008, her daughter had a miscarriage after getting the second dose of GARDASIL; and had to stay in the hospital for 5 to 6 days. The patient was 4 and a half months pregnant. On an unspecified date, a blood work and ultrasound were done (results not provided). Her LMP was 15-FEB-2008 and EDD was 21-NOV-2008. The patient sought medical attention. Additional information has been requested.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Back pain, Blindness, Bone pain, Dizziness, Fall, Headache, Neurological examination normal, Optic neuritis, Physiotherapy, Vision blurred

Symptom Text: Information has been received from a gynecologist concerning a 16 year old female with a history of dizziness postural (2006), who on 05-SEP-2007 was vaccinated with the first dose of GARDASIL intramuscular (lot no. not reported) and on the same day was vaccinated with hepatitis B virus vaccine rHBsAg intramuscular. The second dose of GARDSASIL (lot no. not reported) was administered on 08-NOv-2007 and the third dose of GARDASIL (lot no. not reported) on 08-MAY-2008. Since 12-APR-2008 the patient complained of increasing blurred vision of the right eye. A few days later, on 17-APR-2008, she complained of complete loss of vision on her right eye, accompanied by intense headache. Outpatient neurological and ophthalmic exams showed no pathologies (no exact results reported), but high dose prednisone therapy (manufacturer unknown) 1000 mg, intravenous daily, was initiated (suspected diagnosis "optic neuritis"). Because of the side effects, nausea and dizziness, the mother refused this therapy after 3 days. The patient was hospitalized from 22-APR-2008 to 25-APR-2008. Cranial magnetic resonance imaging and cerebrospinal fluid showed normal results, as well as an electroencephalography performed on 24-APR-2008 and visual evoked potential performed on 25-APR-2008. On 05-MAY-2008, the patient fell on her back and had pain of the cervical spine with headache and dizziness. She went to see an orthopedist and also complained of pain in the lumbar spine since the lumbar punction performed on 22-APR-2008. The patient was treated with physiotherapy. On 17-JUL-2008, the patient again had an ophthalmologic check up, this time in a ophthalmologic department of a hospital. Fixation was good with both eyes and also Lang stereo test was completely positive (proof for intact stereoscopic vision). According to the ophthalmologist, "aggravation' of the symptoms must be considered; he evoked the diagnosis of "schoolgirl syndrome" and suggested psychotherapy. Other business partner numbers included: E2008-07071. Additional information ha

MedDRA PT Abdominal pain, Inflammation, Malaise

Symptom Text: The case is poorly documented and only partially confirmed by a physician. Information has been received from a consumer concerning her 18 year old daughter who on 28-MAR-2007 was vaccinated with her first dose of GARDASIL (lot no., route, injection site not reported). Since 03-MAY-2007 the patient "has been sick for several times". On 30-MAY-2007, the patient was vaccinated with a second dose of GARDASIL (lot no., route, injection site not reported). On 04-JUL-2007, the patient experienced sickness and abdominal pain and blood sample showed inflammation (no otherwise specified). On 12-SEP-2007, another blood sample was taken which was not normal (finds were not specified). On 14-SEP-2007, the patient was hospitalized until 21-SEP-2007. This information was confirmed by a physician. The outcome was not reported. Other business partner numbers include E2008-07120. Additional information is expected.

MedDRA PT Convulsion

Symptom Text: Information has been received from a nurse concerning a 15 year old female who on 16-JUL-2008 was vaccinated with the first dose of GARDASIL. Concomitant therapy included Tdap. The patient was also administered a TB test. On 20-JUL-2008 the patient experienced seizure. The patient was rushed to the Emergency Room. On an unspecified date, the patient recovered from seizure. No product quality was involved. Upon internal review, seizure was determined to be an other important medical event. Additional information has been requested. This was reported to VAERS by the healthcare facility on 23-JUL-2008.

MedDRA PT Wrong drug administered

Symptom Text: Initial information received on 21-JUL-2008 from a health care professional regarding a 1-month-old male who on 18-JUL-2008 was inadvertently administered a dose of GARDASIL (Lot #0588U, batch # NG39260) on the thigh IM. According to the reporter, the infant was going to be vaccinated, according to schedule, with the second dose of hepatitis B virus vaccine, somehow the vaccines were mistaken and the infant was vaccinated with GARDASIL instead. Once the physician realized the mistake he administered, the same day, on 18-JUL-2008, the hepatitis B virus vaccine (manufacturer has not been reported) straight away but on a different site. As a precautionary measure, the patient remained in the hospital for observation. On 21-JUL-2008 the patient was again observed. The patient had no adverse event. Other business partner numbers include E008-06940. This case was closed. No further information is available.

MedDRA PT Arthralgia, Malaise, Nausea, Rash, Urticaria, Vomiting

Symptom Text: Information was obtained on request by the Company from the agency via a Public Case Details form and concerning a 15 year old female who was vaccinated with GARDASIL (Lot No. 658278/0900U, Batch No. j5686, Expiry date 23-MAR-2010). On 28-MAR-2008, one hour post first dose of GARDASIL, the patient experienced nausea, arthralgia, malaise and vomiting. A rash developing on the chest and neck was noted and the patient was transported by ambulance to the hospital. She was admitted to the emergency department with mild urticaria noted to be fading. No other symptoms were noted at that time. The patient was given promethazine 10mg. The patient was observed and discharged. The patient felt unwell with joint pains over the weekend. At the time of reporting on 14-APR-2008, the patient recovered from nausea, arthralgia, malaise, rash, urticaria and vomiting. The agency considered that nausea, arthralgia, malaise, rash, urticaria and vomiting were possibly related to therapy with GARDASIL. The original reporting source was not provided. Information has been received from media monitors advising that the patient's experience was subsequently reported in an article, 18-JUN-2008, page 5. Additional information is not expected.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Asthenia, Athetosis, Central nervous system inflammation, Dizziness, Headache, Loss of control of legs, Memory impairment, Muscular weakness, Syncope

Symptom Text: Information was obtained on request by the Company from the agency via a Public Case Detail Form concerning a 16 year old female who on 02-MAY-2007 was vaccinated with the first dose of GARDASIL (Batch # J0798, Expiry date 07-AUG-2008, Lot # 655742/0138U). After vaccination with the first dose of GARDASIL, the patient experienced dizziness. On 13-JUN-2007 the patient was vaccinated with the second dose of GARDASIL (Batch # J0800, Expiry date 07-AUG-2009, Lot # 655742/0138U). After the second dose of GARDASIL, the patient developed headaches and was concerned about memory impairment. On 19-SEP-2007 the patient was vaccinated with the third dose of GARDASIL (Batch # J2300, Expiry date 12-FEB-2010, Lot # 657872/0583U). On 23-SEP-2007, a few days after the third dose of GARDASIL the patient got up during the night and lost control of her legs and collapsed. The next morning she had recovered. On approximately 10-OCT-2007, approximately 3 weeks after the third dose of GARDASIL, the patient developed right hand weakness and was referred to a neurologist. The patient was treated with methylprednisone to assist in recovery. On 30-JAN-2008 the patient was diagnosed with multifocal central nervous system (CNS) inflammatory disorder, presented with pseudoathetosis. It was advised that the patient recovered over 3 months. At the time of reporting to the agency on 10-JUL-2008 the patient had recovered from the athetosis, asthenia and central nervous system inflammation. The agency considered that athetosis, asthenia and central nervous system inflammation were possibly related to therapy with GARDASIL. The original reporting source was not provided. The agency considered the events of athetosis, asthenia and central nervous system inflammation to be serious for the following reason: medically significant. Additional information is not expected.

MedDRA PT Injection site pain, Injection site swelling, Pain in extremity

Symptom Text: Information has been received from a physician concerning a female who received the three doses of GARDASIL. Recently in July 2008, the patient had soft tissue pain and swelling over the injection site which has persisted since the third injection. The patient complained of pain when raising her arm. The patient was referred to physical therapy. Soft tissue pain and swelling over the injection site and pain when raising her arm, were considered to be disabling. Additional information has been requested.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy, Haemorrhage

Symptom Text: Information has been received for the pregnancy registry for GARDASIL from a nurse practitioner concerning a 15 year old female patient who on 06-JUN-2008 was vaccinated with the first dose of GARDASIL IM. The day after receiving the first dose of GARDASIL, the patient found out she was pregnant (gestation or last menstrual period of "1 month"). On 11-JUN-2008 the patient started bleeding and went to the emergency room on 17-JUN-2008, where it was determined she had a miscarriage. Upon internal review, miscarriage was considered to be other important medical event. Additional information has been requested.

MedDRA PT Deafness unilateral, Ear haemorrhage, Sudden hearing loss

Symptom Text: Information received from health authority (local number L200807-376, reference number RA-030-2008) concerning a 26 year old female in good health and with no risk factors for sudden deafness and no previous history of adverse reaction to other drugs, who in June 2008 was vaccinated with the first dose of GARDASIL via intramuscular route. On 02-JUL-2008 she suffered from sudden deafness of her left ear with haemorrhage of the left ear and C-reactive protein increased. On 04-Jul-2008, an audiogram was performed which confirmed neurosensory deafness of left ear with ear haemorrhage. There was a C-reactive protein elevation. The patient received corrective treatment with ibuprofen 400 mg three times a day during one week, deflazacort 30 mg during two days and buflomedil 600 mg once a day during one week. The patient recovered within an unspecified time frame. Sudden deafness was considered to be disabling. No further information is available. The case is closed. Other business partner number included: E2008-07313.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Blood pressure normal, Dyspnoea, Hypoaesthesia, Paraesthesia, Reaction to previous exposure to any vaccine, Throat tightness, Tremor

Symptom Text: Received Hepatitis A, Menactra, Varivax, and Gardasil. Received Hepatitis A, Menactra, and Varivax first, and was fine. The nurse went to get a different needle for the Gardasil vaccine and was gone for 3-4 minutes. She returned and gave the shot. Within a few seconds, patient complained that her throat felt "like someone had [her] in a headlock". She also complained of pins and needles sensation on her face. She had short, quick breaths but did not initially have shaking or numbness of the hands. We had her lay down and put some ice behind her neck. We also had her blow into a paper bag. She still complained of the pins and needles sensation on her face. We also gave her some Gatorade. 10 minutes later she felt better but was then having shakineess and numbness of extremities. No headache, no vision changes, no syncope. Blood pressure was fine. 20 minutes later the pins and needles sensation was gone, she felt better, and went home. This same patient did have a reaction to a pertussis vaccine (Tetramune) in October 1994, but otherwise has not reacted to vaccines and has had all of them.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Convulsion, Head injury, Headache, Immediate post-injection reaction, Loss of consciousness, Malaise, Nausea, Pain, Wound

Symptom Text: Information has been received from a physician concerning a 14 year old female who on an unknown date was vaccinated with the second dose of GARDASIL (lot# and batch# not reported) via intramuscular route in the deltoid. She had concomitant medication with RUBOZINC. Immediately after injection, the patient experienced generalized pain. Three minutes later, she lost consciousness and experienced convulsions. Her malaise induced a wound of the superciliary arch and head trauma. She was seen at the emergency unit where she stayed one hour. No scan was performed. At the time of reporting the patient still had cephalgia and nausea. Generalized pain, lost consciousness, convulsions, head trauma, cephalgia and nausea were considered to be an other important medical event. Other business partner numbers included E2008-07300. No further information is available.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Asthenia, Hand deformity, Hyperreflexia, No reaction on previous exposure to drug, Pain

Symptom Text: Information has been received from a general practitioner concerning a 14 year old female who on 15-MAY-2007 was vaccinated with a first dose of GARDASIL and on 05-JUL-2007 was vaccinated with a second dose of GARDASIL and were well tolerated. On 27-NOV-2007, the patient was vaccinated with a third dose of GARDASIL. Suddenly, on 18-JUN-2008, at the age of 15 years, the patient experienced left-site hyperreflexia, loss of strength and claw hand with severe pain. The patient was hospitalised on an unknown date. Examinations did not reveal any pathological findings (electro-neurography normal, ANA/ANCA negative, rheuma screening normal, C peptides negative, Borrelia serology normal). Lumbar puncture results were pending. At the time of reporting the patient had not recovered. Other business partner numbers included: E2008-07216. No further information is available.

Other Meds: Unknown

Lab Data: spinal tap, results pending; electroneurography, normal; serum ANA, negative; serum ANCA, negative; serum B. burgdorferi Western blot IgG Ab, normal; serum rheumatoid factor, normal; serum C-peptide test, negative

MedDRA PT Abdominal pain, Diarrhoea, Nausea, Rash generalised, Urticaria

Symptom Text: Information was obtained on request by the Company from the agency via a Public Case Detail form concerning a 15 year old female who on 28-APR-2008 was vaccinated with Gardasil vaccine. Subsequently, on 28-APR-2008 the patient experienced nausea, abdominal pain, diarrhoea and urticaria (also reported as the patient developed severe abdominal pain, nauseated, rash on the back of opposite arm, hive-live which spread all over body), and was hospitalized. At the time of reporting on 03-JUN-2008, the patient's nausea and abdominal pain and diarrhoea and urticaria persisted. The agency considered that nausea, abdominal pain, diarrhoea and urticaria were possibly related to therapy with Gardasil vaccine. The original reporting source was not provided. Additional information is not expected.

MedDRA PT Abdominal pain, Abdominal pain upper, Activities of daily living impaired, Arthralgia, Dizziness, Immediate post-injection reaction, Immunisation reaction, Malaise, Nausea, Pain, Pain in extremity, Pyrexia, Vomiting

Symptom Text: Immunizations given at app. 3 pm, and immediately after administration of vaccines, patient c/o feeling light-headed. Had client lie down, ice pack to forehead & back of neck, feet elevated, and observed for about 30-45 minutes before she felt she was able to leave with her mother. Clt & mother had been given copies of VIS along with verbal& written info regarding possible side effects and action to take if side effects occured. Mother to call agency in am. Mother called on 8/8/08 to report that daughter still feeling dizzy, having abdominal cramps, that both hips were hurting, and that she felt feverish. Mother denied that client was nauseated, and that she had been able to eat this am. Instructed to continue to allow daughter to rest, push fluids, give Tylenol and observe, and if concerned, needs to see medical provider. Received call from ER about 11:30 am, and patient had been taken to ER by her mother. ER personnel reported that she had severe dizziness, bilateral leg pain, and nausea & vomitting, and was hospitalized for observation. 8/15/08 Reviewed ER records of 8/8/08. FINAL DX: immunization reaction Records reveal patient experienced dizziness, lightheadedness, felt faint immediately after receiveing vaccination. Recovered & went to work but recurred w/leg pain & had to leave work. Symptoms persisted next day & went to ER. In ER had nausea, anterior bilateral leg pain, left arm pain, upper abdominal pain, HA, felt sick & achy. Held for observation.

Symptom Text: To Whom It May Concern: My daughter went to our nurse practitioner at Health Care Center on March 31, 2008 for a sore throat. She complained of her throat for about two days prior. Pt would get pharyngitis and strep about twice a year since she was 13. She received a shot of ROCEPHIN in the office on March 31st as well she was given a prescription for ZITHROMAX (Z-PAK) at the same time. I'm not sure exactly what time her appointment was it was around 11:00 am. that day. She dropped off her prescription at the pharmacy and I picked up on my way home. She took her first dose of ZITHROMAX on the 31st. She stayed home from school the next two days. She slept late both days which is not abnormal for her. In the evenings we played rummy, she was congested and coughing a little. She complained of a headache the next night and I gave her some ibuprofen. On Wednesday April 3rd she went to school, (school gets out at 3:05 p.m.) after school she went to tract practice. Her tract practice was a short one, I know she ran but I'm not sure how much. She stopped at a convenience store on the way home from school and got a Red Bull. She went home and changed clothes for work. She called me between 4:30 and 5:00 p.m. on her way to work to tell me about the road being blocked due to rain where we live. She parked her car and was walking the short distance into where she works she collapsed and started seizing. A lady in the drive through told the owner that she had fallen and he went out immediately. He said she was shaking, the employees inside called 911 and then me. The owner told me she stopped shaking and took a few strained breaths and then went limp. The police officer arrive within three minutes, he was a first responder. He did not check for a pulse or attempt CPR (I am in the process of getting a police report as well). Just as I got there an off duty paramedic arrived and started CPR. It took quite awhile before the ambulance arrived; she had been down too long. I later learned that they did not get her heart started unt

MedDRA PT Blood pressure immeasurable, Hypoventilation, Pallor, Syncope

Symptom Text: Information has been received from a health authority (ADR20205971) concerning a 15 year old female with no relevant medical history reported who on 24-DEC-2007 was vaccinated intramuscularly with a dose of GARDASIL. On 24-DEC-2007, the same day as vaccination, the patient experienced fainting, her blood pressure was unobtainable, and she was very pale with very shallow respiratory effort. On 24-DEC-2007, the patient recovered. Other business partner numbers included: E2008-07399. It was reported that the patient's experience was considered to be immediately life-threatening. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Drug exposure during pregnancy, Foetal disorder

Symptom Text: Information has been received from a physician concerning a 14 year old female who in February of 2008 was seen for an emergency contraceptive prevention. On 21-APR-2008 the patient was vaccinated with a first dose of GARDASIL (lot number) 0.5 ml by intramuscular injection (injection site not reported). Concomitant therapy included DEPO-PROVERA. Later the patient was found to be pregnant. At the time of this report the patient was in her 21st week of gestation. Unspecified medical attention was sought. Follow-up information was received from a nurse practitioner who reported that on 24-JUL-2008 the patient had a prenatal ultrasound performed, which revealed possible atrial septal defect of the fetus. Possible atrial septal defect was considered to be a congenital anomaly. Additional information has been requested.

Other Meds: DEPO-PROVERA

Lab Data: ultrasound 7/24/08, possible atrial septal defect of the fetus; beta-human chorionic, positive

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Abasia, Asthenia, Blindness, Gait disturbance, Hypoaesthesia, Livedo reticularis, Multiple sclerosis, Oedema peripheral, Paraesthesia, Paresis, Visual disturbance

Symptom Text: Information was obtained on request by the Company from the agency via a Public Case Detail Form, concerning a 17 year old female with recurrent cough/cold and an allergy to egg whites (vomiting and getting a rash around her mouth after eating cooked egg). The patient was subsequently administered MMR vaccine (brand not specified) under observation in hospital, without any adverse event. She also has a history of an allergic reaction to erythromycin at the age of 3 years when her legs became very mottled and slightly swollen. On 15-APR-2007 the patient was vaccinated with GARDASIL, intramuscularly. One week prior to vaccination, the patient had been treated with penicillin (possibly amoxicillin) for her recurrent cough/cold. On approximately 22-APR-2007, one week after vaccination with GARDASIL , the patient developed multiple sclerosis included abasia, paraesthesia, vision loss and asthenia. It was described that the patient complained of numbness starting on torso from underarms down, which progressively increased over two weeks to include her legs and feet. She was unable to walk without assistance, and was hospitalised by her general physician. The patient was in hospital for three days and was treated with methotrexate. A Magnetic Resonance imaging (MRI) of the patient's brain and spine identified three spinal lesions. After discharge, she complained of flickering in the right eye, and over the next ten days she experienced progressively worsening vision and could only see grey. The patient was readmitted to hospital and was treated with methotrexate. Her sight gradually returned to normal and it took up to one year for her to regain her strength. At the time of reporting to the agency on 29-JUL-2008, the patient had recovered from multiple sclerosis and paresis. The agency considered that multiple sclerosis and paresis were possibly related to therapy with GARDASIL. The agency stated: "Note: disconnect between proposed diagnosis: MS". The original reporting source was not provided. Addition

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Complex regional pain syndrome, Facial paresis, Hemiparesis, Injection site pain, Pain in extremity, Paraesthesia, Paralysis, Psychiatric evaluation

Symptom Text: Information was obtained on request by the Company from the agency via a Public Case Detail Form. This case was also reported in a newspaper article. The patient was a 15 year old female who on 22-OCT-2007 was vaccinated with GARDASIL. The child had also received 2 other doses of GARDASIL (dates not reported). On 22-OCT-2007 the patient experienced pain in extremity, complex regional pain syndrome, hemiparesis, injection site pain, paraesthesia and paralysis. The patient was treated in the Accident/Emergency Department and was hospitalised. It was described that the child initially had pain in the whole left arm requiring emergency department presentation and then 3 days later, she experienced intermittent left arm paralysis and paraesthesia. Later she presented with left facial, arm and leg hemiparesis. The patient's symptoms were inconsistent with signs of brain MRI. The patient was placed on long term physiotherapy and hydrotherapy for left arm with ongoing psychiatric and counseling input as outpatient. At the time of reporting to the agency on 17-JAN-2008, the patient had recovered from pain in extremity, complex regional pain syndrome, hemiparesis, injection site pain, paraesthesia and paralysis. The agency considered that pain in extremity, complex regional pain syndrome, hemiparesis, injection site pain, paraesthesia and paralysis were probably related to therapy with GARDASIL. The original reporting source was not provided. Additional information is not expected.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Blood pressure, Dizziness, Flushing, Headache, Loss of consciousness, Pallor, Pyrexia, Syncope, Vomiting

Symptom Text: My daughter was scheduled for her 12yr-old well visit with Dr. on 8/8/08 at 10:15 am. She was examined and was in perfect health at the time of her scheduled appointment. The Gardasil vaccination was given to her by the nurse. As we were at the front scheduling the next series of shots, within minutes my daughter said she had a really bad headache and then she started to vomit and she blacked out and fainted. She was returned to the examining room where she was propped up on the table and her blood pressure was taken by the nurse. Soon after she started to come around and was given flat coke to drink by the nurse. Since the visit my daughter has experienced headaches and running fevers of 102F to 103F from 8/9/08 thru 8/11/08. 8/15/08 Reviewed PCP medical records of 8/3-8/11/08. FINAL DX: none provided Records reveal patient in good health on 8/3/08 day of vaccination. No records included of reaction. Next note is t/c to parent to check status of recovery on 8/11/08 when continued to have facial flushing & HA. Was afebrile at that time. Had seen another MD over the w/e due to fever with negative findings. Reaction noted to have been lightheadedness & pale.

MedDRA PT Abdominal discomfort, Arthralgia, Blood test, Colonoscopy, Computerised tomogram, Culture stool, Endoscopy, Immediate post-injection reaction, Musculoskeletal pain, Pancreatitis, Pancreatitis acute, Stomach discomfort, Stool analysis

Symptom Text: She received the shot on Jan. 25,2008. Immediately after she started having an upset stomach. She then developed flu- like symptoms on April 18,2008. She was then hospitalized with pancreatitis on April 27, 2008 and was in the hospital with that till May 1, 2008 she had residual pain for 5-6 days and returned to school. Then on May 19, 2008 she started having abdominal. She has seen a pediatric gastroenteralogist every since with no explanation of her pain. She has had several blood test, CT scans, endoscopy, colonoscopy, and stool test. She has had little to no effect from the antispasm medication. She has been hospitalized on and off since several trips to the ED for pain management. She has also now for the last week had unexplained joint pain in her shoulders. I have given her Tylenol and Motrin for pain with little effect.10/20/08-records received for DOS 4/21-4/24/08-DC DX: Acute viral pancreatitis.Presented with C/O abdominal pain localized around epigastric and right upper quadrant began several days prior. GI type flu one week ago and suspected pancreatitis was probably due to enteroviral Coxsackie infection.

Symptom Text: We have tract Ashleigh's symptoms back to early part of December. She complained on and off of achy joints and just not feeling right. In February one of her track coach's approched me with concern and asked if Ashleigh had told me about her knees hurting and the lower part of her legs going numb on several different occasions. The trainer had looked at her and suggested a knee brace. The sparactic numbness continued though. On 4-14-08 Ashleigh received the 3rd HPV vaccine. On 4-18-08 I received a phone call that Ashleigh had experience and ice pick type pain in the back of her head and could not see out of her right eye and was complaining that the right side of face and arm were completely numb. We went straight to Dr. Pai who sent us to Henderson Memorial for a cat scan and then to Trinity Mother Francis Emergency in Tyler for and MRI. Diagnosis: Sphrenoid Sinusitis. She was given a prescription for a Z-pack and Naprolan. Ashleigh's symptoms seem to improve but still complained of achy joints especially in her lower back and hips and now experiencing twitching on the right side of face and arm. On 5-7-08 we took Ashleigh to the emergency room again because her lower back, hips, knees and ankles were hurting and numb. She complained that the pain felt like it was coming from the inside of the bone. Diagnosis: Possible pinch nerve, ice and heat along with Advil were to be implemented 5-8-08 I called Dr. Pai because Ashleigh's symptoms had worsened overnight and now was having trouble walking. He called Dr. Karenpuza an nueroligist and set up for him to see her 5-9-08 the very next morning at 6:30a.m.. Dr. Karenpuza examined Ashleigh and told us he was admitting her into the hospital with the suspicions of MS. He treated her symptons as and MS patient. A spinal tap, MRI, and blood work was ordered along with and IV for a steroid treatment to be given every 6 hrs. for 30 mins each time. Ashleigh was discharged on 5-13-08 and to take Predizone for 5 days along with Aleeve. On 5-20 Dr. Karenpu

MedDRA PT Confusional state, Convulsion, Gaze palsy, Loss of consciousness, Pyrexia, Syncope

Symptom Text: Information has been received from a nurse concerning her 16 year old daughter with questionable allergies to penicillin and a history of Bell's Palsy who in December 2007 or January 2008, was vaccinated with a first dose of GARDASIL (lot number, injection site and route not reported). In February 2008, the patient was vaccinated with a second dose of GARDASIL intramuscularly (injection site and lot number not reported). There was no concomitant medication. On 25-JUN-2008 or 26-JUN-2008, the patient had a relatively high fever of 101.9 F. She was put on ZITHROMAX from 26-JUN-2008 to 30-JUN-2008. On 02-JUL-2008 the patient had a seizure, her eyes rolled to the back of her head and she had a loss of memory. The patient was taken to the emergency room and the following tests were done: CT scan, EEG and MRI which were all normal. The ER did not find the cause of the seizure. Subsequently the patient recovered from the events. Upon internal review, seizure was determined to be an other important medical event. Additional information has been requested. 8/13/08-records received for DOS 7/2/08-presented to ED after loss of consciousness while eating lunch. Coherent and confused enroute to ED. In ED awake, alert oriented with no specific complaints. Unaware of any antecedent symptoms prior to episode. DX: Syncope, probably seizure. 8/15/08-records received-1st Gardasil received 12/26/07-2nd Gardasil received 3/6/08. On 7/10/08-Parent contacted PCP office concerned about seizure after 2nd vaccination. Seizure occurred 1 week ago. 8/13/08-experienced second seizure. Will continue to follow in office.

MedDRA PT Amnesia, Confusional state, Convulsion, Dizziness, Fall, Fatigue, Headache, Immediate post-injection reaction, Neck pain, Syncope, Syncope vasovagal, Tremor

Symptom Text: Information has been received from a physician concerning a patient who was vaccinated with GARDASIL. The physician reported that a patient experienced on 01-AUG-2008 after having at some point previously received a GARDASIL injection. Upon internal review seizure was considered an other important medical event. Additional information has been requested. 8/22/08 Reviewed PCP office records which included ER contact info, labs & vax records. FINAL DX: vasovagal syncope; possible idiopathic seizure Records reveal patient immediately after 1st HPV injection 2/13/08 felt dizzy fainted & had tremors lasting less than 30 second, awoke alert but tired. Recovered completely & d/c to home. Parent informed MD of fainting & tremors while vacationing out of state, woke up confused & had HA x 2 days. Seen in ER where CT scan & labs were WNL. 8/26/08 Reviewed ER medical records of 8/1/2008. FINAL DX: syncopal episode, probable vasovagal Records reveal patient experienced trip & fall into a few inches of water at beach. Got up & walked a few steps then fell forward & had seizure lasting 10-20 sec. Patient had no memory of event. Had HA & sore neck in ER.

MedDRA PT Drug exposure during pregnancy, Foetal cardiac disorder

Symptom Text: Information has been received from a 21 year old female with no medical history or no drug allergies, for the Pregnancy Registry for GARDASIL, who on an unknown date was vaccinated with the first dose of GARDASIL, on 02-JUL-2007 was vaccinated with the second dose of GARDASIL and in October 2007, was vaccinated with the third dose of GARDASIL. Concomitant therapy included hormonal contraceptives (unspecified) and progesterone. In November 2007, the patient found out she was pregnant. The patient stated that she was given a pregnancy test each time and they came back negative, but it was assumed that the patient became pregnant around July 16, 2007. The patient reported that she had her baby on 11-APR-2008, and her son was born with heart defects. The patient stated that her son went to his physician every month too two months and had an electrocardiogram (EKG and ultrasound done), and he would have surgery when his heart gets bigger. The patient stated that her son's surgery around will be when he is a year old. No product quality complaint was involved. Upon internal review, heart defect was considered to be a congenital anomaly. Additional information has been requested.

MedDRA PT Arthralgia, Inflammation, Juvenile arthritis, Musculoskeletal stiffness, Pain in extremity

Symptom Text: Information has been received from a health authorities concerning a 14 year old female patient who on 17-JAN-2008 was vaccinated with the first dose of GARDASIL (batch number not reported) via intramuscular route. On 12-MAR-2008, the patient was vaccinated with the first dose of MENBVAC and on 29-APR-2008 was vaccinated with the second dose of MENBVAC. On 01-MAY-2008, she presented with metacarpal-phalangeal and interphalangeal proximal pain of second and third fingers of hands. She also had knee pain with markedly inflammatory rhythm, morning stiffness of 4 hours. Clinical examination defined arthritis. Biological analysis revealed erythrocyte sedimentation rate (ESR) at 20. Latex and Waaler-Rose tests were positive. Anti DNA antibodies were at 3.4 UI/ml. Anti CCP antibodies were expected. Radiology was normal, there was no signs of erosion. Diagnosis was juvenile rheumatoid arthritis. Methotrexate treatment was initiated. Thumb pain of right hand in Feb-2008 was reported in a traumatic context. At time of reporting the patient had not recovered. Upon internal review, juvenile rheumatoid arthritis was considered to be an other important medical event. Other business partner numbers include: E2008-07298. Additional information has been requested.

Other Meds:

MedDRA PT Contusion, Fall, Head injury, Skin laceration, Syncope

Symptom Text: Information has been received from a paediatrician concerning a 15 year old female who on 25-JUL-2008 was vaccinated with GARDASIL (lot #, route and site not reported). Five hours p.v., (on 25-JUL-2008), the patient experienced syncope, she fell and experienced bruise of her head and laceration of chin (diameter about 0.8 cm length). She was hospitalized for monitoring from 25-JUL-2008 to 27-JUL-2008. Cranial CT on 25-JUL-2008 showed no intracranial bleeding, nor an increase in volume or an edema. A fresh ischemic lesion was not definable at the time of examination. Diagnosis of cranial contusion, fall of unclear cause and chin lesion were established. Routine laboratory: no pathological findings. At the time of the reporting the patient had recovered. Other business partner numbers include: E2008-07283. File is Closed. No additional information is expected.

Other Meds: Unknown

Lab Data: Head computed axial tomography, 25Jul2008, no intracranial bleeding and no increase in volume or an edema; Diagnostic laboratory test, routine laboratory: no pathological findings.

Symptom Text: Information has been received from a nurse practitioner concerning her daughter, a 26 year old female with depression, asthma exercise induced and allergy to nuts who on 31-JUL-2008 was vaccinated with a third dose of GARDASIL (route and administration site not reported). Concomitant therapy included EFFEXOR. On 01-AUG-2008, within 12 hours of the vaccination, the patient experienced facial swelling and puffy cheeks. The patient then had tenderness of her neck and enlarged lymph nodes. She was treated with BENADRYL, ZYRTEC and ice packs. It was mentioned that the patient had no adverse reaction after the first 2 doses of GARDASIL. The patient's facial swelling and tenderness of neck and enlarged lymph nodes persisted. She sought medical attention in the office. Follow-up information was received. The patient became progressively worse on 01-AUG-2008 and 02-AUG-2008 with continued facial swelling and enlargement of both lymph nodes and salivary glands, and difficulty swallowing. The patient underwent CT scan, ENT evaluation and was admitted to the hospital. IV steroids and pain medicine were given. An antibiotic was also given to which she had an allergic reaction. An infectious disease consult was called. At the report time, the swelling has just started to regress slightly, but the parotid glands were tense and obstructed. Additional information has been requested. 08/28/2008 MR received for DOS 8/2-5/2008 with D/C DX: Sialadenitis, likely 2' to allergic reaction. Depression. Pt presented with facial swelling and pain which began the pm of HPV4 shot. Pt developed lip, eyelid and neck swelling initially, then shooting pain with neck movement or touch. Pt then developed difficulty swallowing and eventually difficulty breathing. On PE in ER voice is hoarse, swelling of eyelids, face, lips and neck. Tender to touch. Tonsils enlarged, touching uvula. Decreased neck ROM 2' to pain. Started on abx and steroids with allergic rxn to Clindamycin. Continued steroid tx with clinical improvement. To f/u w

Seriousness: ER VISIT, PERMANENT DISABILITY, SERIOUS

MedDRA PT Activities of daily living impaired, Akinesia, Arthralgia, Arthritis, Crying, Decreased appetite, Erythema, Eye swelling, Fatigue, Gait disturbance, Inflammation, Joint effusion, Joint range of motion decreased, Joint stiffness, Joint swelling, Musculoskeletal stiffness, Myalgia, Nausea, Night sweats, Paraesthesia, Polyarthritis, Pyrexia, Rash maculo-papular, Rheumatoid arthritis, Sleep disorder, Synovitis, Temperature intolerance

Symptom Text: Had her second Gardasil vaccination at the end of August 2007, two weeks later suddenly developed pain in joints of hands, feet, knees and elbows. Pain got progressively worse and required emergency room visit when she could not bend her joints and was in extreme pain. Had multiple tests done and was given prednisone for the inflammation, pain medication and a referral to a Rhematologist. After 2 months of treatment with steroids and multiple blood tests for Lyme disease, Hepatitis and Lupus and others she was diagnosed with Rhematoid Arthritis. It came on out of the blue. She had never had any illness or symptoms prior to the sudden and unexplained onset. We went to the Clinic for a second opinion and they confirmed RA. She has been on Methetrexate and Enbrel which she will have to stay on for the rest of her life. She still has stiffness, pain and inflammation even with the drugs. This happened just after her second dose of Gardisal. I believe there is a connection, prior to that she was a strong healthy young woman with no history of any illness and never had joint pain. There is no history of autoimmune disease in either side of her family and it is extremely rare for RA to develop so suddenly and severely as it did in her case. 09/12/2008 MR received for ER visit 9/23/2007 with DX: arthralgias. Pt presented with c/o 1 week hx of joint pain, now worsening in legs, wrists and shoulder as well as low grade fevers and polymyalgia. Recently started on steroid taper by PCP however pain is now worse with lower extremity joint swelling. D/C on pain meds to f/u with rheumatologist. Rheumatology consult dated 9/28/07 with impression Inflammatory Arthritis in multiple joints. HPI as above now with morning stiffness > 1 hr, fatigue, night sweats, cold sensitivity, nausea and paresthesias in the hands and feet. PE (+) for limping gait, polysynovitis, shoulder, elbow and wrist tenderness with decreased ROM, PIP joints swollen and tender, effusions in both knees, ankles and forefeet tender. Started on prednison

Other Meds: Birth Contol (Yaz)

Lab Data: Multiple blood tests, CPR tests (very high),MRI of joints, Physical examination of joints. Tests were done. Labs and Diagnostics: X-ray bilateral hands (+) for soft tissue swelling of PIP joints which may be a manifestation of early synov

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Caesarean section, Drug exposure during pregnancy, Epidural anaesthesia, Foetal disorder, Heart rate increased, Labour induction, Pyrexia

Symptom Text: Initial and follow-up information has been received from a 23 year old female for the pregnancy registry for GARDASIL who in APR 2007 was vaccinated with the first dose of GARDASIL. No information was received concerning the second dose of GARDASIL. In OCT 2007 the patient was vaccinated intramuscularly with the third dose of GARDASIL. The patient states that she discovered she was pregnant about 1 week after receiving the third dose of GARDASIL (LMP=23-SEP-2007). The pregnancy was confirmed with a pregnancy test. No adverse events were reported. The patient sought unspecified medical attention. On 01-AUG-2008 the patient reported that her pregnancy was fine, no complications. Per the patient, she delivered an healthy and normal boy on 03-JUL-2008 at 40 weeks 5 days by cesarean section. The patient had an elective induction with pitocin and an epidural and progressed to 8cm dilation, at which time she had developed a fever - though she wasn't sure why as there was no infection and both she and the baby had elevated heart rates and the decision for a cesarean section was made at that time. Her son weighed 8 lbs, 3.3 oz. At that time of reporting, the infant was almost one month old and doing well. The patient, reported that she was recovering well - no problems at all. Upon internal review, the patient's fever and increased heart rate and the fetal increased heart rate were considered other important medical events as the events lead to the delivery via cesarean section. Additional information has been requested.

MedDRA PT Inappropriate schedule of drug administration, Leukaemia

Symptom Text: Information has been received from a physician concerning a 26 year old female with a history of loop electrosurgical excision procedure and cervical high grade squamous intraepithelial lesion who on 25-MAY-2007 was vaccinated with the first dose of GARDASIL. On 19-JUN-2008 was vaccinated with the second dose of GARDASIL. On 30-JUL-2008 was vaccinated with the third dose of GARDASIL. On 25-MAY-2007 the patient experienced inappropriate schedule of vaccine administration. In June 2008, the patient experienced symptoms of leukaemia and currently is being studied and treated to leukaemia. The patient's leukaemia persisted. The leukaemia was considered to be an other important medical event. The reporter felt that leukaemia was not related to therapy with GARDASIL. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Abdominal pain upper, Pancreatitis, Pyrexia, Rash, Tenderness, Vomiting

Symptom Text: It was reported in a published article, titled as stated above that a 26 year old woman presented with 24 hours of severe constant epigastric pain and vomiting. She had no history of similar pains, alcohol consumption or gallstones. Four days before presentation she had received her first dose of GARDASIL. Two days after vaccination she developed a fever and self-limiting rash of 3 days' duration. Examination revealed marked epigastric tenderness and temperature of 40 centigrade. Other physical parameters were within normal limits. Biochemical investigations showed normal liver function, moderate leukocytosis, a serum amylase level of 1900U/L (reference range [RR], 23-85U/L) and lipase level of 3400 U/L (RR, 0-160U/L). An upper abdominal ultrasonography showed a non-dilated biliary tree and no evidence of gallstones. Computed tomography showed an oedematous pancreas with peripancreatic fat stranding and arterial enhancement of the pancreatic parenchyma, consistent with pancreatitis without necrosis (Box). Other investigations showed normal serum levels of calcium, triglycerides and parathyroid hormone. Serological tests were negative for acute infection with Coxsackie A9, Coxsackie B1-6, echo, mumps, herpes simplex, hepatitis and varicella zoster viruses. The patient was diagnosed with pancreatitis and treated conservatively with intravenous fluids and analgesia. Pain, symptoms and biochemical abnormalities settled after 10 days. She was discharged and remains well. Magnetic resonance cholangiopancreatography performed after discharge showed no pancreatic parenchymal or ductal abnormality. Acute pancreatitis is common, with an incidence of 5.4-80 per 100,000. Gallstones and alcohol use account for 70%-85% of cases; other causes include drugs, viral infections, tumours, hyperlipidaemia, hypercalcaemia, trauma, iatrogenic injury and pancreatic ductal anomalies. The cause is unidentified in up to 10% of cases. Viral pancreatitis is well recognized, with cytomegalovirus and mumps, Coxsackie, hepatit

MedDRA PT Asthenia, Epstein-Barr virus infection, Hepatitis, Skin discolouration

Symptom Text: Information has been received from a health professional concerning an 18 year old female who on an unknown date was vaccinated with the first dose of GARDASIL (lot# and batch# not reported). The patient had also received hepatitis B virus vaccine (unspecified) some time before. Subsequently the patient experienced severe asthenia and presented with a grayish skin color. Blood test were consequently performed and enabled to diagnosed Epstein-Barr virus infection. One week later, hepatitis was diagnosed. The reporter considered the case an other important medical event. At the time of the reporting, the patient had not recovered. Additional information has been requested.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Cardiac failure acute, Dyspnoea

Symptom Text: Information has been received from a general practitioner concerning a 14 year old female with a history of congenital transposition of great arteries and patent ductus arteriosus who on 07-JUL-2008 was vaccinated with the second dose of GARDASIL (lot No., injection site, route not reported). 36 hours post vaccination, the patient experienced dyspnoea due to acute cardiac insufficiency and was hospitalized in a children's cardiac unit. The patient recovered completely within an unspecified time. The patient's parents decided not to complete the vaccination series. The hospital report was not yet available. The hospital physician considered the event to be possibly related to therapy with GARDASIL. The first dose of GARDASIL was given on an unknown date, toleration not reported. Other business partner numbers included E2008-07448. Additional information has been requested.

MedDRA PT Arthralgia, Asthenia, Chills, Headache, Influenza like illness, Nausea, No reaction on previous exposure to drug, Pyrexia, Sinusitis, Somnolence, Tachycardia

Symptom Text: Initial and follow up information has been received from a general practitioner concerning a 22 year old female with no reported relevant medical history, who on 20-SEP-2007 was vaccinated with the first dose of GARDASIL, intramuscularly. On 20-NOV-2007, the patient was vaccinated with the second dose of GARDASIL, intramuscularly. These vaccinations were well tolerated. On 21-MAY-2008, the patient was given the third dose of GARDASIL, lot #, route of administration and site of injections were not reported. Exact onset not reported, the patient developed headaches, drowsiness, chills and tachycardia. She presented at the physicians office on 26-MAY-2008. At an unspecified time the patient recovered from chills and tachycardia, whereas drowsiness and headache were ongoing at the time of reporting. Follow-up information reported that "shortly" post vaccination, exact onset not reported, the patient developed additionally asthenia, fever, arthralgia, and nausea. Therapy was started with diclofenac and dexamethason. Examinations in the outpatient department of a hospital led to diagnosis of sinusitis. Electrocardiogram (ECG) was normal. It was recommended to carry out surgery. The reporter pointed out that most likely all symptoms were related to sinusitis than to vaccination. At the time of this report the patient had recovered (duration not reported) except for headache and drowsiness. Additional follow-up information reported that on 22-MAY-2008 the patient developed flu-like symptoms, headache drowsiness. On an unreported date at the end of May-2008 the patient was hospitalised. Maxillary sinusitis was diagnosed by x-ray of the paranasal sinuses. Cefuroxim and nasivin (OXYMETAZOLIN) were administered for therapy. Drug screening was negative. Peripheral vestibular disorder could be excluded. Schellong's test, electrocardiogram (ECG), cranial magnetic resonance imaging (MRI) and neurological examinations showed normal results. Electroencephalogram (EEG) showed unspecific "function disorder of the deeper brain struct

MedDRA PT Dizziness, Immediate post-injection reaction, Injection site pain, Musculoskeletal stiffness, Nausea, Pallor, Syncope

Symptom Text: Information has been received from a consumer concerning her 12 year old daughter who on 04-AUG-2008 was vaccinated with GARDASIL (yeast). VARIVAX (dose not reported), VAQTA (inactive) (manufacturer unknown) and tetanus toxoid (manufacturer unknown). On 04-AUG-2008, after being vaccinated with GARDASIL her daughter reported the vaccination stung. Then, she felt dizzy, developed a blank expression on her face, her arms tightened, her head dropped forward and she fainted. She was pale and felt nauseated and her blood pressure was 90/50. She sat at the doctor's office for 10-15 minutes. The arm that had the vaccination for tetanus toxoid also hurt. The patient had eaten very little before vaccination. The patient sought medical attention at the clinic. On 04-AUG-2008, the patient recovered from the events. Additional information is not expected.

MedDRA PT Blindness transient, Dizziness, Faecal incontinence, Immediate post-injection reaction, Visual disturbance

Symptom Text: Patient received her 3rd Gardasil vaccine in her left arm and then immediately following, her Hep A vaccine in her right arm. Within seconds following the vaccinations patient became lightheaded and dizzy, and said she could not see. She stated she thought she was blacking out. She did not lose consciousness. She had been standing up and was immediately assisted to the exam table to sit down. Upon sitting down her dizziness and blindness subsided. She was instructed to lie down. But, patient insisted she had to go to the bathroom right away. As she was escorted to the BR, she became dizzy again and was unable to see. She became incontinent of stool as well. She was assisted to the bathroom and after sitting on the toilet she said she felt better. She was cleaned up and sat in the bathroom for approx. 10 minutes. Upon trying to stand, she again became dizzy, so she sat back down. We stayed in the bathroom approx. 45 minutes until Megan felt able to walk with assistance to the car. During the walk to the car, she continued to feel lightheaded and dizzy, but did not lose consciousness or vision. Upon arriving home she layed on the sofa for 2-4 hours. There were no more adverse symptoms.

MedDRA PT Asthenia, Brachial plexopathy, Chills, Hypoaesthesia, Hyporeflexia, Muscular weakness, Neuralgia, Paraesthesia, Paralysis flaccid, Pyrexia, Radiculitis brachial, Sensation of heaviness, Steroid therapy

Symptom Text: Information has been received from a physician concerning a 25 year old female, with a weak immune system and respiratory tract infection, who is a medical assistant at the physician's office, on 03-JUN-2008 was vaccinated with the first dose of GARDASIL. On 05-AUG-2008 the patient went to the physician's office and received the second dose of GARDASIL in the deltoid. The physician reported that about 40 minutes after receiving the vaccination her arm became very numb and heavy, like something or someone was pulling on her arm, and her fingers were tingling. The physician reported that throughout the day her arm felt like a dead arm. The patient had her blood pressure taken that day which was fine. The physician reported that night the patient could not even move her arm; she had chills and a fever so she called the physician at 2:00 in the morning. The patient had then seen her primary care physician the next morning on 6-AUG-2008 who gave her an emergency referral to a neurologist. A CT scan, bloodwork and an X-ray were performed (results not provided). The patient was diagnosed with paralysis of the arm and was admitted to the hospital. The physician reported that the patient was still hospitalized on 07-AUG-2008 and still had the symptoms, but she was having more test done and had been given PROTONIX (manufacturer unspecified) and prednisone (manufacturer unspecified). Paralysis of the arm and chills and fever were considered to be disabling. Additional information has been requested. 9/5/08 Reviewed hospital medical records of 8/6-8/8/2008. FINAL DX: left acute brachial plexus neuritis; obesity Records reveal patient experienced flaccid paralysis of the LUE the day after the second HPV vaccination in LUE. Started w/numbness, tingling & weakness of LUE approx 15 min s/p vaccination & progressing to being unable to move her LUE. Exam revealed LUE 1-/5 strength diffusely. Neuro consult done. Tx w/prednisone & PT in hospital & to be continued as outpatient. 9/16/08 Reviewed neurologist med

MedDRA PT Sinus arrhythmia, Tachycardia paroxysmal

Symptom Text: Information has been received from an health authority (reference number PEI2008011501) concerning a 19 year old female with no relevant medical history reported who on 19-MAR-2008 was vaccinated with GARDASIL. On 26-MAR-2008 she developed paroxysmal tachycardia. Sinoatrial node dysfunction was diagnosed. On an unspecified date she was hospitalized. Myocarditis and hyperthyroidism (thyroid function test) were ruled out. Laboratory findings on cardiotropic viruses and Borrelia antibodies, (longterm) electrocardiogram (ECG), cardiologic magnetic resonance imaging (MRI) and echocardiography were carried out, and results were not reported. Since 25-APR-2008 she was treated with unspecified beta blocking agents and symptoms improved. On 02-APR-2008, she was vaccinated with hepatitis A and B vaccine (manufacturer unknown). Other business partner numbers included: E2008-07472. Additional information has been requested.

Other Meds: Unknown

Lab Data: diagnostic laboratory test, Laboratory findings on cardiotropic viruses were carried out, results not reported; electrocardiogram, results not reported; magnetic resonance imaging, results not reported; echocardiography, results not reporte

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Information has been received through the Merck pregnancy registry from a health professional concerning a 19 year old female patient with a history of allergic reaction to FLAGYL who on 30-OCT-2007 was vaccinated intramuscularly with the first dose of GARDASIL (Lot# 659437/1266U). An ultrasound performed on 30-OCT-2007, following vaccination with GARDASIL, confirmed that the patient was pregnant (LMP= end of September). No other symptoms were noted. The patient sought unspecified medical attention. This is a consolidation of reports regarding the same patient. Follow up information was received. The patient miscarried at the end of December 2007. Upon internal review, miscarriage was determined to be an other important medical event. Additional information has been requested.

Other Meds: Unknown

Lab Data: ultrasound, 10/30/07 - positive

History: Allergic reaction to antibiotics

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Blood glucose increased, Blood pressure orthostatic, Dizziness, Fall, Feeling hot, Gaze palsy, Headache, Nausea, Oxygen saturation normal, Oxygen supplementation

Symptom Text: Per Nurse Record: Nurse Stat called to front desk. When RN arrived, found pt flat on back on floor, verbal and responding to questions. Per other observers, pt was standing at the desk, her eyes rolled back, and she fell to the floor. This was about 5 minutes after receiving Gardasil injection at 330pm. Pt was immediately evaluated by MD and NP. BS 150; O2sat98%; Oxygen face mask was applied. RN called 911, but the pt declined these services and the call was not completed. MD advised pt that 911 should be called and she should be evaluated for r/o seizure and for the trauma to her head. She again declined 911 services and said her boyfriend would take her to the ER. She states she got her gardasil shot, felt fine, walked out of the room, states she became dizzy/nausea/hot, then she fell, when she came to she said it "felt like she was in a dream", then "flashes of images" orthostatics: 112/80; 80 lying 110/80; 82 sitting 110/80; 88 standing Now pt c/o pain to back of head, slightly nauseated. Pt's boyfriend arrived within 30 minutes and spoke to both NP and MD, who both advised that pt should be seen immediately in ED. Her boyfriend states he will take her now.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Drug exposure during pregnancy, Foetal disorder, Premature labour

Symptom Text: Information has been received from a consumer, for the Pregnancy Registry for GARDASIL, concerning her daughter, a 19 year old female with a history of respiratory syncytial virus infection who in approximately May or June 2007, was vaccinated with the first dose of GARDASIL, she subsequently had the second dose (date unknown); and on 02-JAN-2008, she had the third dose of GARDASIL. The patient had her LMP on 15-DEC-2007 and they later learned that she was pregnant at the time she had her third dose of GARDASIL. The patient went into pre-term labor at twenty-eight weeks and gave birth to a baby boy on 28-JUN-2008. The baby only survived two days. The death of the baby "was due to the delivery which caused a grade 4 hemorrhaging of the brain". The patient is presently doing well physically. The reporter said that her daughter, had consented to our contacting the nurse practitioner. The patient sought medical attention. Upon internal review, the baby born at 28 weeks was considered to be an other important medical event. Additional information has been requested.

Seriousness: ER VISIT, EXTENDED HOSPITAL STAY, HOSPITALIZED, SERIOUS

MedDRA PT Contraception, Grand mal convulsion, Inappropriate schedule of drug administration, Syncope, Vaccine positive rechallenge

Symptom Text: Information has been received from a physician concerning a 27 year old female with no known drug allergies and no pertinent medical history reported, who on an unknown date was vaccinated with the first dose of GARDASIL. On approximately 18-JAN-2008, she was vaccinated with a second dose of GARDASIL. On approximately 17-JUN-2008, the patient was vaccinated with a third dose of GARDASIL. Concomitant therapy included hormonal contraceptives (unspecified). About three weeks after the first dose, the patient had a syncopal episode. On 08-FEB-2008, about 3 weeks after the second dose, the patient experienced tonic-clonic seizure and was hospitalized overnight. The patient was hospitalized from 08-FEB-2008 to 09-FEB-2008. On 08-JUL-2008, about three weeks after the third dose, the patient experienced a second tonic-clonic seizure. An electroencephalography, a magnetic resonance imaging and blood work were done and showed normal results. She was started on an anticonvulsant medication. At the time of reporting, the patient had not recovered. Upon internal review severe tonic-clonic seizure was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Agitation, Anxiety, Arthralgia, Blister, Depression, Dermatitis, Ear pain, Emotional distress, Ephelides, Erythema, Fatigue, Hypersensitivity, Joint swelling, Keratosis pilaris, Melanocytic naevus, Mood swings, Oedema peripheral, Pharyngitis, Pharyngolaryngeal pain, Pruritus, Rash, Rash macular, Rash papular, Rash pruritic, Seborrhoea, Sinus headache, Skin irritation

Symptom Text: Mysterious rash began 9 days after receiving the initial injection with water blister type manifestion and systemic reaction like symptoms with agitation and anxiety (would come and go with no apparent provocation). Sore throat and ear pain. Swelling of right foot intermittent. Joint pain. Rash continued for months. Increasing fatigue, depression, mood swings, and emotional distress. Has seen general practitioner with no findings, dermatologist can not identify skin irritations and has prescribed lotions which have no effect. 9/26/08 Reviewed dermatologist medical records of 6/17/2008. FINAL DX: perioral dermatitis vs seborrheic dermatitis; nevi, freckling; keratosis pilaris, asymptomatic. Records reveal patient experienced rash on face, back & arms 2 days s/p initial HPV vaccine. Rash noted as recurrent water blisters & facial redness that would dry up w/minimal itching. Exam revealed rough patches over nose, cheeks, perioral area & chin area. No vesicles noted on exam. There was rough eczema appearing rash of antecubital & proximal aspects of bilateral forearms. Keratosis pilaris was noted on bilateral upper arms. Numerous macular freckles were noted on face & shoulders. Tx w/lotion/cream. Was to return should re-excerbation ocur. No further visits on record. 9/30/08 Reviewed urgent care medical records of 6/2004-6/17/2008. FINAL DX: none provided Records reveal patient exprienced pruitic rash of face & arms, sore throat, sinus HA, swollen feet on 5/8/08 dx w/allergic reaction/rash, pharyngitis. Tx w/antibiotics. RTC 5/21/08 w/intermittent pruitic rash & swollen hands/knees. Light pink papular itchy rash noted on cheek, scalp & upper arm but no joint swelling on exam. Tx w/antihistamine & steroids. Seen by dermatologist 6/17/08, records previously reviewed.

MedDRA PT Anxiety, Immediate post-injection reaction, Injection site erythema, Rash macular

Symptom Text: A 13 year old girl came in for immunization update, accompanied by her mother. The RN administered four vaccines, beginning with Hep A in the right deltoid. By the time the 4th vaccine was administered in the left arm, the patient's chest had developed red blotches, and it appeared to be spreading up her neck. Red blotches were noted over her right shoulder also. There was only minor erythema around the other vaccine sites. Patient denied itching, difficultly breathing, difficulty swallowing. The physician was called in to examine her and he prescribed Benadryl 50mg, po (the patient had expressed and exhibited extreme anxiety over "getting shots"). Benadryl 50 mg po was given at 11:00 am. The red blotches on her chest and neck resolved over the next 20 minutes. Blotchy erythema remained present, though diminished, surrounding the bandaid over the Hep A site. Patient's vital signs were WNL, and she was allowed to leave with her mother at 11:30 am. Her mother was given a prescription for Benadryl 25 mg to be given every 6 hours over the next 2 days, and advised to call 911 for any difficulty breathing or swallowing. Per phone call to the patient's mother three hours later, the redness had completely disappeared, and she reported the child was doing well.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Arthralgia, Diarrhoea, Headache, Pain in extremity, Pharyngolaryngeal pain, Pyrexia

Symptom Text: Information has been received from a health professional, regarding her daughter, a 19 year old female who on 08-JUN-2008 was vaccinated with the first dose of GARDASIL (batch number not reported) on the deltoid by intramuscular route. On 07-JUL-2008, the patient started with pain in knees, ankles and thumbs. Different tests are being performed on the patient such as tests for rheum and blood smear tests. The patient has no medical history related with these events. Aspirine has been prescribed to treat the pain, the patient has been taking it since 10-JUL-2008. The patient's joint pain persisted. The case was considered by the physician as an other important medical event. Follow-up information was received which reported that the patient was vaccinated with a first dose of GARDASIL (lot# 0569U, batch# NG39330). According to this new information, the patient took Aspirine for 3 days, from the 10-JUL-2008 to 12-JUL-2008, with a frequency of 8 hours. Test results have been reported. C-reactive protein: 9 mg, Antistreptolysin 408, rheumatoid factor 20 units, PCR high sensitivity 1.2 mg/dl. Buccal swab test was positive for streptococcus piogeno. The patient was treated with Amoxicillin 750 mg every 8 hours; the treatment lasted from 15-JUL-2008 until 24-JUL-2008. On 22-JUL-2008 the patient presented cephalgia and fever. The patient recovered from cephalgia after two days, the fever lasted for one day, temperature not reported. It is also reported that the patient presented diarrhea from 24-JUL-2008 until 26-JUL-2008. On 4-AUG-2008 the patient started with headache and throat pain, on 6-AUG-2008 a new swab test and blood work is performed. The patient started on amoxicillin again. The reporter believes that the adverse event is due to the infection and not to the vaccine. The physician considered the patient's adverse events to be other important medical events. Other business partner numbers included E2008-06552. No further information is available.

Other Meds: Unknown

Lab Data: Serum C-reactive protein, 9 mg; Serum high sensitivity CRP, 1.2 mg/dl; Serum rheumatoid factor, 20 units; Serum antistreptolysin O antigen test, 408; Mouth culture, positive for streptococcus piogeno.

MedDRA PT Abdominal pain, Aphthous stomatitis, Arthralgia, Condition aggravated, Crohns disease, Diarrhoea, General physical health deterioration, Inflammation, Uveitis, Weight decreased

Symptom Text: Information has been received from a health authority (reference number BX20080612) concerning a 21 year old female with a family history of Crohn's disease (paternal aunt) who in December 2007, was vaccinated with a dose of GARDASIL. In March 2008, the patient was vaccinated with a second or third dose of GARDASIL intramuscularly. In March 2008, the patient developed diarrhoea with 10 faeces per day (ie. day and night), deterioration of her general condition with a weight loss of 11 kgs in 4 months, colic-type abdominal pain, inflammatory-type arthralgia localised on the interphalangeal joint of the right thumb and both elbows. The patient was also found with oral aphthae and uveitis. In July 2008, she was hospitalised due to the initial flare of a severe Crohn's disease. The patient's condition improved after rehydration, corrective treatment with ofloxacine and budesonide, and enteral feeding. At the time of reporting, she had not recovered. Additional information has been requested. Other business partner numbers include E2008-07648.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Abdominal pain, Pyrexia, Vaccine positive rechallenge

Symptom Text: Information has been received from the Health Authorities agency concerning a 17 year old female patient, with history of suspect ovarian cyst (not confirmed) who in December 2007, was vaccinated with the first dose of GARDASIL (Lot No: 0311U; Batch No: NG14100) which was well tolerated. On 20-FEB-2008, the patient was vaccinated with the second dose of GARDASIL (Lot No: 0588U; Batch No: NG34100) and subsequently experienced fever and abdominal pain at the level of the left colonic frame. On 08-JUN-2008, the patient was vaccinated with the third dose of GARDASIL IM. On 09-JUN-2008, the day after vaccination, she was found with fever up to 40 C and abdominal pain in the left colonic frame inducing walking discomfort. The consults with a gynaecologist and a gastroenterologist, as well as abdominal ultrasound, were not contributory. At the time of reporting the patient had recovered. Health authorities considered that the event was medically significant (other important medical event) and led to several medically significant - several consultations and investigations. The case is closed. Other business partners included: E2008-07626. Additional information is not expected.

MedDRA PT Headache, Inflammation, Lymphadenopathy, Lymphopenia, Neck pain, Pyrexia, Torticollis, Vomiting

Symptom Text: Information has been received from the patient's mother via a health authorities (reference number: MA20081362) concerning her 18 year old daughter who in January 2008, was vaccinated with the first dose of GARDASIL (batch number not reported), on an unspecified date received the second dose of GARDASIL and in July 2008 was vaccinated with the third dose GARDASIL IM. The patient's mother explained that her daughter had received 3 injections of GARDASIL, the latest of which was very recent. Exact dates of vaccination were not specified. In late May 2008, the patient was hospitalized in internal medicine due to a febrile episode with cephalgia. Meningeal syndrome was ruled out by normal CSF and spontaneous resolution of fever and torticollis. The patient was rapidly discharged due to high school exams. No aetiology was found. On 18-JUL-2008, she was hospitalized again due to the same symptoms: fever, cephalgia and vomiting with an onset on 15-JUL-2008, and also left-side cervicalgia with palpable lymph nodes. The patient did not present with skin eruption, adenopathy except left cervical adenopathy - nor hepatosplenomegaly. Signs of inflammation were found, with increased CRP at 245 mg/L on 19-JUL-2008. The same day, the patient also had lymphopenia at 0.88 g/L. It is noteworthy that she had already had lymphopenia at 1.14 g/L during her first hospitalization on 30-MAY-2008- Levels of hemoglobin and platelets were normal. Cervicalgia and fever resolved very rapidly. CRP level decreased at on 22-JUL-2008 and lymphopenia resolved on 22-JUL-2008 with lymphocytes at 2.54 g/L. Paraclinic work-up enabled to rule out many aetiologies: toxoplasmosis, viral serologies and rickettsiosis were negative. Investigations for antinuclear antibodies were negative. Assay for immunoglobulins was normal. Grisel's syndrome was ruled out. The patient was discharged from internal medicine unit after a six day hospitalization. At the time of reporting the patient had recovered. Health authorities considered that the ch

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy, Uterine dilation and curettage

Symptom Text: Information has been received for the pregnancy registry for GARDASIL from an 18 year old female patient, with no pertinent medical history and no drug reactions/allergies, who on 07-MAY-2008, was vaccinated with GARDASIL. Concomitant therapy included RECOMBIVAX HB the same day of the GARDASIL. The patient conceived on 03-MAY-2008. The mother reported that her daughter received GARDASIL and had a miscarriage two weeks ago. The mother reported that her daughter went to the hospital to have dilatation and curettage; however she did not stay in the hospital overnight. The patient sought unspecified medical attention. Upon internal review, miscarriage was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Arthralgia, Feeling of body temperature change, Headache, Hypoaesthesia, No reaction on previous exposure to drug, Pain in extremity, Paraesthesia

Symptom Text: Information has been received from a medical assistant concerning an 18 year old female with no pertinent medical history and no allergies who on 19-JAN-2008 was vaccinated with the first dose of GARDASIL IM 0.5 ml (lot # 659439/1267U) well tolerated. On 29-MAR-2008 the patient was vaccinated with the second dose of GARDASIL IM 0.5 ml (lot # 655604/0052X) well tolerated. On 04-AUG-2008 the patient was vaccinated with the third dose of GARDASIL IM 0.5 ml (lot # 659184/0843X). There was no concomitant medication. On 04-AUG-2008 the patient experienced body chills and tingling in both legs several hours after receiving her third dose. The patient was examined in the local emergency room. The patient was rehydrated with an unspecified intravenous fluid and released to home. The patient's mother contacted the office by phone, on 05-AUG-2008, to relay the adverse event. The current status of the patient was unknown. The reporter considered the body chills and tingling in both legs to be other important events (IV hydration). This is one of several reports from the same source. Additional information has been requested. 9/23/08 Reviewed ER medical records of 8/4/08. FINAL DX: none provided Records reveal patient experienced numbness & pain in both legs, achy joints, pins & needles feeling in legs, temporal HA, felt feverish & chills. Tx w/IVF & pain meds. Improved & d/c to home.

MedDRA PT Abasia, Adrenal disorder, Aphasia, Autism, Blindness transient, Condition aggravated, Confusional state, Congenital hearing disorder, Convulsion, Detoxification, Extremity contracture, Foaming at mouth, Gaze palsy, Hand deformity, Headache, Hepatic enzyme abnormal, Hormone level abnormal, Hypoaesthesia, Hypoglycaemia, Hypothyroidism, Loss of consciousness, Malaise, Migraine, Palpitations, Paraesthesia, Quality of life decreased, Regressive behaviour, Syncope, Vitamin D deficiency, Weight increased

Symptom Text: Where do I begin. My daughter is 23 years old. October of 2007 she received the 2nd GARDASIL vaccine and shortly after became very ill. She experienced migraines, saying her brain hurts, passing out -syncope-, numbness in hands and feet, tingling, limbs contracting, hands like claws, seizures, rolling eyes, foaming from mouth, confusion, heart palpitations. She has been hospitalized 9 times since January of 2008, 3 hospitals, 4 neurologists, she has had EEG's, TEE, lumbar puncture, MRI, MRA, CT, CTA, everything is normal. She also now goes into a regression. Sometimes unable to walk, speak, see, hear. She passes out every day since last year. She is on medical leave from college, no quality of life whatsoever. All the doctors told me that if it is not a medical issue, or a heart issue it was a medical issue. I did explore that route and needless to say, they were incorrect. I contacted a nutritionist and a biochemist and found out that due to her weak immune system the vaccine has traumatized her body and brain. She also is profound since last month in her right ear. She was born with a hearing loss but due to complexity of this illness it has affected her hearing and she has lost it in her right ear. Our nutritionist is putting her on a special diet because everything she is ingesting, all the foods with chemicals are affecting her brain and causing more reaction. They also will be detoxing her but right now she cannot be fully detoxed due to fact that she is do severely deficient. She has developed hypoglycemia, hypothyroidism, vitamin D deficient, her liver enzymes are shot, her adrenal glands are off as well as her hormones. She gained 40lbs from all the meds she was put on and the seizure medication has affected her brain. I was told that the vaccine had adhered to her tissues in her body and we have to remove it bit by bit. The biochemist is going to purchase the vaccine to break down cash component and give my daughter a natural supplement to repair her. Needless to say, we are devastated and heartbroken.

Symptom Text: Information has been received from a mother concerning her 20 year old female daughter, with unremarkable medical history and no known drug reactions/allergies, who in July 2007, was vaccinated with the third dose of GARDASIL. Concomitant therapy included hormonal contraceptives (unspecified). The mother reported that her daughter had lab studies done early this year, and her WBC's were low. Her daughter was hospitalized for 4 days with a throat infection due to her low WBC count. The mother is concerned that GARDASIL is related to the low WBC. The physician cannot determine reason for low WBC count. At the time of the report the patient was recovering. Additional information has been requested. 8/1908 and 8/22/08 MR records received including heme/onc consult and some hospital records. Pt initially seen by PCP 6/5/2008 for c/o sinus sx. Tx with abx. Returned 6/9/08 still c/o being sick now with watery diarrhea. Blister like lesion on L upper thigh sent for bx and labs. Labs showed leukopenia/neutropenia. Refered to heme/onc. Heme/onc consults beginning 6/16/08 for eval of low white count. Assessment: profound neutropenia with a relative monocytosis suggests likely autoimmune disease or drug reaction. To stop BCP. DX: Neutropenia/leukopenia. F/U 6/19/08 with 1 cm supraclavicular node noted on PE. Seen 7/01/08 with sore throat, aches and fever. PE (+) for red tonsils. Tx with abx. WBCs and Neutrophils remain low. Tx with Neupogen. D/C Summary received for DOS 7/2-8/2008 with D/C DX Neutropenia. Light pharyngitis/early peritonsillar abscess, s/p incision and drainage (sepsis and fever resolved). Pt presented with fever of 102' and worsening pharyngitis. WBCs 2.2 on admission. Tachycardic at 123. (+) lymphadenopathy and exudate on tonsils. Pt had I&D of tonsillar abscess (+) for normal respiratory flora. Tx with IV abx and neupogen. WBCs up to 4.2 by d/c.

Other Meds: Hormonal contraceptives

Lab Data: complete blood cell, ?/?/08 - COUNT WAS LOW. Labs and Diagnostics: 6/16/08 WBC 2.8. Neutros 0.15. Admitted to hospital. Lymphoma/leukemia eval (-). Flow cytometry WNL. Bone marrow aspirate with normal karyotype, (-) for leukemia. RF (-

History: None. PMH: none. Recent respiratory sx past 6 months. NKDA

Seriousness: ER VISIT, HOSPITALIZED, SERIOUS

MedDRA PT Activities of daily living impaired, Amnesia, Anticoagulant therapy, Antinuclear antibody positive, Antiphospholipid syndrome, Arthralgia, Asthenia, Cerebrovascular accident, Contusion, Fatigue, Gait disturbance, Hyperreflexia, Ischaemic stroke, Joint swelling, Memory impairment, Myalgia, Night sweats, Nystagmus, Oedema peripheral, Oral contraception, Pain in extremity, Personality change, Pituitary tumour benign, Pyrexia, Speech disorder, Strabismus, Systemic lupus erythematosus, Tonsillar hypertrophy, Transaminases increased, Vision blurred, Visual disturbance, Visual field defect, Weight decreased

Symptom Text: Information has been received from a physician concerning a 13 year old female with attention deficit disorder and no history of drug reactions or allergies who on 11-APR-2008 was vaccinated with the first dose of GARDASIL (LOT#: 659962/1740U) and on 16-JUN-2008 was vaccinated with the second dose of GARDASIL (LOT#: 660389/1968U). Concomitant therapy included oral birth control and ADDERALL. One week after the second vaccine (on approximately 23-JUN-2008) the patient developed joint pain that continued to get worse. She was not able to bath herself. She developed short term memory loss and blurred vision. The patient saw her primary physician and the physician ordered a magnetic resonance imaging (MRI) that revealed a cerebral vascular accident (CVA). The patient was hospitalized. Further diagnosis revealed the patient had lupus and antiphospholipid syndrome. As of 11-AUG-2008 the patient was recovering. Additional information has been requested. 08/25/2008 MR received from PCP from 6/13/08 to 8/7/08. Pt presented 6/13/08 for well check with normal exam and no c/o. Some recent weight loss due to increased activity while training for an athletic event. Seen again 7/1/08 with c/o 3 wk hx of arthalgias, myalgias, weight loss and fatigue. Pt reports poor memory. Subjective fever past weekend as well as swelling of R ankle. Recent ?tick bite. Seen again 7/10/08 with persistant arthralgias, fatigue, muscle aches and loss of vigor. Currently with night sweats and increased transaminases. Rheumatology consult 8/7/08 with DX: SLE characterized by a midbrain stroke and positive labs. On anticoagulants for the CVA. MD reports sx started after 2nd Gardasil dose. PE (+) for several areas of bruising, otherwise WNL. 9/10/2008 MR received for DOS 7/29-8/01/2008 with D/C DX: Antiphospholipid syndrome. Positive ANA, questionable reactive vs true Systemic Lupus Erythematosus. Ischemic stroke. Pituitary adenoma as an incidental finding on MRI. Pt presented with 5 week hx of myalgias, one week hx of vision changes as

Other Meds: ADDERALL TABLETS; hormonal contraceptives

Lab Data: magnetic resonance, 06/??/08 - revealed CVA. Labs and Diagnostics: Alk Phos 133, AST 57. ALT 75. Sed rate 46. ANA (-) on 7/1/08 reported as (+) by rheum. Lyme IgG, IgM (-). Ehrlichia (-). Hepatitis panel (-). Labs and Diagnostics: AP

History: PMH: ADHD, Acne. Oral contraceptives. NKDA.

MedDRA PT Abortion missed, Abortion spontaneous, Drug exposure during pregnancy, Pain

Symptom Text: Initial and follow-up information has been received from a nurse, for the Pregnancy Registry for GARDASIL, concerning a 25 year old female with allergy to TORADOL who on 10-JUN-2008 was vaccinated intramuscularly with the first and only 0.5 ml dose of GARDASIL (lot no. 659962/1740U). There was no concomitant medication. The physician reported that on 27-MAY-2008 the patient had an ultrasound due to complaints of "pain" and the result was negative. The patient had a history of "negative menses". On 12-JUL-2008 the patient had a spontaneous abortion when she was eight weeks pregnant. On the same day, the patient had an evaluation due to a (+) serum beta-human chorionic gonadotropin (missed abortion). The patient saw the physician to seek unspecified medical attention. Upon internal review spontaneous abortion was considered to be an other important medical event. Additional information is not expected.

Other Meds: None

MedDRA PT Hemiplegia, Hypoaesthesia, Paraesthesia

Symptom Text: Information has been received from a physician concerning a 19 year old female who was vaccinated with the first dose of GARDASIL 0.5 mL. The physician reported that the patient experienced tingling and numbness in her arm which progressed into paralysis of an entire one side of her body after receiving the vaccination. The patient sought medical attention and was seen by the physician. At the time of reporting, the patient had not recovered. The physician considered tingling and numbness in her arm and paralysis of an entire one side of her body to be disabling. Additional information has been requested.

MedDRA PT Activities of daily living impaired, Arthralgia, Fatigue, Malaise, Pyrexia

Symptom Text: Information has been received from a general practitioner, as part of a business agreement with Sanofi Pasteur MSD (manufacturer control # E2008-07575), concerning a 12 year old female with no reported relevant history who on an unspecified date in 2008 was vaccinated with the second dose of GARDASIL. Several days later the patient developed fever and pain in all large joints. Additionally she complained of tiredness and malaise. The patient was admitted in a hospital and was hospitalized (date and duration not reported). Significantly increased antinuclear antibodies (1:640) and decreased hemoglobin values were found. Rheumatoid factor was negative, inflammatory parameters were not elevated. It was evoked that the vaccination could have triggered a rheumatic disease. The patient was not able to go to school for 3 weeks. Subsequently, the patient was recovered from fever, joint pain, tiredness and malaise at the time of reporting. Lab parameters were not yet controlled. The causality of fever, tiredness, malaise, significantly increased antinuclear antibodies and decreased hemoglobin was not provided. Other business partner numbers include E2008-07575. Additional information has been requested.

Other Meds: Unknown

Lab Data: diagnostic laboratory test, inflammatory signs were not detected; hemoglobin, decreased; serum ANA, 1:640; serum rheumatoid factor, negative

MedDRA PT Condition aggravated, Petit mal epilepsy

Symptom Text: Information has been received from a registered nurse concerning a 11 year old female with a history of hospitalization in 2005 due to convulsion who on 12-AUG-2008 was vaccinated at 16:30 with a first dose of GARDASIL (lot # 658556/1060U), 0.5 mL, IM, into the left deltoid. At the same visit, the patient also received ADACEL and MENACTRA into the right deltoid. On 12-AUG-2008, after getting her first dose of GARDASIL, the patient experienced a petit mal seizure lasted for about 15 seconds. No lab tests were performed. The patient recovered at the office and was released. Upon internal review, petit mal seizure was determined to be an other medical event. Additional information has been requested.

MedDRA PT Dizziness, Ketoacidosis, Vaccine positive rechallenge

Symptom Text: Information has been received from a nurse practitioner (N.P.) concerning a 23 year old female with diabetes mellitus who on 20-MAY-2008 was vaccinated with the first dose of GARDASIL (lot # 0152X) and on 21-JUL-2008 was vaccinated with the second dose of GARDASIL (lot # 0250X). Concomitant therapy included ORTHO-CYCLEN, LANTUS, NOVOLOG, montelukast sodium (MSD), finasteride (manufacturer unknown), SIMVASTATIN (manufacturer unknown), XYZAL and minoxidil. The patient experienced dizziness after receiving the first dose (recovered) and also the second dose. The patient was recently hospitalized for ketoacidosis. Medical attention was sought via calling the nurse. At the time of this report, the outcome was unknown for the second episode of dizziness and ketoacidosis. No product quality complaint was involved. The temporal relationship to GARDASIL was unspecified by the N.P.. Additional information has been requested.

MedDRA PT Fall, Fracture, Loss of consciousness, Skin laceration, Surgery

Symptom Text: Information has been received from a registered nurse (R.N.) concerning an 18 year old female with no pertinent medical history, drug reactions or allergies who on 05-NOV-2007 was vaccinated in the right arm with a dose of GARDASIL. On the same day the patient also received concomitant therapy Flu vaccine (unspecified). On 05-NOV-2007, 10 minutes after receiving GARDASIL, the patient passed out, and fell on her face. She had a laceration over her left eye and fractured her cheek bone. It was reported that the patient was hospitalized and had several surgeries. The outcome of the patient was not reported. The reporter considered passed out, a laceration over her left eye and fractured her cheek bone to be disabling. Additional information has been requested.

MedDRA PT Abdominal pain, Condition aggravated, Crohns disease, Diarrhoea, Erythema nodosum, Headache, IIIrd nerve disorder, Mobility decreased, Muscular weakness, Nausea, No reaction on previous exposure to drug, Oral intake reduced, Vision blurred, Vomiting

Symptom Text: Information was received on 08-AUG-2008 from a health authority concerning a 21-year-old female with a medical history of Crohn's disease (known since May 2005 and epilepsy (known since May 1997, who in June 2008 was vaccinated with a third dose of GARDASIL (lot # 1427U, batch # NG15200) into her left deltoid muscle via intramuscular route. In one document (hospital report) it was mentioned that the vaccine was given on 12-Jul-2008, but this was a holiday. On another reporting form the date was 19-Jun-2008. The two previous doses of GARDASIL, P1 (lot # 0482U, batch # NG09920) on 11-Dec-2007 and P2 (lot # 0510U, batch # NG20180) on 11-Feb-2008 given to her both in left deltoid via intramuscular route, were well tolerated. On 18-Jun-2008, the patient developed headache, nausea and vomiting. Also, she complained of blurred vision (the patient was experiencing episodes of blurred vision since years lasting a couple of days). On 26-Jun-2008 the patient complained of increasing weakness, especially in the legs (intermittent paralysis?). On 27-Jun-2008, she also complained watery diarrhoea up to 12 times per day, but no abdominal pain. She was hospitalized. On admission, the patient had subfebrile temperature, the clinical examination showed no paresis but erythema nodosum on both lower legs. The following exams showed no pathologies: abdominal sonography, cranial CT and cranial MRI on 26-JUN-2008; ECG and CSF (infectious parameters in the CSF- tick borne virus, CMV, HSV, VZV, EBV-were negative) on 27-Jun-2008. A wide range of lab test was performed, all normal except increased CRP (90 mg/L) and blood sedimentation rate (47/1h), no leucocytosis. In the urine, only 100 germs/mL were detected, nevertheless antibiotic treatment was given. The neurologist could rule out meningitis but stated an oculomotor nerve disturbance probably due to valproic acid overdose following reduced food intake. The dose of valproic acid was reduced. The ophthalmologic exam showed no pathologies. As the leading diagnosis was acute episode of Cr

MedDRA PT Drug exposure during pregnancy, Malaise, Premature labour

Symptom Text: Information has been received from a consumer and a physician for the pregnancy registry for GARDASIL concerning a 15 year old female with a history of appendicectomy (December 2006) who on 25-SEP-2007 was vaccinated with the first dose of GARDASIL (658100/0525U). The patient also received her last dose of MENACTRA (lot# not reported) on 25-SEP-2007. On 03-OCT-2007, the patient was confirmed to be pregnant by a urine pregnancy test (LMP = 20-AUG-2007). Per the patient's mother, the patient did not have any adverse reaction with the vaccination, but is just feeling sick because of the pregnancy. Follow-up information received from the physician indicated that GARDASIL was not received in their office but the patient sought unspecified medical attention in the physician's office. On 27-MAR-2008, the patient gave birth to a normal, healthy male infant weighing 4 lbs 14 oz. The baby's length was 44 cm, head circumference was 34 cm and the Apgar score was 8/9. The patient was 31 weeks from her last menstrual period. There were no complications or abnormalities. At the time of this report, the patient's outcome was unknown. Upon internal review, birth 31 weeks from LMP was considered to be an other important medical event. Additional information is not expected.

MedDRA PT Abasia, Depressed level of consciousness, Dizziness, Fatigue, Gait disturbance, Immediate post-injection reaction, Nausea, Paraesthesia, Somnolence

Symptom Text: Information was obtained on request by the Company from the agency via a Case Line Listing and Public Case Detail form concerning a 15 year old female patient who on 22-FEB-2008 was vaccinated with GARDASIL (Lot No 657872/0583U, Batch No J2896, Expiry Date 12-FEB-2010). On 22-FEB-2008, immediately following vaccination, the patient experienced fatigue, depressed level of consciousness, dizziness, gait disturbance, nausea, paraesthesia and somnolence and was hospitalized. The patients experience was also reported as immediately following vaccination, the student felt tired, dizzy and nauseated. 5 minutes later she developed pins and needles in her hands and felt drowsy. An attempt was made to walk the patient to the sick bay, but she could not walk. The patient's condition worsened. She became more drowsy and needed waking to communicate. The patient's vital signs were satisfactory. The student was transferred to hospital as she was still unable to walk. The patient was discharged from hospital that afternoon. Subsequently, the patient recovered from fatigue, depressed level of consciousness, dizziness, gait disturbance, nausea, paraesthesia and somnolence. The agency considered that fatigue, depressed level of consciousness, dizziness, gait disturbance, nausea, paraesthesia and somnolence were certainly related to therapy with GARDASIL. The original reporting source was not provided. Additional information is not expected.

MedDRA PT Dyspnoea, Nausea, Paraesthesia oral, Pleuritic pain

Symptom Text: Information was obtained on request by the Company from the agency via a Case Line Listing and Public Case Detail form concerning a 19 year old female who on 11-MAR-2008 was vaccinated with GARDASIL (Batch No. J5171, Expiry date 22-MAR-2010). On 11-MAR-2008, after vaccination, the patient experienced dyspnoea, nausea, paraesthesia oral and pleuritic pain. The patient's experience was also reported as being short of breath, pleurtic like chest pain, lip tingling and nausea. The patient was treated with anti histamine and was off work as a result of 2 days. Subsequently, the patient recovered from dyspnoea, nausea, paraesthesia oral and pleuritic pain were possibly related to therapy with GARDASIL. The original reporting source was not provided. Dyspnoea, nausea, paraesthesia oral and pleuritic pain were considered to be disabling. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Convulsion, Syncope

Symptom Text: Information has been received from a licensed practical nurse (L.P.N.) concerning a 22 year old female with no pertinent medical history and no known drug allergies who on 20-MAY-2008 and 01-AUG-2008, was vaccinated intramuscularly with her first and second 0.5 ml doses, respectively, of GARDASIL (Lot # of the two doses 658490/0802U). There was no concomitant medication. On 01-AUG-2008, after receiving her second dose of GARDASIL, the patient fainted and experienced two small seizures. The patient's symptoms resolved in 20 minutes. The patient had a full meal prior to administration of GARDASIL. The adverse events happened during office visit. Follow-up information was received on 15-AUG-2008 from the L.P.N. via phone call. The nurse refused to provide the patient's name. It was reported that the patient only had fruit prior to receiving the second dose of GARDASIL. The nurse stated that when the patient "came to" she was fine. It was reported that the patient was scheduled for her third dose of GARDASIL in October 2008. Upon internal review, seizures were determined to be an other important medical event. This is one of several reports from the same source. Additional information has been requested.

MedDRA PT Convulsion, Disorientation, Dizziness, Feeling abnormal, Hypotonia, Postictal state, Urinary incontinence

Symptom Text: Pt was administered GARDASIL injection-tolerated well. Less than five minutes later, while checking out, pt stated she was feeling funny, light headed, was taken into an exam room and sat on the table. Pt became limp, closed her eyes and made a few strange noises, and began to seize, made sounds 3 more times and urinated on herself. Dr came in and checked her breathing and took her blood pressure. Pt regained consciousness after approximately 2 minutes, but remained disoriented for another several minutes. During this post-ictal period, Dr. arrived. Pt states she felt like everything was a dream. Transport was called to take the patient to the emergency department.

Seriousness: PERMANENT DISABILITY, SERIOUS

MedDRA PT Headache, Injection site pain, Lethargy, Nausea, Pain, Pyrexia

Symptom Text: Information was obtained on request by the Company from the agency via a Public Case Details Form and a Case Line Listing, concerning a 25 year old female who on 14-JAN-2008 was vaccinated with her second dose of GARDASIL, intramuscularly, as prophylactic vaccination. Subsequently the patient experienced lethargy, headache, injection site pain, nausea, pain and pyrexia, which were considered to be disabling by the reporter. It was described that the patient was vaccinated between 10:00 am and 10:30 am on 14-JAN-2008. She felt very well that morning, then experienced onset of lethargy and feeling run-down by mid-afternoon. On 15-JAN-2008 the patient's tiredness continued and she experienced a severe headache which developed around midday around her face and forehead. The patient's headache worsened and she experienced aches (described as body aches) near injection site which spread through muscles in her back and were painful enough that she took pain killers. On 15-JAN-2008 she also experienced nausea. On 16-JAN-2008 the patient developed a fever of 38 degrees Celsius, her normal temperature being 37.5 degrees Celsius. Her headache continued. At the time of reporting to the agency on 16-JAN-2008, the patient stated that lethargy, headache, injection site pain, nausea, pain (body aches), and pyrexia persisted but body aches and nausea were greatly lessened. The agency considered that lethargy, headache, injection site pain, nausea, pain and pyrexia were possibly related to therapy with GARDASIL. Additional information is not expected.

MedDRA PT Asthenia, Hypoaesthesia, Inappropriate schedule of drug administration, Paraesthesia

Symptom Text: Information was received from a health authority (local reference # PEI2008011648) concerning a 35-year-old female with a medical history of intermittent right sided foot extensor paresis, who on 08-Jun-2007 was vaccinated with a first dose of GARDASIL (lot # 654884/0902F, batch # NE24240, route and injection site not reported). Beforehand, on 18-Jan-2007 and 26-Apr-2007 the patient had been vaccinated with tick-borne encephalitis virus vaccine (ENCEPUR, lot # 070021A) (reported as "ENCEPUR ERWACHSENE", encephalitis spring-summer virus vaccine). On 26-APR-2007 she was also vaccinated with a first dose of REPEVAX, lot # Z0869-1 in the left upper arm (route not reported). Since spring/summer 2007, the patient had suffered from generalized weakness. On 20-Aug-2007 the patient was vaccinated with a second dose of GARDASIL (lot # 1339F, batch # NF23310, route and injection site not reported). On 27-OCT-2007, the patient was vaccinated with a third dose of GARDASIL (lot # 1536F, batch # NG08000, route not reported) into her right upper arm. Simultaneously she was vaccinated with an BEGRIVAC, lot # 157041A) into the left upper arm. Generalized weakness had been ongoing when in Nov-2007, the patient developed numbness of foot and hand, and paresthesia of upper limb. Cranial MRT revealed signal enhancement of inferior horns of lateral ventricles. Lumbar MRT showed no pathology of intervertebral disk. The patient was hospitalized on 27-Nov-2007 in order to undergo MRT of cervical and thoracic spine and lumbar puncture. MRT of cervical and thoracic spine revealed no pathological findings. The results of lumbar puncture were normal, whereas results of the oligoclonal antibodies were pending at the time of discharge. Physical examination showed no pathological findings. Microbiological examinations revealed no signs of borreliosis. With all findings considered, numbness, paresthesia and MRT signal changes were of unspecific genesis. The patient was discharged on 29-Nov-2007 with ongoing symptoms. Multiple scl

MedDRA PT Dizziness, Feeling hot, Nausea, Somnolence, Syncope

Symptom Text: Information was obtained on request by the Company from the agency via a Public Case Detail Form and Case Line Listing, concerning a 13 year old female who on 13-MAR-2008 was vaccinated with her first dose of GARDASIL, intramuscularly, as prophylactic vaccination (Lot No. 658219/0817U, Expiry Date 16-MAR-2010, Batch No. J6137). Subsequently, the patient experienced syncope, dizziness, feeling hot, nausea and somnolence and was hospitalised. It was described that approximately one hour post vaccination with her first dose of GARDASIL, the patient complained of dizziness, sleepiness, nausea and feeling hot. The patient (a school student) fainted and the nurses noted that she was slow to recover from the faint. The following day the patient's mother took her to the hospital where she was observed. By the afternoon of day 1 post vaccination, the patient had recovered from syncope, dizziness, feeling hot, nausea and somnolence. Subsequently, the patient was vaccinated with her second dose of GARDASIL (date not reported) and experienced nausea (with associated vomiting). The agency considered that syncope, dizziness, feeling hot, nausea (and associated vomiting) and somnolence were certainly related to vaccination with GARDASIL. The original reporting source was not provided. Additional information is not expected.

MedDRA PT Ocular hyperaemia, Pharyngeal oedema, Rash generalised, Rash pruritic, Swelling face

Symptom Text: Information was obtained on request by the Company from the agency via a Public Case Detail Form and a Case Line Listing concerning a 15 year old female who on 28-MAY-2008 was vaccinated with the first dose of GARDASIL (Lot # 659053/1949U, Batch # K0626, Expiry date 12/06/10). On 29-MAY-2008 the patient experienced rash generalised, ocular hyperaemia, pharyngeal oedema and swelling face. It was described that 19 hours following receiving GARDASIL the student developed itchy rash over her whole body. Also reported swelling to face and throat with red eyes and no difficulty in breathing. The patient attended a hospital for treatment and was provided with cream, eye drops and antihistamines. At the time of reporting to the agency on 08-AUG-2008, the patient had recovered from rash generalised, ocular hyperaemia, pharyngeal oedema and swelling face. The agency considered that rash generalised, ocular hyperaemia, pharyngeal oedema and swelling face were possibly related to therapy with GARDASIL. The original reporting source was not provided. Additional information is not expected.

MedDRA PT Blindness transient, Visual disturbance

Symptom Text: Information was obtained on request by the Company from the agency via a Public Case Detail Form and a Case Line Listing concerning a 17 year old female who on 15-APR-2007 was vaccinated with GARDASIL. Subsequently the patient experienced blindness and visual disturbance and was hospitalised. It was described that the patient complained of flickering vision in the right eye and progressively lost sight over next 8-10 days until all she could see was grey. The patient was treated with methotrexate. At the time of reporting to the agency on 29-JUL-2008, the patient had recovered from blindness and visual disturbance. The patient is undergoing further lumbar, brain and spinal testing. The agency considered that blindness and visual disturbance were possibly related to therapy with GARDASIL. The original reporting source was not provided. Additional information is not expected.

MedDRA PT Chest pain

Symptom Text: Information was obtained on request by the Company from the agency via a Case Line Listing and a Public Case Detail Form concerning a 15 year old female who on 23-APR-2008 was vaccinated with the first dose of GARDASIL (Batch # K0532, Expiry date 12-JUN-2010, Lot # 659053/1949U). On 23-APR-2008, 6 hours after vaccination with GARDASIL, the patient experienced chest pain. It was described as thoracic pain that has failed to settle to date. At the time of reporting to the agency on 14-MAY-2008 the patient had not yet recovered from the chest pain. The agency considered that chest pain was possibly related to therapy with GARDASIL. The original reporting source was not provided. Chest pain was considered to be disabling by the reporting agency. Additional information is not expected.

MedDRA PT Hypotension, Loss of consciousness, Pallor, Syncope

Symptom Text: Information was obtained on request by the Company from the agency via a Public Case Detail Form and a Case Line Listing concerning a 25 year old female who on 29-DEC-2007 was vaccinated with GARDASIL (Lot No. 657874/0582U, Batch No. J2299, Expiry date 26-FEB-2010). On 29-DEC-2007, 10 to 15 minutes after vaccination, the patient experienced syncope, hypotension, loss of consciousness and pallor. It was described that the patient collapsed and was unconscious. The patient was treated in Accident/Emergency Department and was hospitalised. The patient was given adrenaline, oxygen and IV steroids. The patient was informed by the emergency department physician that the reaction was not anaphylaxis. The patient recovered from syncope, hypotension, loss of consciousness and pallor later that day. The agency considered that syncope, hypotension, loss of consciousness and pallor were possibly related to therapy with GARDASIL. The original reporting source was not provided. Additional information is not expected.

MedDRA PT Arthralgia, Asthma, Dyspnoea, Raynauds phenomenon

Symptom Text: Information has been received from an agency concerning a female patient who was vaccinated with the first dose of GARDASIL in May 2007, toleration was not reported. The second dose of GARDASIL (Lot #, route, injection site not reported) was given in June 2007. The patient's mother reported that, since October 2007, the patient developed severe pain in the joints (feet, hands, knees). For exploration, the patient was hospitalized (duration and results of examinations not reported). The physicians evoked different differential diagnoses, such as thrombosis, rheumatism and growth disorder. The patient also had Raynaud's syndrome and was treated with NORVAC tablets, but hardly showed any improvement. Despite the symptoms, the patient was vaccinated with her third dose of GARDASIL in November 2007. The mother also reported that since that 3 months the patient developed asthma and difficulty in breathing. At the time of reporting, from time to time, the patient is still suffering from pain lasting several days. Current treatment consist in "vaccine detoxication", performed by an alternative practitioner. The patient has not yet recovered. Other business partner numbers included: E2008-07588. The case is closed. No further information is available.

MedDRA PT Bruxism, Catatonia, Hyperhidrosis, Immediate post-injection reaction, Incontinence, Loss of consciousness, Pallor, Syncope

Symptom Text: Information has been received from a physician concerning a 19 year old female who on 05-AUG-2008 at 1:45 PM was vaccinated intramuscularly with a third dose of GARDASIL (lot #660620/0571X) in her left arm. There was no illness at time of vaccination. On 05-AUG-2008 at 1:46 PM, one minute after vaccination, the patient fainted, turned pale, had a catatonic reaction and her teeth clenched. The patient was diaphoresis, "blacked out" and needed Oxygen for about 7 minutes. 911 was called. The patient had incontinence. No laboratory diagnostics studies were performed. On 05-AUG-2008, the patient recovered. The physician considered the patient's events to be other important medical event. Additional information is not expected.

MedDRA PT Anaemia of chronic disease, Arthralgia, Autoimmune disorder, Cervical dysplasia, Cutaneous lupus erythematosus, Dysstasia, Fatigue, Gait disturbance, Gonorrhoea, Lymphadenopathy, Mixed connective tissue disease, Myalgia, Nail discolouration, Ophthalmological examination normal, Pain, Pain in extremity, Papilloma viral infection, Proteinuria, Pruritus, Rash, Scar, Sexually active, Skin hyperpigmentation, Skin nodule, Skin plaque, Swelling, Swelling face, Systemic lupus erythematosus, Thrombocytopenia, Vasculitic rash

Symptom Text: Information has been received from a consumer on a news station reporting that her teenage daughter (age not reported) was vaccinated with GARDASIL in December 2007. Subsequently in February 2008, 2 months after receiving GARDASIL the patient developed an "autoimmune disease". The patient developed a rash on her face and arms, leaving scars. She had swelling all over, pain in her joints and poor circulation in her fingertips. Her doctor says "she now suffers from an autoimmune disease and says it is possible the GARDASIL triggered her illness". The mother stated that her daughter had no prior illness or hospitalization. At the time of reporting the patient had not recovered. Upon internal review autoimmune disease was an other medical event. The reporter felt that the autoimmune disease was disabling. Additional information is not expected. 11/21/08 Reviewed PCP medical records o 12/12/07-10/01/2008. FINAL DX: SLE, mixed connective tissue disorder, anemia of chronic disease Records reveal patient in good general health 12/2007, sexually active but urine protein 300+ (H). Started on Bactrim. RTC 1/3/08 w/fatigue. RTC 2/08 w/symetric nodular rash on arms & face x 1 wk w/mild itching & aches/pains x 6 mo. Dermatology, Rheumatology, Nephro & GYN consult done & dx w/SLE (ANA+, rash & proteinuria). Tx w/steroids & plaquenil. 10/24/08 Reviewed rheumatology clinic records of 4/1/08 & hospital medical records of 7/23-7/25/2008. No other records available. FINAL DX: mixed connective tissue disorder w/SLE Records reveal patient had initially been seen in rheumatology clinic on 3/18/08 & dx w/SLE. Tx w/steroids, plaquemil & ASA for rash & (+)ANA. Improved by 4/1 visit w/only minimal pain in distal fingertips. Had been seen by ophthalmology 3/22/08 & exam WNL. Exam on 4/1 revealed slightly enlarged but nontender inguinal lymph nodes, hyperpigmented plaques on face, upper arms, axillae, vasculitic rash on palms, plinter hemorrhages in distal fingermails. Dx at that time: SLE w/discoid rash, elevated muscl

MedDRA PT Arthralgia, Burning sensation, Dizziness, Dysphagia, Extrasystoles, Fatigue, Fluid intake reduced, Gastroenteritis viral, Headache, Inflammation, Joint stiffness, Joint swelling, Lymphadenopathy, Muscle tightness, Muscular weakness, Myalgia, Nausea, Oedema peripheral, Paraesthesia, Pharyngeal erythema, Pharyngolaryngeal pain, Polyarthritis, Pyrexia, Rash, Sleep disorder, Synovitis, Thoracic outlet syndrome, Tonsillar hypertrophy, Tonsillitis, Vision blurred

Symptom Text: Headache, nausea, low fever, slight rash behind legs, very very very bad muscle and joint paints. Couldn't move from bed. Painful to bend or even put feet on floor. Pain was unbearable. Went to doctor and was prescribed IBU 800mg 3 times daily to help keep inflammation down. Sent to a rheumatologist. Tested twice for rheumatoid arthritis, both times negative. All other tests were negative as well. Slowly developed a sore throat and swollen glands. Unable to swallow or drink, everything burned and felt as if tearing at the throat. Went to doctor, tested for mono and strep, again, both negative. Was given antibiotics (doxycycline). They helped clear the infection but still the swollen glands and soreness remain, mostly sore in the morning, and minimizes slightly after taking the first IBU 800mg. Appointments are made for another rheumatologist for joint pain and for primary care physician for swollen glands. 9/04/2008 PCP records rec'd which include 2 rheum consults. Pt presented 5/8/08 with c/o joint pain x 1 week, morning stiffness and swollen joints. DX: arthalgia. Refered to rheum for (+) ANA. Reporting skipped heartbeats 5/29/08. Instructed to eliminate caffeine/choc/ETOH. Seen 5/20/08 with recent viral gastroenteritis. Reporting paresthesias of the hands, stiffness of feet. DX: arthralgia, thoracic outlet syndrome. Seen 6/10/08 with throat pain. Rheum consult 6/18/08. As above, now with muscle weakness and fatigue. PE(+) for trapezius tightness, synovitis in MCP joints. DX: Polyarthralgia. Inflammatory Polyarthritis. Positive ANA. F/U 7/2/08 with increased muscle pain in legs. PE (+) for hand swelling and hallux valgus deformity. PCP OV 7/21/08 No resolution of throat pain- throat red, with enlarged tonsils, yellow exudate, increased cervical nodes. DX: Tonsillitis. Adenopathy. OV 8/29/08 New onset blurry vision, dizziness, poor sleep. To see another rheum in 11/2008.

MedDRA PT Blister, Swelling face

Symptom Text: Information has been received from a licensed practical nurse concerning a 16 year old female with no pertinent medical history and sulfa allergy, CECLOR allergy and seafood allergy who on 18-JUN-2008 was vaccinated intramuscularly with a 0.5 mL first dose of GARDASIL vaccine (LOT# 660391/0063X). On the same day, the patient was also vaccinated with a dose of ADACEL, MENACTRA and HAVRIX. There was no concomitant medication. On 19-JUN-2008, the patient developed blisters that varied in size from a pin point to an eraser. The blisters first appeared under one arm (which arm was unspecified) and then spread over entire body. Her face was swollen and covered with blisters. The patient was examined by her physician on 21-JUN-2008 and an allergist on 23-JUN-2008. The allergist prescribed prednisone. The patient was recovering. Additional information has been requested.

MedDRA PT Myoclonic epilepsy

Symptom Text: Information has been received from a health authority (HA ref No PEI2008008366) concerning a 14 year old female who on 16-AUG-2007, was vaccinated with the first dose of GARDASIL (lot # 1339F batch# NF 23310) i.m. Since 30-AUG-2007, the patient experienced persisting juvenile myoclonic epilepsy. The patient was hospitalized on an unknown date. The treating physician considered the causal relationship as very unlikely. The patient's mother insisted on notification of this case after she had seen an emission on TV. On 11-OCT-2007, was vaccinated with the second dose of GARDASIL (lot # 1340F batch# NF14740) i.m. and on 21-FEB-2008, was vaccinated with the third dose of GARDASIL (lot # 1536F batch # NG1520) i.m. Other business partner numbers included E2008-07675. No further information is available.

MedDRA PT Fall, Loss of consciousness, Mydriasis, Respiratory arrest, Skin disorder

Symptom Text: Information has been received from a registered nurse (R.N.) concerning a 17 year old female with no pertinent medical history, drug reactions or allergies who on 04-AUG-2008 was vaccinated with a dose of GARDASIL (Lot #660389/1968U). Concomitant therapy included Hep A (unspecified). On 04-AUG-2008, after receiving GARDASIL, the patient stood up, passed out with eyes open and hit the ground. She did not breathe for 30 seconds, eyes were dilated and still open and skin was terrible. The patient looked like a corpse. The nurse called the patient the next day (05-AUG-2008) and the patient said she was fine. Unspecified medical attention was sought. Upon internal review, "did not breathe for 30 seconds" was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Contusion, Epistaxis, Idiopathic thrombocytopenic purpura, Petechiae, Urticaria

Symptom Text: Information was obtained on request by the Company from the agency via a Public Case Detail Form and a Case Line Listing a 12 year old female who on 02-APR-2008 was vaccinated with GARDASIL (Lot 3 658219/0817U, Batch # J6137, Expiry date 16-MAR-2010). Other suspect therapy hepatitis B virus vaccine (unspecified) (Batch # JB148). On 17-APR-2008 the patient experienced petechiae, contusion and idiopathic thrombocytopenia purpura and was hospitalised. It was described that approximately 2 weeks following vaccination, the patient developed hives and petechial rash and by the following week she had extensive bruising over her body. On approximately 05-MAY-2008, she was diagnosed with severe idiopathic thrombocytopenic purpura (ITP) and was admitted to hospital. On 16-MAY-2008, haemoglobin was found to be 119 (units not specified) (normal range 120-150) ; platelets were found to be 4 x10^9/L (normal range 150-400 x10^9/L) ; haematology (PCV) was found to be 0.33 (units not specified) (normal range 0.36-0.46) and haemtology (MCHC) was found to be 360 (units not specified) (normal range 315-355). On 17-MAY-2008, platelets were found to be 4 x10^9/L (normal range 150-400 x10^9/L) and haematology (PCV) was found to be 0.35 (units not specified) (normal range 0.36-0.46). The patient is being followed up by physician and is still symptomatic (nose bleeds and excessive bruising). At the time of reporting to the agency on 01-AUG-2008, the patient's petechiae and contusion and idiopathic thrombocytopenic purpura persisted. The agency considered that petechiae, contusion and idiopathic thrombocytopenic purpura were possibly related to therapy with GARDASIL and hepatitis B virus vaccine (unspecified). The original reporting source was not provided. Additional information is not expected.

MedDRA PT Injected limb mobility decreased, Injection site nodule, Injection site reaction, Pain, Skin inflammation, Urticaria

Symptom Text: Information was obtained on request by the Company from the agency, via a Public Case Detail Form and Case Line Listing, concerning a 23 year old female who on 19-FEB-2008 was vaccinated with her third dose of GARDASIL (Lot No. 657874/0582U, Expiry Date 26-FEB-2010, Batch No. J2299), intramuscularly, as prophylactic vaccination. On 21-FEB-2008 the patient developed injection site nodule and injection site reaction. It was described that the patient developed a "hard nodule two days after her third vaccination with GARDASIL. Subsequently, one month later, on 18-MAR-2008, the lump increased in size and sensitivity. It appeared like a misshapen, circular wheal, approximately 3x4 cm round. The patient has dark skin but area appeared inflamed and pinkish in colour and was painful to touch (4/10). It intermittently restricted upward movement of arm due to moderate discomfort." The patient applied cold packs without relief and antibiotic therapy prescribed by her physician was commenced. The patient was advised to observe area and inform clinic of changes and/or when it dissipated. At the time of reporting to the agency on 19-MAR-2008, the patient's injection site nodule and injection site reaction persisted. The agency considered that injection site nodule and injection site reaction were certainly related to therapy with GARDASIL. The original reporting source was not provided. The reporter considered that injection site nodule and injection site reaction were disabling. Additional information is not expected.

MedDRA PT Dizziness, Dysphagia, Dyspnoea, Nausea, Panic attack, Throat tightness

Symptom Text: Information was obtained on request by the Company from the agency via a Public Case Detail Form and a Case Line Listing concerning a 13 year old female who on 02-JUL-2008 was vaccinated with the third dose of GARDASIL (Lot # 658219/0817U, Batch # J6137, Expiry date 16-MAR-2010). Other suspect therapy included hepatitis B virus vaccine (unspecified). On 02-JUL-2008 the patient experienced panic attack, dizziness and nausea and was hospitalised. It was described that 20 minutes post vaccination with the third dose of GARDASIL, the student felt faint and nauseous. The student reported that her throat felt tight and she was unable to breathe. She was given adrenaline 0.5 mg and was repeated as the student had difficulty swallowing. The patient was transported to hospital for observation. The ED records and the physician indicate that episode was a panic attack. On 02-JUL-2008, the patient recovered from panic attack, dizziness and nausea. The agency considered that panic attack, dizziness and nausea were possibly related to therapy with GARDASIL and hepatitis B virus vaccine (unspecified). The original reporting source was not provided. Additional information is not expected.

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a medical assistant for the pregnancy registry for GARDASIL, concerning a 22 year old female with no known pertinent medical history or drug reactions/allergies who on 28-MAY-2008 was vaccinated with a first dose of GARDASIL 0.5 ml IM. Concomitant therapy included ALESSE, LEXAPRO, ZOMIG and phentermine. On 01-JUL-2008 the patient had a blood test that showed she was 5 to 8 weeks gestation. Her last menstrual period was approximately 27-MAY-2008 and her estimated due date is approximately 03-MAR-2009. The patient sought medical attention in the office. Follow-up information was received. On 10-JUL-2008 the patient underwent elective termination. Upon internal review the patient's elective termination was considered to be an other important medical event. Additional information is not expected.

Other Meds: LEXAPRO; ALESSE; phentermine; ZOMIG

Seriousness: PERMANENT DISABILITY, SERIOUS

MedDRA PT Abdominal pain, Headache, Injection site pain, Injection site reaction, Lethargy, Visual disturbance

Symptom Text: Information was obtained on request by the Company from the agency via a Public Case Detail Form and a Case Line Listing concerning a 20 year old female who was vaccinated with GARDASIL. On 29-JUL-2008 the patient experienced visual disturbance, abdominal pain, headache, injection site reaction (described as local tenderness) and lethargy. The patient was treated with simple analgesia and fluids with rest. At the time of reporting to the agency on 30-JUL-2008, the outcome of visual disturbance, abdominal pain, headache, injection site reaction and lethargy was unknown. The agency considered that visual disturbance, abdominal pain, headache, injection site reaction and lethargy were possibly related to therapy with GARDASIL. Visual disturbance, abdominal pain, headache, injection site reaction and lethargy were considered to be disabling by the agency. The original reporting source was not provided. Additional information is not expected.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Abdominal pain, Appendicectomy, Back pain, Dyspnoea, Muscular weakness, Paraesthesia

Symptom Text: Information was obtained on request by the Company from the agency via a Public Case Detail Form and a Case Line Listing concerning a 14 year old female who on 31-AUG-2007 was vaccinated with GARDASIL. On 02-SEP-2007 ("2 days later") the patient experienced muscular weakness, abdominal pain, back pain, dyspnoea and paraesthesia which required an ambulance treatment and the patient was admitted to hospital. It was described that the patient developed lower right abdominal pain, leg weakness and tingling with back pain. The patient still has episodes with some days worse than others. Patient also experienced difficulty breathing. An appendectomy was required. At the time of reporting to the agency on 28-FEB-2008, the patient's muscular weakness and abdominal pain and back pain and dyspnoea and paraesthesia persisted. The agency considered that muscular weakness, abdominal pain, back pain, dyspnoea and paraesthesia were possibly related to therapy with GARDASIL. The original reporting source was not provided. Additional information is not expected.

MedDRA PT Cold sweat, Dizziness, Gaze palsy, Hypotension, Loss of consciousness, Mydriasis, Pallor, Syncope

Symptom Text: Patient received Gardasil and Menactra. Remained seated for approximately 5 - 10 minutes and was discharged. Became clammy and faint when walking to check out of office. Mother noticed she was very pale and asked if she was all right - the child said not. Mother lowered her to the floor. At that time the child's eyes rolled back and her lips and mouth were drawn back. She lost consciousness for a few seconds and then came to on her own. She was examined by a physician who came immediately. Her pupils were slightly dilated, her B/P was slightly lower than normal. When asked if she knew where she was she responded + and she also remembered what had gone on before her syncopal episode. The patient left the office on her own without further difficulty.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Anaemia, Arthralgia, Arthritis reactive, Behcets syndrome, Blister, Contusion, Erythema nodosum, Fatigue, Genital lesion, Headache, Infectious mononucleosis, Inflammation, Joint swelling, Lymphadenopathy, Nausea, Oedema peripheral, Pain, Pharyngolaryngeal pain, Phonophobia, Photophobia, Polyarthritis, Pyrexia, Rash, Skin lesion, Steroid therapy, Stomatitis, Tonsillitis, Upper respiratory tract congestion, Viral infection

Symptom Text: On July, 2007 Patient received the HPV and mennicoccal vacines in preparation for college enrollment. 3 weeks after school began for Fall 2007 she started to expereice extreme fatigue and swollen glands. 4 strep tests over the next 2 months at the campus clinic all came back negative. She continued to have some good days mixed with some bad where she could not get out of bed to attend class. Sometime around late October she started having swelling in her ankles and feet (could not put shoes on) and pain in her elbows and wrists. This was followed by sores and bruising on her lower legs. A week or so later she developed sores inside her mouth and in her genital area. During all of this time, several trips were made to the school clinic, the regional ER and trips back home to see her own doctor. By the time she came home for Christmas in early December she could barely walk due to the blisters and swelling/bruising of her legs and feet. Another trip to her doctor, who recommended she see an infectious disease doctor who once he saw her referred her to another specialist. She was diagnosed with Behcet's Disease - an auto-immune disease. She was immediately put on steriods and another medication to keep the immune system in check. After 7 months she is now off of the steriod but will probably have to take the other medication for the rest of her life. I strongly believe that the vaccines she received in July attacked her immune system. 8/29/08 Reviewed PCP office records. Patient received only one HPV vaccine & it was from one of these lots: 0244U, 0389U or 0524U. FINAL DX: Behcet's disease, anemia Records reveal patient experienced Office note of 9/28 indicates patient had fatigue, sore throat, congestion, aching & low grade fever x 3 wks & had been on oral antibiotics x 1 week w/o improvement. Exam remealed exudate on tonsils & dx w/viral tonsillitis & anemia. Received t/c from patient 11/1/07 following sore throat x 5 days w/temp 104. Again on antibiotics w/o improvement. T/C to office 12/2

Seriousness: ER VISIT, EXTENDED HOSPITAL STAY, HOSPITALIZED, PERMANENT DISABILITY, SERIOUS

MedDRA PT Activities of daily living impaired, Anxiety, Balance disorder, Borderline personality disorder, Cognitive disorder, Complex partial seizures, Condition aggravated, Confusional state, Depression, Dizziness, Dysgeusia, Dyspnoea, Epilepsy, Fatigue, Feeling hot, Headache, Hyperventilation, Incontinence, Loop electrosurgical excision procedure, Muscle twitching, Musculoskeletal stiffness, Nausea, Panic disorder, Partial seizures, Postictal state, Posturing, Somnolence, Speech disorder, Stress, Tension, Tongue biting, Vision blurred

Symptom Text: On October 17, 2006 I recieved my first dose of the Vaccine. I felt fine afterwards other than being a little dizzy. I was a normal 19 year old college student, working, and doing sports. A month and a week after my first dose of the vaccine I was hospitalized with seizures. I had many tests done and continued to have seizures. They said there was no apparent cause for my seizures. I am now 21 years old and am living with epilepsy. It has changed every aspect of my life. I just recently heard a talk show on CNN talking about people who have recieved gardasil and have had adverse side effects including seizures. Now I am on two different seizure drugs and am struggling through school and I can no longer hold a steady job due to driving restrictions, fatique,etc. 10/21/08 Reviewed multiple hospital admission & ER records of 6/27-12/30/2006. FINAL DX: focal to secondary generalized seizure disorder; panic disorder. 11/25-11/27/2006 Hospital admission s/p 3 new witnessed generalized motor seizures while sleeping & bit her tongue; followed by HA, stiffness & confusion. Tx w/dilantin & folic acid. 12/2/06 Seen in ER for possible family witnessed seizures x 2, patient found to be incontinent, postictal, HA, blurred vision, nausea, anxiety. Found w/muscle tension & hyperventilation. Labs revealed toxic dilantin level, 26.2. Meds adjusted & d/c to home w/o further seizure activity. 12/26-12/30/2006 FINAL DX: multiple spells, seizure vs pseudoseizure; borderline personality disorder w/somatoform features; hx of panic disorder. Admission for video EEG after having increased frequency of seizure activity at home despite therapeutic levels of meds. Neuropsych consult done & referred to outpatient psych. D/C to home w/o antiseizure meds. 10/31/08 Reviewed OB/GYN clinic records of 10/06-9/2008. FINAL DX:none provided Records reveal patient had LEEP done 5/23/08. Had been on Yaz & changed to other BCP. 11/11/08 Reviewed neuro clinic records of 11/28/2006-9/19/2008. FINAL DX: epilepsy

Other Meds: birth control, zoloft

Lab Data: LABS: EEG abnormal w/paroxysmal dysfunction but no frank epileptiform activity. CT & MRI brain WNL. CBC, chemistry, CPK 357(H), UA abnormal, tox screen (+) cannabis, EKG.

History: Anxiety PMH: atypical panic disorder on high dose zoloft. Allergy: latex. Contraception. UTI. Night sweats.

MedDRA PT Arthralgia, Carpal tunnel syndrome, Dizziness, Immediate post-injection reaction, Joint swelling, Myalgia, Polyarthritis, Tenosynovitis

Symptom Text: Right after my first vaccine I immediatly fainted, since that day and throughout the last two vaccines i have had strange symptoms. Feeling dizzy occurs all of the time and i have had extreme joint problems including swelling and horrible pain. The dizzyness is continuous, but the joint pain comes and goes. The joint pain and swelling mostly occurs where i had been given the vaccines(arm and thigh). 10/10/08 Reviewed rheumatology records of 1/24-3/11/08. FINAL DX: inflammatory polyarthralgia NOS Records reveal patient experienced intermittent right hip, left shoulder & right wrist pain x 3 mos along with myalgia of LEs, dizziness & lightheadedness s/p HPV vaccines 10/07 & 12/07. Tx w/pain meds initially but no improvement. 3/08 tx w/steroid tx for possible seronegative RA. No further records available. 10/3/08 Reviewed GYN medical records of 2/28/07-4/25/2008. FINAL DX: none provided Records reveal patient in usual state of good health on day of vaccination w/sexual dysfunction. Joint pain reported on 4/25/08 & was being seen by rheumatologist. 10/24/08 Reviewed PCP medical records of 10/11/07-1/22/2008. FINAL DX: Records reveal patient experienced right wrist pain 10/11/07 w/x-ray normal. 12/12/07 c/o of dizziness, lightheadedness, feeling faint x 2-3 weeks. Had fainted w/HPV #1. Right wrist pain persisted & referred to ortho. 1/16/2008 c/o continued left shoulder joint pain, right wrist pain & right hip pain. Referred to rheum.

Other Meds: none

Lab Data: I still to this day see a rheumatologist along with my primary doctor. I had been tested numerous times for all kinds of joint associated problems and all came back normal. LABS: CBC, chemistry WNL. Sed rate 45(H). CRP 4.73(N). ANA

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received for the Merck Pregnancy Registry for GARDASIL from a health professional concerning a 20 year old white female with no pertinent medical history, drug reactions/allergies. On 24-OCT-2007 the patient was vaccinated with a first dose of GARDASIL (lot# 658488/1264U) 0.5 mL IM. There was no concomitant therapy used. On 24-OCT-2007 the patient tested positive on a home pregnancy test after receiving the first and only dose of GARDASIL. Medical attention was sought. The patient called the office. No further information was available. The date of the last menstrual period was 26-SEP-2007 and the estimated date of delivery is 02-JUL-2008. Follow up information was received which reported that in February 2008 the patient had an elective termination at approximately 19 weeks of pregnancy. Additional information is not expected.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a nurse practitioner for the pregnancy registry for GARDASIL concerning a 17 years old female who on 07-JUL-2008 was vaccinated with the first dose of GARDASIL. Concomitant therapy included PROZAC, XANAX, trazodone HCl and albuterol. The nurse practitioner reported that the patient may have been pregnant when the first dose of GARDASIL. No adverse reactions reported. The last menstrual period was 18-JUN-2008. Her due date is 25-MAR-2009. The patient sought medical attention, she was seen by nurse practitioner. There was no product quality complaint. Additional information has been requested. Follow up information has been received from a nurse practitioner that reported that the patient had an elective termination of her pregnancy last week at approximately 8 weeks estimated gestational age (EGA) (approximately 08-AUG-2008). The nurse practitioner reported that she saw the patient on 13-AUG-2008 and she seemed to be doing well, following the termination of her pregnancy last week at approximately 8 weeks EGA. The nurse practitioner stated that the decision to have the termination was not due to the GARDASIL. The patient was also being treated with PROZAC, XANAX and trazodone HCl, and had concerns related to these medication as well as other concerns. Upon internal review termination of her pregnancy was determined to be an other important medical event. Additional information is not expected.

MedDRA PT Abdominal pain, Chest pain, Dyspnoea, Nausea, Paraesthesia, Pyrexia, Vaginal haemorrhage

Symptom Text: Information was obtained on request by the Company from the agency via a Case Line Listing and a Public Case Detail Form concerning a 19 year old female who on 21-SEP-2007 was vaccinated with the first dose of GARDASIL (Batch # J1599, Expiry date 11-FEB-2010, Lot No. 657870/0491U). On 21-NOV-2007 the patient was vaccinated with the second dose of GARDASIL (Batch No. J2299, Expiry date 26-FEB-2010, Lot No. 657874/0582U). On 23-NOV-2007 the patient experienced nausea, abdominal pain, chest pain, dyspnoea, genital haemorrhage, paresthesia and pyrexia. It was reported that the patient developed nausea, shortness of breath, abdominal pain, chest pain which was described as sharp stabbing to back, per vaginal bleeding three days later (? period) and tingling fingers. The patient was hospitalised and the following tests were done: chest - x-ray, ECG, blood tests and stress test (results not specified). At the time of reporting to the agency on 22-JUL-2008 it was not known if the patient had recovered from the nausea, abdominal pain, chest pain, dyspnoea, genital haemorrhage, paresthesia and pyrexia. The agency considered that nausea, abdominal pain, chest pain, dyspnoea, genital haemorrhage, paresthesia and pyrexia were related to therapy with GARDASIL. The original reporting source was not provided. Additional information is not expected.

MedDRA PT Dizziness, Peripheral vascular disorder

Symptom Text: Information has been received from a health authority (reference no. PEI2008011259) concerning a 15 year old female who on 13-MAR-2008 was vaccinated with a first dose of GARDASIL. The next day, the patient developed dizziness and peripheral circulatory disorder. She was hospitalized. Ophthalmological examinations, electroencephalography, electrocardiogram and Schellong test showed normal results. Although she had not completely recovered from the symptoms, on 24-JUL-2008, she was administered the second dose of GARDASIL. The final outcome was not reported. No further information is available. The case is closed. Other business numbers included E2008-7642.

Other Meds: Unknown

Lab Data: ophthalmological exam, normal; electroencephalography, normal; electrocardiogram, normal; orthostatic hypotension measurement, normal

MedDRA PT Ageusia, Facial palsy, Facial paresis, Hypoaesthesia oral

Symptom Text: Information was received from a physician via health authority concerning an 18-year-old female, who on 07-MAY-2008 was vaccinated with a first dose of GARDASIL (lot # 1049U, batch # NG46500, injection site not reported) via intramuscular route. On 29-MAY-2008 the patient present to her general practitioner with numbness of the tongue and loss of taste. Her tongue and facial muscles were normal. Fungal infection was suspected and AMPHO-MORONAL was given for symptomatic treatment. The treatment was not successful. On 01-JUN-2008 the patient experienced drooping of the left corner of the mouth and eyelid paresis, which was diagnosed as left idiopathic facial paresis in the neurology unit. "MRT" and lumbar puncture revealed no pathological findings. At the time of reporting, the patient was recovering. The events were considered to be serious because of the patient's hospitalization (date not specified). Follow-up information was received which reported that on 01-JUN-2008 the patient experienced drooping of the left corner of the mouth and eyelid paresis. The patient was admitted to the neurological hospital where the diagnosis of the left idiopathic facial paresis was established. "MRI" and lumbar puncture revealed no pathological findings. At the time of reporting, the patient was recovering. Other business partner numbers included: E200807755. No further information is available.

Other Meds: Unknown

Lab Data: spinal tap, no pathological findings; magnetic resonance imaging, No pathological findings

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Central nervous system lesion, No reaction on previous exposure to drug

Symptom Text: Information was received from a health authority (local reference # PEI2008008421) concerning a 17-year-old female with complaints about preexisting headache for 5 months, who in APR-2008 was vaccinated with a third dose of GARDASIL (lot number, route and injection site not reported). No adverse effect was reported after the patient's previous vaccination with GARDASIL (P1 in NOV-2007 and P2 in DEC-2007, lot numbers not reported). On an unknown date the patient was hospitalized. MRI of brain on 26-MAY-2008 revealed a left-sided frontal lesion. It was not possible to differentiate whether it was a brain tumor or an encephalitis. A short-term control was recommended. On 29-MAY-2008, CSF test to herpes virus DNA was negative and serology of Borrelia burgdorferi (CSF and serum) for IgG and IgM was negative. Additionally, EEG, cranial MRI, OCT and methionine PET were performed. Detailed results were not reported. Demyelinating disease was excluded. The patient's outcome was unknown. Other business partner numbers included: E200807658. No further information is available.

Other Meds: Unknown

Lab Data: magnetic resonance imaging, 26May08, MRI of brain revealed a left-sided frontal lesion; diagnostic laboratory test, 29May08, negative, CSF test to herpes virus DNA; diagnostic laboratory test, 29May08, negative, Serology of Borrelia burgdor

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Dizziness, Loss of consciousness, Malaise, Pallor, Respiratory arrest, Sensation of heaviness

Symptom Text: Information was viewed in an internet article concerning an adolescent female. " A few weeks ago", in approximately January 2009, the patient was vaccinated with a first dose of GARDASIL, along with a few other booster shots of unspecified vaccines. Moments after getting the injection, the patient felt like "a lead weight was in her veins", all of sudden, "the room started getting dizzy", she complained that she didn't "feel good" and then she went out. The patient passed out. Her mother noticed that "she wasn't breathing and her face was very white, her mouth was white". Paramedics rushed the patient to the emergency room. The patient stayed there for hours as doctors worked to keep her blood pressure up. Additional information is not expected.

MedDRA PT Condition aggravated, Convulsion, Urinary incontinence

Symptom Text: Information has been received from a licensed visiting nurse concerning a 13 year old female with a history of seizure during childhood and no history of drug reactions or allergies who 2 to 3 weeks ago (on approximately 01-AUG-2008) was vaccinated with the first dose of GARDASIL 0.5ml IM, the second dose of VARIVAX (Oka/Merck), MENACTRA and Tdap. Subsequently, the patient went home, sat down and had a drink of water. She then dropped her glass of water; she had a quick seizure and urinated on herself. She recovered soon after. The patient did not have any breakfast that day and the weather that day was very hot. The patient recovered on the same day. The patient was contacted by the nurse. Upon internal review, quick seizure was considered to be an other important medical event. Additional information has been requested.

MedDRA PT Abnormal behaviour, Convulsion, Disorientation, Dizziness, Hypotonia, Loss of consciousness, Urinary incontinence

Symptom Text: Information has been received from a physician office manager concerning a 24 year old female who on 18-AUG-2008 was vaccinated with GARDASIL IM into the right arm. Five minutes after the vaccination, the patient became "woozy" and laid down in an exam room. Her body then went limp. She closed her eyes, made strange noises, and appeared unconscious for 2 minutes. She urinated on herself and then started to seize. After 2 minutes, she returned to consciousness and was disoriented. The patient was attended to by several doctors and was taken to the emergency room. The reporter considered seizure to be disabling. Additional information has been requested.

MedDRA PT Oedema, Retinal detachment, Vitrectomy, Vitreous haemorrhage

Symptom Text: Information has been received from a health authority (HA ref No PEI2008012082) concerning a 23 year old female with myopia and astigmatism, who on 18-SEP-2007, was vaccinated with the first dose of GARDASIL, on 20-NOV-2007 was vaccinated with the second dose of GARDASIL and on 09-JUN-2008, was vaccinated with a third dose of GARDASIL (lot# 1113U batch# NH04240) i.m., into the left upper arm. On 10-JUN-2008, the patient experienced left retinal detachment with fissure of ora serrata. On 13-JUN-2008, the patient was hospitalized at an ophthalmic clinic where she underwent surgery (pars-plana-vitrectomy) on 16-JUN-2008. The retina was attached without complications. Postoperatively, secondary bleeding of vitreous body occurred. On 24-JUN-2008, the patient was discharged with the following results: ultrasound showed attached retina and secondary bleeding of vitreous body. Further examination on 01-AUG-2008 showed attached retina and rest edema. At the time of reporting the patient had not yet completely recovered. The previous two vaccinations with GARDASIL were well tolerated. Other business partner numbers included E2008-07746. No further information is available.

MedDRA PT Abdominal pain, Dizziness, Feeling hot, Injection site reaction, Lividity, Malaise, Pallor, Vertigo

Symptom Text: Information has been received from health authorities (reference number SE20080293) concerning a 16 year old female with a history of Kawasaki's disease 5 days after vaccination of MMR II (Enders-Edmonston, Jeryl Lynn, HPV-77) (MSD) at the age of 18 months (WAES #0808USA03489). At 11 AM on 28-JUN-2008 she was vaccinated with a first dose of GARDASIL IM in the left thigh. At the moment of withdrawing the needle, she experienced a sensation of malaise without pain; however she had to lie down for 15 to 20 minutes. It was also reported that the patient experienced an injection site reaction. On 29-JUN-2008, after she went swimming, she developed livedo on the anteroexternal face of the vaccinated thigh, at a distance from the site of injection. On 30-JUN-2008, she was pale and still had a sensation of malaise. She awoke with abdominal pain, however her periods had just started. At 10:30 AM, as she got up from bed, she experienced vertigo associated with a sensation of heat which obliged her to lie down to prevent a fall. She was hospitalised for surveillance. She had a pulse at 60, normal blood pressure, no adenopathy, no fever and the spleen was unpalpable. It was also reported a heart rate of 70 beats per minute, a respiratory rate of 20/minute, a blood pressure of 102/59, arterial blood oxygen saturation of 100%. Physical examination showed no abnormality and electrocardiogram (ECG) was normal. At 2 PM, at lunch time, she experienced malaise again, with dizziness and heat and abdominal pain, which obliged her to lie down. She progressively improved and fully recovered at 2:30 PM. She was discharged from the paediatrics unit on 01-JUL-2008 after a 2-day hospitalisation. No further information is available. Other business partner numbers included: E2008-07728. The case was closed.

Symptom Text: Information was obtained on request by the Company from the agency via a Public Case Detail Form and a Case Line Listing concerning a 24 year old female who on 10-MAR-2008 was vaccinated with GARDASIL. On 10-MAR-2008, immediately after vaccination, the patient experienced back pain, dizziness, injection site pain, injection site rash, insomnia, myalgia, pain, paraesthesia and pyrexia. It described by the patient that she presented to the physician with the flu on 10-MAR-2008. The physician thought she was fine and advised her that she should get the GARDASIL. The patient advised that she was put on the spot and agreed to get the injection. The nurse was called and she received her first injection. That night all through the night her arm became swollen and sore. She had intense pain in her lower back, groin and shooting pains down her legs. She had tingling in her feet and arms, pain down her arm to her fingers with tingling. The next day she nearly fainted when she sat up and every time she moved she had chronic dizziness coupled with ringing in her ears and blackouts. Later that evening a red rash started to appear on her arm and she could not move her arm without extreme pain. She felt paralyzed. A rash appeared on her lower back and looked like a heat rash. She had high fevers and intense pain, lots of sweat and then she would feel very cold as if her spine was frozen. The back rash disappeared but the arm rash increased in size. The patient went back to the physician who said the rash would go down. (the physician did not administer anything). The rash did not go down. By 13-MAR-2008 the rash had increased in size, her upper arm was swollen and itchy, could not move her arm, was pale, dizzy, feverish and she had pains in her back and legs. She had insomnia. The patient consulted a homeopath (as the patient no longer trusted the physician) who administered "china and apis and other herbs". The patient reported that it wasn't until she started taking these that the rash went down and the f

MedDRA PT Concussion, Dizziness, Fall, Head injury, Headache, Loss of consciousness, Nausea, Somnolence, Syncope, Syncope vasovagal, Urinary incontinence

Symptom Text: Information was obtained on request by the Company from the agency, via a Public Case Detail Form and a Case Line Listing, concerning a 20 year old female who on 24-APR-2008 was vaccinated with GARDASIL (Batch No. K0532, Lot No. 659053/1949U, expiry date 12-JUN-2010). Subsequently, on 24-APR-2008 the patient experienced vasovagal syncope, dizziness, fall, head injury, headache, nausea, somnolence and syncope. It was described that the patient "felt dizzy, faint and had a fall. She was unconscious for 2-3 minutes. She hit her head on the floor and had concussion. She lost bladder control and had a headache, nausea and was drowsy". On 24-APR-2008 the patient was admitted to the emergency department of hospital. She was reviewed by a neurosurgeon and observed for 5 to 6 hours. On 26-APR-2008 the patient recovered from vasovagal syncope, dizziness, fall, head injury, headache, nausea, somnolence and syncope. The agency considered that vasovagal syncope, dizziness, fall, head injury, headache, nausea, somnolence and syncope were certainly related to therapy with GARDASIL due to the timing of the events after vaccination with GARDASIL. The original reporting source was not provided. Additional information is not expected.

MedDRA PT Anxiety, Convulsion, Status epilepticus

Symptom Text: Information has been received from an agency concerning a 12 year old female who on 17-MAR-2008 was vaccinated with GARDASIL. Other suspect therapy included RECOMBIVAX HB, MSD (Batch # J6045, Expiry date 21-FEB-2010). On 17-MAR-2008 the patient developed status epilepticus and was hospitalised. It was reported that a number of atypical seizures were witnessed in the emergency department and the ICU and along with the normal investigations a diagnosis of functional seizures associated with anxiety was reached. At the time of reporting to the agency on 27-MAR-2008 the patient had not yet recovered from the status epilepticus. The agency considered that status epilepticus was possibly related to therapy with GARDASIL and included RECOMBIVAX HB (unspecified). The original reporting source was not provided. Additional information is not expected.

Other Meds: Unknown

Lab Data: laboratory test, ??08, functional seizures with anxiety

Seriousness: DIED, HOSPITALIZED, SERIOUS

MedDRA PT Activities of daily living impaired, Amyotrophic lateral sclerosis, Asthenia, Ataxia, Axonal neuropathy, Blood product transfusion, Constipation, Cough, Dehydration, Depression, Dysarthria, Dysphagia, Dysphonia, Dyspnoea, Dysstasia, Facial paresis, Fatigue, Gastrointestinal tube insertion, Guillain-Barre syndrome, Headache, Intensive care, Motor dysfunction, Motor neurone disease, Muscle contractions involuntary, Muscular weakness, Musculoskeletal pain, Nausea, Neck pain, Nervous system disorder, Neurological examination abnormal, Neuromyopathy, Oral intake reduced, Pneumonia aspiration, Progressive bulbar palsy, Respiratory failure, Tachycardia

Symptom Text: Information has been received from a neurologist concerning a 21 year old female previously in good health who in March 2008, was vaccinated with the first dose of GARDASIL (lot# not provided). Concomitant medication included several other vaccinations (not including MENACTRA). Subsequently, the patient developed motor neuron disease consistent with amyotrophic lateral sclerosis (ALS). Her progressive clinical course began in April 2008. The patient had not received a second dose of GARDASIL or any other vaccines since onset of symptoms. She developed upper extremity weakness which had become generalized and much more severe. She had been hospitalized in intensive care for several weeks with respiratory failure. Her condition deteriorated despite treatment with immunoglobulin. She had upper and lower motor neuron features with fasciculations. There is no sensory loss. Diagnostic workup included cerebrospinal fluid analysis (CSF) and muscle biopsy that ruled out other conditions (such as Guillaine Barre) and clinical picture is consistent with amyotrophic lateral sclerosis. Antineuronal antibodies were pending. A Superoxide dismutase (SOD) was pending and Stathmin (SMN) test will be ordered if SOD was normal. The reporting physician did not believe that illness was related to GARDASIL. Additional information has been requested. This is one of several reports from the same source. 9/9/08 Autopsy states COD as unclassified neurologic process, clinically presumed to be atypical GBS vs bulbar varient of ALS. FINAL DX 8/17-8/21/08 admission: amyotrophic lateral sclerosis & death by respiratory collapse. Developed cough, difficulty breathing, difficulty swallowing, poor oral intake, constipation, lack of energy 6 days prior to admit; had received Depo-Provera & outpatient IVIG prior to admit w/o any improvement. Admitted to ICU. Gradually worsened over the hospital stay, had NGT for feeding but refused PEG tube placement or tracheostomy. Referred to hospice & expired. FINAL DX 7/28-8/1/2008 admission: axona

Other Meds: therapy unspecified

Lab Data: None LABS: EMG/NCS abnormal. Brain MRI abnormal; c-spine MRI WNL. CSF WNL. West Nile IgG (+), IgM (-)but testing done s/p IVIG. ANA (+). Echocardiogram WNL, SPI-C MRI. Muscle biopsy (+) marked neurogenic changes. CXR (+) for possibl

MedDRA PT Abortion induced, Drug exposure during pregnancy, Pregnancy test positive

Symptom Text: Information has been received from a gynaecologist for the Pregnancy Registry for GARDASIL concerning a 17 year old female who started a spontaneous pregnancy (estimated conception date: 25-MAY-2008) 6 days before receiving the third dose, on 31-MAY-2008, of GARDASIL (Lot#, batch # and route of administration not reported). She had received the first and second doses in December 2007 and February 2008. The patient was concomitantly treated with ALDARA for vulvar condylomae she probably had since February 2008 and were noticed in May 2008. The patient had stopped contraception. ON 10-MAY-2008, she experienced miscarriage followed by bleeding lasting 5 to 6 days (WAES # 0807USA00520). It was also reported that the patient had unprotected sexual intercourse on 25-MAY-2008. She was seen by her gynaecologist on 25-JUN-2008 due to her positive pregnancy test on 17-JUN-2008. She was then approximately one month pregnant. No adverse reaction was reported. Upon internal review this case was linked to case number E2008-06249 (events experienced by the patient following the second dose of GARDASIL). Follow-up information was received which reported that the case was upgraded to serious. The reporting physician considered the induced abortion to be an other important medical event. In a letter dated 10-AUG-2008, the reporter specified that on 12-JUL-2008 the patient had a voluntary termination of pregnancy. This case is closed. Other business partner numbers included: E2008-05982 and E2008-06249. No further information is expected.

Other Meds: ALDARA, Unk - 2008

Lab Data: Unknown

History: Pregnancy; Miscarriage

MedDRA PT Abasia, Arthralgia, Vaccine positive rechallenge

Symptom Text: Information has been received from a consumer concerning her approximately 15 year old daughter, who in December 2007, the end of January 2008 and the end of May 2008 was vaccinated with the first, second and third doses of GARDASIL vaccine. Within two weeks after receiving each shot, the patient experienced severe pain in her hips. The pain was so severe she couldn't walk. She had a magnetic resonance imaging of her hips and it was reported "ok." To this day, the mother reports that her daughter (the patient) experiences hip pain. No further information is available.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Convulsion, Headache, Syncope, Syncope vasovagal, Vomiting

Symptom Text: Information has been received via a company representative from a pharmacist concerning a 13 year old female who on 12-AUG-2008 was vaccinated with GARDASIL. On 12-AUG-2008, straight after receiving the vaccine the patient fainted and experienced a mild seizure that lasted a few seconds. She recovered from the fainting and seizure. Four hours later she experienced vomiting and a headache. The patient's vomiting and headache has resolved. The reporter and the attending doctor felt that fainting and mild seizure were not related to therapy with GARDASIL, but they can not rule out the association. Both reporter and doctor felt that the patient may have experienced a vasovagal response. She was very scared at the time of the vaccination. The term fear has been added as a concurrent condition. Vasovagal response has been coded as an event. The patient was not hospitalized due to any of the adverse events. Syncope has been deleted as an adverse event since it was a symptom of the vasovagal response. Mild seizure is considered to be an other medical event. Additional information is not expected.

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Initial and follow-up information has been received from a physician and a nurse practitioner, for the Pregnancy Registry for GARDASIL, concerning a 16 year old female who on 12-AUG-2008 was vaccinated with a first dose of GARDASIL (lot number, injection site and route not reported). The nurse practitioner reported that the patient denied sexual activity and by mistake requested a urine pregnancy test on the patient that came back positive. The nurse practitioner reported the patient had elected to have an abortion unrelated to the vaccine on 21-AUG-2008. The nurse practitioner also reported that the patient also had a HIV and Hepatitis test after it was discovered she was pregnant because of the history of baby's father. Follow-up information was received from the nurse practitioner which reported that the patient did have an elective abortion on 21-AUG-2008. Upon internal review, elective abortion was determined to be an other important medical event. Additional information is not expected.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Asthenia, Burning sensation, Computerised tomogram normal, Confusional state, Decreased appetite, Diplopia, Disturbance in attention, Dizziness, Fatigue, Head discomfort, Head injury, Headache, Impaired driving ability, Impaired work ability, Laboratory test normal, Lethargy, Loss of consciousness, Memory impairment, Middle ear effusion, Musculoskeletal stiffness, Myalgia, Neck pain, Nervous system disorder, Pain, Pain in extremity, Paraesthesia, Pharyngolaryngeal pain, Photophobia, Photosensitivity reaction, Somnolence, Syncope, Vision blurred, Weight decreased

Symptom Text: Four minutes post injection, she fainted on her feet and struck the front of her head on the checkout window frame. A receptionist, nurse and attending physician came to her aid. The next 30 days brought severe debilitating headaches, confusion, decreased consciousness, extreme muscle aches, weakness, eye sensitivity, dizziness, decreased appetite, lack of energy, and weight loss. We returned to the pediatrician's office four days after injections because she suffered from these symptoms. She was diagnosed with fluid behind her ears. Blood was drawn twice, tests were run; all results were negative. A CT scan showed no abnormal development. Still she was suffering from severe persistent headaches. Two months after shots, she visited a neurologist. A 2 1/2 hour screening was done; showed impairment. A copy of the lab report was sent to pediatrician who called our home with sentiments. The neurologist prescribed two different drugs that didn't touch her headaches, but rendered her unable to drive, work or do school work. Four months after shots, she begins chiropractic care to ease pain. No success. Six months after shots, she has blurred vision. Eye exam performed; no abnormalities detected (20/20 vision). Nine months later; MRI-all normal. Begins physical therapy; persistent pain. Twelve months later; additional problems. Sudden onset of stiff neck & neck pain, joint stiffness, tingling in fingers, burning in lower back muscles, strong aching in arms, and all body muscles. Exhaustion and headaches, headaches! 9/3/08-records received-9/7/07-9/18/07-presented with C/O fatigue and headaches since 9/4/07 date HPV and meningitis vaccines were administered at which time she passed out but recovered. 9/7/07 C/O weakness and fatigue. Head feels heavy and there is pressure. Lethargic, sleeping. Sore throat. Appetite decreased. 10/29/07-evaluation for possibility of concussion after hitting right side of head on 9/4/07. C/O blurry vision and occasional double vision and sensitivity to light. Difficulty concentrating and

MedDRA PT Back injury, Bone pain, Burning sensation, Chest discomfort, Heart rate increased, Migraine, Musculoskeletal discomfort, Myalgia, Paraesthesia, Syncope

Symptom Text: Information has been received from a consumer concerning her daughter, a 17 year old female who on 04-SEP-2007 was vaccinated with the first dose of GARDASIL, 0.5ml. Concomitant therapy included meningococcal vaccine (manufacturer unspecified). Subsequently the patient fainted soon after and hurt her spine "a little over a year ago". Since then the patient has experienced extreme muscle pain, pressure in her chest, burning pain in her back, rapid heart beat, and extreme migraines. The patient is also experiencing tingling in her fingers. The patient had Blood work, MRI, and CT Scan. The patient' events did not improve. At the time of the report, the patient was not recovered. The patient sought medical attention. Additional information has been requested.

MedDRA PT Body temperature, Loss of consciousness, Oxygen supplementation, Syncope, Urinary incontinence

Symptom Text: On Tuesday August 26,2008 we had a 18 year-old female patient who came in with mother for vaccines, that were in need promptly requested by school. Patient information, vaccine questioner, and VFC application were given to the patient due to the fact that it was the patients first time at the facility. After the patient had concluded inputting here information she was registered in LINK. Patient at the moment was due for a total of 4 vaccines which are as follows: VARICELLA, HPV, MENINGOCOCCAL, and HEPATITIS A. The patients mother was then informed that the subsequent vaccines mentioned were due along with IIPV, but that GARDASIL was not needed by school system. After the mom was informed about GARDASIL and what it prevents, mother agreed to render that vaccine along with the other three. The patient was then taken to the triage room and vitaled. The temperature recorded at the time was 97.9 oral-temperature. Routing slip from LINK was then given to PAC to approve all vaccines that were in need. After PAC approval all four vaccines were administered. Patient was advised by medical assistant to have a seat in the waiting room, while vaccine card was being printed. While the patient was seated at the waiting area she collapsed while being seated. The patient was unconscious and ammonia was passed by nasal area. The patient gained conscience, but immediately went unconscious again. While patient collapsed again she urinated at the same time. Ammonia was passed for the second time and gained conscience permanently. Oxygen tank was then put on the patient to help the oxygen flow. Paramedics were called and arrived 5 minutes latter at the scene. Paramedics vitaled the patient and recommended for her to go with them. Patient was adamant and denied the advice and she signed the AMA for the paramedics. The patient left 5 minutes after the paramedics were gone. Patients was called the following day of the incident and mother stated daughter was fine and no problems were noticeable.

Seriousness: ER VISIT, HOSPITALIZED, PERMANENT DISABILITY, SERIOUS

MedDRA PT Amnesia, Encephalitis, Monoplegia, Vomiting

Symptom Text: Information has been received from a physician concerning a 16 year old (also reported as 15 year old) female who on an unspecified date was vaccinated with a first dose of GARDASIL (route and administration site not reported), and was vaccinated with a second dose of GARDASIL (route and administration site not reported) (also reported as having been given the week of 08-AUG-2008). Two months after she received the initial vaccine, the patient developed memory loss. It was also reported that shortly after the second vaccination, the patient developed paralysis of her arm. The patient was evaluated by her pediatrician, whose initial impression was that the symptoms may have been a psychology issue. Following this office evaluation the patient experienced other symptoms such as vomiting and was evaluated at an emergency room. The patient underwent numerous unspecified tests and saw unspecified specialists (results not provided). Subsequently the patient was hospitalized for encephalitis and has since been discharged. The physician doubts there was a link between the diagnosis of encephalitis and the vaccination. The physician reported that someone at the emergency room may have suggested to the patient's mother that there may be a link between the diagnosis and GARDASIL. The patient's encephalitis persisted. The physician considered the encephalitis to be disabling. Additional information has been requested.

MedDRA PT Arthritis, Oral contraception

Symptom Text: Information was received on 15-AUG-2008 from a gynaecologist concerning a 19-year-old female who on 14-JAN-2008 was vaccinated with a third dose of GARDASIL (route and site not reported). In June 2008 the patient developed arthritis. The adverse event was ongoing at the time of reporting. The patient was vaccinated with P1 of GARDASIL on 02-JUL-2007 and with P2 of GARDASIL on 17-SEP-2007. No information about vaccination reaction is given. Follow-up information of hospital report was received from the gynaecologist on 22-AUG-2008 and the case was upgraded to serious because of hospitalization. It was reported that the previous doses of GARDASIL given to the patient, P1 (lot # 655101/0513F, batch # NE35170) on 03-JUL-2007 (not 02-JUL-2007 as previously reported) and P2 (lot # 1339F, batch # NF23310) on 17-SEP-2007, were well tolerated. On 14-JAN-2008, the patient was vaccinated with the third dose of GARDASIL (lot # 0277U, batch # NG00020, route and injection site not reported). Concomitant medication included hormonal contraceptives. In May 2008, the patient developed swelling of joints. The patient was hospitalized on an unknown date and seronegative early arthritis since May 2008 was suspected. Treatment with prednisolone was initiated. Under this therapy her symptoms improved. After stopping the steroid therapy in the end of July 2008, the patient experienced relapsing symptoms and was admitted in hospital again (exact date not available). X-ray of both hands on 08-AUG-2008 showed swelling of soft tissue, but no lesions. Rheumatoid arthritis or an early Bouchard's poly-arthrosis was suspected. Extensive blood tests showed normal results. And also test on borrelia antibodies was negative. The suggestion of methotrexat therapy was denied by the patient and a further therapy with prednisolone was intended. The patient was not recovered at the time of reporting. Other business partner numbers included: E2008-07762. No further information is available.

Other Meds: hormonal contraceptives (unspecified), unk, unk

Lab Data: X-ray, 08Aug08, X-ray of both hands showed swelling of soft tissue, but no lesions; Diagnostic laboratory test, normal, extensive blood tests showed normal results; Serum Borrelia burgdorferi antibody test, negative.

MedDRA PT Caesarean section, Drug exposure during pregnancy

Symptom Text: Information has been received from a health professional via CSL as part of a business agreement (manufacturer control # GARD 2007 12 21 004) concerning an 16 year old primipara female who on 31-JUL-2007 (in follow-up reported as 19-JUN-2007) was vaccinated with the first dose of GARDASIL (invalid Batch # NE43240 provided). On 10-SEP-2007 (in follow-up reported as 25-JUL-2007) the patient was vaccinated with the second dose of GARDASIL (invalid Batch # NE43230 provided). On 13-DEC-2007 (in follow-up reported as 14-NOV-2007) the patient was administered third dose of GARDASIL (invalid Batch # NE43240 provided) inadvertently while at 13 weeks gestation. No adverse symptoms were experienced at the time of reporting on 21-DEC-2007. Follow-up information has been received from a completed first Encounter Questionnaire. The date of the patient's last menstrual period was unknown. The patient's pregnancy was confirmed by an ultrasound on 04-DEC-2007 (gestation 13 weeks). The estimated delivery date is 10-JUN-2008. On 22-Aug-2008, a completed "Use in Pregnancy - Pregnancy Outcome Questionnaire" was received from a health professional. it was unknown whether the patient had any diagnostic tests or if the patient had taken any prescription drugs during her pregnancy. It was also unknown whether the patient had any infections/illnesses during her pregnancy. On 06-JUN-2008, the patient had to have a LUSCS (lower uterine segment cesarean section) delivery for a suspicious CTG (cardiotocography) reading. The patient delivered a normal, healthy female baby weighing 2790 grams at approximately 39 weeks gestation. The infant was 50 cm in length and had a head circumference of 35 cm. The infant's APGARS was "6'9s". The infant did not have any congenital anomalies or any complications. Upon internal medical review, LUSCS delivery for a suspicious CTG reading was considered an other important medical event. Additional information is not expected.

Other Meds: Unknown

Lab Data: ultrasound, 04Dec07, pregnancy confirmed - gestation 13/52; fetal monitoring tests, 06Jun08, LUSCS delivery for a suspicious CTG reading

MedDRA PT Breast cancer

Symptom Text: Information has been received from a 25 year old female with chemotherapy who on 19-FEB-2008 was vaccinated with GARDASIL first dose. On 20-APR-2008 was vaccinated with GARDASIL second dose. On approximately 30-APR-2008 the patient experienced breast cancer. The patient's breast cancer persisted. Upon internal review, breast cancer was considered to be an other important medical event. On 16.7.2008 the patient was placed on the first chemotherapy cycle with DOCETAXEL TAXOTERE and CYCLOFOSFAMIDE (dose and duration not reported). The patient was placed on the second chemotherapy cycle with DOCETAXEL TAXOTERE and CYCLOFOSFAMIDE (Date, dose and duration not reported). Patient stated that prior to each therapy with chemotherapy she was placed on therapy with STEROIDS. Also once a month therapy with ZOLADEX injection, and NEUPOGEN injection on the eighth and twelfth day post chemotherapy. The patient is scheduled for the third course of chemotherapy in a few days time. The patient is scheduled for a total of 4 chemotherapy cycles. Additional information has been requested.

MedDRA PT Convulsion, Fatigue, Feeling hot, Hypotonia, Tremor

Symptom Text: Information has been received from a physician and a medical assistant, concerning a 12 year old female who on 30-NOV-2006 was vaccinated with the first dose of GARDASIL (lot # 653735/0688F). On 10-MAY-2007, the patient was vaccinated with the second dose of GARDASIL (657736/0389U). On 19-AUG-2008, the patient was vaccinated with the third dose of GARDASIL (lot # 660612/0229X) and had a seizure. The patient went to the car with her mother after the vaccination and complained of feeling hot and tired. The patient slumped over and had a generalized shaking that lasted 5 seconds. The patient was being monitored in the office at the time of the call. the patient did not have any problems with the first and second dose of GARDASIL. Laboratory data included glucose test reading 81. The patient sought medical attention. Upon internal review, seizure was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Back pain, Blood product transfusion, Epstein-Barr virus infection, Eye movement disorder, Facial palsy, Headache, Hyporeflexia, Lumbar puncture, Lymphadenopathy, Meningitis viral, Musculoskeletal pain, Neurological examination abnormal, Paraesthesia, Pyrexia, Sleep disorder, Throat lesion, Tonsillar inflammation, VIIth nerve paralysis

Symptom Text: Information has been received from a physician concerning a 14 year old female patient who on 13-MAR-2008 was vaccinated with her first dose of GARDASIL. Concomitant therapy included MENACTRA. On 09-APR-2008, the patient experienced back pain, fever and headache. The patient was given Z-PAK. On 14-APR-2008, the patient presented at the office with complete facial paralysis and was admitted to the hospital. On 18-APR-2008, the patient was discharged. A neurologist in the hospital diagnosed her with possible Guillain-Barre and bilateral 7th cranial nerve palsy. On 24-APR-2008, the patient was seen by a physician and her adverse events were resolving but not complete. On 15-MAY-2008, the neurologist felt her symptoms were resolving and possibly not related to Guillain-Barre or GARDASIL. The neurologist diagnosed her as having Epstein-Barr meningitis. Back pain, fever, headache, facial paralysis and Epstein-Barr meningitis were considered to be disabling, immediately life-threatening and an other important medical event. Additional information has been requested. 10/3/08 Reviewed neuro medical records of 5/15/2008. FINAL DX: Epstein Barr viral meningitis with montherapy multiplex Records reveal patient experienced HA x 2 weeks in 4/2008. Developed shoulder pain, LBP, sleep disturbance & fever. Seen in ER, dx w/throat lesion & tx w/antibiotics. No response to antibiotic therapy although throat lesion did improve. Developed severe pain, facial weakness, tingling in fingertips. Hospitalized & brain MRI revealed inflammation of VII crainal nerve bilaterally. LP showed WBC (H), protein (H) & marginal glucose indicating viral meningitis. EBV IgM (H). Neuro exam on 5/15/08 revealed right facial weakness w/depressed UE reflexes. 10/31/08 Reviewed hospital medical records of 4/14-4/18/2008. FINAL DX: bilateral 7th cranial nerve palsy, possible variant of GBS triggered by acute Epstein-Barr infection. Records reveal patient experienced HA, muscle aches, fevers, strep throat, mono x approx 2 wks. D

Other Meds: MENACTRA

Lab Data: Unknown LABS: MRI revealed enhanced facial nerves c/w neuritis CSF: protein 386(H), glucose (L) WBC 60(H), lymphs 96%, macrophages 4%c/s neg. EBV (+).

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Polyarthritis, Tendonitis

Symptom Text: Information has been received from a physician (initial reporter) concerning a 15 year old female who on 08-JAN-2008 was vaccinated with the first dose of GARDASIL, lot # not available. On 24-MAR-2008 the patient was vaccinated with the second dose of GARDASIL, lot # not available. Concomitant therapy included vaccination with ADACEL. In March 2008, the patient was diagnosed with polyarthropathy with positive ANA and negative for rheumatoid factor. In May 2008, the patient was found to be HLA B27 positive. The physician (primary source) reported that the patient was hospitalized twice for pulse steroids and in June 2008 that patient was started on therapy with sulfasalazine 500 mg BID for the treatment of Enthesitis-related arthritis (described also as polyarthropathy with positive ANA and negative rheumatoid and HLA B27 positive). The primary source physician also reported that the patient's condition is improved, but activity is tricky. A magnetic resonance imaging of sacro-iliac joint was negative. ANA positive 1:80. The initial reporter physician felt that polyarthropathy with positive ANA was possibly related to therapy with GARDASIL. The primary source physician was uncertain whether Enthesitis-related arthritis (also described as polyarthropathy with positive ANA and negative rheumatoid and HLA B27 positive) was related to therapy with GARDASIL. Final outcome of events not provided. No further information is available.

Symptom Text: Pt, a strong, athletic fourteen year old volleyball player received the GARDASIL vaccine at her pedatirician's office on July 10, 2007. At that time she weighed approx 131 lbs. and had no other medical conditions other than a previously diagnosed thyroiditis (Hashimoto's) treated with SYNTHROID 75 mcg. On the day of her visit to the pediatrician for a school and sports physical she received the GARDASIL along with the Hepatitis A vaccine because we were planning on traveling outside the country later in the year. She began her volleyball training a few weeks later and although she was keeping pace she often complained of exhaustion. Because the training was vigorous, no one thought of it. School began in late August and she continued a vigorous regiment. By mid September she was complaining of back muscle pain which we thought was simply from playing. She had also begun complaining of stomach pains. By the first of October there was a marked difference in her stamina and the pain and obvious muscle weakness became more obvious. As a player who could easily seven ten to fifteen hard serves in a row during a game, she could barely put two or three serves over the net. In mid October she was seen by her pediatrician who could find nothing medically wrong with her. But by the end of October, she could barely carry her book bag in school and could barely walk the hallways during a full day of school. She was seen by her endocrinologist during the first week of November for her regular check up and this exhaustion was brought up. Lab work done revealed that if there was something wrong, it was not due to her thyroid which was functioning normally. Two weeks later she was seen again by her pediatrician, again nothing was diagnosed. Another week later she was seen again and lab work was done to rule out Strep and mononucleosis. Seven days later we were told her mono titer was positive so everyone assumed that was the cause for her fatigue. After days of bed rest, no real improvement was noted. Three weeks later, she was

MedDRA PT Dyspnoea, Fatigue, Gait disturbance, Headache

Symptom Text: Information has been received from a physician concerning a 21 year old female with iron deficiency and helicobacter pylori infection and with no known drug reactions/allergies who in January 2008, was vaccinated with a first dose of GARDASIL (route and administration site not reported). In March 2008, the patient was vaccinated with a second dose of GARDASIL (route and administration site not reported). On 25-JUL-2008 the patient was vaccinated with a third dose of GARDASIL (route and administration site not reported). There was no concomitant medication. A few days after her third dose of GARDASIL on approximately 28-JUL-2008 the patient experienced headache, extreme fatigue and difficulty breathing and walking. She was seen in two emergency rooms and has been evaluated by a neurologist. A computed axial tomography (CT) scan and an unspecified brain scan were performed, but no result provided. The patient's headache, extreme fatigue, difficulty breathing and difficulty walking persisted. The headache, extreme fatigue, difficulty breathing and difficulty walking were considered to be disabling by the reporting physician. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Abdominal pain lower, Convulsion, Hypersensitivity, Tremor

Symptom Text: Initial and follow up information has been received from a nurse practitioner in form of medical record, concerning a healthy 21 year old female patient with no previous medical history reported, who on 21-AUG-2008 was vaccinated with the third dose of GARDASIL. On the same date, the patient was vaccinated with a first dose of hepatitis A (unspecified) (manufacturer unknown). Vaccines were administered in preparation of travel abroad. The nurse reported that the patient experienced seizure after receiving her third dose of GARDASIL. Subsequently, the patient experienced lower abdominal pain and seizure described as uncontrollable left sided shaking to left arm face and shoulders. On 23-AUG-2008, the patient started to have the same shakes and was taken to the emergency room but was not admitted. She had no headache, nausea, vomiting, numbness or weakness. While being examined in the emergency room, the patient had the same rhythmic movement of face and arm. Possible extrapyramidal and muscular contraction symptoms were noted by the emergency room. Liver function tests were check and were within normal limits. The patient was prescribed benztropine mesylate (manufacturer unknown), BENADRYL, and dexamethasone (manufacturer unknown). On 28-AUG-2008, the patient was seen in the reporting nurse practitioner's office for follow-up to the emergency room visit. It was noted that the patient had no problems since the emergency room visit. Assessment noted as an allergic reaction, possible reaction to GARDASIL. On an unknown date, the patient recovered. There was no product quality complaint. Upon internal review, the patient's seizure was considered an other important medical event. No additional information is expected. All available medical records will be provided on request.

MedDRA PT Autoimmune thyroiditis, Multiple sclerosis, No reaction on previous exposure to drug

Symptom Text: Information has been received from a health authority. It was reported that a 20 years old female patient was vaccinated with the first dose of GARDSASIL (Batch #NF 23310, Lot # 1339F) on 09-JUL-2007 and was well tolerated. On 13-SEP-2007, the patient was vaccinated with the second dose of GARDASIL (Batch #NF46730, Lot #1473F, route and site not reported). The patient developed multiple sclerosis in November 2007. She was hospitalized on an unspecified date. In hospital, MRI and neurological examinations confirmed diagnosis of multiple sclerosis. Despite ongoing multiple sclerosis the patient was vaccinated with a third dose of GARDASIL (Batch #NG00020, Lot # 0277U) on 20-DEC-2007. Hashimoto's thyroiditis was diagnosed in December 2007. She was hospitalized on an unspecified date. The patient has not yet recovered. Other business partner numbers included: E2008-07866 and E2008-07903. No further information is available.

MedDRA PT Hepatitis, Incorrect route of drug administration

Symptom Text: Information has been received from a general practitioner concerning a 18 year old female who on 01-AUG-2007, was vaccinated with the first dose of GARDASIL, on 03-OCT-2007 with the second dose of GARDASIL and on 20-FEB-2008, with the third dose of GARDASIL via subcutaneous route recommended route, I.M. In April 2008, the patient developed post vaccination hepatitis. Test found Gamma G3 at 33 and transaminases at 52.9, serologies for hepatitis B and C were negative and alcohol etiology was ruled out. At the time of reporting, CMV serology was still questioned. The patient was not hospitalized and fully recovered. It was noted that the patient's mother had cervical dysplasia. The hepatitis was considered an other important medical event. Other business partner numbers included E2008-07935. No further information is available.

Other Meds: Unknown

Lab Data: serum alanine aminotransferase, 52.9; serum gamma glutamyl transferase, 33; serum hepatitis B Ab, Comment: negative; serum hepatitis C antibody test, Comment: negative

MedDRA PT Dizziness, Muscle spasms, Trismus

Symptom Text: Information has been received from a physician concerning a 19 year old female who on 20-AUG-2008 was vaccinated with the first dose of GARDASIL 0.5 ml IM (lot # 659184/0843X). The patient was given a TB test at the same visit that she received the vaccine. On 20-AUG-2008 the patient experienced lockjaw, lightheadedness and cramping of her right leg within twenty minutes after vaccination. The patient was seen at the emergency room where she was given intravenous VALIUM and intramuscular TORADOL. The patient recovered from lockjaw, lightheadedness and cramping of her right leg on 20-AUG-2008. Upon internal review, the patient's events were determined to be other important medical event (IV and IM treatment required). Additional information has been requested.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Arthralgia, Arthritis, Gastroenteritis, Incorrect route of drug administration, Oedema

Symptom Text: Case of misuse received from a gynaecologist through the pharmacovigilance form and by phone. Information has been received from a gynaecologist concerning a 19 year old female, who on 08-FEB-2008 was vaccinated with a first dose of GARDASIL in the left shoulder via the subcutaneous route instead of the recommended intramuscular route. No adverse reaction was reported. Concomitant therapy included hormonal contraceptives (unspecified). In April 2008 the patient was vaccinated with a second dose of GARDASIL. The batch number was not reported. Four days after vaccination with the second dose the patient experienced arthralgias with inflammatory joints on knees, wrist, and ankle. She was hospitalized and biological work-up was negative. The patient was treated with NSAID's and corticosteroids. At the time of the report, the patient was recovering. Follow-up information received from the gynaecologist via the pharmacovigilance form and by phone: The patient's weight and height were reported. She received the second dose of GARDASIL (batch number not reported) in APR-2008. The patient had concomitant oral contraception with HOLGYEME since 2007. Fifteen days after the second injection, she developed arthritis of the major joints, reported as moderate and not serious. In an attached letter from a rheumatologist dated 26-APR-2008, it was reported that arthralgia also appeared 48 hours after an episode of gastroenteritis. Tests performed on 24-APR-2008 also found sedimentation rate at 15 mm and CRP at 5 mg. The rheumatologist added that the patient had not been relieved by NEXEN nor APRANEX associated to analgesics, and consequently, corticotherapy was started at 30 mg/day and gradually tapered. The gynaecologist reported that the patient had recovered, however at the time of the reporting there was a residual oedema on the right wrist and the left ankle. Other business partner numbers included: E2008-05323 and E2008-07884. No further information is available. The case was closed.

Other Meds: cyproterone acetate/ethinyl estradiol, 2007 - Unk

Lab Data: serum C-reactive protein, 24Apr08, 5 mg; erythrocyte sedimentation rate, 24Apr08, 15 mm

MedDRA PT Hemianopia homonymous, Multiple sclerosis

Symptom Text: Information has been received from a general practitioner concerning a female patient who on unspecified dates was vaccinated with the first and second dose of GARDASIL. Concomitant therapy included hormonal contraceptives (unspecified). On 08-MAY-2008, a few time after the second dose vaccination, the patient suffered from a lateral homonymous hemianopia. An MRI showed hypersignals of T2 with a contrast uptake. The lumbar puncture revealed an oligoclonal band. Suspicion of multiple sclerosis was diagnosed during a hospitalization. The patient had only recovered from the symptoms. The patient had no personal medical history reported, but her father had medical history of ulcerative colitis and ankylosing spondylitis. Further information is expected. Other business partner numbers include E2008-08042.

Other Meds: hormonal contraceptives (unspecified), Unk - Unk

Lab Data: magnetic resonance imaging, hypersignals of T2 with a contrast uptake; spinal tap, revealed an oligoclonal band

History: Unknown

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT CSF oligoclonal band present, Central nervous system lesion, Demyelination, Familial risk factor, Hemianopia homonymous

Symptom Text: Initial information has been received from a general practitioner, concerning a 21 year old female patient, who on 18-DEC-2007 was vaccinated with the first dose of GARDASIL via intramuscular route in left deltoid (Batch number not reported). On 19-FEB-2008, the patient was vaccinated with the second dose of GARDASIL (Batch number not reported) IM in the left deltoid. On 08-MAY-2008, a few time after vaccination with the second dose of GARDASIL, the patient suffered from a lateral homonymous hemianopsia. A MRI showed hypersignals of T2 with a contrast uptake. The lumbar puncture revealed an oligloclonal band. Suspicion of multiple sclerosis was diagnosed during an hospitalization. The patient had only recovered from the symptoms. She had concomitant hormonal contraceptives (JASMILLENE) since November 2006. She had no personal medical history reported but her father had medical history of ulcerative colitis and ankylosing spondylitis. Follow-up information has been received, concerning the patient who, 30 minutes later she received the second dose of GARDASIL, developed a slight nodosity of mild intensity resolved in 24 hours. On 08-MAY-2008, she developed a right bilateral homonymous hemianopsia of severe intensity resolved by the end of June 2008. Diagnosis was impairment demyelinating and evoqued diagnosis was a suspicion of multiple sclerosis. A cerebral MRI performed on 10-JUN-2008 showed four nodular lesions in hypersignal T2 of subcortical substance: three of them were located at the level of the left frontal lobe, the third one was just ahead of left ventricle of anterior horn and the fourth one was facing porterieur foot of posterior knee of corpus callosum, lateralized on the left just inside of lateral ventricle. No visible ischemic lesion. No visible anomaly at the level of chiasma or orbital cavity. No abnormal peri-cerebral collection. Conclusion was small nodular pictures of white cortical substance leading to persue the work up in particular to find a demyelinating pathology and an evolutive follo

Other Meds: drospirenone (+) ethinyl estradiol, Nov06 - Unk

Lab Data: magnetic resonance imaging, 10Jun08, four nodular lesions in hypersignal T2 of subcortical substance (see narrative); spinal tap, 12Jun08, revealed pure intrathecal inflammatory process and absence of detectable anti-myelin IgM reactivity;

Seriousness: ER VISIT, EXTENDED HOSPITAL STAY, HOSPITALIZED, PERMANENT DISABILITY, SERIOUS

MedDRA PT Abasia, Abdominal pain upper, Anger, Asthenia, Ataxia, Atrophy, Blood product transfusion, Cerebellar syndrome, Depression, Dizziness, Eye movement disorder, Hyperglycaemia, Hyperreflexia, Hyporeflexia, Malaise, Mood altered, Motor dysfunction, Muscular weakness, Myoclonus, Nausea, Opsoclonus myoclonus, Oropharyngeal pain, Sensory loss, Social avoidant behaviour, Steroid therapy, Tremor, Vertigo, Wheelchair user

Symptom Text: In December of 2007 and January of 2008, patient became withdrawn and concerned that she did not lose weight despite diet and exercise, and she started having opsoclonus. She had no illnesses around the time of onset of those symptoms. Brother had been quite ill (thought initially to be meningitis, but turned out to be unknown) and is now better. She had a meningitis vaccine and HPV vaccine at the time that she started to be withdrawn. Over the course of 1-2 weeks she became ataxic, and had very "jumpy arms". This myoclonus spread to her legs such that she could not walk. She denied headaches, nausea, and or vomiting. No muscle aches or leg pain. No tinnitus or hearing loss. At the time of a February 11, 2008 admission she had severe opsoclonus, myoclonus, dysmetria, and perhaps a wide amplitude tremor. An extended evaluation was started looking for a neuroblatoma and a ganglioneuromal, mitochondrial disease, inflammatory diseases, and other diseases. There were a few abnormal lab results, which normalized later. The lactate normalized only after starting mitochondrial vitamins. No evidence of a ganglioneuroma or neuroblastoma was found. Blood mitochondrial mutations were sent and later returned as normal. Because the lactate was high, we added Thiamine 25 mg twice daily and riboflavin 50mg twice daily, CoQ, and Keppra was started later at 1mg/kg/day, and advanced as tolerated, then lowered when she started feeling nauseated. She received steroid x 1 week courses, with marked hyperglycemia, but no improvement. She received IVIG, then sent to hospital. She was discharged from hospital with improved opsoclonus, but still unable to walk or reach easily. She returned to hospital for a second course of IVIG. After that, the mitochondrial meds were stopped, she remained unable to walk, and had variable but usually less opsoclonus. Physical therapists noted some weakness and atrophy, and she had one episode when she would fall to the left side when the tuning fork was put near her left ear. She had

Other Meds:

Lab Data: Blood lactate 6.6, followed by 5.4 both in free flowing blood, without tourniquet; Pyruvate, requested but not obtained; CPK 103; Blood mitochondrial mutations, normal 14 mutations and 3 deletions, including MERRF mutations; Urine spot HVA:

History: History derived from review of medical record, several of my prior exams and visits, and discussion with PCP; Seasonal allergies.' PMH: Asthma. Allergic to Augmentin and Benadryl.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Abdominal pain, Constipation, Diarrhoea, Dizziness, Gastritis, Vomiting

Symptom Text: Information has been received from a physician concerning a female who on an unspecified date was vaccinated with a 0.5 dose of 9/9/08-GARDASIL IM. Secondary suspect therapy included VARIVAX. About one week later, the patient was hospitalized with severe abdominal pain. She has since been released. The patient sought unspecified medical attention. At the time of reporting, the outcome of the patient was unknown. Additional information has been requested. On the evening of 13-AUG-2008 the patient started to vomit. The next day on 14-AUG-2008, the patient was complaining of abdominal pain and vomiting. She was taken to the ER that night. The patient was not admitted to the hospital at that time. The patient was sent home on the night of 14-AUG-2008. On 15-AUG-2008 the patient developed diarrhea and complaint of abdominal pain and vomiting. The patient was admitted to the hospital on 16-AUG-2008 and discharged on 18-AUG-2008 (diagnosis not provided). 12/22/08-records received for ED visit 8/14/08 C/O abdominal pain, vomiting waxing and waning, began day of presentation to ED. Difficulty moving bowels. Dizzy when has pain. Constipation. DX: Gastritis.

Other Meds: Unknown

Lab Data: Unknown 9/9/08-Urine and blood work (unspecified) were performed (results came back normal). 12/22/08-records received-KUB negative.

History: Unknown 9/9/08- The physician also noted that the patient does have a history of abdominal pain and that the patient had been on Miralax for quite some time.

MedDRA PT Convulsion

Symptom Text: Information has been received from a consumer at a public exhibit concerning her daughter who was vaccinated with a dose of GARDASIL. Subsequently the patient experienced seizure. The patient's mother reported that the patient would have to take seizure medication "for the rest of her life". At the time of this report, the event persisted. Upon internal review, seizure was determined to be an other important medical event. No further information is available.

MedDRA PT Asthenia, Back pain, Drug administered at inappropriate site, Inappropriate schedule of drug administration, Paraesthesia, Paraplegia

Symptom Text: Information has been received from a physician concerning a female who on 31-JUL-2007 was vaccinated with the first dose of GARDASIL (lot # 1341F batch#NF12410) I.M. right gluteal. On 16-OCT-2007, was vaccinated with the second dose of GARDASIL (lot # 0251 batch# NF56480) I.M. right gluteal and on 20-MAY-2008, was vaccinated with the third dose of GARDASIL (lot # 1113U batch# NH10080). On 06-APR-2008, the patient presented acute back pain as a case of emergency. The patient was treated with diclofenac and osteopathic therapy and the symptoms fully resolved. On 11-APR-2008, the back pain recurred, accompanied by weakness and paresthesia of the legs. The patient was admitted to the outpatient department of the hospital where the suspicion of paraparesis was established. The differential diagnosis of conversion disorder was assumed. After a chiropractic treatment the patient recovered. On 14-APR-2008, the patient was admitted to hospital due to relapsing symptoms. Cranial MRI, EEG, CSF showed no pathologies. Functional paraplegia was diagnosed. Despite ongoing symptoms the patient was vaccinated with a third dose of GARDASIL. In June-2008, the symptoms relapsed and the patient was hospitalized on 10-JUN-2008 again. Suspicion of severe conversion disorder with recurrent hysterical paralysis was diagnosed. The physician did not assess a causal relationship with GARDASIL vaccinations (second and third doses). At the time of reporting the outcome was unknown. Other business partner numbers included E2008-07850. No further information is available.

Symptom Text: Information has been received from an office manager, concerning a 25 year old female patient who on an unspecified date was vaccinated with the second dose of GARDASIL. The patient experienced pain and swelling in her left arm after the vaccine was given. The patient was given GARDASIL in another clinic but she presented to the physician's office with this reaction. The reporter stated the patient had pain and swelling after the first dose but was not this severe. The pain and swelling lasted one week after this second dose was given. The patient was sent to the hospital and admitted. The patient recovered on an unknown date. The patient sought medical attention at physician's office. There was no product quality complaint. Follow up information has been received from medical records and the office manager, concerning a 25 year old female patient who on an unknown date was vaccinated with 0.5 mL of the second dose of GARDASIL IM. On 01-MAY-2008, the patient was seen in office for swelling and pain in arm which began on 28-APR-2008. The patient was sent over for ultrasound and it was determined she had a hypoechoic thrombus that completely occluded and moderately expanded the left subclavian vein, axillary vein, mid and proximal basilic vein, mid and proximal brachial vein and proximal - most cephalic vein. No blood flow identified within these particular structures. The thrombus did not extend distal to the antecubital fossa. The patient was hospitalized for an unspecified number of days. Approximately, on 05-MAY-2008 (also reported as one week) the patient was recovered. The reporter considered the event to be life-threatening and an other important medical event. No further information is expected. All available medical records will be provided upon request. 9/15/2008 MR received from PCP including some hospital records. Pt presented to PCP on 4/28/08 with c/o shoulder pain x 5 days, tingling fingertips. Pain from shoulder to elbow with movement. DX: LUE radiculopathy. Sent for X-ray and

Other Meds: Unknown

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Accidental overdose, Inappropriate schedule of drug administration

Symptom Text: Health Department administered Menactra, Adacel, and 2nd Varvax on 4/17/08. Client then presented to Dr. office with office for physical, and was vaccinated with additional doses of all three vaccines and a fourth dose of HPV on 8/14/08. This resulted in 4 Gardasil, 2 Menactra, 2 Adacel, and 3 Varivax vaccines administered. Parent stated that MD office administered vaccines, despite patient instructing them that she already received these vaccines in April at the Health Department Clinic. Parent was verbally upset and wanted to report this to the health department. Health Department is therefore reporting this error on behalf of the parents request. Vaccines were entered into the Immunization Registry following the 4/17/08 clinic, and were present at the time of re-vaccination at the MD office. Parent did not report any adverse reactions at the time of the call which was 24 hrs after the duplicate adminstration.

MedDRA PT Influenza like illness, Injection site pain, Lymphadenopathy, Malaise, Oral herpes

Symptom Text: Within 24 hours my daughter felt really sick, similar to the flu. A small lymph node on her lower jaw area swelled up (appeared like a cyst under her jaw) and she got what appeared to be a large fever blister on her lip, only it didn't hurt. She has never had fever blisters (herpes simplex) before. Her symptoms lasted a few days. My daughter rarely gets very sick, even with common cold/flu, so this was very peculiar. Fortunately, the symptoms only occurred after her first shot, which she said hurt going in. The final two shots were not painful and she did not get sick. Gardasil.

Other Meds:

Lab Data: Doctor's office said her symptoms were not a result of the shot. Telephone call only.

MedDRA PT Activities of daily living impaired, Anaemia, Arthralgia, Asthma, Bone marrow failure, Breath sounds abnormal, Bronchitis, Bronchospasm, Chest discomfort, Condition aggravated, Cough, Decreased appetite, Dyspnoea, Eructation, Exercise tolerance decreased, Fatigue, Headache, Hypoaesthesia, Lymph node palpable, Lymphadenopathy, Malaise, Muscle fatigue, Myalgia, Nausea, Pain, Paraesthesia, Pharyngeal erythema, Pharyngitis, Pyrexia, Sinus congestion, Steroid therapy, Upper respiratory tract congestion, Viral infection, Wheezing

Symptom Text: GARDASIL and MENACTRA were given 7/8/08. First adverse symptoms appeared around 7/22/08. Numbness and tingling extending down left arm were noted. Nausea, headache, fatigue, arthralgias throughout body were noted on 7/23/08. Complaints of fevers, swollen glands in neck, belching, increased nausea, extreme muscle fatigue on exertion, shortness of breath leading to bronchospasms and asthma type symptoms continued with progression through current day of 8/27/08. Originally treated with antibiotics around 7/28/08 thinking it was bronchitis. Tested for mono, CBC done with mono spot which was negative. Progression continued and course of MEDROL dose pack given for 5 days for breathing difficulty and bronchospasms. Inhaler added 8/7/08. Extreme fatigue is interfering with daily live. Breathing difficulties are interfering with athletics as she is a division I soccer athlete unable to currently participate fully due to fatigue and breathing difficulties. 9/12/08 Reviewed PCP medical records of 7/8/08-8/28/2008. FINAL DX: Records indicate patient was in good health on day of vaccination. RTC 7/28/08 w/malaise, aches, red throat, lymph node swelling. Dx w/pharyngitis & tx w/antibiotics. RTC 8/4/08 w/cough, SOB & fatigue. Tx w/steroids. 8/7/08 contacted office w/wheezing & tx w/inhaler. 9/23/08 Reviewed student health services records of 8/27-9/10/08. FINAL DX: persistent fatigue, myalgias, bronchospasm, anemia Records reveal patient experienced viral infection & bronchitis approx July, 2008 & tx w/antibiots, steroids & inhaler. When seen 8/27 had SOB, chest/head congestion, chest tightness, exhaustion & decreased appetite. Labs revealed mild bone marrow suppression, decreased peak flos & decreased aeration. Tx w/additional meds. RTC 9/10 w/persistent extreme fatigue, myalgia & bronchospasm. 4/13/09 received additional student health services records of 11/24/08-3/25/2009. FINAL DX: fatigue, myalgias, bronchospasm, decreased exercise performance, etiology unclear Records reveal patient experienced

Seriousness: ER VISIT, PERMANENT DISABILITY, SERIOUS

MedDRA PT Activities of daily living impaired, Chest discomfort, Dyspnoea, Fatigue, Headache, Hypoaesthesia, Lymphadenopathy, Muscular weakness, Myalgia, Nausea, Paraesthesia, Pyrexia

Symptom Text: Information has been received from a nurse concerning her daughter, a 18 year old female patient with a history of supraventricular tachycardia, who on 08-JUL-2008 was vaccinated with a dose of GARDASIL (lot# 660555/0279X) I.M. into left arm. Concomitant therapy included MENACTRA. On 22-JUL-2008, the patient developed numbness and tingling of her left arm and fingers. She then developed fever, nausea, headache, widespread myalgia and cervical lymphadenopathy. On 26-JUL-2008, the patient experienced tightness in her chest and shortness of breath. The patient was examined by the physician on 28-JUL-2008 and was prescribed a "Z-pack" ZITHROMAX. A mono test and complete blood count were normal. On 01-AUG-2008, a MEDROL dose pack and PROVENTIL inhaler were added. The patient began to experience extreme fatigue and bilateral lower extremity muscle weakness. She was unable to participate in team sports and a soccer competition because of her incapacity. The patient was examined by an unspecified physician at the college on 22-AUG-2008. A repeat mono test and complete blood count were normal. The patient has a follow-up appointment scheduled for 05-SEP-2008. The patient's numbness and tingling of her left arm and fingers, tightness in her chest, shortness of breath, fever, nausea, headache, widespread myalgia, cervical lymphadenopathy, extreme fatigue and bilateral lower extremity muscle weakness persisted. Numbness and tingling of her left arm and fingers, tightness in her chest, shortness of breath, fever, nausea, headache, widespread myalgia and cervical lymphadenopathy, extreme fatigue and bilateral lower extremity muscle weakness were considered to be disabling by the nurse. No further information is available.

MedDRA PT Vaginal ulceration

Symptom Text: Information has been received as part of a business agreement (manufacturer's report number: unknown). The information was received via a mail list discussion group set up by a center. A Program Officer of a district division General Practice (GP) reported that, in 2007, 'several months ago' (in follow up approximately June 2007), a non-sexually active female patient, with an infected toe and a history of negative Herpes Simplex antibody tests in May 2008, was vaccinated with GARDASIL on approximately June 2007. The patient developed vaginal ulceration a few days after the vaccination with GARDASIL. Concomitant therapy included included LEVLEN ED and KEFLEX. Herpes simplex PCR swabs were done 2 times and were negative each time. In follow up Herpes Simplex antibody tests were done 2 x with negative results. This is one of several reports from the same source. Additional information was received from the physician on 26-AUG-2008. It was reported that the patient has one sexual partner and developed severe genital ulceration which was described as deep punched out ulcers not typical of herpes virus. At the time of reporting the patient had recovered from the genital ulceration. Severe genital (vaginal) ulceration was considered as an other medical event by the reporting physician. Additional information is not expected.

MedDRA PT Abdominal pain, Anxiety, Chest pain, Chills, Dizziness, Dysuria, Eye pain, Gait disturbance, Headache, Hyperreflexia, Hyperventilation, Influenza like illness, Multiple sclerosis, Myalgia, Photophobia, Pyrexia, Vision blurred

Symptom Text: Julissa received her 1st HPV vaccine on 4/11/07 (Merck 0263U), 2nd HPV vaccine on 7/5/07 (Merck 0279X), and her 3rd HPV vaccine on 7/11/08 (Merck 0279X). She also received her MCV4 on 7/5/07 (Sanofi Pasteur u2222aa) and Tdap on 4/11/07 (GSK C2609AA). At her annual physical on 8/21/08, she described dizzyness, headache, blurry vision, eye pain, and gait disturbance. She subsequently had a head CT and head MRI. The head MRI was suspicious for multiple sclerosis, and on 8/23/08 she was hospitalized at Brigham and Women's Hospital, which was a 7 day hospitalization and she was given the diagnosis of multiple sclerosis. In retrospect, Julissa's mother feels that her symptoms described at her annual physical had been had been going on for some time, and had been exacerbated each time she had an HPV vaccine. It is not entirely clear to me how long she has been symptomatic with her MS. 11/10/08-records received for DOS 8/23-8/29/08-DC DX: Multiple sclerosis. Anxiety. Presented with dizziness, generalized weakness and weakness of lower extremities. Summer 4/2008 after receiving HPV4 C/O pain in right eye and blurriness, light bothered the eye and had floaters. Significant fatigue. Two months prior developed flu-like symptoms with muscle aches, headaches, low grade chills and fever. Seen in ED normal labs and thought to had a viral infection. Week later developed abdominal pain and burning with urination. Urinary tract infection. Developed unsteady walking and increased reflexes in legs.

Other Meds: Lo/Ovral

Lab Data: Head MRI 8/22/08: "Findings: Multiple periventricular and subcortical white matter T2 hyperintense lesions are present many of which have the perivenular morphology perpendicular to the lateral ventricles. The largest lesion is located

MedDRA PT Convulsion, Dizziness, Headache, Lupus-like syndrome, Pyrexia

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. On 22-FEB-2008 a 21 year old female with seasonal allergies was vaccinated with her third dose of GARDASIL (lot # 658560/1062U) IM. Concomitant therapy included oral contraceptive. Approximately four months post the vaccination, she experienced headache, seizures, fever, dizziness and lupus-like syndrome. She was hospitalized several times and placed in intensive care unit. Computed axial tomography (CT) scan and lab work were performed. The original reporting source was not provided. The VAERS ID # is 324169. A lot check has been requested. A standard lot check investigation was performed. All in-process quality checks for the lot number in question were satisfactory. In addition, an expanded lot check investigation was performed. The testing performed on the batch prior to release met all release specifications. The lot met the requirements of the center and was released. No additional information is expected.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: This is a case of pregnancy follow-up reported by a specialist through the Sanofi Pasteur Pregnancy Registry on 01-Jul-2008. A female patient started a spontaneous pregnancy on 21-May-2008 (estimated conception date) and received the third dose injection of GARDASIL (batch number not reported) in the first week of June 2008. Her last menstrual period was on 07-MAY-2008. At the time of reporting the patient had no adverse effect. Follow-up information received from the specialist through the Sanofi Pasteur MSD Initial Questionnaire of Pregnancy Registry: Case upgraded to serious as the patient had a spontaneous abortion (OME). Patient's date of birth and weight were completed. An echography performed on 23-JUL-2008 showed no signs of fetal vitality. On 27-JUL-2008 she experienced a spontaneous abortion. The patient had a medical history of legally induced abortion in 2007. Other business partner numbers include E2008-06142. The case is closed. No further information is available.

Other Meds: Unknown

Lab Data: ultrasound, 23Jul08, no signs of fetal vitality

History: Legally induced abortion

Seriousness: HOSPITALIZED, PERMANENT DISABILITY, SERIOUS

MedDRA PT Drug exposure during pregnancy, Inappropriate schedule of drug administration, Pain, Premature labour, Uterine hypertonus

Symptom Text: Information has been received from a 37 year old female with a history of gestational diabetes, 1 pregnancy and 1 live birth, 0 miscarriage and 0 stillbirth, who on 09-FEB-2008 was vaccinated with her first dose of GARDASIL. Subsequently she became pregnant, as confirmed by a pregnancy test kit. Estimated date of delivery is on 23-OCT-2008. There were no concomitant medications or diseases at time of vaccination. Vaccination schedule will be deferred until after delivery. Additional information has been received on 27-AUG-2008. On 19-AUG-2008, the patient started to experience pain and contractions. Patient was given isoxsuprine HCL TID. Upon return consultation with physician on 25-AUG-2008, the patient still complained of pain and contractions. The patient was hospitalized on 25-AUG-2008. Treatment medication include Isoxsuprine HCl given intravenously. It was noted that her cervix was still closed/not dilated and both ultrasound and urinalysis tests done on approximately 25-AUG-2008 showed normal results. Subsequently, the patient was discharged improved on 27-AUG-2008. Aside from being advised to continue her low-salt, low-fat, low-sugar diet, the patient was also advised to have complete bed rest until follow up evaluation by the physician approximately next week. Thus, pre-mature labor was considered disabling. Vitamin supplements such as IBERET and CACI-AID were continued. The patient thinks that pre-term labor is probably not related to GARDASIL. This might have been brought about by her extensive traveling which required her to drive for long hours the past couple of weeks. No further information is available at the moment. Pregnancy outcome will be followed up on the estimated date of delivery.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Cyanosis, Dyspnoea, Eye rolling, Hyperhidrosis, Pallor, Posturing, Unresponsive to stimuli, Urinary incontinence

Symptom Text: Approx. 5 mins post-vaccination, pt became pale, diaphoretic. She was positioned with head down. She then became unresponsive. Assisted to floor with feet elevated, resp. WNL-she was somewhat responsive & talking. A few seconds later her eyes rolled back, no resp., no response to painful stimuli, posturing (arms drawn up or in towards trunk) face turned blue. Pt gasped and resumed normal breathing within 30-40 seconds. She also lost urinary continence. Patient quickly became alert, oriented x3 and drank a coke. Mom reported one other episode previously that she called "passing out" 6 years ago where patient passed out at school. Mom took her directly to E.R. Only thing identified then was +strep. CT scan was done & normal at that time. Patient was referred to her doctor.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Abdominal pain upper, Drug exposure during pregnancy, Live birth, Postpartum haemorrhage, Transfusion, Urinary tract infection

Symptom Text: Information has been received through the Merck pregnancy registry from a registered nurse concerning an 18 year old female who on 02-JUL-2007 was vaccinated with the first dose of GARDASIL (655205/1426F). On 24-SEP-2007 the patient was vaccinated with the second dose of GARDASIL (657617/0384U). The patient was seen in the emergency room on approximately 27-NOV-2007 with stomach aches and had a positive blood pregnancy test (LMP = 14-OCT-2007). On 04-DEC-2007 the patient was seen in the physician's office and had a positive urine pregnancy test. Concomitant therapy included pre-natal vitamins + Vitamin C. On 28-FEB-2008, the patient had an amnio test done, and the results were within normal limits. On approximately 17-MAR-2008, the patient experienced urinary tract infection and was treated with MACROBID, 100mg, BID during 5 days. On 21-JUL-2008, at 40 weeks from LMP, the patient had a male liveborn infant normal who weighed 7lbs 5 ounces, length 21.5 inches, and had a head circumference of 14 inches. There were no complications, infections or illnesses during the pregnancy or the labor/delivery. The registered nurse reported that the patient had heavy bleeding post partum and required transfusion x 2. The patient sought medical attention. Upon internal review heavy bleeding post partum requiring blood transfusions x 2 was determined to be an other important medical event. No further information is available.

Other Meds: Vitamins (unspecified)

Lab Data: Amniocentesis, 02/28/08, WNL = within normal limits; Serum beta-human, 11/27?/07, positive; Urine beta-human, 12/04/07, positive

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Blindness unilateral, No reaction on previous exposure to drug, Optic neuritis retrobulbar, Pupillary reflex impaired, Visual acuity reduced

Symptom Text: Information has been received from a pediatrician concerning a 15 year old female who on 20-MAY-2008 was vaccinated with the first dose of GARDASIL (lot no. 1113U; batch no. NH10090) and was well tolerated and on 24-JUL-2008, the patient received the second dose of GARDASIL (lot no. 1172U; batch no. NH10130). On 25-JUL-2008 the patient developed decreased vision (left eye) within 24 hours post-vaccination and was hospitalized as a case of emergency. The patient showed a positive RAPD (Rapid afferent pupillary defects). Retrobulbar neuritis was diagnosed. On 26-JUL-2008, the vision aggravated and visual evoked potential (VEP) nearly showed no signals anymore, the patient had blindness of the left eye. A cranial MRI was performed that showed no indications of demyelinating foci. The cause of retrobulbar neuritis had not been clarified as of 26-AUG-2008. The physician reported that parainfectious or paravaccination events might also be possible at this age (15 years old). On 31-JUL-2008, the patient was discharged with resolving symptoms, the patient was treated with cortisone, but the symptoms relapsed and aggravated. In Aug 2008, the patient was hospitalized again. Other business partner numbers included: E2008-08009. Additional information has been requested.

Other Meds: Unknown

Lab Data: visual evoked potential, 26Jul08, no signals; magnetic resonance imaging, 26Jul08, no indication of demyelinating foci; ophthalmological exam, 26Jul08, rapid afferent pupillary defect positive

MedDRA PT Inappropriate schedule of drug administration, Pancreatitis

Symptom Text: Information has been received from a physician as part of a business agreement (manufacturer control number GARD 2008 08 28 001) concerning a 20 year old female who on 11-APR-2007 was vaccinated with her first dose of GARDASIL (Lot No. 657874/0582U, Batch No. J2299, Expiry date 26-FEB-2010). Subsequently, on 11-OCT-2007, the patient received her second dose of GARDASIL (Lot No. 658214/0734U, Batch No. J2926, Expiry date 13-MAR-2010) (considered as inappropriate schedule of vaccine) and on 25-FEB-2008 she received her third dose of GARDASIL (Lot No. 658214/0734U, Batch No. J2926, Expiry date 13-MAR-2010). Concomitant therapy included LEVLEN. On 04-AUG-2008 the patient experienced pancreatitis (also reported as sudden onset of acute pancreatitis) and was hospitalized. On 4-AUG-2008, the patient's lipase result was 2025 (units not specified) and was reported as abnormal. It was also reported that the patient's lipase and amylase increased. The patient was treated with IV rehydration and "settled quickly". No cause for the pancreatitis was identified. Subsequently, the patient was "well" since discharge. The patient was reviewed by her physician 3 weeks later at which time all bloods had returned to normal. Additional information has been requested.

Other Meds: ethinyl estradiol (+) levonorgestrel, Unk - Unk

Lab Data: diagnostic laboratory test, 25?Aug08, all bloods returned to normal; serum lipase test, 04Aug08, 2025, abnormal; serum amylase test, ??08, increased

Seriousness: ER VISIT, EXTENDED HOSPITAL STAY, HOSPITALIZED, PERMANENT DISABILITY, SERIOUS

MedDRA PT Concussion, Dyspnoea, Gait disturbance, Guillain-Barre syndrome, Headache, Hypoaesthesia, Muscular weakness, Paraesthesia

Symptom Text: Information has been received from a medical assistant concerning a 16 year old female patient who on an unspecified date was vaccinated with GARDASIL. Concomitant therapy included tetanus toxoid (manufacturer unknown). The medical assistant reported that the patient was diagnosed with Guillain-Barre Syndrome after receiving a dose of GARDASIL vaccine. After receiving GARDASIL vaccine, the patient suffered a concussion in a soccer game. She was taken to an emergency room and released. However she was taken to the emergency room again because she complained of headaches along, tingling in her hands and feet. She also felt weakness on her legs. She was then released from the emergency room. Then on 26-AUG-2008, she was admitted to the hospital because she complained of shortness of breath, headaches and numbness of her extremities. She could not walk without assistance. After she was admitted to the hospital, she was diagnosed with Guillain-Barre Syndrome. On 12-SEP-2008, follow-up information was received from a medical assistant who provided the primary physician's name and telephone number. The patient's Guillain-Barre Syndrome was considered to be disabling. Additional information has been requested.

MedDRA PT Carcinoma in situ, Cervical conisation, Cervical dysplasia, Human papilloma virus test positive, Inappropriate schedule of drug administration

Symptom Text: Information has been received from a physician concerning a 27 year old female, who on 24-JAN-2008 was vaccinated IM in the deltoid muscle with a first dose of GARDASIL (Lot# 0352U; Batch# NG00320). No adverse event occurred. On 07-APR-2008 the patient was vaccinated IM in the deltoid muscle with a second dose of GARDASIL (Lot# 1068U; Batch# NH06410). On 27-MAY-2008 PAP IVa (suspicion of carcinoma in situ) was diagnosed. A conisation was performed in an outpatient department. The result showed carcinoma in situ (CIN III). On 21-NOV-2007 a PAP smear showed normal finding (PAP II). The patient recovered on an unspecified date. The physician considered the cervical intraepithelial neoplasia III, carcinoma in situ, abnormal Pap smear, and positive Human papilloma virus serology test to be other important medical events. Other business partner numbers included: E2008-08110. Additional information is not available.

Other Meds: Unknown

Lab Data: cervical smear, 21Nov07, PAP II; cervical smear, 27May08, PAP IVa

MedDRA PT Cerebrovascular accident, Depressed level of consciousness, Dysstasia, Eye movement disorder, Facial palsy, Fall, Hemiplegia, Hypoaesthesia, Ischaemic stroke

Symptom Text: Information has been received from a Health Authority in a foreign country (HA ref. no. LM20080247) concerning a 15 year old female with pollen allergy and asthma who in MAR-2008 was vaccinated with the first dose of GARDASIL. In MAY-2008 the patient was vaccinated with the second dose of GARDASIL IM. On 13-JUL-2008 the patient experienced a fall with the impossibility to stand up. She was found 3 1/2 hours later. The patient had spent the night at a nightclub, had drunk alcohol and energising drinks and had smoked. Physical examination showed slight obnubilation, spontaneous deviation of the head and eyes towards the right, left hemiplegia, left facial paralysis and hypoaesthesia of the left hemibody. Brain MRI with magnetic resonance angiography found hyperintensity in the right sylvian territory related to recent ischaemic cerebrovascular accident. Thrombophilic work-up was normal. Auto-immune work-up showed speckled positive antinuclear antibodies on the first test with 1/640, of centromere type. Toxic assay in urine found negative opioid, cocaine, cannabinoid, amphetamines and GHB. Viral serologies, ie HIV, HCV and EBV were negative. The patient was not using contraceptive pill. She had concomitant medication with AERIUS or CLARITIN and VENTOLINE. At the time of reporting, she had not recovered. Other business partner numbers include E2008-08198. Additional information has been requested.

Other Meds: AERIUS; CLARITIN; VENTOLINE

Lab Data: Magnetic resonance imaging, brain MRI with MRA found hyperintensity in the right sylvian territory related to recent ischaemic c; diagnostic laboratory test, thrombophilic work-up negative; Serum ANA, 1/640, of centromere type; Urine drug s

MedDRA PT Demyelinating polyneuropathy, Hypoaesthesia, Inappropriate schedule of drug administration, Lymphadenopathy, Monoparesis, Paresis, Radiculitis brachial

Symptom Text: Information has been received from a health authority concerning a 17 year old female who on 20-JUL-2007 was vaccinated with the first dose of GARDASIL (lot n. not reported). It was well tolerated. On 07-JAN-2008, the patient was vaccinated with a second dose of GARDASIL (lot n. not reported). Concomitant medication included unspecified hormonal contraceptives. On 02-MAR-2008, the patient developed numbness in the right arm, hand and shoulder and was hospitalized. Neurological examination revealed paresis of the right arm, hypoaesthesia of right arm and shoulder especially of forearm and hand on radial side and less important paresis of right leg. The patient didn't experience pain. CSF was normal, no local IgG, IGA and IGG synthesis. Oligoclonal IgG was negative. Borreliosis was ruled out. On 02-MAR-2008, was performed a serum C-reactive protein test (CRP) and the result was 21.8 mg/L. On 03-MAR-2008, was performed a motor evoked potential (MEP): central motor conduction time to arms normal as well as to the right leg. The central motor conduction time to the left leg was extended. A nerve conduction velocity was performed on 04-MAR-2008, which showed demyelinating axonal sensomotoric polyneuropathy (tibial nerves were not concerned). Native MRI of plexus on 06-MAR-2008, was in favor of neuritis of the right plexus cervicobrachialis. Detection of several enlarged lymph nodes in the course of the cervical vasomotor nerve sheath on both sides. Lab findings performed on 08-MAR-2008 including serum thyroid-stimulating hormone test (TSH), vitamins B1, B6, B12, E, serum folic acid, cryoglobulins, rheumatoid factors, serum antinuclear antibodies test (ANA), serum antineutrophil cytoplasmic antibody test (ANCA), ganglioside autoantibodies, GM1-antibodies, antibodies against Campylobacter intestinalis and jejuni and HIV, Treponema pallidum hemagglutination assay (TPHA), were normal, except elevated serum C-reactive protein test (CRP) which the result was 40.4 mg/L. Cranial and cervical magnetic resonance imaging (MRI) we

MedDRA PT Central nervous system lesion, Demyelination, Headache, Migraine with aura, Nausea, Paraesthesia, Paraesthesia oral, Speech disorder, Visual disturbance

Symptom Text: Information has been received from a health authority concerning a 17 year old female who on 11-JUN-2007 was vaccinated with the first dose of GARDASIL, lot n. not reported and was well tolerated. On 06-AUG-2007, the patient was vaccinated with a second dose of GARDASIL (lot n. not reported). On 20-SEP-2007, the patient developed visual disorder ("sparkling in the right visual field"), later paresthesia spreading from the fingers to the whole right hand. Additionally, she experienced paresthesia of the tongue and speech disorder. The symptoms resolved after 5 to 10 minutes and were followed by headache with nausea. She recovered completely within 2 days. It was noted the patient's father had a history of migraine in his youth. On an unspecified date, an electroencephalography was performed and showed normal results. Migraine accompagnee was suspected. Cranial MRI on 09-OCT-2007, showed a lesion of 1 cm diameter in the front part of the corpus callosum and lesion of nearly 1 cm diameter in the right temporal medullary layer. It was suspected that the lesion could be a residual of a inflammatory demyelinating focus without signs of activity. On 04-DEC-2007, she was vaccinated with a third dose of GARDASIL (lot n. not reported). A control MRI on 08-DEC-2007 showed unchanged results. The clinical relevance of these cerebral lesions remained unclear. CSF in December 2007 showed a slight increase of cells (not otherwise specified), no oligoclonal bands were detected. At the time of reporting the patient had recovered. File closed. Migraine accompagnee and residual of inflammatory demyelinating focus without signs of activity were determined to be an other important medical events. Other business partner numbers included: E2008-07962. Additional information is not expected.

Other Meds: Unknown

MedDRA PT Drug administered at inappropriate site, Mucosal inflammation, Papilloma viral infection

Symptom Text: Initial and follow-up information has been received from a nurse concerning a 20 year old female who on 07-APR-2008 was vaccinated intramuscularly into the left gluteus with the first 0.5 ml dose of GARDASIL (lot no. 659655/1486U). On 29-May-2008, the patient had a colposcopy done which showed positive for human papilloma virus. The biopsy showed squamous mucosa and attached endocervical glandular mucosa with mild chronic inflammation and reactive changes. Focal changes suggestive of human papillomavirus-associated cytopathic effect. The patient stated that she had only one sexual partner (1st partner for each other). On 06-JUN-2008 the patient was vaccinated intramuscularly into the left deltoid with the second 0.5 ml dose of GARDASIL (lot no. 660387/1967U). At the time of this report, the patient was still positive for human papilloma virus. The patient sought unspecified medical attention. The reporter considered human papilloma viral infection to be other important medical event. Additional information is not expected. All medical records are available upon request.

MedDRA PT Alopecia, Arthralgia, Dizziness, Headache, Menorrhagia

Symptom Text: "HAIR LOSS,AND IRREGULAR MENSES,JOINT PAIN, HEADACHES ETC: Our daughter, who had completed her series of 3 vaccinations of "Gardisil" has been experiencing considerable hair loss. Her first shot was in May 24, 2007, the second on July 26, 2007 and the third and final on November 27, 2007. Here are the other specifics....our daughter was 13 turning fourteen. She has had every blood test imaginable to rule out the obvious which may cause hair loss such as thyroid disease, polycystic ovary disease, diabetes, and the list goes on and on. Everything came back negative. We even have a future appointment scheduled with a rheumatologist this coming November 08. We have seen the Endocrinologist and two dermatologists (a scalp biopsy proved negative to any infection, disease, etc. Granted, she had a typical amount of stress during the school year, as any young teen would, but nothing to cause this. Everyday our daughter says to us, "you should see how much hair fell out in the shower today". She's so afraid to brush or comb it because of the extreme shedding. She literally, to date has half the amount of hair she had one year ago. Let me tell you she had beautiful hair. The hair loss is becoming quite visible at the forward part of her scalp. This has been devastating, hair is everything to a teen. (to anyone this is devastating) We must also mention that her periods have been totally out of whack. She went 6 months at one point without one. It finally came back, but it is so sporadic, getting every two weeks, at times extremely heavy, etc... She also complains of intermitent dizziness.

MedDRA PT Acne, Oedema peripheral, Pain in extremity, Scab, Skin discolouration

Symptom Text: Client states approx. 1 hour after receiving immunizations on 8/19/08 both arms became swollen and painful. Client states this lasted 4 days then resolved. Then on 9/1/08 client reports she had swelling and black and blue marks in her upper arms with approx 20-30 "pimples" on her arms, face, and head. She states they were painful to the touch. Client visited the Western Univ. Health Center 9/3/08 for evaluation. PP gave client a prescription for BACTRIM, took culture of her "pimples" that are now scabbed over and made a follow up appt for next week. On 9/3/08 physician at Health Center took samples to culture from scabbed spots on client's head. 9/29/08- POI to be sent to Med. Clinic for details.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Cervical dysplasia, Colposcopy, Papilloma viral infection

Symptom Text: Previous pap smear before vaccine was normal, all pap smears after vaccine have been abnormal. I now have cervical dysplasia and presence of HPV. I've had 3 colposcopy's because of abnormal cells. My partner of over 2 years developed genital warts following the second dose of garadisil. I was administered one shot on 7-11-07 and a second shot 9-17-07. In October of 2007, he started developing bumps in his genital region and in December of 2007 he routinely began getting them burned/lasered off. His dermatologist initially thought it was contagisom molluscum, but now over a year later and with them still not gone, she believes it to be genital warts. He has never had any previous problems/signs of this disease ever before and neither have I. I was never asked what medications I was on prior to the shots or if i was sick and might have a low immune system. (I have ashtma, severe allergies, and often get sick). Also, I was not tested prior to the shots to see if i had been infected with the HPV virus in the past. I believe that these incidents are a direct result of the gardasil vaccine. I had been in a monogomous relationship for a year without any problems or symptoms. It was not until I started getting the gardasil vaccinne that we both started noticing adverse side effects. I do not think that doctors are asking the proper questions before administering this shot. Whose to say everyone's body can fight off the virus in the vaccines, especially if the person has already been infected and has a low immune system?

MedDRA PT Dysphonia, Pain, Pharyngeal oedema, Swollen tongue, Urticaria

Symptom Text: Patient recevied both varicella and HPV on 7/9/08. The mother called our clinic on 7/18/08 with the note documented below.Nurse Comments: Placed call back to mom. Mom states patient had reported to mom last night that her throat felt swollen. Mom gave Benadryl. Mom states today she has her voice back. Questioned if patient had hives yesterday or just itching. Mom states patient did have hives and she gave Benadryl yesterday. States right now patient is reporting that her tongue feels thick and her throat feels swollen. Mom states patient says she aches all over. Patient recently just went off of her Florinef that she had been on x 2 years and wondered if that could be contributing. Recommended mom give Benadryl again now. Discussed with Dr. here in the office who states patient should go to ER at this time. Mom informed of this and states understanding. Completed by Nurse: July 18, 2008 11:52 AM Patient was taken to clinic by mother. The physician form there called and discussed the case with Dr. She ordered a referral to an allergist. The patient has an appointment with an allergist on 9/17/08 for this and other past allergic reactions.

Symptom Text: Information has been received from a physician assistant concerning her daughter who on an unspecified date was vaccinated with a second dose of GARDASIL (lot number, injection site and route not reported). Three weeks after the vaccination, the patient experienced paralysis. The patient had to quit the volleyball team because her walking was effected. The patient underwent "a full work up" that was negative for any medical reason for the paralysis. Therapy with HPV was discontinued. The event was transient in nature and completely resolved in four weeks. It was reported that the patient completed the series of GARDASIL last year. Upon internal review, paralysis is considered to be an other important medical event. Additional information has been requested. 9/19/08 Reviewed PCP #2 medical records of 10/10/07-6/26/08. FINAL DX: viral syndrome & polyarthralgia Records reveal patient experienced morning joint pain & stiffness & swelling of hands & feet for approx 2 wks prior to 10/10/07 visit. Had cold s/s prior to symptoms start. Received HPV #2 on 3/21/08. 5/5/08 Had finger laceration w/nerve & tendon involvement & was referred to ortho/hand surgeon, required surgery. Received HPV #3 on 5/22/08 but no Lot # provided. Seen 6/26 for sore throat, nausea, malaise, fatigue, decreased appetite, body aches & fever x 1 day. Tx w/ antibiotics for sinusitis & pharyngitis.

MedDRA PT Condition aggravated, Tinnitus

Symptom Text: After the second dose of study drug on 06/26/2008, the subject had a recurrence of the AE tinnitus on 06/26/2008 (there is no grade 1 tinnitus on the CTCAE.) The subject stated that this second episode of tinnitus was much milder than the previously reported episode that had resolved on 05/13/2008. The patient had discussed his tinnitus and the vaccine study with his physician on 5/22/08. The subject felt strongly that he wanted to continue on study. This 06/26/2008 episode resolved fully without treatment on 07/09/2008.

MedDRA PT Convulsion, Injection site pain, Syncope, Syncope vasovagal, Vaccine positive rechallenge

Symptom Text: Information has been received from a consumer concerning her daughter an 18 year old female with no known drug allergies/reactions and no pertinent medical history reported who on 16-JUN-2008 was vaccinated with the first dose of GARDASIL. On 19-AUG-2008, the patient was vaccinated with a second dose of GARDASIL. Concomitant therapy included MENACTRA. On 16-JUN-2008, and after receiving the first dose of GARDASIL, the patient had severe pain at the injection site. Then, on 21-JUN-2008, she was taken by ambulance to the emergency room because she had fainting spells. While in the emergency room she had an electrocardiogram (EKG) done and the emergency room physician diagnosed with vasovagal, and she was able to gone that day. The consumer reported that the patient then received the second dose of GARDASIL, and she also had severe pain at the injection site again. Then, on 02-SEP-2008, she had two seizures. The consumer reported that the patient was then sent to the hospital at 10:30 PM on 02-SEP-2008 by ambulance because of the seizures and was then admitted to the hospital at 12:00 AM. At the time the patient was admitted she had a computed axial tomography (CAT scan), a magnetic resonance imaging (MRI) and a electroencephalography (EEG) done. The patient was the diagnosed with early onset seizure disorder and was prescribed KEPPRA (manufacturer unspecified)) and she can not drive for 6 months. The consumer reported the patient was then able to leave the hospital on 03-SEP-2008 at 8:30 PM. The consumer stated that the patient has not had a seizure since but it may because of the medication she is taking. The patient will not receive the third dose of GARDASIL. Additional information has been requested.

MedDRA PT Injection site erythema, Injection site pain, Injection site swelling, Injection site warmth, Pain in extremity, Radiculitis brachial

Symptom Text: Initial report was received 11 September 2008 from a health care professional. A 21-year-old female patient had a past history of amoxicillin allergy, had received a first dose intramuscular right arm injection of ADACEL, lot number C2996AA and a first dose intramuscular left arm injection of GARDASIL (manufacturer Merck), lot number 0052X on 05 September 2008 and one day later, she developed a red raised 6cm diameter hot area at the injection site (arm not specified). On 08 September 2008, three days post vaccination, the patient developed right arm pain from her shoulder to her hand. She was evaluated by her physician on 11 September 2008 who diagnosed the patient with brachial neuritis. Laboratory and diagnostic testing had not been performed. The reporter stated that the patient had previously experienced a "swollen arm after TB test". At the time of the report, the patient's recovery status was unknown. No further information was provided.

Other Meds: ALESSE

Lab Data:

History: The patient had a past history of amoxicillin allergy and had been taking Alesse (birth control) at the time of vaccination. The patient also had a past history of a "swollen arm after a TB test".

MedDRA PT Drug exposure during pregnancy, Foetal disorder, Live birth, Oral contraception

Symptom Text: Information has been received from a nurse through a Merck pregnancy registry concerning a 26 year old female patient with a history of 4 pregnancies and 2 live births who was on oral contraceptives in the first trimester, with gestational diabetes and insulin dependency, who on 31-MAY-2007 was vaccinated with the first dose of GARDASIL (lot# 657737/0522U). The patient was pregnant with a LMP of 09-Apr-2007. Follow up information indicated that on 09-Jan-2008 the patient delivered a normal liveborn male infant weeks from LMP 37 2/7 with a Apgar score 8/9. Follow up information has been received in the form of medical records. On 09-JAN-2008, the baby was born with hyperbilirubinemia and bilateral cephalohematomas. The weight was 8 lbs, the length 21 inches, head circumference 13.8 inch. On 12-JAN-2008 and 13-JAN-2008, the patient was admitted for phototherapy. Saturday, 12-JAN-2008, the patient's bilirubin was 19 and Sunday, 13-JAN-2008, rebound bilirubin was 11 (5 hours off phototherapy). A total bilirubin measurement with a heel stick was performed. The lab results were reported as: -12-JAN-2008: 18.0 mg /dl 19.2 mg /dl. -13-JAN-2008: 12.3 mg/dl 10.8 mg/dl 11.2 mg/dl 16.1 mg/dl. On 14-JAN-2008, the baby had a sick visit to the doctor and still had jaundice and cephalohematoma, with icteric sclera and hyperbilirubinemia. Some lab test was performed, which included a measurement of Total bilirubin with a heel stick. The results was : 12.2 mg/dl. On 18-JAN-2008, the baby had a sick visit date, and it was noted that the baby had jaundice from chest to upper abdomen (seedy yellow) and hyperbilirubinemia. The pediatrician was concerned about the baby's head swollen. The baby still had cephalohematoma. On examination on 25-JAN-2008, it was noted that the baby still had bilateral cephalohematoma; the left side greater the right side. It was also noticed that the baby had urine frequently, had jaundice in the face, and diaper rash. The baby was 15 days. A lab test was performed which included a PKU (result not reported)

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Abasia, Aphthous stomatitis, Appendicectomy, Appendicitis, Arthralgia, Arthritis, Arthropathy, Back pain, Bone pain, Enthesopathy, Iron deficiency, Juvenile arthritis, Lymphadenopathy, Mastication disorder, Meningism, Microcytic anaemia, Mobility decreased, Night sweats, Oedema peripheral

Symptom Text: Information has been received from a general practitioner concerning a 15 year old female who in springtime 2008 was vaccinated with a dose of GARDASIL. Subsequently the patient experienced meningism from which she recovered within a not reported time. Afterwards the patient developed rheumatic disease (not otherwise specified) and was hospitalised (exact date not yet reported). At the time of reporting the patient was not recovered. Follow up information has been received. On 11-APR-2008, the patient was vaccinated with a 3rd dose of GARDASIL. She underwent an appendectomy due to appendicitis starting on 12-APR-2008. She also complained about pain in mandibular joint and difficulty in mastication. In the course swelling of feet and she was unable to walk. Concomitantly the patient complained about enlarged axillary lymph nodes, oral aphthae and night sweat. The patient was hospitalised from 13-MAY-2008 to 15-MAY-2008 due to suspicion of juvenile rheumatic disease. Symptoms had started about 1 year ago with relapsing pain in cervical spine and pain in knee. Due to increased ESR and IgA values (see lab date) differential diagnoses of a chronic gastrointestinal inflammation with extraintestinal manifestation and a reactive arthritis couldn't be definitely ruled out. Under treatment with VOLTAREN symptoms improved notedly. A check up in the rheumatological outpatient department was arranged in six weeks. The patient was told to continue the medication with VOLTAREN and physiotherapy. Upon medical letter dated 05-JUN-2008 the following diagnoses were established: multiple joint disorders (symptoms included arthritis, mobility decreased, juvenile rheumatoid arthritis, pain in joint, mastication disorder, unable to walk, swelling of feet); microcyteic anaemia, iron deficiency, enthesopathy and mandibular joint arthritis. No further information is available. The case was closed. Other business partner numbers included E2008-05437.

MedDRA PT Activities of daily living impaired, Immediate post-injection reaction, Injection site pain

Symptom Text: Information has been received from a physician's assistant concerning a female with no drug reactions/allergies, who in August 2007, was vaccinated intramuscularly with a first dose of GARDASIL (lot # not reported) 0.5 mL. There was no concomitant medication. In August 2007 after the GARDASIL was administered, the patient experienced immediate severe pain at the injection site of the left arm. Due to the pain, the patient was unable to participate in sports. The pain resolved in one week without requiring treatment. The patient contacted the physician's office via phone. The patient has not received the second or third dose of GARDASIL. No further information was available. Immediate severe pain at the injection site was considered to be disabling. Additional information has been requested.

MedDRA PT Urticaria, Vaccine positive rechallenge

Symptom Text: Information has been received from a physician concerning a 20 year old female with allergies and attention deficit disorder who on 17-AUG-2007 was vaccinated with the first dose of GARDASIL, the second dose was given on 18-OCT-2007, and the third dose was given on 21-FEB-2008. Concomitant therapy included montelukast sodium and CONCERTA. On 27-AUG-2007 the patient developed hives and the hives continued throughout the series and then disappeared in May 2008. The hives appeared on her face, legs, arms, feet and stomach. The hives were described as "large welts, like golf ball size". The patient was seen twice in the emergency room and received EPIPEN administration on each of the visits, she was then discharged home. The patient had been seen by two allergists. Skin testing was performed, but it could not determine the cause for the hives. The physician stated that the allergist believed that the hives were hormone related. Upon internal review, hives requiring epinephrine was determined to be and other important medical event. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Hypoaesthesia, Muscular weakness, Pain in extremity, Sensory loss

Symptom Text: Information has been received from a nurse concerning her 17 year old daughter who in 2007 received the first and on an unspecified date a second dose of GARDASIL. On 14-AUG-2007 was vaccinated with the third dose of GARDASIL (lot # 655618/0186U) 0.5 ml, IM. On 07-JUL-2008, the patient experienced pain, weakness and numbness in her right thumb and arm. Medical attention was sought, she had blood tests, was seen by a neurologist and will have an Magnetic Resonance Imaging (MRI) the week of 21-JUL-2008. The primary care doctor thought this may be associated with GARDASIL until he saw on the chart that the third dose was given in the opposite arm. At the time of reporting, the patient's pain and weakness and numbness persisted. No additional information at this time. Additional information has been requested. 9/16/2008 MR received from PCP. Seen 7/9/2008 with c/o acute onset of numbness which began in the R thumb and spread up to the level of mid triceps. PE (+) for decreased strength of the fingers, wrist and elbow. Sensory deficit to R mid tricep. Tearful and anxious re: symptoms. Ascending sensory deficit on R hand to upper arm with motor weakness. Reflexes intact. Referred to neuro. Neuro consult 7/11/08-improving numbness of unknown etiology. Numbness improving, now only to elbow. Pinprick and touch sensation diminished on R arm. F/U visit 3 weeks later with continued improvement. Still some numbness and decreased sensation of the hand. Will f/u with EMG and/or MRI PRN.

MedDRA PT Dizziness, Erythema, Nausea, Pharyngeal oedema, Pharyngolaryngeal pain, Pyrexia

Symptom Text: Information has been received from a mother concerning her daughter, a 23 year old female with penicillin allergy and "cold medicines" allergy and a history of bipolar and shaken baby syndrome who on 10-JUL-2008 was vaccinated with the first dose of GARDASIL. (Dose, route of administration and lot number were not provided). Concomitant therapy included SEROQUEL, LEXAPRO and TEGRETOL. The patient felt faint after the vaccination. Two days later her throat began to swell and was sore. The mother reported "Her throat was so swollen that she could not eat cereal." The patient also had a red face, fever and was nauseous. The patient sought medical attention via telephone. She started taking BENADRYL on 16-JUL-2008. Her symptoms were improving since starting the therapy with BENADRYL. Additional information has been requested.

MedDRA PT Dyspnoea, Vaccine positive rechallenge

Symptom Text: Information has been received from a physician and a nurse concerning an approximately 17 year old female who on 05-JAN-2008 and 12-MAR-2008 was vaccinated with her first and second doses, respectively, of GARDASIL (Lot # 655327/1287U and 0515X). The patient experienced shortness of breath after her first and second doses of GARDASIL. Subsequently the patient recovered from the events. The reporting physician did not think the reactions were vaccine-related, especially since the patient did not mention the reactions after they happened and came into the office to let the doctor know she would not be getting the third dose. Additional information has been requested.

MedDRA PT Drug exposure during pregnancy, Premature labour

Symptom Text: Information has been received for the pregnancy registry for GARDASIL from a nurse practitioner concerning a 16 year old female with no drug reactions/allergies, reflux, migraine and a history of cardiac surgery who on 07-MAR-2007 was vaccinated with the first dose of GARDASIL IM (Lot# 654885/1424F). Concomitant therapy included rizatriptan benzoate (MSD), propranolol HCl and ranitidine. The patient was pregnant when she was vaccinated with GARDASIL. The patient had a positive pregnancy test. As of 01-MAY-2007, she was noted to be 2.5 months gestation. Follow-up phone call information was received from the nurse practitioner who reported that the patient delivered a healthy, normal, baby that is now 7 months old and not experiencing any problems. During the pregnancy, the patient did have some symptoms of pre-term labor, but went on to deliver full-term, vaginally. No additional information is expected.

MedDRA PT Drug exposure during pregnancy, Inappropriate schedule of drug administration, Seasonal allergy

Symptom Text: Initial and follow up information has been received from the Merck Pregnancy Registry for GARDASIL via a physician concerning a "healthy" 18 year old white female smoker with a history of some problems with her menses who on 29-JUN-2007 was vaccinated intramuscularly into the left arm with a 0.5 ml first dose of GARDASIL. On 05-NOV-2007, the patient was vaccinated with a second dose of GARDASIL. On 05-NOV-2007, the patient was vaccinated with a second dose of GARDASIL (Lot #655620/0170U). Concomitant therapy included SEASONALE. Subsequently, the patient called the doctor's office and stated her home pregnancy test was positive. On 14-NOV-2007, she was seen in the doctor's office and a urine test confirmed pregnancy. A Quantitative blood test for pregnancy was also performed, but the results were not available yet. The patient's last menstrual period was on 04-OCT-2007, estimated date of conception was 18-OCT-2007 and the estimated date of delivery was 10-Jul-2008. On an unspecified date, the patient developed seasonal allergies and was treated with montelukast (MSD). On 22-FEB-2008 and 19-MAY-2008 the patient had routine ultrasound tests with "good" results. It was reported the patient delivered a normal, 18 1/4 inch, 6 lb. 7 oz. female at 38 weeks, 5 days with a had circumference of 12 3/4 inches (Apgar score not reported). Additional information has been requested.

Other Meds: SEASONALE

Lab Data: diagnostic laboratory, 11/14/07 - Quantatitive blood test -- Results not reported; ultrasound, 02/22/08 "good - Routine; ultrasound, 05/19/08 "good - Routine; urine beta-human, 11/14/07 - Positive - confirms pregnancy; Apgar score, 07/05/08

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Anxiety, Drug exposure during pregnancy, Pregnancy induced hypertension

Symptom Text: Initial and follow-up information has been received through the Merck pregnancy registry from a physician and a licensed vocational nurse (LVN) concerning a 19 year old female with a history of depression and anxiety. The patient had a history of an elective termination of 1 previous pregnancy. On 26-SEP-2007, the patient was vaccinated with her first dose of GARDASIL (Lot # 0530U). Concomitant therapy included "CLONAZEPAK" (therapy unspecified). Subsequently, the patient found out she was pregnant. The patient's last menstrual period (LMP) was 02-OCT-2007, with an estimated delivery date of 09-JUL-2008. The patient sought medical attention. On 16-JUN-2008, the patient was treated with VISTARIL 50 mg, 1 every 6 hours PRN for anxiety. During the pregnancy, the patient had complication of mild pregnancy induced hypertension (PIH). On 02-JUL-2008, 39 weeks from LMP, the patient delivered a normal female infant with Apgar score of 9/9. Additional information is not expected.

Other Meds: [therapy unspecified]

Lab Data: Apgar score, 02/07/08, 9/9

History: Depression; Anxiety; Termination of pregnancy - elective

MedDRA PT Drug exposure during pregnancy, Genital haemorrhage, Live birth

Symptom Text: Initial and follow up information has been received from a registered nurse through the Merck pregnancy registry for GARDASIL concerning a 26 year old female with no previous pregnancies, no pertinent medical history, and no known allergies who on 27-JUL-2007 was vaccinated with her first dose of GARDASIL (Lot #658100/0525U) intramuscularly. On 28-SEP-2007 the patient received her second dose of GARDASIL (Lot #658100/0525U) intramuscularly. There was no concomitant medication. On 28-SEP-2007, before the second dose, a urine pregnancy test was administered. The result was negative for pregnancy. The patient called the office stating that she was pregnant and an OB intake appointment was on 14-DEC-2007. A urine pregnancy test was performed on this day with positive results. On 27-DEC-2007 an ultrasound was performed, and on 24-JAN-2008 a maternal serum alphafeto protein was done, both tests were within normal limits. The patients last menstrual period was 02-OCT-2007 and the estimated delivery date was 08-JUL-2008. During the first trimester, the patient had complication of first trimester spotting. On 10-JUL-2008, 41 weeks from the LMP, the patient delivered a normal live born female infant weighing 7lbs 14ozs and apgar of 9/9. Additional information is not expected.

Other Meds: None

Lab Data: Ultrasound, 12/27/07, NT scan - within normal limits; Urine beta-human, 09/28/07, results were negative; Serum alpha-fetoprotein, 01/24/08, screening - within normal limits; Urine beta-human, 12/14/07, results were positive.

MedDRA PT Wrong drug administered

Symptom Text: Initial and follow up information has been received from a registered nurse concerning a 48 year old male, with a thyroid nodule, tick bite, allergies to FLEXERIL and SYNTHROID and a history of a positive PPD tuberculin test who on 20-MAY-2008 was vaccinated intramuscularly in the left deltoid with a single dose of GARDASIL (Lot # 658556/1060U). The nurse reported that the patient was intended to received a tetanus toxoid vaccine (unspecified), but GARDASIL was inadvertently administered. The nurse confirmed that this was a case of human error and not product confusion. No problems were reported. The nurse reports that there were no known adverse events. The patient was at the office "to evaluate area of tick bite". The patient had a negative "Lyme's titer" (not further specified). On 21-May-2008, the office called the patient and the patient reported no ill effects. The patient has not contacted the office subsequently. No additional information was provided. Additional information is not expected.

Other Meds: Unknown

MedDRA PT Ear pain, Injection site pain, Wrong drug administered

Symptom Text: Initial and follow-up information has been received from a registered nurse concerning a now 12 year old male who on 04-JUN-2008 was vaccinated IM in the left arm with a dose GARDASIL (lot# 659962/1740U) 0.5 ml. Concomitant therapy included BOOSTRIX. The nurse had indicated that the patient had inadvertently received the GARDASIL vaccine. No adverse effects were reported at the time. Follow-up information from the nurse indicated that on 05-JUN-2008, the patient complained of pain at the injection site for 2-3 days and complained of earache of the left ear for a day following the injections. The patient did not seek medical attention. The patient recovered on 08-JUN-2008. Follow-up information from a phone call was received on 01-AUG-2008. The nurse had clarified that the patient had inadvertently received the GARDASIL due to wrong drug being administered. The nurse also stated that "the family stated he has had earaches before." No other information is available. No further information is available.

MedDRA PT Anaphylactic reaction, Anxiety, Cardiac murmur, Choking sensation, Dyspnoea, Feeling cold, Haematemesis, Muscle twitching, Nausea, Oxygen saturation decreased, Stridor, Syncope, Tachypnoea, Throat tightness, Vision blurred, Vomiting

Symptom Text: Information has been received from a physician via another company as part of a business agreement (manufacturer control # GARD 2007 05 25001) concerning a 15 year old female who was vaccinated with GARDASIL. On the day of vaccination with GARDASIL the patient "fainted and kept fainting". The physician advised that the patient developed a new heart murmur. Echocardiography and Holter monitoring were done and the results were normal. The physician advised that the patient may be "histrionic". Further Information has been received from the NSW Department of Health, via CSL as part of a business agreement, with follow-up information received on request by the Company via a Line Listing from the NSW Department of Health. As part of the regular school-based immunisation program funded by the government, on 07-MAY-2007, the patient was vaccinated with GARDASIL (Lot No. 655742/0138U, Batch No. J0798, Expiry date 07-AUG-2009). Half an hour after the vaccination the patient fainted. The patient complained of nausea, blurred vision, mild twitching prior to fainting. The patient has continued to faint since. Total 12 times in 13 days. The patient was referred to general physician and cardiologist. Nothing abnormal was detected by a cardiologist. The outcome was reported as ongoing. The reporter considered that repeated syncope was probably related to therapy with GARDASIL. The original reporting source was not provided. Information was also obtained on request by the Company from the agency via a Case Line Listing and a Public Case Detail Form. It was reported that on 07-MAY-2007 after vaccination with GARDASIL the patient developed muscle twitching, nausea and blurred vision which required consultation with a specialist physician. At the time of reporting to the agency on 29-MAY-2007 the patient had not yet recovered from the syncope, muscle twitching, nausea, blurred vision and syncope. The agency considered that syncope, muscle twitching, nausea and blurred vision were probably related to therapy with

MedDRA PT Abdominal pain upper, Anaphylactic reaction, Asthenia, Back pain, Dyspnoea, Eye pruritus, Hypersensitivity, Tachycardia, Vision blurred

Symptom Text: Information has been received from the agency, via CSL as part of a business agreement, with follow-up information received on request by the Company via a Line Listing from the agency. This case was also reported in a newspaper article. On 11-MAY-2007, as part of the regular school-based immunisation program funded by the government, a 16 year old female was vaccinated with GARDASIL (Lot No. 655742/0138U, Batch No, J0798, Expiry date 07-AUG-2009). 1 hour post vaccination on 11-MAY-2007, the patient developed an allergic reaction described as shortness of breath, feeling weak, stomach ache, backache, itchy eyes, blurred vision and elevated pulse rate (100/min). The patient was transferred to an emergency department at a hospital, however no treatment was given and the patient was subsequently discharged. The agency considered that allergic was possibly related to therapy with GARDASIL. The original reporting source was not provided. Information was obtained on requested by the Company from the agency via a Public Case Detail Form and a Case Line Listing. It was reported that on 11-MAY-2007, 1 hour post vaccination with GARDASIL, the patient experienced shortness of breath, stomach ache, felt weak, backache, itchy eye, tachycardia and blurred vision (In follow-up it was reported that on 11-MAY-2007, the patient also experienced anaphylactic reaction). On 11-MAY-2007, the patient recovered from shortness of breath, stomach ache, felt weak, backache, itchy eye, tachycardia and blurred vision (In follow-up it was reported that on 11-MAY-2007, the patient also recovered from anaphylactic reaction). The agency considered that shortness of breath, stomach ache, felt weak, backache, itchy eye, tachycardia and blurred vision were possibly related to therapy with GARDASIL (In follow-up it was reported that the agency considered that anaphylactic reaction was probably related to therapy with GARDASIL. The original reporting source was not provided. Information has been received from media monitors advising that the patient'

MedDRA PT Allergy to vaccine, Anaphylactic reaction, Chest discomfort, Chest pain, Cough, Drug eruption, Dyspnoea, Feeling cold, Immediate post-injection reaction, Injection site pain, Nausea, Paraesthesia, Rash generalised, Rash pruritic, Tachypnoea, Throat tightness, Urticaria papular, Wheezing

Symptom Text: Information was obtained on request by the Company from the agency via a Case Line Listing with follow-up received from the agency via a Public Case Details Form. This case was also reported in a newspaper article. On 17-MAY-2007 a 16 year old female was vaccinated with GARDASIL, intramuscularly as prophylaxis (Lot No. 655742/0138U, Batch No. J0798, expiry date 07-AUG-2009). Subsequently after vaccination with GARDASIL, the patient developed papular urticaria and drug eruption, starting on the inside of wrists and progressively spreading over entire body. The rash was extremely itchy. On 24-JUL-2007 the patient's papular urticaria and drug eruption resolved. A skin biopsy was conducted by a dermatologist and the result was discussed with a specialist. It was thought that GARDASIL was the cause. The agency considered the papular urticaria and drug eruption were certainly related to therapy with GARDASIL. The original reporting source was not provided. Information was received from the media monitors advising that the patient's experience was subsequently reported in an article. Subsequently, the patient's experience was reported in a published article. It was reported that this patient's experience was classified as anaphylaxis. It was described that less than 5 minutes post vaccination, the patient reported symptoms of immediate pain at the injection site, rash on face, neck and chest, generalized prickle sensation, sensation of throat closure, cough, difficulty breathing or talking, tight painful chest, felt wheezy, nausea and felt cold. The observed signs and symptoms witnessed by the school nurses were urticarial rash to face and neck and tachypnea. The patient was treated with salbutamol. This patient fulfilled level 2 of Brighton level of diagnostic certainty of anaphylactic reaction. The authors of the article considered that anaphylaxis was certain or very likely related to therapy with GARDASIL. The article also discussed the experiences of 7 other patient's who experience anaphylaxis following vaccinatio

MedDRA PT Anisocytosis, Asthenia, Cell death, Cholestasis, Chromaturia, Febrile infection, Haemolytic anaemia, Hyperbilirubinaemia, Jaundice, Rash pruritic, Steroid therapy, Transfusion

Symptom Text: Information has been received from a health authority concerning a 17 year old female with chronic urticaria and family history of rheumatoid arthritis (mother) who in June 2008, was vaccinated with the third dose of GARDASIL IM (lot # not reported). On 29-JUL-2008 the patient developed pruritic rash on the hands and the back, treated with H1 antihistamines, which asthenia and seemingly dark urine. She was admitted on 02-AUG-2008 due to febrile icterus revealing haemolytic anaemia. Tests found anaemia with haemoglobin at 6.5g, regenerative with 276,000 reticulocytes, macrocytic, and also anysocytosis with 10% spherocytes. Initial work-up (values not provided) found cytolysis, cholestasis, bilirubinaemia, significantly decreased haptoglobin but normal hemostasis, absence of vitamin deficiency and schizocytes. Coombs test was positive for IgG. The following serologies were negative: hepatitis A, B, C, HIV, mycoplasma, parvovirus B19. Infectious mononucleasis test was negative. Abdominal ultrasound and CT scan of abdomen and chest were negative; thymoma was ruled out and there was no adenopathy. Antinuclear antibodies were slightly positive with 1/60. The following antibodies were negative: native anti-DNA, anti smooth muscle, antiribosome, antimitochondrial, antireticulum, anticardiolipid, anti-SSA, anti-Sm, anti-Jol. The patient received blood transfusion and corrective treatment with corticosteroids, which enabled her discharge on 18-AUG-2008 with hemoglobin rate of 8.6 g and 9.9 g on 20-AUG-2008. Follow-up consultation was scheduled one month later. The patient was reported to have recovered. The case is closed. Other business partner numbers included: E2008-08298 and NT20080392. Additional information is not expected.

MedDRA PT Chillblains

Symptom Text: Information has been received from a health authority concerning a 18 year old female with history of acne who in April 2008, was vaccinated with the first dose of GARDASIL (lot # not reported) IM. Suspect therapy reported by the health authority also comprised isotretinoin in April 2008 for the treatment of acne and ethinylestradiol (+) drospirenone on May 2008 for contraception. A few days after vaccination, the patient experienced flares of childblain suggestive of lupus eruption. Antinuclear antibodies were positive at 1/320. In a dermatological consultation, it was decided to discontinue isotretinoin, then ethinylestradiol (+) drospirenone one month later. Further testing of antinuclear antibodies was scheduled. The health authorities specified that flares of childblain already existed before the first injection of GARDASIL. At the time of reporting, the patient had not recovered. Flares of childblain suggestive of lupus eruption and positive antinuclear antibodies were considered to be other important medical events. Other business partner numbers included: E2008-08308 and SE20080306. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Ageusia, Facial palsy, Headache, Muscle twitching, Pharyngolaryngeal pain, Steroid therapy

Symptom Text: Gardasil vaccine was given to my daughter on August 5th, 2008. On the morning of September 11th, 2008 my daughter woke up with the right side of her face paralyzed. She is unable to smile on the right side. She can not blink well with the right eye. She also can not taste. She has had a headache on the right side of her head behind her ear. We went to the emergency room immediately and after a thorough exam she was diagnosed with Bell's Palsy. Needless to say she is not going to be getting the 2nd and 3rd dose of Gardasil. We have been reading that Bell's Palsy has been reported as a side effect of Gardasil. I feel strongly that others need to be aware of the possible serious side effects. Merck should not downplay these very serious side effects. We are very upset that it has been marketed as "very safe". 9/16/08 Reviewed ER medical records of 9/11/08. FINAL DX: Bell's palsy Records reveal patient experienced HA, taste alteration, right eye twitching x 2 days, right facial paralysis, mouth drooping & unable to completely close right eye x 1 day. Had sore throat 1 week prior. Tx w/steroids & referred to PCP on d/c to home.

MedDRA PT Drug exposure during pregnancy, Vaginal haemorrhage

Symptom Text: Information has been received through the Merck pregnancy registry from a nurse concerning a female with no pertinent medical history and no history of drug reactions or allergies on prior pregnancies who between January and April 2008 received at least 2 doses of GARDASIL at a different facility. There was no concomitant medication. The patient was pregnant. Her last menstrual period was approximately 26-DEC-2007. The estimated due date is 02-OCT-2008. The patient was seen in the reporter's office in April 2008 for obstetric care. On 23-APR-2008, the patient had a normal ultrasound and negative serum alpha-fetoprotein test. On approximately 26-MAY-2008, the patient developed vaginal bleeding. On 25-MAY-2008, an ultrasound was performed and was normal. At the time of the report, the patient's outcome was unknown. Additional information has been requested.

MedDRA PT Abdominal pain, Asthenia, Azotaemia, Cardiac failure congestive, Cardiomyopathy, Chest pain, Chills, Death, Dizziness, Dyspnoea, Hypotension, Hypoxia, Intensive care, Intra-aortic balloon placement, Malaise, Myocardial infarction, Myocarditis infectious, Pain, Pyrexia, Respiratory distress, Shock, Tachycardia, Ventricular tachycardia, Viral cardiomyopathy, Viral myocarditis

Symptom Text: Information has been received from a physician concerning a 17 year old female with acne who on 24-JUL-2008 was vaccinated with the first dose of GARDASIL. Concomitant therapy included erythromycin, solution, topical. On 04-AUG-2008, the patient experienced abdominal pain, chest pain and aching everywhere and was hospitalized. On 05-AUG-2008, the patient experienced myocarditis and died. Diagnosis was myocarditis but the doctor said it was not related to GARDASIL. The last time she was seen in this office was 2005. No additional information at this time. Additional information has been requested. 10/01/08 Death certificate states COD as myocarditis & CHF as contributing factor. 9/22/08 Reviewed PCP medical records. Reveals patient experienced abdominal pain, chest pain & aching everywhere. Expired 8/5/08 w/viral infection of the heart. Concomitant med was erythomycin topical solution for acne. Patient noted to be in good health on day of vaccination. 4/2/09 Received hospital medical records for 8/3-8/4/2008. FINAL DX: deceased secondary to severe nonischemic cardiomyopathy secondary to viral myocarditis Records reveal patient experienced fever, chills, feeling unwell x 2-4 days. Presented to ER w/abdominal & chest pain, weakness, dizziness, hypotensive, tachycardia, SOB, respiratory distress w/hypoxemia, azotemia, shocklike symptoms. EKG w/diffuse ST changes & ST elevations. Dx w/acute anteroseptal MI Emergent cardiac cath revealed EF 23% & balloon pump placed. Intensive care, deteriorated, V-tach, decompensation, extensive resuscitation efforts failed.

Other Meds: erythromycin

MedDRA PT Coma, Death

Symptom Text: Information has been received from a nurse practitioner concerning a 19 year old female who was vaccinated with a dose of GARDASIL. The nurse practitioner stated that the patient "was admitted to the hospital while in a coma and died shortly afterward. The physician at the hospital felt that this was caused by GARDASIL". The cause of death was not reported. The vaccine was not given to the patient at the nurse practitioner's office, so she was unsure of further details. The reporter considered the event to be immediately life threatening and disabling. Attempts are being made to verify the existence of an identifiable patient and reporter. Additional information has been requested.

MedDRA PT Abdominal discomfort, Cardiac enzymes increased, Catheterisation cardiac, Chest discomfort, Chest pain, Death, Dizziness, Dyspnoea, Ejection fraction decreased, Hypoaesthesia, Nausea, Resuscitation, Ventricular tachycardia

Symptom Text: This is a 17-year-old patient who presents ON 8/3/08 with an approximately 4-day history of nonspecific nausea and abdominal discomfort. This was initially thought to be dyspepsia. The patient was treated with Pepto-Bismol. There may have been some initial improvement; however, the patient continued to have persisting abdominal discomfort. Upon admission, patient had increased symptoms of shortness of breath with dizziness and left upper extremity and left lower extremity numbness. The patient also has crushing substernal left-sided chest discomfort. The patient presented to the Emergency Department, at which point cardiac enzymes ordered were significantly elevated. Patient was given Zofran for her nausea. Patient was also given aspirin 81 mg x3. D-dimer was checked (2). Patient was started on dopamine drip. Due to the patient's deteriorating status, the patient was taken emergently by Cardiologist for a right and left heart catheterization. Based on report, left heart catheterization shows no evidence of coronary disease. Ejection fraction was measured at 23%. Based on the verbal report from MD, there is no tamponade physiology on right heart catheterization. Patient has no previous surgical or significant medical history. She had recently received the Gardasil vaccine from her PCP. Patient denies history of asthma, cardiac disease. Secondary to her EF, an intraaortic balloon pump was placed and the patient was returned to CCU. However, over the next 6-8 hours, her function continued to deteriorate, she went into V tach which led her to further decompensate. She was resuscitated for more than 1-1/2 hours to maintain her blood pressure above 90. Cardiothoracic surgery was consulted to place her on bypass and place her on an assistive device. However, due to her current status, it was elected not to do so. CPR continued until the priest was available, and care was withdrawn. Patient was pronounced dead on 8/4/08.

Other Meds:

MedDRA PT Hypoaesthesia facial, Hypoaesthesia oral, Lumbar puncture, Multiple sclerosis

Symptom Text: Information has been received from a physician concerning an 18 year old female with no pertinent medical history or no drug allergies who on an unspecified date, was vaccinated with the first dose of GARDASIL. There was no concomitant medication. After receiving GARDASIL at an unspecified time, the patient developed left sided facial numbness. The patient was diagnosed with multiple sclerosis six months after receiving first dose from a magnetic resonance imaging test and from a spinal fluid test. At the time of reporting, the patient was recovering. Medical attention was sought via office visit. No product quality complaint was involved. Upon internal review, multiple sclerosis was determined to be an other important medical event. Additional information has been requested. 10/21/08 Reviewed neurology medical records of 8/28-9/9/2008. FINAL DX: multiple sclerosis Records reveal patient experienced left facial & tongue numbness x 6 days on initial evaluation 8/28. RTC 9/9 for spinal tap w/abnormal CSF c/w MS. Referred for repeat MRI w/gadolinium which had been denied by insurance previously.

MedDRA PT Activities of daily living impaired, Dizziness, Head injury, Headache, Syncope

Symptom Text: Information has been received from a physician concerning her niece, a 21 year old female patient who about a year ago, in 2007, was vaccinated with the first dose of GARDASIL. The patient received the first dose of GARDASIL and fainted and she hit her head about 10 minutes after receiving the first dose. The patient was transported to the emergency room for the treatment. The patient experienced numerous days of headache and dizziness that went on for at least one month. The patient was unable to compete in sports and missed the rest of her sport season. The patient completed the remaining two doses of GARDASIL without problems. The patient recovered from delayed syncope event, head injury, headache and dizziness. The delayed syncope event, headache and dizziness were considered to be disabling by the physician. Additional information has been requested.

MedDRA PT Cervix carcinoma

Symptom Text: Information has been received from a physician concerning a female with a history of condyloma who in 2008 was vaccinated with GARDASIL. The physician noted that the patient was cauterized and subjected to biopsy prior to vaccination. The result of the biopsy was negative. In 2008, after three weeks from vaccination, the patient was again subjected to another biopsy as part of check up and monitoring. The result was (+) for cervical cancer. Relationship of cervical cancer with GARDASIL is unknown at the time of reporting. The physician did not indicate stage of CIN. It was advised by another physician that her patient undergo MICROARRAY procedure to pinpoint the real cause of infection. Cervical cancer is considered serious. Upon internal medical review, cervical cancer is also considered an important medical event. Additional information has been requested. This is an amended report. Other important medical event serious criteria has been changed from "no" to "yes'.

MedDRA PT Incorrect route of drug administration, Paraesthesia mucosal, Paraesthesia oral, Sensation of heaviness

Symptom Text: Information has been received from a gynaecologist concerning a 22 year old female with not reported medical history, who on 22-JUL-2008 was vaccinated with the first dose of GARDASIL (lot # 1114U; batch NG10940) SC into the right upper arm. Therapy included doxycycline for an unspecified indication, starting on 29-JUL-2008 for 10 days. On 13-AUG-2008, the patient experienced paresthesia of the lips, the tip of the tongue and the buccal mucous membrane. Since 14-AUG-2008 she also developed paresthesia and feeling of heaviness of the left upper and lower arm. The patient was hospitalized from 15-AUG-2008 to 16-AUG-2008. Neurological examination was normal except for the paresthesia in the upper and lower arm and feeling of heaviness of the left arm. CSF showed normal results for cells and protein. Results of oligoclonal bands were not available at the time of reporting. Cranial magnetic resonance imaging (MRI) showed two small lesions at the anterior and posterior horn. At time of reporting, the patient had not recovered. No final diagnosis was established. Other business partner numbers included: E2008-08313. Additional information has been requested.

Other Meds: Doxycycline

Lab Data: magnetic resonance imaging, 15?Aug08; Two small lesions at the anterior and posterior horn; CSF oligoclonal band profile, 15?Aug08, results not available; cerebrospinal fluid total protein test, 15?Aug08, normal; cerebrospinal fluid analysis

MedDRA PT Central nervous system lesion, Demyelination, Dysaesthesia, Hypoaesthesia, Neurological symptom

Symptom Text: Information has been received from the health authority (reference number 89029) concerning a 23 year old female with thyroiditis, celiac disease and allergic rhinitis who on 06-FEB-2008 was vaccinated IM with a first dose of GARDASIL (batch # NF35170/lot #1475F), and on 16-APR-2008 was vaccinated IM with a second dose of GARDASIL (batch # NF35170/lot #1475F). On 21-APR-2008, five days after the second dose she presented with neurologic symptoms consistent in dysaesthesia and hypoasthesia of the lower right limb that lead to hospitalization for a suspected central nervous system inflammatory disease. On 13-MAY-2008, a magnetic resonance imaging (MRI) with gadolinium revealed disseminated hyperintense demyelination lesions of the brain and of the spinal cord. On 19-JUN-2008 cerebrospinal fluid examination showed positive anti IgG oligloconal bands. On 19-JUN-2008, a new MRI with T2-fluid attenuated inversion recovery (FLAIR) revealed a slight increase on the number of the disseminated hyperintense demyelinating lesions. From 24-JUN-2008 to 27-JUN-2008 the patient was treated with high dose of E.V. corticosteroid with an improvement of the symptoms. The diagnosis suspected was of an acute disseminated encephalomyelitis (ADEM) or a multiple sclerosis (MS). Follow up information of this case is pending. Additional information is expected.

Other Meds: Unknown

Lab Data: magnetic resonance imaging, 13May08, (MRI with glandolinium)-disseminated hyperintense demyelinating lesions of the brain and spinal cord; magnetic resonance imaging, (MRI with FLAIR) - slight increase on the no. of the disseminated hyperin

MedDRA PT Muscle spasms, Pharyngitis, Urticaria

Symptom Text: Information has been received from local Health Authorities (reference number DJ20080735) concerning a 23 year old female patient with no relevant medical history reported who on 27-JUN-2008 was vaccinated with GARDASIL injection (batch number not reported). Secondary suspect therapy on the same day included REPEVAX injection (batch number not reported). Other concomitant therapy included "HOLGYEME". On 28-JUL-2008 the patient experienced an urticaria of unknown aetilogy and a pharyngitis. She was prescribed corrective treatment with XYZALL from 28-JUL-2008 to 31-JUL-2008 and with paracetamol. On 31-JUL-2008 the patient suffered from cramps in lower extremities mainly nocturnal with progressive intensity. She consulted the physician on duty at the hospital on 01-AUG-2008. XYZALL which was suspected was stopped and cramps disappeared 2 to 3 days later. At the time of reporting the outcome for urticaria and pharyngitis was not specified. The events of urticaria, muscle spasms and pharyngitis required hospitalization. Additional information is not expected. Other business partners included are: E2008-08268.

MedDRA PT Dermographism, Incorrect route of drug administration, Rash, Skin lesion, Urticaria

Symptom Text: Information has been received from the health authority concerning a 14 year old female with a personal and family history of asthma and atopy, who on 23-OCT-2007 was vaccinated subcutaneously with the first dose of GARDASIL. The second and third doses were administered on 08-JAN-2008 and 13-JUN-2008, respectively. In early December 2007, approximately 5 to 6 weeks after the first injection, the patient experienced rash of urticaria on the back of her hands. Flares of urticaria were recurring everyday with no identified eliciting factor and despite treatment with ATARAX, XYZALL and POLARMINE for one month followed by corticotherapy with SOLUPRED for 15 days. In April 2008, an unspecified examination showed isolated dermographism and the patient was hospitalized. Biological tests were normal. No hepatic or autoimmune thyroid impairment was found. All serologies were negative for Hepatitis A virus (HAV), Hepatitis B virus (HBV) and Epstein Barr virus (EBV). toxoplasmosis, tomocara, antistreptokinase, antistreptolysin-O and hydatidosis. Flares subsequently regressed on antihistamines alone. However, on 14-JUN-2008, the day after the third injection , cutaneous lesions recurred then resolved on H1 antihistamines. Subsequently, the patient recovered from chronic urticaria on H1 antihistamines. Other business partner numbers include: E20080823 and MA20081479. Additional information is not expected.

MedDRA PT Myalgia, Sensation of heaviness, Vaccine positive rechallenge

Symptom Text: Initial and follow-up information has been received from a paediatrician concerning a 17 year old female who on 22-MAY-2007 was vaccinated with the first dose of GARDASIL (lot # 654884/0902F, batch # NE24240) IM into the upper arm. No adverse effects occurred. On 23-JUL-2007 she was vaccinated with the second dose of GARDASIL (lot # 1518F, batch # NF23330) IM into the upper arm. She developed muscle pain in the arms and legs, in particular during exertion (walking upstairs, doing sports) approximately 14 days post vaccination. Despite ongoing adverse events she was vaccinated with a third dose of GARDASIL (lot # 0276U, batch # NF58550) IM into the upper arm on 23-NOV-2007. She developed increased muscle pain since the third dose of vaccination. Concomitant therapy included hormonal contraceptives. The adverse events were ongoing, but less intense. She still complained of pain and a feeling of heaviness in the lower legs in particular when under stress or physical exertion. Laboratory tests on blood count, borreliosis complement fixation reaction, serum creatine kinase test, serum aspartate aminotransferase test and serum C-reactive protein test showed normal results (date not reported). Laboratory findings on 24-JUN-2008 revealed that antistreptolysin was negative, and C-reactive protein was 0.20 mg/dl, and borrelia spp. IgG and IgM (serum) were negative, and there was no indication for a borrelia infection. The reporter assessed the case as serious as an other important medical event. Other business partner numbers included: E2008-05780. Additional information has been requested.

Other Meds: Hormonal contraceptives (unspecified), unk, unk

MedDRA PT Diplopia, Dizziness, Hypoaesthesia, Inappropriate schedule of drug administration, Paralysis, Vertigo, Visual disturbance

Symptom Text: Information has been received from a 31 year old female consumer who in January 2008, was vaccinated with a third dose of GARDASIL. One to two weeks post-vaccination, she developed dizziness, double vision, numbness and paralysis. On 06-MAR-2008 she was admitted to a neurological department of a hospital. An infection was excluded in hospital. Dizziness and double vision were ongoing at the time of reporting. The outcome of numbness and paralysis was not reported. The first dose of GARDASIL was administered in July 2007, and the second dose of GARDASIL was in October 2007 and were well tolerated. The family physician was contacted and confirmed the events of the patient. A doctor's report was sent indicating that the patient was hospitalized from 06-MAR-2008 to 08-MAR-2008. At the end of January 2008 the patient developed continuous vestibular vertigo with abnormal vision (rotating colored circles). She was referred to the ophthalmologist and the examination showed no pathologies. Approximately 14 days prior to hospitalization the patient experienced blurred vision and a few days prior she complained of weakness of both hands with mild hypoaesthesia. A Cranial MRI from 27-FEB-2008 and cerebro spinal fluid on 06-MAR-2008 showed normal results and an infectious genesis of the symptoms was ruled out. There was no indication of a chronic inflammatory CNS disease. Borrelia IgM was negative. The abnormal vision resolved in an unspecified time. Vestibular vertigo and blurred vision were ongoing. The outcome of hypoaesthesia and weakness was not reported. The patient had had a history of borreliosis in 2006, and since then recurrent arthralgia. Other business partner numbers included E2008-08099. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Abdominal pain, Dyspnoea

Symptom Text: Information has been received from a physician concerning a 20 year old female with endometriosis who on 15-AUG-2008 was vaccinated with the first dose of GARDASIL. Concomitant suspect therapy included LUPRON DEPOT administered on 26-AUG-2008 (indication not reported). Other concomitant therapy included meningococcal vaccine (unspecified). On approximately 27-AUG-2008, "about 12 days after initial dose of GARDASIL vaccine" the patient experienced abdominal pain and shortness of breath. On 02-SEP-2008 "last night" the patient visited hospital emergency room (ER) and was administered medication for abdominal pain. Lab studies were performed with no results reported. The patient was discharged from the emergency room. The ER physician felt that the patient's visit was "probably related to patient's condition of endometriosis and LUPRON DEPOT vaccine." The reporting physician was not the physician of record when the patient received the initial dose of HPV vaccine, as the patient was relocated due to hurricane. At the time of this report, the patient's abdominal pain and shortness of breath persisted. It was reported that the patient planned to received the next scheduled HPV vaccine and was scheduled to see the physician on 03-SEP-2008. The patient's abdominal pain was considered to be an other important medical event since the event required pain medication in the ER. Additional information has been requested.

MedDRA PT Idiopathic thrombocytopenic purpura, Injection site pain

Symptom Text: Initial and follow-up information has been received from a physician concerning a female patient who on 08-OCT-2007, was vaccinated with her first dose of GARDASIL (Lot # 657622/0388U). On 07-DEC-2007, was vaccinated with her second dose of GARDASIL (Lot # 659435/1265U). On 23-JUN-2008, was vaccinated with her third dose of GARDASIL (Lot # 660393/0067X). After receiving the vaccine "the patient experienced numbness at injection site. The physician stated that she may have thrombocytopenia, she required platelets." The patient sought unspecified medical attention. In follow-up, the nurse reported that the patient had a concurrent condition of Idiopathic thrombocytopenic purpura (ITP). The nurse stated that the patient's mother inquired if the GARDASIL vaccinations had anything to do with the problems her daughter was experiencing with ITP. The nurse stated that the patient made a general statement that the injection was painful and the patient did not complain of injection numbness. Upon internal review, thrombocytopenia was determined to be an Other Important Medical Event. No further information is available.

MedDRA PT Dizziness, Headache, Neck pain

Symptom Text: Initial and follow up information has been received from Health Authority (HA ref. 082692) concerning a 16 year old female patient who on 01-JUL-2008 was vaccinated with GARDASIL (lot no., batch no., route, injection site not reported). The day after vaccination (on 02-JUL-2008) the patient developed headache, slight pain in the neck and dizziness. There was no nausea or vomiting. She visited open health care center and after two hours of observation she was better and could return home. The outcome was recovered. Headache, slight pain in the neck and dizziness were considered to be other important medical events. Other business partner numbers include E2008-07077. The case was closed. No further information is available.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Eye infection, Scar, Visual acuity reduced

Symptom Text: Information has been received from a consumer concerning her daughter a 21 year old female with penicillin allergy and sulfonamide allergy and no other medical history who in May 2008, was vaccinated with a first dose of GARDASIL. Concomitant therapy included a birth control medicine (name not provided). One week after receiving GARDASIL, the patient developed a bad eye infection in her left eye. The patient's vision with this eye had become worse and had a scar on this eye. Unspecified medical attention was sought. The patient was noted to be recovering. No product quality complaint was involved. Additional information has been requested.

MedDRA PT Palpitations

Symptom Text: Information has been received from a registered nurse (R.N.) concerning her 14 year old daughter with adverse drug reaction to pertussis vaccine (caused muscle rigidity) who on 26-JUN-2008 was vaccinated intramuscularly with her first 0.5 ml dose of GARDASIL. Concomitant therapy included unspecified birth control medication. On 07-JUL-2008 the patient started to experience intermittent episodes of heart palpitations. The episodes of palpitation lasted from several minutes to a few hours and resolved without treatment. On 12-JUL-2008 the patient was evaluated in a local emergency room. A complete blood count was normal. A 24 hours Holter monitoring was performed (results pending). At the time of the report, the patient was still experiencing 1-2 episodes of heart palpitations per day. Additional information has been requested.

Other Meds: hormonal contraceptives

MedDRA PT Asthenia, Hypoaesthesia, Rash

Symptom Text: Information has been received from a health professional concerning a 16 year old female patient with a history of absence seizure free for 2 years-off divalproex sodium (DEPAKOTE for 2 years) who on 25-JUN-2008 at 10:00 am was vaccinated intramuscularly in the right arm with a first dose of GARDASIL (Lot #658222/0927U). On 25-JUN-2008 the patient went to bed and woke up four times that evening complaining of numbness in the left arm and weakness. She developed a rash on both arms from wrist to elbows the next day on 26-JUN-2008. The numbness and weakness resolved the next morning. At the time of reporting, the outcome of the rash on both arms from wrist to elbows was unknown. It was not specified if there was an illness at the time of vaccination. No further information is available.

MedDRA PT Injection site erythema, Injection site pain, Injection site swelling, Urticaria

Symptom Text: Information has been received from a consumer concerning her daughter, an 18 year old female with penicillin allergy who on an unspecified dates was vaccinated with the first and second doses of GARDASIL. The patient did not experience any adverse symptoms after the first and second dose of GARDASIL. In March 2008, was vaccinated with the third dose of GARDASIL, intramuscular, in the left upper arm. There was no concomitant medication. In March 2008, since the patient received the third dose of GARDASIL she developed redness, swelling and tenderness at the injection site of the left upper arm within hours of receiving it. The injection site reaction resolved in a few days without treatment. Since then, the patient has experienced intermittent episodes of widespread hives. The patient was examined by her primary care physician, as well as an allergist, who both prescribed antihistamines and a short-course of unspecified steroids. Contact information for the primary care physician and allergist were not provided. The allergist performed allergy testing, which was negative. The patient continues to experience the episodes of hives. The patient is scheduled to be evaluated by a dermatologist on 21-JUL-2008. No further information available at this time. Additional information has been requested.

MedDRA PT Chest pain, Palpitations

Symptom Text: Information has been received from a medical assistant concerning a 16 year old female who in July 2008, was vaccinated with a 0.5 ml dose of GARDASIL intramuscularly into the deltoid (lot number not reported). It was unspecified if this was the patient's first dose or a subsequent dose. Subsequently, also reported as about a week ago, the patient experienced heart palpitations and chest pain. The patient's mother called the office and the reporter instructed the patient to go to the emergency room. It was reported that the office had checked with the hospital but it did not appear that the patient went to the emergency room. Additional information has been requested.

MedDRA PT Alopecia, Inappropriate schedule of drug administration

Symptom Text: Information has been received from a 29 year old female consumer with no pertinent medical history, no family history of alopecia and no allergies who on 22-JAN-2007 was vaccinated with the first dose of GARDASIL (lot#654389/0961F) 0.5ml IM. On an unspecified date the patient was vaccinated with the second dose of GARDASIL (lot#657617/0384F) 0.5ml IM. On 16-JUL-2007 the patient was vaccinated with the third dose of GARDASIL (lot#658222/0927U) 0.5ml IM> There was no concomitant medication. By March 2007, the patient experienced severe hair loss after the first dose and the patient's hair began as a small bald spot. There was a patch of hair missing and the area was completely slick. The patient saw a dermatologist who said it was not caused by vaccine but instead from alopecia. After the third dose the patient's entire crown of her head was bald and slick. The tests performed on the patient which all came up as negative for lupus, thyroid problems and heavy metal. Additional information has been requested.

Other Meds: None

MedDRA PT Cold sweat, Convulsion, Malaise, Muscle rigidity, Pallor

Symptom Text: Information has been received from a nurse practitioner concerning a female in her early 20's who on 09-SEP-2008 was vaccinated with the first dose of GARDASIL and experienced a vaso vascular episode or seizure following administration of vaccine. There was no concomitant medication. The patient received the vaccination and stated that she did not feel well. The patient was assisted to a chair and laid her head back against the wall. The patient called a nurse and had placed her head on the desk. Effort was made to have the patient sit up and placed her between her knees. She became rigid and made snorting noises. The patient was lowered to the floor and woke up in a few seconds. She was pale and clammy, blood pressure was 108/72. Patient was treated with an ice pack to the back of the neck. Within 15 minutes the patient reported feeling better and went home. the events were considered to be disabling. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Alkalosis, Drug exposure during pregnancy, Premature labour, Renal failure, Toxoplasmosis

Symptom Text: Information has been received through the Merck pregnancy registry from a physician concerning a 17 year old female with a history of a pap smear on 01-DEC-2006 that was positive for HPV and showed ASCUS, and a colposcopy on 11-JAN-2007 which showed LGSIL, who on approximately 03-JUN-2008 was vaccinated with a first dose of GARDASIL (route and administrating site not reported) at her primary care provider's office. The patient found out she was pregnant about 3 or 4 weeks after receiving the GARDASIL. The patient has a follow up exam scheduled with the physician. The patient sought medical attention by calling the office. The patient's last menstrual period was approximately 21-JAN-2008. The estimated due date is 24-OCT-2008. An ultrasound test perform on 11-JUN-2008 indicated a SIUP at 20 weeks and 3 days. On 26-JUN-2008 a pap smear was negative for HPV. Follow-up information was received from a registered nurse indicating that on 26-JUN-2008 a toxoplasma IgG and IgM was performed with a positive result. Spiramycin was used from 18-JUL-2008 to 11-AUG-2008 for the treatment of toxoplasmosis. The patient's complications during pregnancy included renal failure and alkalosis. On 26-AUG-2008 the patient gave birth prematurely at 31 weeks. The birth weight of the female infant was 1630 gm. Upon internal review the premature birth and the mother's renal failure were determined to be other important medical events. Additional information has been requested.

MedDRA PT Brain oedema, Cerebral haemorrhage, Cerebral infarction, Headache, Meningeal disorder, Pyrexia, Thrombophlebitis, Visual disturbance, Vomiting

Symptom Text: Information has been received from a health authority concerning a 14 year old female non smoker patient who had menorrhagia and hypertrichosis which was treated with MINERVA 35 since beginning of June, 2008 till August, 2008 and familial hypertrichosis (not ovarian, not adrenal) treated with ALDACTONE 25 mg/day since 04-SEP-2006. Patient had a history of viral meningitis at the age of six. On 18-JUN-2008 the patient was vaccinated with a first dose of GARDASIL, (batch number not reported). On 14-AUG-2008 the patient was vaccinated with a second dose of GARDASIL (batch # NH27440) lot # 1524U. Concomitant suspect therapy included MINERVA 35. Concomitant therapy included ALDACTONE TABLETS. On 14-AUG-2008 she suffered from important cephalgia. On 15-AUG-2008 she developed vomiting with improvement on 16-AUG-2008. Since 17-AUG-2008 she had fever at 38.5 C with cephalgia and vomiting persisting until 19-AUG-2008, the day she consulted emergencies at hospital: Laboratory result showed serum C-reactive protein test at 19 mg/L, cerebrospinal fluid test normal (clear, 2 leukocytes < mega-element/L, GR<100 mega-element/L, cervicospinal fluid proteins at 0.22 g/L (N:0.2-0.4), glycorrhachia at 3.1 mmol/L (N:2.3-4), PCR herpes simplex and enteroviruses negative, and computed axial tomography scan normal. Diagnosis was a meningeal syndrome. She was treated with PROFENID and DAFALGAN. On 20-AUG-2008 there was no improvement therefore she was hospitalized in neuropediatrics via emergencies. An enocephalic magnetic resonance imaging performed on 25-AUG-2008 put in relief a thrombophlebitis of anterior part of superior longitudinal sinus, of bilateral cortical fronto-parietal veins and of lateral sinus and left signoid. There was also a left tempro-occipital congestive edema with some hemorrhagic spots of corticosubcortical junction. CT scan performed on 27-AUG-2008 showed a regression of thrombus of superior longitudinal sinus and of left lateral sinus. Left retro-insular temporal venous infarct without any hemorrh

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Information has been received from a certified medical assistant for the pregnancy registry for GARDASIL, concerning a 16 year old female who on 27-JUL-2007 was vaccinated with the first dose of GARDASIL, 0.5 mL, I.M. and on 05-OCT-2007 with the second dose of GARDASIL. On 14-MAR-2008, the patient was scheduled to receive a third dose of the series, but the patient had a positive pregnancy test and the third dose was not given. On 17-MAR-2008, the patient had a miscarriage of the pregnancy. The reporter stated that the patient has since become pregnant again. On an unspecified date, positive pregnancy test since having miscarriage was performed (WAES # 0809USA01854). The patient sought unspecified medical attention. Upon internal review, miscarriage of the pregnancy was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Anaphylactic reaction, Anxiety, Feeling hot, Headache, Pharyngolaryngeal pain, Pruritus, Rash, Viral infection

Symptom Text: Information has been received from the NSW via the agency concerning a school girl with asthma and penicillin allergy who on 08-SEP-2008 was vaccinated with the third dose of GARDASIL (Lot # 659659/0055x, Batch # K3031, Expiry date 06-AUG-2010). On 08-SEP-2008 the patient experienced anaphylactic reaction described as pruritus, feeling hot, rash, feeling of impending doom. It was reported that the student was treated at the school, then by the paramedics and was treated with 0.5 mL 1:1000 adrenaline. The patient recovered en route to the emergency room where she was also treated with prednisone but not admitted overnight. The patient was followed up around 09-SEP-2008 or 10-SEP-2008 and was still recovered however she had a sore throat and head. The patient's physician considered that her subsequent sore throat and head were the result of a coincidental virus. The agency considered that anaphylactic reaction was related to therapy with GARDASIL. Upon internal medical review (epinephrine) adrenaline administration in the emergency room within 24 hours of vaccination was considered an other important medical event. Additional information is not expected.

Symptom Text: Patient received first dose of GARDASIL vaccine on 06/12/2008. Per Clinic note: "HLD is a 24-year-old woman who experienced what has been described as a grand mal seizure at about 3 p.m. on 08/21/2008. This was a seizure that was witnessed by a friend and afterwards she was evaluated at the Emergency Room. Patient states that on that day of the seizure, she had been feeling kind of dizzy and out of it all day. She had never experienced that exact feeling before. HLD has been taking XANAX at a dose of 1.5 mg nightly for two or three years for anxiety. The day before the seizure, she had missed her evening dose of XANAX. In addition she had very little, if any, sleep that night before the seizure and she reported feeling also somewhat stressed out on the 08/21/2008. The witness describes the seizure as HLD getting a strange look on her face and gazing around the room randomly for about 30 seconds, after which HLD's eyes rolled back in her head and she fell to the floor and had what were described as flailing movements of her arms and her legs for about 2 to 3 minutes with some turning blue towards the end. Afterwards, she was confused, did not know where she was, or what was going on. In the Emergency Room, she did have a CT scan that showed no evidence of trauma or bleeding or midline shift but that there was an old lacune in the left inferior BG. She had postictal confusion, lasting for a few hours. She did have quite a severe headache and received narcotics in the Emergency Department which may have contributed to some difficulty in clearing of her mentation. She also had muscle soreness for about three days afterwards. During this seizure, she did not bite her tongue. She did not have any bowel or bladder incontinence. At the time of her evaluation in the Emergency Department, the seizure was attributed possibly to withdrawal from XANAX compounded by a sleep deprivation and stress. She has had no further events since the time of her Emergency Department visit. CT scan did not show a cause for seizures but did s

Other Meds: Alprazolam 0.5mg po at bedtime as needed. -08/14/2007-present. CHANTIX Starting Month Pack 0.5mg x 11 doses, then 1mg x 42 doses. -06/12/2008-071/2/2008- Hydrocodone/Acetaminophen 5/500mg 1 tab every 8 hours as needed for pain -07/16/2008-0

Lab Data: CT showed old lacune left inferior basal ganglia. CBC and CMP are within normal limits. Electroencephlaogram-EEG-from 09/02/2008 reports no focal swelling or background asymmetries seen. No epileptiform asymmetries seen. EEG normal. Labs a

MedDRA PT Arthralgia, Injection site bruising, Injection site pain, Joint stiffness, Pain in extremity, Paraesthesia, Pyrexia, Tonsillitis

Symptom Text: Information has been received from a registered nurse concerning an 18 year old female, with environmental allergies and no pertinent medical history, who on 23-MAY-2008 was vaccinated with the first dose of GARDASIL vaccine and on 16-JUL-2008 was vaccinated with the second dose of GARDASIL vaccine (Lot No. 660557/0072X). There was no concomitant medication. On 17-JUL-2008, the patient developed right and sometimes left leg pain and fever. She also had soreness and bruising at the injection site and some tingling of her hands. She had a sore throat when vaccinated. She has been prescribed ADVIL and will see her primary physician. At the time of the reporting the patient has not recovered. The patient sought medical attention, phone call. Additional information has been requested. 9/26/08 Reviewed OB/GYN medical records of 5/23-8/11/08. FINAL DX: none provided Records reveal patient in good health on 5/23/08, day of HPV #1, Lot 1968U. Received HPV #2, Lot 0072X on 7/16/08 & had sore throat prior to vax. Experienced joint pain & stiffness, fever x 4 days. Seen by PCP 7/18 & dx w/tonsillitis. Had sore throat x 1 wk. Joint pain & stiffness resolved.

MedDRA PT Anogenital warts, Inappropriate schedule of drug administration

Symptom Text: Information has been received from a registered nurse concerning a 25 year old female, with no drug reaction/allergies, and with normal PAP smear, who on 10-JAN-2007 was vaccinated with the first dose of GARDASIL (lot number unknown) IM 0.5 mL, and late on 21-MAY-2007 was vaccinated with the second dose of GARDASIL (Lot number 655324/0088U) IM 0.5 mL. Concomitant therapy included unspecified birth control pills. In the morning of 18-JUL-2008, the patient was in the office and mentioned to the physician she had genital warts. The patient had a PAP smear done (results unknown). The physician treated her for condyloma and will be back to the office later on 18-JUL-2008, possibly to receive the third dose of GARDASIL. At the time of the report the patient had not recovered. The patient sought medical attention, phone office and visited office. Additional information has been requested.

MedDRA PT Syncope

Symptom Text: Information has been received from a licensed practical nurse concerning a 13 year old female who on an unspecified date was vaccinated IM with the first 0.5 ml dose of GARDASIL vaccine (yeast). Concomitant therapy included varicella virus vaccine live (VARIVAX), tetanus toxoid (unspecified, manufacturer unknown) meningococcal ACYW conj vaccine (dip toxoid) (MENACTRA) (Sanofi Pasteur). The patient experienced syncope soon after vaccination. Unspecified medical attention was sought at the office. She recovered on the same day as vaccination at the office and was released. Additional information has been requested. No further information is available.

MedDRA PT Erythema, Inappropriate schedule of drug administration, Scar, Vaccine positive rechallenge

Symptom Text: Information has been received from a 37 year old female consumer with no medical history and an allergy to penicillin who in October 2007, was vaccinated with the first dose of GARDASIL vaccine (yeast) in her left arm "in the muscle". In December 2007 the patient was vaccinated with the second dose of GARDASIL vaccine (yeast) given in the same spot on her left arm. In April 2008, the patient was vaccinated with the third dose of GARDASIL vaccine (yeast) on the back side of her right arm. There was no concomitant medication. A few days after (also reported as a few weeks after) the first dose a red mark appeared that looked like a pimple at first. The red mark was still there when she went back for her second dose. After the second dose the red spot became worse. The patient did not have any red marks after the third dose. At time of reporting, the mark on the patient's left arm was still there, looks like a scar, but has gotten fainter. Unspecified medical attention was sought. Patient outcome was recovering. No further information was available.

MedDRA PT Erythema, Rash

Symptom Text: Information has been received from a consumer concerning her 19 year old daughter who on an unspecified date in January 2007, was vaccinated with her first dose of GGARDASIL vaccine (yeast) (Lot #, site, and route not reported). There was no concomitant medication. On an unspecified date in May 2007, the patient was vaccinated with her third dose of GARDASIL vaccine (yeast) (Lot #, site, and route not reported). No information was provided regarding the second vaccination with GARDASIL vaccine (yeast). On an unspecified date in June 2007, the patient experienced a red rash in her hip area going up to her breast area. The patient has been having this rash on and off since June 2007. The patient has sought unspecified medical by visiting "a couple of doctors and dermatologists and no one can determine the cause." As of the time of this report, the red rash was persisted. No additional information is available. Additional information has been requested.

MedDRA PT Injected limb mobility decreased, Rash

Symptom Text: Information has been received from a nurse practitioner concerning a 19 year old female with no medical history who on 06-SEP-2007 was vaccinated IM in the deltoid with the first dose of the GARDASIL vaccine (yeast). On 19-NOV-2007 the patient was vaccinated in the upper thigh with the second dose of GARDASIL vaccine (yeast). In March 2008, the patient was vaccinated with the third dose of GARDASIL vaccine (yeast). After the first dose the patient was unable to lift her arm and had to go to the neurologist. A month later she developed a rash on her neck. A month after the second dose the patient broke out in rash on her lower body underneath the skin that looked like "bug bites". The patient has been experiencing rashes since the third dose. The rash clears out then comes back again. The patient was seen by multiple specialists and blood work was done that came back abnormal and the nurse asked the patient to call her with the outcomes of the blood work. The patient outcome was not recovered. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Headache, Hypoaesthesia, Vaccine positive rechallenge

Symptom Text: Information has been received from a registered nurse concerning a female patient with no known drug allergies and no pertinent medical history, who on 30-MAY-2007 was vaccinated with the first dose of GARDASIL vaccine (yeast) 0.5 mL. On 31-JUL-2007, she received the second dose of GARDASIL vaccine (yeast) 0.5 mL. On 01-DEC-2007, she received the third dose of GARDASIL vaccine (yeast) 0.5 mL. The nurse reported that the patient developed numbness on her right arm and right leg after receiving the vaccinations. The numbness got worse each time she had the vaccinations. She also complained of headaches, so she took some ibuprofen (MOTRIN). The patient saw the physician. Labs diagnostics studies included computerized axial tomography scan and magnetic resonance imaging (MRI), with no date or information reported about the results. At time of reporting, the patient was recovering. Additional information has been requested.

Other Meds: Unknown

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Feeling abnormal, Immediate post-injection reaction, Oral herpes, Pyrexia, Respiratory disorder, Viral upper respiratory tract infection

Symptom Text: Information has been received from a health care worker at a physician's office and from emergency room (ER) records (patient education materials) concerning a 24 year old white female student who on 17-JUN-2008 was vaccinated into left deltoid with a first dose of GARDASIL vaccine (yeast) (lot # 660553/0070X). There was no illness at the time of vaccination. The health care worker reported that on 23-JUN-2008, the patient called the office and complained of nasal and above upper mouth lip sores since receiving the GARDASIL vaccine (yeast) (also reported as "immediately post injection"). The patient also reported that she had been febrile and feeling worse everyday. She was asked about having a history of herpes and denied having a history of herpes. She was asked to stop by the office for an evaluation. The reporter stated that when the patient visited the office and visual exam was done, she had sores that looked 100% herpetic. She was reassured that the outbreak was not due to GARDASIL vaccine (yeast), and she was sent to the emergency room for a second opinion and documentation of incident. The patient education materials from the emergency room for the patient, referred to the patient's injury and illness as viral respiratory illness, "she had an upper respiratory illness caused by a virus". Home care education for the viral respiratory illness included : rest for severe symptoms, avoid exposure to cigarette smoke, TYLENOL or ADVIL or MOTRIN for fever, muscle aching, headache. Also to avoid dehydration by drinking 6-8 glasses of fluids daily, and to return promptly or contact physician if any cough with lots of colored sputum occurs (mucus or blood), chest pain, shortness of breath, wheezing, or having trouble breathing, severe headache, face, neck or ear pain and any fever over 1200.4 degrees F (38.0 degrees) for more than three days. The education materials also noted the patient's cold sore-herpes labials, HSV; type 1. Home care information for the cold sore included: the patient's use of TYLENOL or ADVIL

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy, Inappropriate schedule of drug administration

Symptom Text: Information has been received from a physician, concerning a 34 year old female patient, with no previous medical history reported, who on 13-MAY-2008 received the third dose of GARDASIL (Lot # 1208U and batch # NH13360). One week after vaccination the patient started a pregnancy. She was vaccinated at 3 weeks of amenorrhea as the starting date of her last menstruation periods was 21-APR-2008. No adverse reaction was reported. Follow-up information was received from a physician, through the Sanofi Pasteur MSD GARDASIL pregnancy registry, which reported that this is a case of pregnancy. This is also a case of misuse, ie vaccine administered beyond recommended age. Follow-up information was received from a physician, through the Sanofi Pasteur MSD GARDASIL pregnancy questionnaire, which reported that the case was upgraded to serious on 18-JUL-2008, the patient experienced a spontaneous abortion. Spontaneous abortion was considered to be an other important medical event. Other business partner numbers included: E2008-05313. No further information is available.

MedDRA PT Drug exposure during pregnancy, Premature rupture of membranes, Suppressed lactation

Symptom Text: Initial and follow up information has been received for the Pregnancy Registry for GARDASIL from an office medical assistant and nurse practitioner concerning a 23 year old female with a history of migraine headaches and HPV and no previous pregnancies who on 11-JUN-2007 was vaccinated with her first dose of GARDASIL (lot #657868/0523U). On 07-AUG-2007 the patient received her second dose of GARDASIL (lot# 658554/0928U). On 20-DEC-2007 the patient came in the office for her third dose of GARDASIL (lot# 659441/1446U). The patient did receive the third dose that day, but during conversation she mentioned she had been spotting and had stopped taking her birth control. The office medical assistant reported that later on that day, they had found out that the patient was pregnant. The patient's last menstrual period was 01-NOV-2007 (previously reported as 03-DEC-2007) and estimated date of delivery by ultrasound was 20-AUG-2008. An ultrasound was performed that showed 5 weeks gestation. No adverse event was involved that time. Medical attention was sought, by a physician. Follow-up information was received. On 14-JUL-2008 the patient experienced premature rupture of membranes and delivered a normal, healthy male baby weighing 5 pounds 10 ounces at 34 weeks. There were no congenital anomalies. The infant with apgar scores of 6.8 was in NICU for breathing. Meconium stained membranes were noted on placenta pathology. Concomitant therapy included UNISOM for insomnia and ZANTAC for heartburn. The patient also noticed decreased milk production during breast feeding. Upon internal review, in NICU for breathing was determined to be an other important medical event. Follow-up information was received from a physician who reported that the mother was not a patient of his and the baby's name was a name unknown to him. Additional information has been requested.

Other Meds: UNISOM; ZANTAC

MedDRA PT Bladder pain, Dysuria, Hypertonic bladder, Inappropriate schedule of drug administration, Pollakiuria

Symptom Text: Information has been received from a consumer concerning his daughter a 27 year old female with no pertinent medical history and no allergies who in January 2008, was vaccinated with the first dose of GARDASIL vaccine (yeast). In March 2008 the patient was vaccinated with the second dose of GARDASIL vaccine (yeast). In early June 2008, the patient was vaccinated with the third dose of GARDASIL vaccine (yeast). There was no concomitant medication. Middle to late in June 2008, the patient began to experienced a burning sensation in the area of her bladder when urinating and she had a more frequent need to urinate than usual. Originally her physician treated this as an urinary tract infection and more recently she was diagnosed as having an overactive bladder. Blood tests and urine sample tests were performed. At the time of this report there was slight improvement. No further information is available.

MedDRA PT Thrombocytopenia

Symptom Text: Information has been received from a physician concerning a 14 year old female patient who on 20-MAY-2008, was vaccinated with the first dose of GARDASIL vaccine (yeast) and the second dose of GARDASIL vaccine (yeast) was given on 22-JUL-2008. The patient had a lesion removed from her scalp (the lesion was present prior to starting of the HPV vaccine series). When the plastic surgeon requested to have additional margins of the lesion area of the scalp removed he performed a complete blood count on 22-JUL-2008 that showed a platelet count of 40.000. A diagnosis of thrombocytopenia was given. A repeat complete blood count was performed on 24-JUL-2008, and that showed a platelet count of 42.000. The physician mentioned that he spoke with the pathologist performing the complete blood count/manual smear review and was told that the smear was normal. The patient's thrombocytopenia persisted. Additional information has been requested.

MedDRA PT Rash macular

Symptom Text: Information has been received from a physician concerning a 20 year old female who on 16-JUN-2008 was vaccinated with the first dose of GARDASIL vaccine (yeast) in the upper left deltoid. After vaccination, she was asked to sit for 15 minutes before leaving the office, 10 minutes later, the patient experienced red blotches on her right and left thighs. She did not feel pain. The symptoms cleared and she called the office to set up an appointment for her second dose. Additional information has been requested.

MedDRA PT Asthenia, Balance disorder, Benign intracranial hypertension, Diplopia, Eye pain, Headache, Myopia, Neck pain, Optic nerve disorder, Pain, Pruritus, Strabismus, Vision blurred, Visual disturbance

Symptom Text: Information has been received from health professional concerning an 11 year old female with nearsightedness and drug allergies to ZITROMAX, sulfamethoxazole, plus BACTRIM, and sulfa, who on 06-JUN-2007, 08-AUG-2007 and 08-NOV-2007 was vaccinated into the right arm with the first, second and third doses of GARDASIL (Lot# first dose 657737/0522U, second dose lot#658222/0927U and third dose lot#659435/1265U). On 15-SEP-2007 the patient experienced headaches and was diagnosed with pseudotumor cerebri by neurologist and neuro-ophthalmologist. On 10-OCT_2007 she was seen by a neuro-ophthalmologist who felt that she had mild myopia on the right eye, intermittent exotropia and mild elevation of the optic nerves nasally, right side worse than left. Venous pulsations were not noted. The physician indicated that she needed studies to rule out an intracranial cause of the elevation of her optic nerves and it was suspected that she might most likely have pseudotumor cerebral. On 15-OCT-2007 she had a magnetic resonance venography (MRV) which was also normal. On 19-October-2007 the patient saw a neurologist who reported tha the patient is an 11-year-old young lady sent for evaluation of probable pseudotumor cerebri (PTC). Her problems began about 1 month ago (mid September), when she had suden onset of horizontal double vision and she noted that her eyes were turning in. She stated the two images are side-by-side. She was seen by her family doctor and then and ophthalmologist. A few days later she developed headaches. She describes her headaches as fluctuating, sharp pain at the top and back of her head. She also experienced pain in her neck. The pain was more severe in the morning and at about noon each day. When the pain gets worse, her eyes get a bit blurry and hurt. Her vision might also darken slightly. She sometimes felt somewhat unsteady and weak with a headache. She was taking over-the-counter medication without improvement of the heacaches. At times she felt some achiness of her body. She injured her wrist in March

MedDRA PT Drug exposure during pregnancy, Foetal disorder

Symptom Text: Information has been received through Merck pregnancy registry from a nurse midwife concerning an underweight 20 year old female with a history of LGSIL, biopsy, colposcopy, and 1 previous pregnancy with an elective termination, who on 27-JUN-2007 was vaccinated with the first dose of GARDASIL. Concomitant therapy included 150 mg DEPO-PROVERA, and prenatal vitamins 200 mg. It was reported that the patient was found to be pregnant and at the time of reporting the patient was about 14 weeks pregnant (last menstrual period was approximately 15-MAY-2007 and her estimated delivery date was 20-FEB-2008. Unknown medical attention was sought. No product quality complaint was involved. Follow-up information was received from a certified nurse midwife and from pediatric medical records indicating that on 19-FEB-2008, at 39 weeks and 6 days the patient delivered a 6 pound 7 ounce female infant with an apgar score of 9/9. The infant was reported to be normal with no congenital anomalies and no complications. It was reported that a neonatal prenatal ultrasound showed in utero hydrocephalus. Both lateral ventricles were dilated and there was some dilation in the third ventricle. A late repeat ultrasound (on 14-NOV-2007 and 27-DEC-2007) showed resolution. Additional information has been received from a physician via pediatric medical record concerning a 10 week old female. On 05-MAR-2008 the patient was seen at the office for her 2 week visit. It was reported that the child's growth and development were normal. On 28-APR-2008 the patient was seen at the office for her 2 month visit. It was reported that the child was well, with normal growth and development. The patient presented to the office with a dysconjugate gaze in which the patient's pupil's were not responding, and the patient could not "track." Inutero hydrocephalus was seen on an ultrasound. A late ultrasound showed resolution, therefore a repeat ultrasound was scheduled. The patient was referred to another physician to be examined. The patient was instructed to follo

MedDRA PT Drug eruption, Pruritus, Rash generalised, Rash maculo-papular, Skin exfoliation

Symptom Text: Information has been received from a physician concerning a female patient (age unknown) was vaccinated with a dose of GARDASIL (lot number, injection site and route not reported). After vaccination the patient developed an exanthema. The outcome was not reported. Follow-up information was received. Upon receipt of new information this case was upgraded due to hospitalization. The hospital report was sent via the dermatologist: The 14-year old female patient was vaccinated with a third dose of GARDASIL (lot number, site and route not reported) on 01-APR-2008. One week after the vaccination, the patient experienced generalized exanthema with pruritus. It started from the injected arm and extended over the whole body. She was hospitalized on 13-APR-2008. Routine laboratory without pathological findings. Drug eruption was diagnosed. Dermatological examination showed a maculopapulous exanthema with mild desquamation. Local treatment included a mixture of topic betamethasone in zinc oxide lotion (lotio alba 1:1). The pruritus was treated with FENISTIL drops as needed. Under this therapy systems improved notedly and the patient was discharged recovered on 18-APR-2008. The physician assessed the eruption as probably caused by the vaccine. Tinea pedis of the left foot has been observed for several weeks prior to reporting date and has been treated with LAMISIL CREME. Other business partner numbers included: E2008-07977. No further information. The file is closed.

Seriousness: ER VISIT, EXTENDED HOSPITAL STAY, SERIOUS

MedDRA PT Amenorrhoea, Amnesia, Bruxism, Chest pain, Convulsion, Costochondritis, Eye movement disorder, Loss of consciousness, Memory impairment, Muscle twitching, Presyncope, Somnolence, Syncope vasovagal, Unresponsive to stimuli

Symptom Text: Information has been received from a consumer concerning her 17 year old daughter who was vaccinated with the three doses of GARDASIL in 2007 (March, April and September). In March 2007 she started to have seizures. She had a total of 7 seizures in 2007. She had no history of seizures prior to receiving GARDASIL. Her daughter had another seizure last month (August 2008). She has been taking unspecified medication for her seizures. The patient sought medical attention at the emergency room. The patient's mother also indicated that the patient was hospitalized. Patient's mother stated: "My daughter started having seizures when she received GARDASIL and I don't know why. She has never had seizures before and I told the doctor the only thing that was different was she received GARDASIL". "I don't know how to tell my daughter that this was because of GARDASIL". "She can't get her driver's license because of her seizures". "She's now taking a medication for her seizures which would cause birth defects if she tries to have children in the future". Additional information is not expected. 10/23/2008 10/23/2008 PCP records received. WCC 3/20/08 with normal exam except c/o heavy periods and passing large clots. Seen for hospital f/u after 3 episode of vasovagal syncope. 2nd HPV dose given 34 days after 1st. Another syncopal episode reported by mom. Seen 6/19/07 for Amenorrhea x 3 months. Seen 6/25/07 with c/o intermittent mid-sternal chest pain x 2 weeks. Assessment costochondritis. Syncopal episode with head twitching, amnesia and post-episode grogginess. Referred to Neurology. Neurology records received beginning 8/8/2007 to 8/27/2008 with DX: Seizures. Pt initially presented to neurologist after several episodes of passing out. First 2 likely episodes likely syncope, the 3rd episode of unresponsiveness more likely seizure or psuedoseizure. After several more, started on Trileptal. No episodes until 8/5/08 but mother reports forgetfulness, and grades have dropped. No menses x 3 months. Obn 8/5/08 pt found unrespo

Other Meds: [therapy unspecified]

Lab Data: Unknown. Labs and Diagnostics: EKG in SR with 1st' AV block. 24 hr EEG WNL. Holter monitor WNL. Urine drug screen (+) for tricyclic anti-depressants which pt denies.

History: Unknown. PMH: 1 syncopal episode 8/06 with brain CT and Echo WNL

Seriousness: ER VISIT, LIFE THREATENING, SERIOUS

MedDRA PT Bradycardia, Dyspnoea, Hyperhidrosis, Immediate post-injection reaction, Inappropriate schedule of drug administration, Malaise, Nausea, Pallor, Syncope vasovagal

Symptom Text: Information has been received from a physician assistant concerning a 22 year old female with allergy to CECLOR, who on 16-AUG-2007 was vaccinated intramuscularly with a first dose of GARDASIL (Lot # reported as "9725103") 0.5 ml, on 21-NOV-2007 was vaccinated intramuscularly with a second dose of GARDASIL (Lot # 654539/0742U) 0.5 ml and on 21-AUG-2008 was vaccinated intramuscularly in the left deltoid with a third dose of GARDASIL (Lot # 655604/0052X) 0.5 ml. There was no concomitant medication. The physician assistant (P.A) reported that the patient experienced a vasovagal attack after getting the third dose of GARDASIL on 21-AUG-2008. Immediately after vaccination, the P.A reported that the patient stated that she was not feeling well and was having difficulty breathing. She became pale, nauseous, very sweaty, and had bradycardia. She was laid completely flat. She did not lose conscious nor did she vomit. The patient was given ammonia inhalant and recovered in about 15-20 minutes. It was reported by the P.A that the events were considered to be serious as life threatening as the patient was having difficulty breathing. The patient remained recovered. The P.A reported that the events were "directly related" to GARDASIL. There was no product quality complaint. A Lot check has been requested. Additional information has been requested.

MedDRA PT Death neonatal, Drug exposure during pregnancy, Premature baby, Suicide attempt

Symptom Text: Information has been received from Merck pregnancy registry through a 15 year old female consumer with cardiac murmur, asthma, and an allergic reaction to Penicillin, Augmentin, and c-Chlor who in October 2007, was vaccinated with the first dose of GARDASIL (lot# not provided). At the time of reporting the patient was approximately 16 weeks pregnant. No adverse side effects were reported. Unknown medical attention was sought. An ultrasound showed that the baby was okay at this point. The patient's outcome is unknown. No product quality complaint was involved. Follow-up information was received from the patient's mother which reported that in March 2008, the patient gave birth to a female baby at 23 weeks. The baby was born alive, her organs were well developed and had a strong heart beat. The baby weighed 11lb 8oz. Eight hours after birth, the baby died. According to the patient's mother, the doctors could do nothing for it because the baby was too premature. The patient's mother reported that the patient had even attempted suicide. Upon internal review, premature baby, birth weight low and suicide attempt were considered to be other important medical events. Additional information is not expected.

Other Meds: None

MedDRA PT Angioedema, Eye swelling, Lacrimation increased, Rhinorrhoea

Symptom Text: Information was received from an HCP on 01-SEP-2008 (local reference # BGAR2008106) concerning a 16-year-old female, with a medical history of hay fever (her family also has it), who on 23-JUN-2008 was vaccinated via intramuscular route into her left deltoid with a first dose of GARDASIL (lot number not reported). One and half hour after the administration, she experienced Quincke's oedema with manifestations of running nose, tearing eyes and swollen eyes. The events lasted a few days. The patient started a treatment on 23-JUN-2008 to treat the adverse events (end date of treatment unknown), including CETIRIZIN 10 mg (2 tablet/day, oral, 3 days) and MEDROL 32 mg (1 tablet/day, oral, descending scheme 32-16-8-4 mg). Subsequently she recovered from the adverse events. The reporter considered the events as medically significant. Other business partner numbers included: E200808241. No further information is available.

MedDRA PT Activities of daily living impaired, Convulsion, Diplopia, Disturbance in attention, Dizziness, Drooling, Extrasystoles, Fatigue, Gaze palsy, Headache, Hyporeflexia, Migraine, Musculoskeletal stiffness, Nausea, Palpitations, Phonophobia, Photophobia, Postictal state, Status migrainosus, Tremor, Vomiting

Symptom Text: PT HAD THE SECOND GARDASIL INJECTION IN SEPT '07. AND THE FOLLOWING MONTH SHE STARTED HAVING HEADACHES, ABOUT 3XS A WEEK. THEN IT GRADUALLY INCREASED SOME WORSE THAN OTHERS. FINALLY ON JANUARY 1 '08, SHE HAD A SEVERE MIGRAINE. THAT INCAPACITATED HER FOR AN ENTIRE 2 DAYS. THE PAIN WENT ON FOR A WEEK THEN SHE BEGAN TO GET HEART PALPS. THEN AFTER GIVING HER MEDICINE FOR THE MIGRAINE. SHE HAD A SEIZURE ONE NIGHT. SHE WAS TAKEN TO THE E.R. BY AMBULANCE AND WAS ADMITTED FOR A DAY AND A HALF. IN ORDER TO GET CONTROL OF THE HEAD PAIN WHICH BY THIS TIME HAD BEEN CONSTANT FOR ABOUT 3WKS. FINALLY THE HOSPITAL WAS ABLE TO GET RID OF THE HEADACHE. BUT THE SAME DAY SHE WAS RELEASED WE HAD TO RETURN BECAUSE THE PAIN RETURNED WORSE. SHE WAS GIVEN PAIN MEDS I.V. AND SENT HOME. WE TRIED VARIOUS MIGRAINE MEDS AND NOTHING WORKED FOR LONG. THEN WE SAW A NEUROLOGIST WHO TREATED HER FOR ABOUT 2MNTHS. SHE HAD A COUPLE MORE SEIZURES BETWEEN THAT TIME, AND THE NEUROLOGIST ADMITTED HER AGAIN. TO START THE I.V. PAIN MED. SHE WAS ADMITTED FOR 2DYS THEN. FINALLY HAD SOME RELIEF FOR THE FIRST TIME IN A MNTH SINCE THE LAST ADMISSION. THAT LASTED 2DYS AND THEN THE PAIN RETURNED. AND HER SEIZURES INCREASED. SHE MISSED A LOT OF SCHOOL, WAS NOT ABLE TO PLAY OR CONCENTRATE. SHE LIVED IN CONSTANT FEAR OF FALLING OUT AND HAVING INCREASED HEART PALPS. SHE HAD BOUTS OF BIGEMENY ALSO. THIS HAS GONE ON SINCE THE 2ND SHOT OF THAT GARDASIL. SHE HAS NEVER TAKEN MORE THAN TYLENOL FOR PAIN ALL HER LIFE. VERY ACTIVE, FUN KID. BUT FOR MONTHS SHE HAD BEEN STRUGGLING WITH THIS. I FOLLOWED THE REPORTS ON THIS DRUG WHICH LEAD ME TO CONTACT SOMEONE ABOUT THIS. THEN DIFFERENT PEOPLE I SPEAK WITH IN DR OFFICES HAVE HAD FAMILY MEMBERS ALSO HAVE BAD REACTIONS, ALSO THE MORNING NEWS CLIP ABOUT HOW SOME OTHER YOUNG GIRLS HAD BAD REACTIONS. NOW SHE IS GETTING BETTER (PROBALLY BECAUSE SHE DID NOT HAVE THE 3RD INJECTION). BUT EVEN NOW THINGS ARE HARD FOR HER. SHE HAS REALLY BAD MIGRAINES NOW WHICH WAS NEVER AN ISSUE, AND SHE GETS TIRED EASIER NOW, MUCH EASIER. I WOULD

Seriousness: ER VISIT, EXTENDED HOSPITAL STAY, HOSPITALIZED, SERIOUS

MedDRA PT Computerised tomogram, Convulsion, Dizziness, Extrasystoles, Lumbar puncture, Migraine, Nuclear magnetic resonance imaging

Symptom Text: Information has been received from a consumer concerning his 15 year old daughter with no pertinent medical history or allergies who in July 2007 and on an unspecified date was vaccinated intramuscularly with a 0.5 ml first and second doses of GARDASIL (lot #658094/0524U, 658563/1063U), respectively. There was no concomitant medication. The patient experienced bigeminy after receiving GARDASIL. "Two months after the second dose", the patient developed severe migraines, dizziness and seizures. The patient had been hospitalized twice because of the migraines. The patient stayed in the hospital for 1 and 1/2 days for the first stay and 2 days for the second stay. During the hospital stay, the patient received "intravenous dihydroergotamine mesylate". "Spinal tap, MRI, CT scan" were performed but no results provided. The patient had also been seen by a neurologist. At the time of this report, the patient was recovering. Additional information has been requested.

MedDRA PT Dyspnoea, Loss of consciousness, Oxygen supplementation, Syncope, Urinary incontinence

Symptom Text: Symptoms = Fainting, urination, short of breath. Signs = None; Time cause= 4:15 pm 30 minutes after doses given. Please see attached !!; On Tuesday August 26, 2008 we had a 18 year-old female patient who came in with mother for vaccines, that were in need promptly requested by school. Patient information, Vaccine Questioner, and VFC application were given to the patient due to the fact that it was the patients first time at the facility. After the patient had concluded inputting here information she was registered in LINK. Patient at the moment was due for a total of 4 vaccines which are as follows: Varicella, HPV, Meningococcal, and Hepatitis A. The patients mother was then informed that the subsequent vaccines mentioned were due along with HPV, but that GARDASIL was not needed by School system. After the mom was informed about GARDASIL and what it prevents, mother agreed to render that vaccine along with the other three. The patient was then taken to the triage room and vitaled. The temperature recorded at the time was 97.9 Oral-temperature. Routing slip from LINK was then given to P.A.C to approve all vaccines that were in need. After approval all four vaccines were administered. Patient was advised by Medical Assistant to have a seat in the waiting room, while vaccine card was being printed. While the patient was seated at the waiting area she collapse while being seated. The patient was unconscious and ammonia was passed by nasal area. The patient gained conscience, but immediately went unconscious again. While patient collapsed again she urinated at the same time. Ammonia was passed for the second time and gained permanently. Oxygen tank was then put on the patient to help the oxygen flow. Paramedics were called and arrived 5 minutes later at the scene. Paramedics vitaled the patient and recommended for her to go with them. patient was adamant and denied the advice and she signed the AMA for the paramedics. The patient left 5 minutes after the paramedics were gone. Patient was called the following day of th

MedDRA PT Erythema, Pruritus, Vaccine positive rechallenge

Symptom Text: Information has been received from a nurse practitioner concerning a 23 year old female patient who in May 2008, was vaccinated with a first dose of GARDASIL vaccine (yeast) and approximately on 22-JUL-2008 was vaccinated with a second dose of GARDASIL vaccine (yeast). Concomitant medication was not reported. The nurse practitioner reported that the patient developed a red itchy area at the right wrist the evening she received GARDASIL vaccine (yeast). This occurred after both the first and second doses. Both doses were administered in the right arm. The saw her primary care physician after the first accident and he prescribed VALTREX for her and the symptoms resolved. After the second incident the patient saw the reporting nurse practitioner. No treatment was ordered. The nurse practitioner did perform a blood test for Herpes Simplex Virus 1 that was positive. The patient recovered on an unspecified date. There was no product quality complaint. Additional information has been requested.

MedDRA PT Headache, Injection site discomfort, Nausea, Photophobia

Symptom Text: Information has been received from a physician concerning her 20 year old with Gilbert's syndrome, CECLOR and BACTRIM allergies and a history of tonsillectomy (June 2008) and wisdom teeth removal (07-JUL-2008), who at the end of May 2008 was vaccinated with a first dose of GARDASIL vaccine (yeast) and on 28-JUL-2008 was vaccinated with a second dose of GARDASIL vaccine (yeast) 0.5 ml intramuscularly. Concomitant therapy included YAZ. After vaccination with the first dose of GARDASIL vaccine (yeast), the only complaint the patient had was injection site discomfort. The patient developed a severe headache after her second dose of GARDASIL vaccine (yeast). A dull headache began on 29-JUL-2008 around 10:30 pm after she returned home from working at the movie theater. The headache was at the back of her head and radiated to the top. On 30-JUL-2008, she awoke with a severe headache at the back of neck and to the left side of the head. She also had nausea and light sensitivity. The patient stated that "it is the worst headache ever". The patient sought medical attention. There was no product quality complaint. Additional information has been requested.

Other Meds: YAZ

MedDRA PT Fatigue, Headache, Malaise, Onychoclasis, Photophobia, Tremor

Symptom Text: Information has been received from a pharmacist concerning a 12 year old female with graves' disease and no known allergies, who on 05-SEP-2007 was vaccinated with a first dose of GARDASIL vaccine (yeast) 0.5 ml intramuscularly. On 06-NOV-2007 and on 08-MAR-2008 was vaccinated with a second and a third dose of GARDASIL vaccine (yeast) respectively. There was no concomitant medication prior to vaccination with GARDASIL vaccine (yeast). The pharmacist mentioned that the patient had experienced headaches since the first dose of GARDASIL vaccine (yeast). She had already completed the series. The headaches had persisted since September 2007, the degrees of the pain changed from dull to severe pain, but had never fully resolved. The patient had been seen by a neurologist. Scans of her head were performed and all results were negative. The pharmacist mentioned that the neurologist believed that the headaches are "tension headaches". The patient had been on several medications and pain medications without relief. Her endocrinologist took her off all the medications and prescribed her a muscle relaxer at bed time. This also did not seem to provide the patient with relief. The patient sought medical attention. She contacted the pharmacist. There was no product quality complaint. Additional information has been requested. 10/1/08 Reviewed PCP medical records of 8/11-9/2/08. FINAL DX: Records reveal patient experienced chronic HAs. 10/17/08-records received for DOS 2/5-10/6/08-follow-up visits for Grave's disease diagnosed 1/8/07. Visit on 2/5/08-headache waxes and wanes began in early September 2007-occurring daily ever since. Visit on 5/6/08- C/O feeling tired and malaise worse in morning. Intermittent headache per another physician they are tension headaches. Intermittent tremor. Brittle nails. Visit 10/6/08-Continues with headaches for last 13 months. No longer feeling tired or malaise. 11/6/08-records received-DOS 1/2/08-C/O continued headaches since 11/7/07-CT scan of head and sinuses normal. Some sensitivity t

MedDRA PT Liver function test abnormal

Symptom Text: Information has been received from a nurse practitioner (NP) concerning a 17 year old female who was vaccinated with GARDASIL vaccine (yeast), In approximately March 2008, "about 5 months ago", the patient's liver specific protein profile was 2.5 times above normal after she received the first dose. It was noted that the latter profile was a liver profile lab report. Liver specific protein profiles also remained at same level after the second dose as well. Recently liver specific protein profiles were closed to normal. The patient sought unspecified medical attention. Additional information has been requested.

Seriousness: ER VISIT, HOSPITALIZED, LIFE THREATENING, SERIOUS

MedDRA PT Cerebrovascular accident, Encephalitis, Vaccine positive rechallenge

Symptom Text: Information has been received from a physician concerning a 13 year old female who on an unknown date was vaccinated with GARDASIL. The first dose was received at another clinic but it was not sure about the second dose. The physician reported that the patient had cerebritis and inflammation of the brain after each GARDASIL shot. It was reported that the doctors concurred that the patient had a stroke. The patient was hospitalized (duration unspecified) and cerebritis and inflammation of the brain and stroke were considered to be immediately life-threatening. The outcome was not reported. The patient sought medical attention, "saw doctor and hospital". Additional information has been requested.

MedDRA PT Cough, Iron deficiency, Loss of consciousness, Malaise, Pain, Vaccine positive rechallenge

Symptom Text: Information has been received from a pharmacist concerning a 14 year old female who on 19-FEB-2008 she was vaccinated with the second dose of GARDASIL (lot no. not reported). Since MAR-2008 the patient experienced frequent pain not otherwise specified, regular loss consciousness and fit coughing. Medical work-up not specified were normal. The patient had not recovered. Follow up information has been received on 08-SEP-2008 reported that the patient was vaccinated with the first dose GARDASIL (lot no. 1358F, batch no. NG01510) IM in the right arm on 19-DEC-2007. On 19-FEB-2008 she was vaccinated with the second dose of GARDASIL (lot no. 0311U, batch no. NG14100) IM in the right arm. Unexpected pain appeared several times after the second dose of GARDASIL. It was localized on different part of the body and lasted 2 to 10 minutes each. Regular loss of consciousness reported as malaise occurred in MAR-2008 associated to an important iron deficiency. On 24-JUN-2008 she received the third dose of GARDASIL (lot no. 1201U, batch no. NG41880) IM in the left arm and pain did not change. At the time of reporting the patient had recovered with sequelae: pain was still occurring. She had concomitant treatment of BI-PROFENID since 11-MAR-2008 and of TARDYFERON since 20-MAR-2008 during 2 months. Pain, malaise, iron deficiency and coughing were considered to be other important medical events. The case was closed. Other business partner numbers include E2008-04899. No further information is available.

MedDRA PT Multiple sclerosis, Paraesthesia, Steroid therapy

Symptom Text: Information has been received from a general practitioner concerning a 20 year old female who was well tolerated with the previous vaccinations (hepatitis A, hepatitis B, typhoidis, meningo) and was in good health when vaccinated with GARDASIL. On 17-AUG-2007 the patient was vaccinated with the first dose of GARDASIL. The patient was well tolerated with the first dose and had no adverse effect. On 26-OCT-2007 the patient was vaccinated with the second dose of GARDASIL (batch number not reported). On 10-DEC-2007 the patient presented with paraesthesia of one arm. She was hospitalized. In January 2008, a magnetic resonance imaging performed showed plaques. The patient was treated with a bolus of corticosteroids. 3 to 4 months later she presented with new manifestations (not described). On 18-JUN-2008 another magnetic resonance imaging performed showed hypersignals. Diagnosis was multiple sclerosis. The patient was treated again with a bolus of corticosteroids. Results of the lumbar puncture were not provided. The patient was also prescribed interferon. At the time of reporting this treatment was on going and the patient had not recovered. Other business partner numbers include E2008-08603. Additional information has been requested.

Other Meds: Unknown

MedDRA PT Dizziness, Pharyngitis, Rash, Syncope, Weight increased

Symptom Text: Information has been received from a physician concerning a 23 year old female with a history of endometriosis who on 24-JUL-2008 was vaccinated with the first dose of GARDASIL. Concomitant therapy included ALLEGRA-D and YAZ. The patient developed pharyngitis followed by a rash after receiving her first dose of GARDASIL. The patient was treated by her family physician (not this physician) with steroids. After this treatment the patient experienced weight gain, syncope and possible seizure. The patient was evaluated in an emergency room for syncope and possible seizure. A complete blood cell count (CBC) and blood chemistry panel were performed and the results were within normal limits. At the time of reporting the patient continued to experience some lightheadedness and her weight was still greater than it was prior to receiving GARDASIL. The pharyngitis and rash had been resolved. Upon internal review possible seizure was considered to be an other important medical event. Additional information has been requested.

Other Meds: YAZ; ALLEGRA-D

Lab Data: complete blood cell - within normal limits; partial blood chemistry - within normal limits

MedDRA PT Caesarean section, Complication of pregnancy, Drug exposure during pregnancy, Foetal disorder, Premature labour, Threatened labour

Symptom Text: This is a case of pregnancy follow-up initially reported on 22-Feb-2008 by a general practitioner through the Sanofi Pasteur MSD pregnancy registry. A 14 year old female patient started a spontaneous pregnancy before receiving the first dose of GARDASIL (batch number not reported) on 19-FEB-2008. Beta-human chorionic gonadotropin level was positive 3 days after vaccination. Before vaccination, the patient claimed that she never had sexual relations. Further information is expected. Follow-up information received on 23-Apr-2008 through initial pregnancy follow-up form: Patient's pregnancy was reported as spontaneous. Her last menstrual period date was unknown (estimated to be 18-Nov-2007). Estimated conception date was on 01-Dec-2007. Estimated delivery date was on 26-Aug-2008. She never had a pregnancy before. An echography performed on 28-Feb-2008 defined her term as 15 weeks of amenorrhea. Follow-up information was reported by the general practitioner on 11-SEP-2008: The patient's weight was reported as 38 kg (previously 63 kg). She had no family history of congenital anomaly or genetic issue. No abnormal examinations, no infections or diseases were observed during pregnancy. However the patient experienced complications during her pregnancy, with a threatened premature labour. The foetus had acute foetal distress. Products of conception were examined, however the result was not described. On 06-AUG-2008 the patient gave birth to a baby boy via cesarean section at 37 weeks of amenorrhea. The baby's weight was 2.6 kg, his Apgar score was 9 at 1 and 5 minutes. The baby was found with hydrocephaly. The outcome was not reported. Follow-up information was reported by the physician on 16-SEP-2008: Prenatal ultrasounds were normal. The baby presented with hydrocephaly, cortical atrophy and respiratory distress. He recovered from respiratory distress after one day. The events were reported as other important medical events. Other business partner numbers include E2008-01516 and E2008-08541.

Other Meds: Unknown

Lab Data: ultrasound, 28Feb08, Comment: 15 weeks of amenorrhea; ultrasound, Comment: prenatal ultrasounds: normal; Apgar score, 06Aug01, Comment: 9 at the 1 minutes; Apgar score, 06Aug01, Comment: 9 at the 5 minutes; serum beta-human chorionic gonado

MedDRA PT Congenital anomaly, Drug exposure during pregnancy

Symptom Text: Initial and follow-up information has been received from a 25 year old female consumer with allergy to PERCOCET, for the Pregnancy Registry for GARDASIL, who on 08-NOV-2007 was vaccinated with the first 0.5 ml dose of GARDASIL. On 08-JAN-2008 the patient was vaccinated with the second dose of GARDASIL. As of 25-FEB-2008, the patient reported that she was 10 weeks pregnant. The patient reported in follow-up that on 16-SEP-2008 she delivered a healthy 8 pounds 13 ounces boy. The baby had a complete unilateral cleft lip and palate, which was diagnosed prenatally on ultrasound. The patient reported that she was prepared for this finding and she had already scheduled follow-up for the baby for surgery (dates not provided). The patient reported that both she and the baby were doing well, no problems for herself. Additional information has been requested.

Other Meds: Unknown

Lab Data: ultrasound - diagnosed prenatally that the baby had a complete unilateral cleft lip and palate; beta-human chorionic - positive

MedDRA PT Alopecia, Headache, Immune system disorder, Menstruation irregular, Urticaria

Symptom Text: Information has been received from a consumer concerning her 20 year old daughter with allergies to dander, dust and cigarette smoke who on an unspecified date in July 2007, was vaccinated with her first dose of GARDASIL (Lot #, site and route dose of GARDASIL (Lot #, site and route not reported). In the middle of August 2007, the patient was vaccinated with her second dose of GARDASIL (Lot #, site and route not reported). On an unspecified date in January 2008, the patient was vaccinated with her third dose of GARDASIL (Lot #, site and route not reported). Concomitant therapy included montelukast sodium (MSD) and ADVAIR (taken as needed). On an unspecified date, while the patient was in college, she had "blood work done" (not otherwise specified). When the patient came home in May 2008, "she had a complete panel" and the physician told her "her immune system was out of whack". In March 2008, the patient experienced minor hair loss. In May 2008, the patient experienced major hair loss where her hair would "fall out on its own without even having to touch it, when she shakes her head, washing her hair and touching her hair as well". The patient has experienced really bad headaches "Where she cannot move" (not further specified). The patient already had dander allergies, but when they flared up it would come out as a sinus problem, but lately the allergies have come out in the form of hives (not further specified). Her menstrual period was irregular, but now it is back to normal (not further specified). The patient has seen a dermatologist who has her "not washing her hair, increase her protein and is using ROGAINE". The dermatologist gave the patient a B-12 shot, and "now the patient's food intake is being monitored". The patient is going to see her primary care physician. The patient's hair loss has persisted. No further AE information was provided. Additional information has been requested.

MedDRA PT Abdominal pain, Arthralgia, Gastroenteritis, Nausea, Neck pain, Vomiting

Symptom Text: Information has been received from a physician concerning a 16 year old female with a history of rheumatoid arthritis who on 21-SEP-2007 was vaccinated with a first dose of GARDASIL vaccine (yeast) (lot# 656372/0243U) (route and administrating site not reported), and a dose of MENACTRA vaccine (dip toxoid). On 21-NOV-2007 the patient was vaccinated with a second dose of GARDASIL vaccine (yeast) (lot# 657737/0522U) (route and administrating site not reported). On 05-DEC-2007 the patient had to see a rheumatologist for neck and hip pain. On 01-APR-2008 the patient was vaccinated with a third dose of GARDASIL vaccine (yeast) (lot# 659962/1740U) (route and administrating site not reported) and after that the patient experienced nausea and vomiting and was diagnosed with gastroenteritis. On 24-JUN-2008 the patient started experiencing abdominal pain and was referred to another physician who prescribed omeprazole (MSD) which did not help and switched to REGLAN. The patient sought unspecified medical attention. Additional information has been requested.

Seriousness: EXTENDED HOSPITAL STAY, HOSPITALIZED, LIFE THREATENING, PERMANENT DISABILITY, SERIOUS

MedDRA PT Abasia, Convulsion, Nervous system disorder, Pyrexia, Rash, Renal failure, Speech disorder, Systemic lupus erythematosus

Symptom Text: Information has been received from a physician concerning a 10 year old female with CYTOXAN allergy who in May 2007 was vaccinated with the first dose of GARDASIL. In July or August of 2007, the patient was vaccinated with the second dose of GARDASIL. There was no concomitant medication. The patient has not yet received the third dose. The patient first experienced high fever and rash in July 2007. The patient was diagnosed with lupus. She then progressed to having seizures and kidney insufficiency. The patient lost all neurological functions including the ability to walk and talk considered to be disabling. She was hospitalized from 23-NOV-2007 to 30-JAN-2008 until there was some improvement. The patient was given oxygen while in the hospital. The patient still can not walk but able to recover her speech. The patient was considered to be recovering from lupus, seizures and renal insufficiency. Seizures were considered to be immediately life-threatening. Lupus, seizures, loss of ability to walk and talk and kidney insufficiency were considered to be an other important medical events and disabling by the physician. Additional information has been requested.

MedDRA PT Convulsion, Daydreaming, Ear pain, Epilepsy, Fatigue, Feeling abnormal, Grand mal convulsion, Headache, Loss of consciousness, Memory impairment, Mental status changes, Paraesthesia, Thinking abnormal, Tongue biting

Symptom Text: Information has been received from a consumer concerning her 16 year old daughter with allergy to DPT and pertussis shot, and no pertinent medical history who on 21-JUN-2007 was vaccinated with the first dose of GARDASIL. On 06-SEP-2007, the patient received the second dose of GARDASIL and within a week later, approximately on 13-SEP-2007, she started to feel like she's not herself and she felt tired all the time. Patient's mother reported that she feels like she was in a cloud and she has been day dreaming. Patient was brought to her family doctor and had a cat scan, blood test and sleep study and it was determined that she had seizures activity. Patient is currently on seizures medication and the symptoms started to improve. Third dose of GARDASIL was given on 03-JAN-2008. Lot numbers were not available. There was no concomitant medication. Upon internal review, seizures activity was considered to be an other important medical event. Additional information has been requested. 10/1/08 Reviewed PCP medical records of 12/27/07-8/28/08 which include Neuro consult of 1/21/08 FINAL DX: epilepsy Records reveal patient experienced black out spells often after a nap, pain behind left ear, tingling in head & becomes briefly unaware w/different thinking & forgetfulness when resolves. Referred to Neuro for altered mental status & possible seizures. Had generalized tonic-clonic seizure & bit tongue 4/2008. Neuro consult 1/21/08

Other Meds: None

Lab Data: computed axial, seizures activity; sleep study, seizures activity; diagnostic laboratory, blood test LABS: sleep study WNL. EEG abnormal. CT head WNL. CBC & chemistry WNL. GTT abnormal.

History: PMH: mild acne, enlarged tonsils, loud snoring. Vaccine reaction @ 5 mo w/allergy to DPT.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Arthralgia, Convulsion

Symptom Text: Information has been received from a 23 year old female with possible penicillin allergy who on approximately 06-AUG-2008 (about six weeks ago) was vaccinated with the second dose of GARDASIL. There was no concomitant medication. The patient reported that since second dose was given on approximately 06-AUG-2008, she had 3 cases of seizures (last episode happened about a week ago, approximately 10-SEP-2008). She mentioned that she only had one incident of seizure activity prior to GARDASIL. The patient stated that she also was experiencing joint pain in her hip as well. At time of reporting, the patient had not recovered. Laboratory tests and studies performed included electroencephalography, cat scan and blood work with unknown results. The patient sought unspecified medical attention. Upon internal review, episodes of seizures were considered to be other important medical events. Additional information is not expected.
