Seriousness: HOSPITALIZED, LIFE THREATENING, SERIOUS

MedDRA PT Blood culture negative, Blood pressure decreased, Fatigue, Hyperthermia, Intensive care, Laboratory test normal, Myalgia, Pyrexia, Sepsis, Toxic shock syndrome

Symptom Text: Shortly after the second GARDASIL shot in the series at the end of March 2007, my daughter became mysteriously ill, with very severe muscle pains and fever on 4/2/2007. On 4/4/2007, the condition worsened. She was brought to the ER where her blood pressure dropped drastically and symptoms intensified. She was airlifted to another hospital, nearly died, and spent a week in the ICU. For the next year, she was fatigued and overheated very easily. The physicians never came up with a definitive diagnosis. They suspected toxic shock syndrome, septicemia or some other infection, but no infection site was located, and all blood cultures and other tests were negative. Her illness remains a total mystery. My wife and I suspect that it could have been an immunologic reaction to the GARDASIL vaccine, and what we have learned since then seems to support this.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Abasia, Arthralgia, Influenza like illness, Joint swelling, Muscular weakness, Pain

Symptom Text: Information has been received from a physician and a registered nurse (RN) concerning a 17 year old female who on 31-JAN-2007, 07-APR-2007 and 07-AUG-2007 was vaccinated with a 0.5 ml first, second and third doses of GARDASIL vaccine (yeast) (lot #655617/1447F, 657617/0384U and 658222/0927U), respectively. The RN reported that a week and one half after the second dose, on approximately 17-APR-2007 the patient developed flu like symptoms with body ache. Following the third dose of GGARDASIL vaccine (yeast), the patient developed joint swelling and pain with muscle weakness that started in November of 2007. The symptoms got progressively worse to the joint where the patient could not walk. The patient consulted an infectious disease specialist, various testing were performed but the results were negative. The joint swelling and pain with muscle weakness was continued to present. The patient presently was "better" as far as the joint pain, but still had mild joint pain and muscle weakness. Additional information has been requested.

Seriousness: EXTENDED HOSPITAL STAY, HOSPITALIZED, PERMANENT DISABILITY, SERIOUS

MedDRA PT Anxiety, Central nervous system lesion, Paraesthesia, Pharyngolaryngeal pain, Syncope, Vertigo, Vomiting

Symptom Text: Information has been received from a physician concerning a 17 year old female with asthma who was vaccinated with GARDASIL. In November 2006, the patient experienced paraethesias of the left thumb, left hand and right forearm and was hospitalized. On an unspecified date the patient experienced anxiety and sore throat. On 14-MAY-2007 the patient experienced syncope, paresthesias of the left hand, right fingers and right toes and vomiting. The patient sought unspecified medical attention. On 15-MAY-2007 head computed tomography showed possible low attenuation of the region of the left occipital lobe. This may represent a chronic area of old infarction. Recommend magnetic resonance imaging (MRI) to further evaluate. On 15-MAY-2007, the brain MRI showed multiple periventricular white matter lesions, tube which demonstrated enhancement following contrast administration. Findings may be related to an active demyelinating process such as multiple sclerosis versus a post viral acute disseminated encephalomyelitis. Correlation with cerebrospinal fluid was recommended. On 18-MAY-2007 cerebrospinal fluid (CSF) cytopathology performed for a history indicating vertigo, was negative for malignant cells. There was rare clusters of small lymphocytes. Enterovirus shell viral culture indicated no virus was detected. On 18-MAY-2007 complete blood count with differential was within normal limits except for mean corpuscular hemoglobin (MCH) was 31.5 and granulocytes were 71.9. Antinuclear antibody screen, rheumatoid factor, sedimentation rate, component C3 test and component C4 test were within normal limits. A complement total CH50 was 64, Lyme AB screen with reflex western blot showed no detectable antibody, serum IGG was high at 1656 and a miscellaneous fatty acid profile was within normal limits. Serum Borrelia burgdorferi IgM Western blot antibody and serum Borrelia burgdorferi IgG Western blot antibody tests did not detect antibodies. CSF Myelin Basic Protein was negative. However, the oligoclonal IGG bands showed that the pat

MedDRA PT Injection site discomfort, Injection site swelling, Injection site urticaria

Symptom Text: Information has been received from a registered nurse concerning a 15 year old female (previously reported as male) who on 03-MAY-2007 was vaccinated SC with a second dose of varicella virus vaccine live (Oka/Merck) (Lot#656122/1309F). Additional suspect vaccination included an IM first dose of Gardasil (Lot# 657622/0388U). Subsequently the patient developed a raised welt, swelling and discomfort at the injection site which was the size of a softball. Unspecified medical attention was sought. Subsequently, the patient recovered. No further information was provided. There was no product quality complaint involved. Additional information is not expected. This is one of several reports from the same source.

MedDRA PT Death, Unresponsive to stimuli

Symptom Text: Information has been received from a medical assistant concerning a 22 year old female with no known medical history and no known allergies who was vaccinated with GARDASIL. Subsequently the patient experienced an unexplainable death. The mother of the patient found her daughter unresponsive and dead in her bed. It was noted that this death was reported to VAERS and the death was not caused by GARDASIL. It is unknown if medical attention was sought. The medical assistant considered the death to be disabling and life-threatening. No further information is available.

MedDRA PT Injection site erythema, Injection site reaction, Injection site swelling, Pain in extremity

Symptom Text: Information has been received from a healthcare employee concerning an 18 year old female who on 08-MAY-2007 was vaccinated with VARIVAX (Lot # 656078/0169U). Concomitant vaccine therapy administered at the same time included a first dose of GARDASIL. On 08-MAY-2007 the patient developed a local injection site reaction in the arm with swelling and redness. Symptoms resolved without any treatment. No other information was available at the time of this report. Unspecified medical attention was sought. No product quality complaint was sought. Additional information has been requested. Follow-up information received from a certified medical assistant stated that on 08-MAY-2007, the patient was vaccinated with a second subcutaneous dose of VARIVAX in the upper left arm. A first intramuscular dose of GARDASIL (Lot # 657006/0188U) was given in the left deltoid. A first subcutaneous dose of MENOMUNE (Lot # U2278AA) was given in the upper right arm on 08-MAY-2007. The patient stated that her arms hurt the day of injection, 08-MAY-2007 and then redness and swelling appeared on 09-MAY-2007 which lasted until 13-MAY-2007. The patient was seen on 11-MAY-2007 and the redness was approximately a quarter size. Subsequently, the patient recovered.

MedDRA PT Erythema, Induration, Tenderness

Symptom Text: Information has been received from a health professional concerning a 14 year old female student with no medical history or allergies, who on 25-JUN-2007 at 13:12, was vaccinated with her second SC dose of varicella virus vaccine live (Oka/Merck) (lot# 657783/0644U) in the right arm. Concomitant vaccination administered that day at 13:12 included a first IM dose of Gardasil vaccine (MDS) (lot# 658094/0524U) in the left arm. There was no illness at the time of vaccination. On 28-JUN-2007, at 14:59 the patient developed a 4-5 cm diameter area of the right arm that was red, hard, and slightly tender for 2 days, with induration 2 cm within, over the right tricep. No medical attention was sought. No labs or diagnostic studies were performed. The patient was reassured and advised to apply an ice pack and take Motrin. Subsequently the patient recovered. Additional information has been requested.

Seriousness: ER VISIT, HOSPITALIZED, SERIOUS

MedDRA PT Abdominal pain, Activities of daily living impaired, Amnesia, Apnoea, Cough, Dizziness, Dyspnoea, Gaze palsy, Headache, Hypoaesthesia, Loss of consciousness, Malaise, Migraine, Orthostatic hypotension, Posture abnormal, Presyncope, Syncope, Vision blurred

Symptom Text: Information has been received from a consumer concerning his 14 year old granddaughter with a history of migraine who in September 2008, was vaccinated with a dose of GARDASIL. In October 2008 (on an unspecified time after vaccination), the patient experienced abdominal pain and headaches. Her symptoms had been getting more pronounced and more frequent. Since December 2008, the patient had spent more time out of school than in school. On approximately 18-FEB-2009 ("three weeks ago") the patient was doing homework and was feeling well. Then she began to look unwell and laid down on the couch. As her grandparents watched, the patient's body started to "draw up", her hands became claws, and she developed numbness in her legs and hands. Then she developed extreme shortness of breath and coughing. Her head rolled back, her eyes crossed, she passed out and stopped breathing. Paramedics were called and she was taken to a hospital. This was about the seventh time the patient had gone to the ER in the last two months. Oxygen was given in the ambulance. By the time she reached the hospital the patient was responding. After this episode the patient lost her memory for a week and only recognized a few people. The patient was later released from the ER. In the last 2.5 months the patient had spent two nights in the hospital. While at a children's hospital for testing, the patient fainted and was admitted for testing for one week. The patient had had migraines lasting as long as a month. Numerous MRIs and CAT scans were performed. On 10-MAR-2009 (" Last night") the patient went to the ER. All tests had come up with no diagnosis. Unknown medications had not worked. At the time of reporting, the adverse events persisted. Additional information has been requested. 4/10/09-records received for DOT 9/7/08-consult for evaluation of syncope. Initial syncopal episode 1-2 years ago however this past week epxperienced 3-4 episodes with 1st episode ocurring 9/3/08 when running for about half an hour and started feeling dizzy and passed

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Fibromyalgia, Injection site induration, Injection site warmth, Lymphadenopathy, Muscle contractions involuntary, Muscle spasms, Night sweats, Rash, Rhabdomyolysis, Trismus, Vision blurred

Symptom Text: Information has been received from the mother of a 24 year old female consumer with allergy to CELEXA and allergy to metals who on 05-JUN-2007 was vaccinated with the first dose of GARDASIL (lot #655849/0263U), 0.5 mL IM in the arm. Concomitant therapy included VALIUM, baclofen, prednisone, TORISEL, "dizanidine HCl" [therapy unspecified], PERCOCET, oxycodone, PRILOSEC, estradiol, ZOLOFT, ALLEGRA, albuterol and "birth control pills" (unspecified). On 05-JUN-2007 after getting her first 0.5 mL dose of GARDASIL, the patient's arm was "warm and hard for a couple of weeks" and the patient recovered from this event. On approximately 19-JUN-2007, a couple of weeks after the first vaccination, the patient's clavicular lymph node swelled up. The swelling was almost gone when the patient received the second dose of GARDASIL (Lot #658100/0525U) on 08-AUG-2007. On 09-AUG-2007, after the second dose, every lymph node in the patient's body swelled up. She could not open her mouth and could not relax her muscles. The patient was admitted to the hospital for 3 days, her serum creatine kinase level went up to 500 and she was diagnosed with rhabdomyolysis. The patient had muscle missing on the bottom of her right foot and she had symptoms of fibromyalgia. She had muscle contractures and spasms and had rashes on top of the spasms. The patient developed hormonal problems, did not have her period for 6 months and was having night sweats. The patient's left eye was "out of focus" and the muscles were "jumping around in her left eye." She had a magnetic resonance imaging (MRI), blood work and an eye test performed which results were not reported. At the time of reporting, the patient was recovering from the events while on therapy (unspecified). No product quality complaint was involved. Additional information has been requested.

Other Meds: [therapy unspecified]; PERCOCET; albuterol; baclofen; VALIUM; estradiol; ALLEGRA; hormonal contraceptives; PRILOSEC; oxycodone; prednisone; ZOLOFT; TORISEL

Lab Data: magnetic resonance, 08/09/07, results not reported; ophthalmological exam, 08/09/07, results not reported; hematology, 08/09/07, results not reported; serum creatine kinase, 08/09/07, 500, went up to 500

MedDRA PT Activities of daily living impaired, Arthralgia, Chills, Cough, Dyspepsia, Fatigue, Gastrooesophageal reflux disease, Inflammation, Migraine, Oesophagitis, Pain, Pyrexia, Screaming

Symptom Text: Adverse reaction to the HPV (Gardasil) vaccine. This is a summary of what we have been through for over a year. Patient was 14 at the time of her first vaccination (first vaccine 7/11/07, second vaccine 9/12/07). She was just the average teenager enjoying herself and having fun with her friends. She works hard and really struggles to do well in school and is in honors classes. She is a real achiever. She also has dreams for her future and goals that are very important to her. We did not know that July 11th, 2007 would be the day that would change our lives. This is what our family's life has been like. When the Gardasil adverse reaction started July 12th, 2007, we started logging it to see if there was a pattern and there was no pattern. The migraine headaches went on for months and she would just scream. It was so hard because we did not know what to do. She has been in and out of the hospital and emergency rooms, several dozen doctor appointments (over 50 doctors), dozens of trips for blood work. She has been on approximately 70+ different types of medicine including Demerol to stop the pain. They have checked for anemic, valley fever, thyroid problems, allergies, asthma, sinus infections, chest x-rays, MRI, CT scans, eyes checked, EEG, EKG, upper GI, endoscopy (upper scope), heavy metal poisoning, arthritis/inflammation, checked her white blood cells, etc. She has had migraine headaches that were every day and were so bad that she would scream. She said that it felt like someone was stabbing her in the head with a knife. Her heart burn made her curl up on the floor in severe pain, she has an inflamed esophagus which was a result of chronic coughing. She missed approximately 50 days of school. We have been seeing a neurologist that specializes in migraine headaches (1st appt. 11/8/2007). We are also seeing a naturopathic doctor (1st appt. 6/2/2008) because the doctors in the medical profession do not know what to do other than give her more drugs. We are still dealing with ice pick migraine heada

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Drug administered at inappropriate site, Erythema, Immediate post-injection reaction, Incorrect route of drug administration, Pruritus

Symptom Text: Initial and follow up information has been received from a health professional concerning a 13 year old female who on 27-SEP-2007, at 10:07, was vaccinated with a first dose of 0.2 mL of varicella virus vaccine live (Oka/Merck) (Lot # 65843/1184U) intradermally into the left forearm, followed later by the remaining dose of 0.3 mL subcutaneously into the left arm (Lot # 658431/1184U). Concomitant vaccine therapy that same day, at 10:07, included , a first dose of Gardasil intramuscularly into the right arm (Lot # 654535/0960F), a first dose of Adacel, intramuscularly into the left arm (Lot # C2491AA), and a first does of Menactra intramuscularly into the right arm (Lot # U2062AA). The patient was initially given 0.2 mL into the left forearm as an intradermal shot. The patient was later given the remaining 0.3 mL subcutaneously into the left upper arm. There was an immediate localized skin erythema and itching at the left forearm. This event was reported as a nursing error, and not product confusion. Unspecified medical attention was sought at the office. There was no product quality complaint. At the time of reporting the patient had recovered on an undisclosed date. Additional information is not expected.

MedDRA PT Fall, Head injury, Inappropriate schedule of drug administration, Syncope

Symptom Text: Initial and follow up information has been received from a registered nurse concerning a 20 year old white female student with no known allergies (previously reported as 17 year old) who on 31-DEC-2007 (previously reported as on ??-JUN-2007) at 11:00 AM was vaccinated intramuscularly into right deltoid with a 0.5 mL first dose of GARDASIL (Lot # unknown) and in April 2008 was vaccinated intramuscularly with a 0.5 mL second dose of GARDASIL. Concomitant therapy included ESTROSTEP. In follow up report from the doctor's office it was reported that the patient had syncope five minutes after (about 11:05 AM) she got her first injection. She fell off the examination table and hit her head on the floor. She went to the emergency room and a head computed axial tomography (CT scan) was done with negative result. It was reported that on 31-DEC-2007 patient recovered. Additional information is not expected.

Other Meds: ESTROSTEP

MedDRA PT Death

Symptom Text: Information has been received from a physician concerning a "17 year old" female who on an unspecified date was vaccinated with GARDASIL. In April 2008, approximately 6 weeks ago the patient died. The physician reported that one of the patient's mother did not want to agree to the vaccine because her friend's daughter died after receiving it. The 17 year old patient was found dead on the floor by her mother. The autopsy was performed and the outcome was unspecified. The physician only has information on the patient that refused the vaccine. No further information was provided. The reporter felt that the event was disabling and life threatening. Additional information has been requested.

MedDRA PT Wrong drug administered

Symptom Text: Information has been received on request from the FDA under the act regarding a 15 year old female with no previous illnesses, who on 28-JAN-2008 was vaccinated IM in the left arm with a first dose of GARDASIL (Lot# 658554/0928U). Concomitant therapy included ADACEL (Lot# C2771AA) administered in the right arm, and MENACTRA (Lot# U2405AA) administered in the left arm. On 28-JAN-2008 GARDASIL was misadministered. It was documented on the patient's immunization record by the office assistant for the patient to receive GARDASIL and MENACTRA when the patient's parent had requested MENACTRA and ADACEL. The ADACEL was administered later. The parent was upset over the administration of GARDASIL. No laboratory diagnostics were performed. At the time of the report, the outcome of the patient was unknown. The VAERS ID# is 305701. Additional information is not available.

Symptom Text: Information has been received on request from the FDA under the Freedom of Information Act concerning a 15 year old female with asthma, allergic rhinitis, nickel dermatitis and a history of a fractured toe who on 25-SEP-2007 was vaccinated intramuscularly into the left arm with the first dose of GARDASIL (Lot # 658094/0524U). Concomitant therapy included MENACTRA (Lot U2382BA), ADVAIR, albuterol, CLARITIN and TRIAMCINOLON COMPOSITUM. On 20-DEC-2007, prior to admission, the patient presented with a several day history of numbness and tingling in her extremities, with progressive weakness. Symptoms began six days prior to admission with right fifth digit numbness. Four days prior to admission she felt increasing pharyngitis and numbness and tingling in lips. Three days prior to admission she felt increasing generalized weakness. Two days prior to admission the patient was increasingly hoarse. On the day of admission the patient demonstrated a wide based gait, and was holding onto the wall to walk. She fell in the bath tub and was unable to get up. She had decreased grip strength. She also had a ten pound weight loss one week prior to admission. Some of her symptoms also included acid reflux, global myalgias, jaw pain, and back pain. She had a pruritic rash on her frame. Diagnostic testing performed included an electromyography on 27-DEC-2007 indicating the medial ulnar motor response was very low in amplitude and mildly long in distal latency. A repeat electromyography was performed on 04-JAN-2008 revealed no response obtainable in the median or ulnar motor nerves, and the peroneal motor study showed low amplitude response and MIL. Treatment required admission to the intensive care unit, prolonged period of intubation and ventilator support, plasmapheresis, intravenous immunoglobulin, physical and occupational therapy and nasogastric tube feeding. She also had developed bilateral ptosis and tracheitis. she was diagnosed with Guillain-Barre syndrome on 17-JAN-2008. She was transferred to a rehabilitation unit and re

MedDRA PT Dyspnoea, Fatigue, Heart rate increased

Symptom Text: Information has been received from a consumer concerning her 15 year old daughter, with an allergy to pollen and a history of tonsillectomy, who on 04-OCT-2007 and 04-Dec-2007 was vaccinated with her first and second doses, respectively of Gardasil (lot #s not reported). "Sometime later in December 2007", the patient began to have breathing problems (NOS), sometimes accompanied by a rapid heart beat. Also, it was reported that she has been much more fatigued than usual. It was reported that periodically, some of these episodes have been very severe and temporarily incapacitate her. Usually, the breathing problems last for one or two minutes and then they dissipate. The patient's breathing problems and fatigue persisted. Unspecified medical attention was sought. A CAT scan endoscopy and echocardiogram are schedule to be done in March, 2008. Additional information has been requested. Follow-up information was received from the physician and nurse who reported that the patient was an active dancer who developed shortness of breath after dancing. She was referred for an allergy and asthma evaluation as well as a cardiac evaluation. Her allergy and asthma tests as well as echocariogram were negative, and she was ruled out as having cardiac, asthma or allergy problems. On an unspecified date she was diagnosed with excercise induce reactive airways disease and bronchospasm. The doctor stated that the rapid heart beat and breathing problems (shortness of breath) were symptoms of this. These events (as well as the fatigue) were considered non-serious. At the time of this report the patient still continued to occasionally have this breathing related reaction after she danced but was reported as stable. The physician also reported that on 18-FEB-2008, the patient was evaluated for joint pain and achey muscles (also considered non-serious). The patient was diagnosed with arthralgia and bronchospasm. All lab work including CBC, ANA, ESR and others were within normal limits (labs not provided). On 26-FEB-2008, the patient was

MedDRA PT Oedema peripheral, Pain in extremity

Symptom Text: Information has been received from a physician concerning a female who in approximately February 2008, was vaccinated with the first dose of GARDASIL (lot# not provided). The same night following vaccination, the patient went to the Emergency Room with a swollen and painful arm. No further information was provided. Additional information has been requested. Additional information received from D-form (07/APR-2008). For the reporter, the patient received her first dose of GARDASIL and within 48 hours experienced pain, swelling and redness of arm, resulting in an ER visit. The patient was treated with oral steroids. Subsequently, the patient recovered from the pain, swelling and redness of her arm. The reporter did not see the patient during the acute reaction, but was informed after recovery. There is no additional information. Additional information received from D-form (29-APR-2008). The patient is an otherwise healthy 11-year-old female with a history of chicken pox disease as a younger child. On 19-MAR-2008 the patient was vaccinated in the left arm with the first dose of GARDASIL (lot# 657621/0387U). On 12-APR-2008 the patient developed Herpes Zoster on the skin of her left back/side/chest. The patient twice sought unspecified medical attention in the physician's office. VALTREX was initiated on 18-APR-2008. The patient is currently recovering. The physician is not sure if the Herpes Zoster was related to GARDASIL vaccine. Additional information is not expected.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Hypoaesthesia, Pain in extremity, Vaccine positive rechallenge

Symptom Text: Information has been received from a physician concerning a 21 year old female who on 28-NOV-2007 was vaccinated intramuscularly in the left arm with her first dose of GARDASIL (lot # 658556/1060U). Concomitant therapy included hormonal contraceptives (unspecified). On 19-FEB-2008 the patient was vaccinated intramuscularly in the left arm with her second dose of GARDASIL (lot# not reported). While in the office, the patient experienced soreness down her arm to her fingers and intermittent numbness in her hand all in the left arm. The patient used ibuprofen (MOTRIN) intermittently and was offered physical therapy, but declined. The patient recovered after 6 weeks. The patient sought medical attention in the office. Additional information has been requested.

MedDRA PT Drug exposure during pregnancy

Symptom Text: Information has been received from a consumer through the Merck pregnancy registry concerning a 16 year old female who on 01-FEB-2008 was vaccinated with the third dose of GARDASIL (lot# not reported). Concomitant suspect therapy included VARIVAX (Oka/MSD) (MSD) (lot# not reported). Other concomitant medication included VENTILAN (albuterol) and prenatal vitamins. Per the reporter, the patient found out that she was pregnant about a week after receiving the third dose. Before she was known to be pregnant, the patient had a pap smear that was irregular, so a biopsy of the cervix was performed. Per the reporter, "I don't know if this made her more fertile. Also, before her pregnancy, when she received her first dose, she experienced an irregular menstrual cycle." The patient sought unspecified medical attention. Additional information has been requested.

Other Meds: VENTILAN(ALBUTEROL); vitamins (unspecified)

Lab Data: cervical smear, irregular; cervix biopsy; diagnostic laboratory; beta-human chorionic , positive;

Seriousness: ER VISIT, HOSPITALIZED, PERMANENT DISABILITY, SERIOUS

MedDRA PT Abasia, Abdominal distension, Abdominal pain, Activities of daily living impaired, Arthralgia, Fatigue, Joint swelling, Nausea, Rash, Serum sickness, Urticaria

Symptom Text: Patient was given the second injection of the Gardasil vaccine on 4/8/08 by her pediatrician. It was the only injection she received. A few days later she experienced severe joint pain and swelling plus skin hives/rashes. Her pediatrician put her on 60 mg of Prednisone for 3 days. When the symptoms worsened, we were sent to hospital on 4/23/08. Patient was diagnosed with Serum Sickness from the Gardasil vaccine. We started seeing Dr. in Rheumatology on 6/12/08. Dr. prescribed pulse IV Solumedrol administered by a home care nurse along with the oral steroids. Patient experienced a reoccurrence of symptoms on 8/15/08 and 9/3/08. With each reoccurrence she was unable to walk, with joint and abdominal swelling and pain. Methotraxate and Enbrel were prescribed along with the oral and IV steroids. Patient relapsed again and was admitted to hospital for testing on 10/15/08. When no new diagnosis or treatment came out of three days of inpatient examination, we sought a second opinion with Dr. in Pediatric Rheumatology. She stopped the Enbrel and Methotraxate and started reducing the steroids. Patient also saw Dr. in Gastroenterology for her constant nausea. Testing has been inconclusive. Patient experienced another reoccurrence of symptoms in February and March of 2009. Patient began physical therapy on 3/14/09 to help with the joint pain. Patient missed 30 days of school her first semester of senior year, and has already missed 10 days of her second semester due to this illness. Patient takes 10 pills every morning and 6 every evening, along with other medication as needed. She continues to experience consistent fatigue and nausea along with intermittent joint pain and skin hives/rashes.

MedDRA PT Arthralgia, Oedema peripheral

Symptom Text: Information has been received from a physician concerning a 23 year old, 67.5 inch, 168 pound female dental hygienist with no pertinent medical history or allergies, who on 21-FEB-2008 was vaccinated with the first dose of GARDASIL (lot # 657006/0188U), expiration date 21-NOV-2009, IM to the left deltoid. It was reported that within 1 week of receiving the GARDASIL, the patient began developing severe knee pain and lower extremities swelling. The patient sought medical attention and was treated with ibuprofen (manufacturer not specified), over the counter 400 mg up to three times a day. On 05-MAR-2008, the patient saw the physician for obvious edema and knee effusion. Laboratory tests were ordered and a c-reactive protein (CRP) was noted to be 24.6, BSR was 65, and Antistreptolysin O Ab was high at 248.6. The patient was treated with MEDROL DOSE PAK, and DYAZIDE over 1 week. The symptoms resolved on approximately 12-MAR-2008. A follow-up visit to a rheumatologist found no other likely causes for the symptoms except for GARDASIL. Additional information has been requested.

Other Meds: ZOLOFT

MedDRA PT Herpes zoster, Immunodeficiency common variable, Sepsis syndrome, Streptococcal infection

Symptom Text: Information has been received from a health authority, concerning a 16 year old female patient, and recurrent infections with transaminases increased (since 2005), who on 29-MAR-2007 was vaccinated with the first dose, which was well tolerated (lot # 654884/0902F; batch NE24240); on 07-MAY-2007 was vaccinated with the second dose, which was well tolerated (lot # 655671/1024F; batch NE63230); and on 06-DEC-2007 was vaccinated with the third dose in the upper arm, of Gardasil (lot # 0251U; batch NF56480). In January 2008, the patient developed streptococcal infection with sepsis syndrome and herpes zoster. In March 2008, the patient was diagnosed with a common variable immunodeficiency, with decreased IgG and IgG 1. She was hospitalized (date and duration not reported. Common variable immunodeficiency was considered to be immediately life threatening. The reporter (not specified), considered a relation to the vaccine doubtful, as the patient showed recurrent infections with increased transaminases, which occurred for the first time in 2005. Other business partner numbers include: E2008-03745; reference # PEI2008004690.

Other Meds: Unknown

Lab Data: serum immunoglobulin G test, 01Mar08, decreased; serum antiendomysial antibodies test, 01Mar08, IgG 1 decreased

MedDRA PT Anxiety, Chest pain, Dizziness, Dyspnoea, Inflammation, Nasopharyngitis, Paraesthesia, Vision blurred

Symptom Text: two weeks after the vaccine for Gardasil I had a cold that lasted a month and a half. Than on 3/20/08 I went to the emergency room because of chest pains shortness of breath dizziness tingling in arms and legs blurred vision. They diagnosed me as having an anxiety attack and they prescribed Xanax. Which I ended up taking to much due to the chest pains i was having I than ended up in the er the next day. After that i went to my doctor for a follow up and saw (P.A) who prescribed cough suppresant and zithromax that I took for 5 days and she told me to go see a cardiologist and a psychiatrist. So then I saw Dr. (Cardiologist) he ran test. He then said my heart was inflammed and gave me trial moblic i had to take for 3 days along with Zantac. I still continued with the chest pains and tingling in arms and legs with the shortness of breath. He then did a 2D echo and had me take a stronger dose of moblic and then had a CT of my chest because he thought I had a pulmonary emboli. Then he gave me motrin 800 mg every 8Hrs as needed for chest pains. I still get the chest pains constantly. Yesterday I started with the shortness of breath and tingling in my arms and legs, the dizziness and blurred vision. I will be calling the cardiologist again on Monday 05/05/08 to see what else I need to do. At that time I will be letting him know that I did recieve the Gardasil injection in January 24,2008, since I had forgotten to tell him. I did not think it was important at the time, but now I am wondering if this is a side effect of Gardasil.I have no problems prior to recieving the shot.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Information has been received from a 21 year old female consumer that is also the patient, who has no pertinent medical history, drug reaction/allergies or concomitant medication usage. On 05-DEC-2007, the consumer was vaccinated (route and site not reported) with the 1st dose of GARDASIL (lot# not reported). The consumer found out she was pregnant after receiving the 1st dose of GARDASIL. The consumer reported that she was 6 weeks pregnant. The patient did receive unspecified medical attention. No lab diagnostic test were performed. Follow up from the consumer indicated that she had a miscarriage on 31-JAN-2008. She added that "everything is OK now," and added that she had no problems since then. Upon internal review, had a miscarriage was considered to be serious as an other important medical event. No additional information is expected.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Folliculitis, Lymphadenopathy, Skin lesion, Syncope, Vaccine positive rechallenge

Symptom Text: Information has been received from a physician concerning an 18 year old female patient with no medical history reported, who on 12-OCT-2007 was vaccinated intramuscularly into the deltoid with the first dose of Gardasil. On an unspecified date in November 2007, the patient developed bilateral lymphadenopathies of the right groin which resolved one month later. The patient also experienced syncope in November 2007, with "immediate" cessation. This event was considered not serious by the reporter. On 04-JAN-2008, the patient was vaccinated intramuscularly into the deltoid with a second dose of Gardasil. In approximately February 2008 "about a month ago", the patient developed lymphadenopathy at several unspecified sites. It was reported that one of the adenopathies (size 3x2 cm) persisted at the right groin and was associated with exudate. For the events following the second dose of Gardasil, folliculitis was not ruled out and dermatologic examination results were expected. The patient received corrective treatment with unspecified antibiotics that did not solve the problem. The physician consequently ruled out infection. The outcome was currently reduced to what looked more like a skin lesion (the size of an almond) than as an adenopathy. It was reported that the patient did not experience syncope after the second dose of Gardasil. Lymphadenopathy, folliculitis and skin lesion were considered to be other important medical events. Other business partner numbers included: E200802858, E200802742 and RA0152008. No further information is available.

MedDRA PT Hypoaesthesia, Injection site pain, Muscular weakness

Symptom Text: Information has been received from a physician concerning a 16 year old female who on 06-MAR-2008 was vaccinated IM in the deltoid muscle with the third dose of GARDASIL (Lot# not reported). Dates and lot #s of previous two vaccinations of GARDASIL were not reported. There were no concomitant medications reported. On 06-MAR-2008 about 10 minutes post vaccination the patient experienced injection site pain and numbness "starting from below the injection site and spreading down to the hand". In the course she additionally developed weakness of the hand. It was reported that the injection site pain resolved after one day and the numbness and weakness were ongoing. It was reported that on 22-APR-2008 the patient was admitted to the hospital for diagnostics. The physician reported that the first two doses of the vaccine were well tolerated. Other business partner numbers include E2008-03768. Additional information has been requested.

MedDRA PT Abdominal pain upper, Autoimmune disorder, Back pain, Haemolytic anaemia, Malaise, Pharyngolaryngeal pain, Pyrexia, Vomiting projectile

Symptom Text: Initial and follow up information has been received from a pediatrician and a consumer concerning his 19 year old daughter with an allergy to a medicine for acne that caused her to projectile vomit who on 23-NOV-2007, around Thanksgiving, was vaccinated with a first dose of GARDASIL (Lot# 658488/0930U). It was reported that she got sick and did nothing the next day. On 14-MAR-2008, the patient was vaccinated IM with a second 0.5 ml dose of GARDASIL (Lot# 659962/1740U). On 17-MAR-2008 three days after receiving the vaccine, the patient developed a fever that wouldn't go away. She tested positive for hemolytic anemia and was hospitalized. On 18-MAR-2008, four days after receiving the second dose the patient had complained of a sore throat, stomach and back ache and a fever up to 104 degrees. She had been in the hospital for the past week. Laboratory diagnostic studies performed was reported as "every test they could do". On 21-MAR-2008, the patient had a mononucleosis spot test and it was negative. The patient went back to college and her symptoms worsened. The patient was admitted to the hospital (dates unknown). She was then transferred to a different hospital. It was reported that the patient had 105 vials of blood drawn and the diagnosis of hemolytic anemia seemed to point to an autoimmune response from the second dose of GARDASIL. The patient was discharged from the hospital (hospitalization dates unknown) and it was reported that the patient remains on steroid therapy. At the time of this report, the patient had not recovered. It was also reported that the patient had to drop out of college. The reporting physician was consulting with an infectious disease specialist to confirm the cause of the diagnosis. No product quality complaint was involved. Additional information has been requested.

Symptom Text: Initial and follow up information has been received from a Registered Nurse (R.N) and by telephone concerning a 19 year old female patient who on 23-NOV-2007 was vaccinated into the left arm with a first dose 0.5 mL of GARDASIL (lot # 658488/0930U) and on 14-MAR-2008 she was vaccinated IM in the right arm with a second dose 0.5 mL of GARDASIL (lot # 659962/1740U) at another office. On 31-MAR-2008, the patient went to a college health clinic with fever, chills, sore throat body aches, nausea, "mono-like symptoms". She had laboratory work done and was diagnosed with Viral syndrome and anemia. Her laboratory work indicated low white blood cell (WBC) count and red blood cell count (RBC). It was reported that she had vomiting, no appetite, inflamed liver and spleen, dark urine, shortness of breath and fever. She also had pain in lower back and abdominal area. The patient had unspecified laboratory work and was referred to infectious disease. After ten days of unconfirmed diagnosis, the patient was hospitalized. On an unknown date the patient was discharged from the hospital. The patient was driven back home and was seen by a cardiologist who noted she was in "good condition". She saw another infectious disease specialist again. This time the patient was admitted to the hospital from 24-APR-2008 to 01-MAY-2008 for fever. The patient had bone marrow and other unspecified laboratory tests done. Some enlarged lymph nodes were detected in pelvis and small bowel. Her hemoglobin was 7.9 and "1.7". She was treated with PREDNISONE 60 mg and at the time of this report was on PREDNISONE 40 mg daily. She tested positive for Epstein-Barr virus (EPV) reported as "EPV" and cytomegalovirus (CMV). Patient's parvo virus, west nile virus/IGM needed to be retested. She lost 17 lb and had to withdraw from college with only one credit to complete. It was noted that the patient had difficulty with everyday activities. The patient's outcome was unknown. The patient's EBV and CMV were considered to be disabling as the patient had to withdraw

MedDRA PT Autoimmune disorder, Lymphadenopathy, Pyrexia

Symptom Text: Information has been received from a Registered Nurse (R.N.) concerning a 19 year old female patient with sulfonamide allergy who on 14-MAR-2008 was vaccinated with a dose of Gardasil. The nurse stated that the patient did not receive the Gardasil at her office and it was unknown which dose in the series of the vaccine was given. The nurse reported that the patient developed a fever of 102 to 103 degrees F after she received the Gardasil vaccine which has started for the past month (start date was not specified). The fever came and went almost every day, but did not last the whole day. The patient was hospitalized on 24-APR-2008 in relation to the fever and was discharged on 01-MAY-2008. During her hospitalization it was determined that she had a low white blood cell count and might have a possible auto immune disease. Serum antinuclear antibodies test (ANA) screen was done. Results not provided. A computerized Axial Tomographic (CAT) scan indicated that the patient had enlarged lymph nodes in abdominal cavity, small bowel, and in upper pelvis. She had unspecified blood and laboratory tests done. It was reported that patient was improving and was on steroid therapy. No other information available at the time of this report. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Arthralgia, Femoral pulse abnormal, Gait disturbance, Groin pain, Oedema peripheral, Pain in extremity, Pallor, Peripheral coldness, Skin discolouration, Tenderness, Weight bearing difficulty

Symptom Text: The morning after her injection she woke up complaining of upper right leg pain, near the groin area where the leg bends. No fever or reddness.Two days later the pain extended down to the knee, and by a week and a half later the pain extended down to the foot. She was also experiencing swelling of the leg and blanching of the skin accompanied by her leg getting cold to touch. Her right leg is painful to touch and she can not tolerate weight bearing. After a day at school the leg is very painful and swollen.So far nothing seems to help, heat, ice, elavating the leg,or vicodin. So she takes extra strength tylenol for the pain. 5/28/2008 MR received from PCP for 2 OVs dated 4/29/08 and 5/02/08 with DX: R leg pain and R leg pain now with absent femoral pulse. Pt presented with c/o of R leg pain which began 1 day s/p HPV vax. Initially started in the groin, then moved distally to the thigh and knee, and now to the ankle over the course of several weeks. Pt was unable to walk for several days but is ambulating with crutches. Pt reports occasional swelling and purplish skin discoloration. PE (+) for pain and tenderness to touch and with hip and ankle flexion and. extension. RTO 3 days later with worsening pain and now coldness of the R lower extremity as well as the purple color. PE (+) for purple discoloration and cool to touch especially in the calf area. No palpable femoral pulse. Concern for acute arterial obstruction. DDx spinal nerve impingement, bony abnormality, RSD.

Other Meds: None

Lab Data: On 4/25 she went to her PMD. On 4/29 she had an xray and ultrasound. These test were negative. On 5/6/08 she is getting a bone scan. Labs and Diagnostics: Venous duplex studies (-). X-ray of hip, knee, and ankle (-). Arterial duplex

MedDRA PT Abdominal pain, Cough, Disturbance in attention, Fatigue, Headache, Hypersomnia, Lethargy, Lymphadenopathy, Malaise, Pharyngitis, Pharyngitis streptococcal, Pharyngolaryngeal pain, Pneumonia, Sinusitis, Somnolence, Stomach discomfort, Tonsillitis, Viral infection, Vomiting

Symptom Text: Initial and follow up information has been received from a physician and a registered nurse, concerning a 15 year old Caucasian female patient with allergies to penicillin, cefadroxil monohydrate (DURACEF) and cefalexin (KEFLEX), who on 23-JUL-2007 was vaccinated with her first dose of GARDASIL (lot# 658094/0524U). On 08-OCT-2007 the patient was vaccinated with her second dose of GARDASIL (lot# 658558/1061U). Concomitant therapy referred to use of an albuterol inhaler, and a nebulizer with prednisone. On 12-NOV-2007, the patient visited the physician with complaints of sore throat, enlarged cervical nodes, slight cough and headache, and was diagnosed with pharyngitis, with onset noted as 05-NOV-2007. Treatment included azithromycin (Z-PAK). On 05-JAN-2008, she visited the office again with sore throat, upset stomach, headache, lethargic and sleeping more than normal. She was again diagnosed with pharyngitis, and with fatigue and lethargy. A strep test and mononucleosis test were negative. Treatment was to watch and repeat testing, if not better by the end of the week. The patient was having trouble staying awake to do her school work, and was feeling ill. On 10-JAN-2008, visited the office with complaints of feeling tired all the time, abdominal pain and headache; she was diagnosed with a viral systemic illness. Treatment include eating healthy, and gradually increasing physical activity. On 16-JAN-2008, she visited the office with a sore throat, cough and headache, tired easily, but she was afebrile. She reported taking ibuprofen prn. Her tonsils were enlarged and exudative and she was diagnosed with acute tonsillitis and lymphadenopathy. A strep and mono test were negative; white blood count (WBC) was 8,000 with left shift. Treatment included cefprozil (CEFZIL) for 10 days. On 17-JAN-2008, however, the strep culture had grown positive group A beta strep. On 28-JAN-2008, the patient still had a sore, swollen throat and headache, but no fever, visited the office, and was diagnosed with streptoco

Other Meds: Albuterol; Prednisone

MedDRA PT Abdominal pain upper, Acute sinusitis, Balance disorder, Dizziness, Fatigue, Headache, Hypotension, Lethargy, Nasal congestion, Oral intake reduced, Pharyngitis, Pharyngolaryngeal pain, Sinus headache, Somnolence, Vertigo, Viral infection, Weight decreased

Symptom Text: Initial and follow-up information has been received from a physician concerning a 12 year old female, who on 23-JUL-2007 was vaccinated with her first dose of Gardasil (lot# 658094/0524U). Concomitant vaccination included Tdap (Lot# AC5213018A13). On 08-OCT-2007 the patient was vaccinated with her second dose of Gardasil (lot# 658558/1061U). On 04-FEB-2008 the patient was seen in the office and complained of a sore throat, headache, and stomach ache. The patient was diagnosed with acute pharyngitis. The physician believed the pharyngitis to probably be viral, but would follow culture to 48hours. The strep ID was negative. The patient was given information on how to treat and what to watch for. On 18-FEB-2008 the patient was seen at the office with complaints of dizziness/vertigo, severe headache, and felt "off balance." The patient was diagnosed with fatigue, lethargy, and a headache. The patient also experienced weight loss. The patient's head, ears, eyes, nose, and throat (HEENT) was within normal limits, complete blood count (CBC) was normal, serum Epstein-Barr virus antibody test was negative, and blood pressure was 106/60. The patient appeared to be recovering from viral illness. The physician discussed low blood pressure with the patient. The patient was reminded to stand up slow, eat a healthy diet and to call if signs and symptoms worsened or did not improve. On 25-FEB-2008 the patient was seen in the office with complaints of headache, dizziness, and a decrease in oral intake with a 6-10 pound weight loss over the week. The patient's mother reported that the patient has been sleepy during the week. The patient experienced nasal congestion, and mild pain over frontal sinuses. The patient was diagnosed with headache and acute sinusitis. The patient was prescribed ZITHROMAX TRI-PAK. It was reported that the headache was gone. The patient was advised to take antibiotic with chocolate milk or a meal to help with the upset stomach and to continue the ZITHROMAX TRI-PAK and call with any oth

MedDRA PT Drug administered at inappropriate site, Inappropriate schedule of drug administration, Injection site pain, Malaise, Multiple sclerosis relapse, Paraesthesia

Symptom Text: Information has been received from a health professional concerning his 29 year old wife with multiple sclerosis (diagnosed in 2007 with demyelinating disease) and papilloma viral infection (detected 6 months after giving birth, HPV positive on 2 Pap tests third and fourth were negative, results of the fifth pending) and a history of pregnancy (at age 26 normal labor) and malaise who on 09-APR-2008 was vaccinated into the buttock with a first dose of Gardasil. Concomitant therapy included interferon. On 09-APR-2008 the patient experienced intense pain during administration. On 10-APR-2008 one day post vaccination, the patient started with malaise, a tingling sensation on the left side of her face and around the eye area. The patient went to the neurologist. According to the neurologist the patient had multiple sclerosis relapse. She was treated with three doses of corticosteroids administered on 14-APR-2008, 15-APR-2008, and on 16-APR-2008. The neurologist did not establish the vaccine as the cause of the MS relapse, but there was a slight risk. Multiple sclerosis relapse and intense pain during administration were considered to be other important medical events. No further information is available.

MedDRA PT Injection site reaction, Pyrexia, Throat irritation

Symptom Text: Information has been received from a gyneacologist concerning a 16 year old female who already felt unwell for three days prior to the vaccination, who, on an unspecified date, was vaccinated with a dose of Gardasil. The lot#, injection route, and injection site were not reported. The following night the patient experienced severe fever and was hospitalised. The patient showed a mild injection site reaction and complained about a raspy throat. A blood sample was taken and only showed slightly increased inflammatory values (not otherwise specified). The patient recovered and was discharged from the hospital one day later. The treating physician in the hospital considered no causal relation to the vaccine but an intercurrent infection. Additional information is not available.

Other Meds: Unknown

Lab Data: Diagnostic laboratory test blood sample - showed slightly increased inflammatory values (not otherwise specified).

Seriousness: PERMANENT DISABILITY, SERIOUS

MedDRA PT Chronic fatigue syndrome, Cold sweat, Condition aggravated, Feeling hot, Hyperhidrosis, Inappropriate schedule of drug administration, Insomnia, Panic attack

Symptom Text: Information has been received from a physician via CSL as part of a business agreement concerning a 29 year old female with chronic fatigue syndrome following a head injury (1998), nontoxic multi-nodular goitre and irritable bowel syndrome who uses alternative practitioners. On 20-DEC-2007 the patient was vaccinated in her left deltoid with the first dose of Gardasil (Lot # 654672/0444F, Batch # NE09880). There was no concomitant medication. It was reported that for 4 days the patient was okay and then for two and a half months the patient experienced hot and cold sweats, insomnia, panic attacks and exacerbation of chronic fatigue syndrome which are gradually settling (also reported as not yet recovered in the same report). The patient was not treated for the adverse events. The reporter felt that hot and cold sweats, insomnia, panic attacks and exacerbation of chronic fatigue syndrome were unlikely to be related to therapy with Gardasil. Hot and cold sweats, insomnia, panic attacks and exacerbation of chronic fatigue syndrome were considered to be disabling in the patient's opinion. Additional information is not expected.

MedDRA PT Caesarean section, Delayed delivery, Drug exposure during pregnancy

Symptom Text: Initial and follow up information has been received from Pregnancy Registry for Gardasil from a Nurse Practitioner (N.P.) and with a follow up telephone call concerning a 18 year old (previously reported as 20 year old) female patient with abnormal PAP test. She was obese and was a smoker who had cervical condyloma and "SAA". It was reported that patient was vaccinated around December, 2006 with a first dose of Gardasil. On 05-FEB-2007 she was vaccinated with the second dose of Gardasil (lot # 654510/0962F). Concomitant therapy included "birth control patch", Tylenol as needed for headache and she was treated with prenatal vitamins for pregnancy. The reporter reported that patient received her first injection and was pregnant. She had routine obstetrics labs done. No further information was available. In follow up it was reported that her last menstrual period (LMP) was on 03-JUN-2007 and expected delivery date was 09-MAR-2008. There was no information about delivery or outcome of the delivery. In follow up information from the doctor's office it was reported that on 27-SEP-2007 routine serum maternal alpha-fetoprotein test was done. Patient had ultrasound on 25-JUL-2007, 22-AUG-2007, 10-OCT-2007 and in 09-JAN-2008 for confirmation dates and screening of pregnancy. On 22-AUG-2007 pregnancy associated plasma protein test and on 27-SEP-2007 maternal serum alphafeto protein (MSAFP) was done. No information for the results are available. It was reported that on 13-MAR-2008 at 40.4/7 weeks from LMP patient delivered a female normal baby by cesarean section delivery. The indication for C/S delivery was not reported at this time. The baby weighed 8 lb 12 oz and her apgar score was 8.9. No complication was reported with the baby. Upon internal review patient's failure to progress (delayed delivery and) required a cesesaren section delivery. The event was determined to be an other important medical event. Additional information has been requested.

Other Meds: Tylenol; Vitamins (unspecified)

Lab Data: ultrasound 07/26/07 confirmation, dates, screening; ultrasound 08/22/07 confirmation, dates, screening; ultrasound 10/10/07 confirmation, dates, screening; ultrasound 01/09/08; laboratory test Routine OB labs; serum alpha-fetoprotein 09/27/

MedDRA PT Breech presentation, Caesarean section, Drug exposure during pregnancy

Symptom Text: Information has been received from a nurse practitioner, for the Pregnancy Registry for Gardasil, concerning a 25 year old female with a history of one previous pregnancy and a miscarriage and a history of childhood epilepsy who on 12-JUN-2007 was vaccinated with a first dose of Gardasil (Lot # 657868/0523U) 0.5 mL IM. Concomitant medications included prenatal vitamins daily (unspecified) as a supplement and ZANTAC daily for reflux. The patient received her first dose of Gardasil IM and since found out that she is pregnant. The nurse practitioner mentioned the pregnancy is normal to date. Medical attention was sought. No additional information is available. The last menstrual period (LMP) was 16-MAY-2007 and the estimated time of delivery is 07-FEB-2008. Follow-up information was received. Medical history and dates of LMP and estimated date of delivery was updated. Follow-up information was received from the physician's office. On 10-SEP-2007 there was a quad screen performed and was within normal limits. On 30-JAN-2008 the patient had a normal healthy baby girl weighing 8 pounds 1 ounce. The apgar score was 9/9. The patient was 38 and 6/7 weeks from LMP. During labor/delivery the baby was in a frank breech presentation and c-section was done. Upon internal review c-section for breech presentation was considered to be an other medical event. Additional information is not expected.

Other Meds: ZANTAC; vitamins [unspecified]

Lab Data: diagnostic laboratory 09/10/07 quad screen-within normal limits

MedDRA PT Diplopia, Gait disturbance, Mycoplasma infection, Ophthalmoplegia

Symptom Text: Information has been received from a pediatrician concerning a 17 year old female patient who on 28-JAN-2008 was vaccinated with a first dose of Gardasil and on 27-MAR-2008 was vaccinated IM into the upper arm with a second dose of Gardasil (batch # NG20180, lot # 0510U). On 07-APR-2008 she developed ophthalmoplegia and diplopia followed by gait disturbance on same day. The patient was hospitalised on 13-APR-2008. Internuclear ophthalmoplegia and suspicion of multiple sclerosis was diagnosed. Cerebral spinal fluid (CSF) shoed: three oligoclonal bands (a control was sent to a reference laboratory, result not yet available), normal cell count, albumin ratio pathologically increased, slight barrier disorder and no borreliosis. Cranial magnetic resonance imaging (MRI) revealed multiple inflammatory lesions (mesencephal) and periventricular), spinal MRI was normal. Auditory evoked potential (AEP), somatosensory evoked potential (SEP), Visual evoked potential (VEP) and nerve conduction were normal as well as electroconvulsive therapy (ECT) test. Ophthalmological examination, visus of right eye was 0.8 and left eye was 0.7. Serology test revealed a seroactive infection with Mycoplasma pneumoniae. The patient was treated with URBASON one gram per day for three days. The patient improved during the stay in the hospital. The patient was discharged on 21-APR-2008. Further therapy with physiotherapy and adaptation of glasses was planned. The reporter assessed the relation to the vaccine as possible. The other business partner number included: E200803914. The file is closed. No further information is available.

MedDRA PT Abdominal pain upper, Anorexia, Anxiety, Condition aggravated, Depression, Fear, Insomnia, Menstruation irregular, Nausea, Self esteem decreased, Suicidal ideation, Temporal lobe epilepsy, Thinking abnormal, Weight decreased

Symptom Text: Information has been received from a physician and a consumer concerning a 14 year old female patient with temporal lobe epilepsy (also reported as mild by the mother) who on 21-JAN-2008 was vaccinated with a first dose of GARDASIL. Concomitant therapy included carbamazepine (CARBATROL). The reporter reported that her daughter developed "irrational thoughts and fears that developed into suicidal thoughts." Her grades in school went down and she developed low self esteem. She also experienced "real bad stomach pain" for a month. She was "sick to her stomach and could not eat". Her weight went from 109 pounds to 96 pounds because she was not eating. She had electroencephalography (EEG), blood work (not specified what test), hepatic function tests (Liver test) and pancreatic test done. No results reported for the tests. The reporter indicated that because of these events her daughter will not complete the GARDASIL series. The patient's outcome reported to be recovering. In follow up telephone call the physician (neurologist) stated that the patient had temporal lobe epilepsy and it could result in the patient being more prone to depression and anxiety. He also indicated that the patient might have received the first and second injection of GARDASIL in the late luteal phase of her menstrual cycle which could have resulted in exacerbating mood changes associated with the menstrual cycle and "epileptiform activity". He stated that it was hard to confirm that GARDASIL exacerbated the patient's condition. Upon internal review suicidal thoughts was determined to be an other important medical event. Additional information has been requested. 5/19/08-records received for neurology consultation visits 2/7/08-Impression:History of epilepsy since 15 months of age with symptoms and MRI findings suggestive of complex partial seizures including some with secondary generalization in early childhood. MedDRA PT Type 1 diabetes mellitus, Vision blurred, Weight decreased

Symptom Text: Information has been received from a physician and a medical assistant concerning a 12 year old female patient who on 06-APR-2007 was vaccinated IM with a first dose of Gardasil (lot #655324/0088U) and on 02-AUG-2007 she was was vaccinated with a second dose of Gardasil (lot # 657622/0388U). On 16-JAN-2008 she was was vaccinated her third dose of Gardasil (lot # 657868/0523U). No concomitant therapy was reported. The physician reported that the patient developed diabetes Type 1 after receiving three doses of Gardasil. She was examined in the hospital on 25-APR-2008 and on 28-APR-2008. She was not admitted to the hospital on either occasion. The patient was started on insulin. No further information was provided. The patient's outcome was not recovered. In follow up telephone call the medical assistant reported that the patient began experiencing rapid weight loss and blurry vision (dates not reported). She was diagnosed with Type 1 diabetes. The physician considered patient starting on insulin to be life threatening and disabling and an important medical event. Additional information has been requested.

MedDRA PT Abdominal pain, Blindness transient, Nausea

Symptom Text: Information has been received from a 22 year old female patient who is allergic to amoxicillin and had human papilloma viral infection. On 25-APR-2008 she was vaccinated with a first dose of Gardasil. She reported that approximately twenty minutes after vaccination she began to feel nauseous. In addition, her vision was adversely affected. She began to see black dots and then "everything went black" and she had a temporary total loss of vision for ten to fifteen seconds. She reported that she laid down for ten minutes and she seemed fine after that. The only other symptom she had been experiencing was abdominal cramping as of 26-APR-2008. She had a colposcopy of the cervix on the same day she received the injection. The patient reported to be recovering. Upon internal review temporary total loss of vision was determined to be an other important medical event. No further information is available.

MedDRA PT Caesarean section, Drug exposure during pregnancy

Symptom Text: Information has been received from a physician, via the Merck pregnancy registry, concerning a 25 year old female patient who on 22-MAR-2007 was vaccinated with a dose, 0.5ml, IM, of GARDASIL (Lot # 655503/0012U). The physician stated that on 24-MAR-2007, the patient had a positive pregnancy test (over the counter), and added that the patient was pregnant at the time of vaccination. The LMP date was 25-FEB-2007, with an estimated date of delivery of 02-DEC-2007. Follow up information from a nurse at the physician's office, indicated that on 12-DEC-2007, the patient delivered a "normal and healthy baby girl," via a C-section. Attempts for a vaginal delivery included PITOCIN, and "resulted in spontaneous decreases on the baby's heart rate." The infant weighed 8 lb 6 oz, with an Apgar score of 9/9. No further information was reported. Upon internal review, "resulted in decrease in the baby's heart rate" (led to a C-section) was determined to be serious as an other important medical event. Additional information is not expected.

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a physician concerning an 18 year old female with no pertinent medical history or drug reactions/allergies who on an unspecified date was vaccinated with a third dose of Gardasil. Subsequently the patient may have been pregnant when she received the third dose of Gardasil. The doses of Gardasil were administered at another physician's office. Unspecified medical attention was sought. On an unspecified date the patient had a positive beta-human chorionic gonadotropin test (unspecified). The patient's LMP date was 13-FEB-2008. The patient's estimated date of delivery is 19-NOV-2008. Follow-up information was received from the physician's office. On an unspecified date the patient had terminated her pregnancy. The patient's outcome was unknown. Upon internal review abortion induced is considered to be an other medical event. Additional information has been requested.

Other Meds: Unknown

Lab Data: beta-human chorionic, positive

MedDRA PT Chest pain, Gait disturbance, Muscle spasms, Musculoskeletal stiffness, No reaction on previous exposure to drug, Palpitations, Pyrexia

Symptom Text: Information was obtained on request by the Company from the agency via a Public Case Detail Form and a Case Line Listing concerning a 15 year old female who had no reaction to the first two doses of GARDASIL. The patient was vaccinated with the third dose of GARDASIL (Lot No. 655742/0188U, Batch No. J0799, Expiry date 07-AUG-2009). On 19-SEP-2007 the patient experienced pyrexia, chest pain, gait disturbance, muscle spasms, musculoskeletal stiffness and palpitations and was hospitalised. It was described that the patient experienced fever, spasms in her arms and legs - could not walk properly, neck stiffness, chest pain and racing heart rate. At the time of reporting on 08-OCT-2007, the outcome of pyrexia, chest pain, gait disturbance, muscle spasms, musculoskeletal stiffness and palpitations were unknown. The agency considered that pyrexia, chest pain, gait disturbance, muscle spasms, musculoskeletal stiffness and palpitations were possibly related to therapy with GARDASIL. The original reporting source was not provided. Subsequently the patient's experience was reported in an article, 25-JAN-2008. Additional information is not expected.

MedDRA PT Injection site reaction, Injection site swelling, Rash erythematous

Symptom Text: Information was obtained on request by the Company from the agency via a Public Case Detail Form and a Case Line Listing concerning a 26 year old female who was vaccinated with GARDASIL (Lot No. 657870/0491U, Batch No. J1973, Expiry date 11-FEB-2010). On 31-JUL-2007 the patient experienced injection site reaction and rash erythematous. It was described that the patient experienced swollen injection site and raised erythematous rash on arms and torso. At the time of reporting on 30-OCT-2007, the patient had recovered from injection site reaction and rash erythematous. The agency considered that injection site reaction and rash erythematous were possibly related to therapy with GARDASIL. The original reporting source was not provided. Injection site reaction and rash erythematous were considered to be disabling by the agency. Subsequently the patient's experience was reported in an article 25-JAN-2008. Additional information is not expected.

MedDRA PT Abdominal pain upper, Acidosis, Ascites, Hypocalcaemia, Pancreatitis, Pyrexia, Rash generalised

Symptom Text: Information was obtained on request by the Company from the agency via a Public Case Detail Form and a Case Line Listing concerning a 26 year old female who on 27-SEP-2007 was vaccinated with GARDASIL. Concomitant therapy included doxycycline hyclate, PHENERGAN TABLETS/SUPPOSITORIES) and ZANTAC. On 29-SEP-2007 the patient experienced rash generalised, abdominal pain upper (described as right upper quadrant epigastric pain), blood amylase increased, lipase increased, pancreatitis and pyrexia and was hospitalized, CT scan revealed pancreatitis and intraabdominal fluid. On 03-OCT-2007, the patient's calcium was low (hypocalcemia) while pH was 7.25 (acidosis). Abdominal x-ray was abnormal. CT scan of the abdomen revealed a grossly oedematous pancreas and ascites. Blood and urine culture were negative. The patient's GGT was 49, ALT (SGPT) was 27 and the AST (SGOT) was 45. White blood cell count was 10.3 while the haemoglobin was 91%. Other laboratory investigations such as VRE, adenovirus CMV, EBV, HSV, mumps, varicella zoster and toxoplasma screens were all negative. At the time of reporting on 19-OCT-2007 the patient's rash generalised and abdominal pain upper and blood amylase increased and lipase increased and pancreatitis and pyrexia persisted. The agency considered that rash generalised, abdominal pain upper, blood amylase increased, lipase increased, pancreatitis and pyrexia were possibly related to therapy with GARDASIL. The original reporting source was not provided. Subsequently the patient's experience was reported in an article, 25-JAN-2008. Additional information is not expected.

MedDRA PT Gait disturbance, Paralysis

Symptom Text: Information has been received from a nurse within the doctor's office concerning a female patient who was vaccinated with a second dose of GARDASIL. The nurse reported that she heard from her aunt that a patient received the GARDASIL injection and experienced paralysis and could not even cut her own dinner after the injection was administered. The patient had to walk with a cane and also went to physical therapy. She did not receive the vaccine at the reporting nurse's office. No further information was known. The paralysis was considered to be disabling. Additional information is not available.

MedDRA PT Guillain-Barre syndrome, Limb discomfort

Symptom Text: Information has been received from the physician concerning a 17 year old female who was vaccinated with a first dose of GARDASIL. Three weeks to the day of the vaccination, the patient came into the office for a follow up visit with discomfort of leg muscles. It was reported by the physician that this might be sensory variant GUILLAIN BARRE. The patient was being treated on a outpatient basis and with over the counter ADVIL as need but no prescriptions. At the time of this report, the patient had not recovered. No product quality complaint was involved. Upon internal review, GUILLAIN-BARRE was considered to be an other important medical event. Additional information has been requested.

MedDRA PT Hypoaesthesia, Paraesthesia, Vaccine positive rechallenge

Symptom Text: Information was obtained on request by the Company from the agency via a Public Case Detail Form and a Case Line Listing concerning a 26 year old female who on 24-SEP-2007, was vaccinated with the second dose of GARDASIL (Lot # 657870/0491U, Batch # J2138, Expiry date 11-FEB-2010). On 24-SEP-2007, after vaccination, the patient experienced hypoaesthesia and paraesthesia which was described as pins and needles and numbness in vaccinated arm, feeling spread across back of her neck and down other arm and into her leg and was hospitalized. It was also reported that the patient had the same reaction after the first dose of GARDASIL. The agency considered that the same reactions were certainly related to therapy with Gardasil. At the time of reporting on 19-OCT-2007, the had patient recovered from the hypoaesthesia and paraesthesia. The agency considered the hypoaesthesia and paraesthesia were certainly related to therapy with GARDASIL. The original reporting source was not provided. Subsequently the patient's experience was reported in an article. Additional information is not expected. A copy of the published article is attached as further documentation of the patient's experience.

MedDRA PT Anxiety, Cerebellar artery occlusion, Cerebrovascular accident, Demyelination, Diplopia, Dizziness, Dysstasia, Gait disturbance, Paraesthesia, Pyrexia, Sinus tachycardia, Vitamin B12 deficiency, Vomiting, Wallenberg syndrome, Weight increased

Symptom Text: Information has been received from a consumer concerning her 20 year old daughter with allergy to azithromycin (ZITHROMAX) who on 09-NOV-2007 was vaccinated with the first dose of GARDASIL, 0.5 mL, (injection form) (Lot # not reported). On 09-JAN-2008, the patient was vaccinated with the second dose of GARDASIL, 0.5 mL, (injection form) (Lot # not reported). Concomitant therapy included drospirenone (+) ethinyl estradiol (YAZ). On 01-FEB-2008, after getting the second dose of GARDASIL, the patient experienced a stroke and was hospitalized. The patient stayed in the hospital for one week. At the time of this report, the patient was recovering from the event. The causality of the event was not reported. No product quality complaint was involved. Additional information has been requested. 6/3/08 Reviewed hospital medical records for 2/4-2/8/2008. FINAL DX: small right CVA; vitamin B12 deficiency; sinus tachycardia; Wallenberg syndrome. Records reveal patient experienced dizziness, left sided numbness, diplopia, fever & vomiting x 2 days. Developed sinus tachycardia & anxiety controlled w/meds. Cardio & neuro consults done. Improved left face & arm paresthesias but left thigh & lower leg paresthesias persisted at d/c to home. Difficulty getting OOB & walking. To have outpatient PT/OT as well as f/u w/neuro & cardio. 9/5/08 Reviewed heme, neuro & rheum consultant medical records of 3/10-5/30/2008. FINAL DX: CVA, lateral medullary syndrome (Wallenberg's) related to the occlusion of the posterior inferior cerebellar artery. Records reveal patient experienced recent CVA, 20# weight gain since CVA.

MedDRA PT Chills, Nausea, Pain, Peripheral vascular disorder, Pruritus generalised, Pyrexia

Symptom Text: Information has been received from a gynecologist, concerning a 16 year old female patient who on 08-OCT-2007 was vaccinated IM with the first dose (lot #0251U; batch NF56480; well tolerated), and on 10-DEC-2007, vaccinated IM with the second dose (lot #0276U; batch NF58550; well tolerated), and on 14-APR-2008 vaccinated IM with the third dose (lot # 1068U; batch NH06410) of GARDASIL. On 14-APR-2008 after vaccination, the patient complained about chills, nausea, and pain concerning the whole body. After treatment with paracetamol, twice, the patient developed a fever of up to 39 degrees C. The patient was admitted to the hospital on 15-APR-2008 because of generalized pain and a peripheral circulatory disorder. On 15-APR-2008 and 16-APR-2008, the patient's C-reactive protein (CRP) was increased (values 7.5 and 9.4, respectively - units not specified). On 16-APR-2008, leukocytes were decreased at 3,200, and thrombocytes were decreased at 105,000 (units not specified). Under medication with unspecified infusion and ibuprofen, she recovered on 17-APR-2008, and was discharged from the hospital. On 21-APR-2008, there were no abnormal lab findings. Other business partner numbers include: E2008-03964. Additional information has been requested.

MedDRA PT Amnesia, Feeling abnormal, Hypotonia, Malaise, Nausea, Pulse pressure decreased, Syncope, Unresponsive to stimuli

Symptom Text: Information was obtained on request by the Company from the agency via a Case Line Listing and Public Case Details form, concerning an 18 year old female who on 26-SEP-2007 was vaccinated intramuscularly with GARDASIL, Batch No. J2926, expiry date 13-MAR-2010, Lot No. 658214/0734U). Subsequently, on 26-SEP-2007 the patient experienced nausea, amnesia, feeling abnormal, hypotonia, syncope and was unresponsive to stimuli, described as "patient reported feeling ill and collapsed. Suppine and unresponsive to verbal stimuli for 30 minutes, pulse faint, floppy, nauseated and spaced out. The patient had no memory of the event". The patient was admitted to the Accident and Emergency department of hospital and was treated with oxygen and IV fluids. Results of laboratory investigations showed serum glucose of 5.3 mmol/L and an electrocardiogram (ECG) was normal. At the time of reporting to the agency on 17-OCT-2007 the patient had recovered from nausea, amnesia, feeling abnormal, hypotonia, syncope and being unresponsive to stimuli. The agency considered that nausea, amnesia, feeling abnormal, hypotonia, syncope and being unresponsive to stimuli were possibly related to therapy with GARDASIL. The original reporting source was not provided. Subsequently, the patient's adverse experiences were reported in an article. Additional information is not expected.

MedDRA PT Drug exposure during pregnancy, Foetal disorder

Symptom Text: Initial and follow up information has been received through the Merck Pregnancy Registry from a registered nurse concerning a 25 year old female with a history of a spontaneous abortion at five weeks from her last menstrual period and malignant melanoma at age 19, with a dysplastic nervous system, and an allergy to penicillin and an allergic reaction to CECLOR, who on 16-MAY-2007 was vaccinated IM in the left deltoid with a 0.5 ml first dose of Gardasil (lot # 657736/0389U). On 16-JUL-2007 the patient was vaccinated IM in the right deltoid with a 0.5 ml second dose of Gardasil (lot # 658100/0525U). There was no concomitant medication. Subsequently the patient became pregnant. Unspecified medical attention was sought. On 03-AUG-2007 the patient had a positive beta-human chorionic gonadotropin test (unspecified). Her last menstrual period was 27-JUN-2007. The estimated date of delivery was 03-APR-2008. It was reported that the patient had one previous pregnancy and one spontaneous abortion at 5 weeks. At the time of the report, the outcome of the patient was unknown. Follow-up information indicated that 39 weeks from her last menstrual period on 27-MAR-2008 the patient gave birth to a male infant. The infant weighed 7 pounds 6 ounces, was 19.5 inches long, and had an Apgar score of 8/9. It was reported that the infant was normal, with no complications or abnormalities. The infant did develop a minimal cleft lip. Other medications used during the pregnancy were ZITHROMAX for a urinary tract infection, prenatal vitamins, and GYNAZOLE for candida. The reporter considered the minimal cleft lip to be a congenital anomaly. Additional information has been requested.

MedDRA PT Blindness transient, Dizziness

Symptom Text: Information has been received from a physician concerning a female patient with no known drug allergies and no previous medical history who on an unspecified date was vaccinated at another physicians office with her first dose of GARDASIL (lot #unknown, site and route not reported). There was no concomitant medication. The patient reported to the physician that 3.5 post vaccination, she "felt lightheaded for 5 minutes, experienced dizziness, could not see, and everything turned black for a few seconds. Five minutes after the 1st lightheaded spell went away, it happened again and lasted for 5 minutes." The patient did not seek medical attention. It was reported that on an unspecified date the patient was considered to have recovered from the events. The physician reported that the patient plans to continue further doses of the vaccination. No additional information was reported. Upon internal review, vision loss was considered to be an other important medical event. Additional information has been requested.

MedDRA PT Neuropathy peripheral, Sensory disturbance

Symptom Text: Information was obtained on request by the Company from the agency via a Public Case Detail Form and a Case Line Listing concerning a 16 year old female who was vaccinated with GARDASIL. On 28-AUG-2007 the patient experienced neuropathy peripheral and was hospitalised. It was described that approximately 4 weeks after the second dose of GARDASIL, the patient developed bilateral ascending sensory loss in her lower limbs. The examination of the patient revealed a low in sensation to all modalities lower legs to knees. The patient had normal jerks and downgoing plantar reflexes. At the time of reporting on 15-OCT-2007, the patient's neuropathy peripheral persisted. The agency considered that neuropathy peripheral was possibly related to therapy with GARDASIL. The original reporting source was not provided. Subsequently, the patient's experience was reported in an article. Additional information is not expected. A copy of a published literature article is attached as further documentation of the patient's experience.

MedDRA PT Drug exposure during pregnancy, Ruptured ectopic pregnancy

Symptom Text: Initial and follow up information has been received from a health professional concerning a 25 year old female with hypertension and protein in urine who on 20-MAR-2007 was vaccinated with Gardasil (lot#655849/0263U). There was no concomitant medication. The nurse reported that the patient was pregnant. The patient's last menstrual period was 27-FEB-2007 with an expected delivery date of 04-DEC-2007. In follow up telephone call to the doctor's office the Licensed Practical Nurse (L.P.N.) reported that the patient was still pregnant with a due date of 06-JUN-2008 and she mentioned that "everything was on track with patient's pregnancy, looked like a big baby." She mentioned that patient continued to have problems with her hypertension and protein in urine which existed before her pregnancy. When the reporter was called back to clarify/confirm patient's information she reviewed her chart and reported that patient had a ruptured ectopic pregnancy on 17-APR-2007. No other information regarding the last menstrual period (LMP) dates were provided. It was confirmed that the patient had not received any additional doses of the vaccine since the March 2007 dose. Upon internal review ruptured ectopic pregnancy was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Genital ulceration

Symptom Text: Information was obtained on requested by the Company from the agency via a Public Case Detail Form and Case Line Listing concerning a 17 year old single female with one sexual partner, with no history of HSV infection who was vaccinated with GARDASIL. Subsequently after vaccination with GARDASIL, the patient developed genital ulceration which was described as severe deep genital ulcers on labia and perineum 2 weeks after vaccination with GARDASIL. In June 2007, 2 HSV PCR swabs done were negative. Serology was negative at 6 weeks. At the time of reporting on 17-OCT-2007 the patient had recovered from the genital ulceration. The agency considered that genital ulceration was possibly related to therapy with GARDASIL. Genital ulceration was considered to be disabling by the agency. The original reporting source was not provided. Subsequently the patient's experience was reported to an article, 25-JAN-2008, page 6. Additional information is not expected.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Caesarean section, Drug exposure during pregnancy, Foetal disorder

Symptom Text: Information has been received through the Pregnancy registry concerning a 19 year old female patient, who on 19-MAY-2007 was vaccinated with a second dose of Gardasil. It was reported that the patient was 20 weeks pregnant. The patients last menstrual period was 16-APR-2007 and her estimated delivery date was 21-JAN-2008. The patient sought unspecified medical attention. At the time of the report, the outcome of the patient was unknown. Follow up information was received on 24-MAR-2008 and 02-APR-2008. The patient delivered a baby boy on 28-JAN-2008 (weeks from LMP-40). The baby was born with pneumonia. He weighed 9 lbs. 2 oz. The baby's pediatrician was called on 02-APR-2008. The nurse confirmed the patient had well visits and was seen multiple times during the month of February for pneumonia and what looked like abdominal pain. A request for Medical Records was faxed to the nurse to obtain the baby's records. Follow up information received in the form of physician's notes, indicated that on 28-JAN-2008, the infant first had a "vacuum attempt without success and positive meconium." The physician noted the infant was status post "C-section for failure to progress," and added that the mother was group B strep positive. After birth, the infant had an increased respiratory rate and "was on oxyhood overnight." The chest X-ray revealed right lower lobe pneumonia. Treatment in the hospital included IV ampicillin and gentamycin, and the infant "continued to do well with respiratory rate decreasing and 99% spO2 room air, feeding well." The infant was discharged on 02-FEB-2008 ("two days ago"). On 04-FEB-2008, the infant was seen in follow up at the physician's office, and was "improving clinically" the physician's assessment was pneumonia due to streptococcus, group B. Mild facial jaundice was documented. He was also diagnosed with diaper rash-candida, also noted as etoxicum rash; nystatin was prescribed, with follow up in 2 days. The infant was continued on AUGMENTIN. On 06-FEB-2008, the infant was seen by the physician

Other Meds: vitamins (unspecified) 10 mg

Lab Data: chest X-ray 01/28/08 right lower lobe pneumonia; cesarean section 01/28/08; respiratory rate 01/18/08 increased; vaginal Streptococcus positive

MedDRA PT Drug exposure during pregnancy, Nausea, Pityriasis, Threatened labour

Symptom Text: Initial and follow up information has been received from a Registered Nurse (R.N.) concerning a 17 year old female who on 30-APR-2007 was vaccinated IM with a first dose of Gardasil lot # 657621/0387U. Concomitant therapy included prenatal vitamins (unspecified). The nurse reported that the patient became pregnant sometime after her first injection. Patient was positive over the counter pregnancy test. In follow up it was reported that on 16-AUG-2007 ultrasound showed 7 weeks pregnancy and the expected date 04-MAR-2008. The patient's outcome was unknown. In follow up information from doctor's office it was reported that patient was treated with prenatal vitamins starting from 15-AUG-2007 for pregnancy. On 16-AUG-2007 she was diagnosed pityriasis. On 05-SEP-2007 patient was treated with 10 mg REGLAN for nausea every 6 hour as needed. Fetal arrhythmia was detected at 20 weeks of her pregnancy. She saw maternal Fetal Medicine (MFM) doctor and her fetal cardiac ultrasound was normal. It was reported that she had threatened preterm labor and on 08-NOV-2008, she was treated with magnesium sulfate intravenous (IV) in the hospital for it. After she was off magnesium sulfate she was treated with PROCARDIA 20 mg every 6 hour for preterm labor. On 08-NOV-2008 she was noted to be positive ureaplasma of the vagina/cervix. Other laboratory tests included biophysical profile, Amniotic fluid index (AFI), Non stress test (NST) was done weekly starting 27-DEC-2007 and then twice weekly till 28-JAN-2008. It was reported that patient had a normal female baby on 12-MAR-2008, 41 weeks from her last menstrual period. The baby weighed 8lb 1oz and her Apgar score was 8/9. There were no abnormalities reported. Additional information has been requested.

Other Meds: vitamins (unspecified)

Lab Data: ultrasound 08/16/07 - 7 weeks pregnancy, EDC 3/4/08; diagnostic laboratory - biophysical profile; diagnostic test - Amniotic fluid index (AFI); fetal nonstress test 12/27/07 - Weekly starting 27-DEC-2007 then twice weekly till 28-JAN-2008;

MedDRA PT Activities of daily living impaired, Confusional state, Dizziness, Dysarthria, Fatigue, Feeling abnormal, Hypoaesthesia, Limb discomfort, Malaise, Nausea, Pain, Tremor, Vision blurred

Symptom Text: Patient presented to office at 0830 for vaccines. MMR, Menactra, and HPV administered by nurse at approximately 0845. Patient went to waiting room after vaccinations for approximately 10-15 minutes. At about 0900, Patient presents back to nurse's office and reports that she felt "funny" after first vaccine, but did not think much of it. Dizziness and shaking worsened while waiting in waiting room and difficult to focus while trying to read her book. Blood pressure at that time noted to be 110/78 and pulse 84. Client states she ate breakfast, does not feel faint, just dizzy. Sprite provided for client and offered to let her lie down. Client states she feels fine in chair. 0915: Client states dizziness and shaking remian the same. Client is conversing with nurse. Conversation appropriate and alert and oriented X 3. 0930: patient's mother was present to sign for vaccines and ask questions, but left before vaccine was given. Mother of child called at 0930 to inform her of situation. Blood pressure 108/74. Mother of child came to the office to get child. 0945: Client states dizziness/shaking the same. Conversing with nurse appropriately. 1005: Dr's office notified regarding patient's condition. Physician not in office at this time, but clerical staff planned to relay message and return call to client for further recommendations or advice. Client discharged to home with mom and sister. States still has shaking feeling, but no worse than it was at 0900. Patient has a history of hypothyroidism and is considered prediabetic. She is on Synthroid and Metformin. Was also diagnosed with pancreatitis in 11-07 with unknown cause. Patient's approximate weight is 225 pounds. 1615: Telephone call to patient to follow up on condition. Child not home, mother reports that she slept for about 4 hours after leaving office and now feeling a little better. Still a little dizzy and nauseated, but did go to work at Firesteel. Dr. returned call to family and was not concerned at this time. Stated that client could take

MedDRA PT Drug exposure during pregnancy, Intra-uterine death, Premature labour

Symptom Text: Information has been received through the pregnancy registry, for Gardasil concerning a 26 year old female patient who on 03-JAN-2007 was vaccinated with the second dose of Gardasil. Concomitant therapy included prenatal vitamins (unspecified). On approximately 14-FEB-2007, six weeks later she became pregnant. She went into labor on 23-JUL-2007 and the baby passed away (reason unspecified). The patient sought medical attention at the hospital. On 02-NOV-2006 the patient received the first dose of Gardasil and it was required that she will not be getting the third dose. The patient's outcome was unknown. No product quality complaint was involved. Upon internal medical review baby passed away and premature labor were considered to be other important medical events. Additional information has been requested.

MedDRA PT Breech presentation, Caesarean section, Drug exposure during pregnancy

Symptom Text: Information has been received from a licensed practical nurse concerning a 20 year old female with depression, anxiety disorder and migraine and no drug reactions/allergies who on 22-JUN-2007 was vaccinated with a first dose of GARDASIL (lot# 653735/0688F) 0.5mL IM. Concomitant therapy included LYRICA, PROCAC, DEPAKOTE, BUSPAR, trazodone HCl and nabumetone. On 27-AUG-2007 the patient was vaccinated with a second dose of GARDASIL (lot# 655503/0012U) 0.5mL IM and is "2 months pregnant". Medical attention was sought. A urine beta-human chorionic gonadotropin test was positive for pregnancy. The date of the last menstrual period was approximately 06-JUL-2007 and the estimated date of delivery is approximately 11-APR-2007. No other information was available at this time. Follow-up information was received from the L.P.N. The L.P.N. reported that the patient delivered a baby girl "just yesterday, last night" (08-MAY-2008). A C-section was performed since the baby was breech. The baby was 7 pounds 4 ounces and 19 inches long. The baby was healthy with no congenital anomalies. The patient's due date was 06-MAY-2008 so the baby was born at 40 weeks and two days gestation. Upon internal review breech presentation was considered to be an other medical event. Additional information is not expected.

MedDRA PT Encephalitis, Headache, Pyrexia, Vision blurred

Symptom Text: Information has been received from a physician concerning a 20 year old female with no allergies, who, on an unspecified date, was vaccinated with a dose of Gardasil. There was no concomitant medication. There were no illnesses at the time of vaccination. It was noted that the reporting physician recommended the HPV vaccination to the patient but she was vaccinated at her college campus. Three to four days post vaccination the patient experienced a high fever, headache, and blurred vision. The patient went to the emergency room but was not admitted. The patient then returned to the emergency room a second time and was admitted to the hospital for two days. The patient was diagnosed with encephalitis. At the time of the report, the outcome of the patient was unknown. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Cerebrovascular accident, Thrombosis

Symptom Text: Information has been received from a physician concerning an approximately 23 year old female patient who was vaccinated with Gardasil. The physician stated that a patient of hers came into the office telling her that her neighbor's daughter received Gardasil and suffered from a stroke or a clot. No further Information was provided. The physician that the representative calls on, did not have any details about the patient. Upon internal review, stroke was considered to be an other important medical event. Additional information is not expected.

MedDRA PT Convulsion

Symptom Text: Information has been received from a physician concerning a 20 year old female with a "fear of needles" who on 30-APR-2008 was vaccinated with Gardasil (lot# 0152X) 0.5mL IM in the left deltoid. On 30-APR-2008 the patient experienced a seizure "about 45 seconds" after administration of Gardasil. The seizure lasted less than one minute. The patient rested on the exam table until stable but, when the patient stood up she experienced another seizure. Unspecified medical attention was sought. The physician stated that the patient recovered quickly and after resting in the office again she was able to leave the office fully recovered on the same day. No medical treatment was required. No further information was available. Upon internal review convulsion was considered to be an Other Medical Event. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Dizziness, Gaze palsy, Muscle twitching

Symptom Text: Patient received 1st GARDASIL, felt faint, eyes rolled back in her head & twitched. Nurse helped her lay on exam table. After 1-2 minutes she was alert asking what had happened. Remained laying & conscious for 20 minutes - attempted to have her sit up & continued to feel dizzy - laid her back down x another 20-30 min. Felt better, but not well enough to walk to the car with mom. Friday - stayed home because she was still dizzy when she got up. Sat/Sun - felt better. Mon - went to school & came into office because felt dizzy again - in office BP + blood sugar were stable at 120/70 + BS of 88. Exam essentially normal.

MedDRA PT Abasia, Activities of daily living impaired, Aphasia, Convulsion, Encephalopathy, Pyrexia

Symptom Text: 11 year old girl with no prior problems was given GARDASIL on May 1, 2008. The following day she began having fevers. The next day she had seizures. She has been in the hospital since May 3, 2008. She can not walk or talk and must be spoon fed. The mother has been told there is encephalopathy, but no cause has been determined. No physicians have advised the parents of the medical cause. The mother has questioned the drug "GARDASIL" because the girl was fine until having been given the drug. The treating physicians have not determined the nature and extent of any permanency at this time.

Other Meds:

Lab Data: The patient has been in the hospital since May 3, 2008. The mother says CT and MRI scans and spinal taps have been given as well as brain function tests.

History: No pre-existing conditions.

MedDRA PT Hypoaesthesia, Injection site anaesthesia, Injection site pain, Muscular weakness

Symptom Text: Information has been received from a neurologist concerning a 16 year old female with a history of gastroenteritis (2 weeks prior to 06-MAR-2008), and no reported concomitant medications, who on 06-MAR-2008 was vaccinated with the third dose of GARDASIL IM into the deltoid muscle, (Lot # not reported). On unspecified dates the patient had previously received the first and second doses of GARDASIL injection, (Lot #'s not reported), it was noted that these were well tolerated. On 06-MAR-2008 about 10 minutes post vaccination with GARDASIL, the patient complained about injection site pain and experienced numbness, starting from "below injection site" and spreading down to the hand. In the course she additionally developed weakness of the hand. Injection site pain resolved after 1 day (07-MAR-2008), other symptoms were ongoing. On 22-APR-2008 she was admitted to the hospital for diagnostics. The physician reported that ENG, EMG, SEP, CSF, and cranial MRI showed normal results, (test dates not specified). The symptoms could not be allocated to a concrete nerve. Tentative diagnosis was "plexopathy." Under physiotherapy symptoms improved remarkably. At discharge (date unspecified) only discreet complaints were seen. Other business partner numbers include E2008-03768. Additional information is not available.

MedDRA PT Blindness, Inflammation, No reaction on previous exposure to drug, Retinal artery spasm, Syncope

Symptom Text: Information has been received from a physician concerning an 18 year old female with Hashimoto's thyroiditis and hay fever and no reported concomitant medications, who on 18-JUN-2007 was vaccinated with the first dose of GARDASIL (dose, and lot# not specified). The second dose of GARDASIL (dose, and Lot# not specified) was administered on 20-AUG-2007. It was reported that the first and second doses were well tolerated. On 20-DEC-2007 the patient received the third dose of GARDASIL, IM to the upper arm, (lot#0277U, Batch#NG00020). On 21-Dec-2007 she experienced a syncope, followed by a loss of vision for about ten minutes. On 31-Dec-2007 another episode of vision loss occurred for about ten minutes. The patient was hospitalised from 04-JAN-2008 till 08-JAN-2008. On admission date she was free of any complaints. physical neurological examinations were normal. Cranial MRI, CT, MR angiography of the cervical arteries and duplex sonography of the brain supplying vessels, EEG, echo cardiography, longterm ECG and ophthalmologic examination were all normal. Vasculitis was ruled out. Laboratory findings were all normal except for slightly increased ANA (>1:120), "BSR" (35/75), and CRP (0.8mg/dl). A lumbar puncture was carried out and revealed "inflammatory liquor cerebrospinalis syndrome." No final diagnosis was established. A cause for the symptoms could not be found. No follow-up lumbar puncture was carried out. The ophthalmologist evoked "relapsing spasms of the retinal vessels" and therapy was started with acetyl salicylic acid (ASS 100). No further episodes occurred. The reporter mentioned "ongoing mild vision discomfort" on 28-FEB-2008. The final outcome was not reported. A causal relation to the vaccine was not discussed. The file was closed. Other business partner numbers include E2008-03019. Additional information is not expected.

MedDRA PT Amnesia, Cyanosis, Disorientation, Fall, Loss of consciousness, Mydriasis, Tetany

Symptom Text: Information has been received from a health authority concerning a 14 year old female with a history of rhinitis and conjunctivitis (with no evidence of true allergy: negative cutaneous test to pneumallergens) and family atopic diathesis, who on 16-JAN-2008 was vaccinated intramuscularly with the first dose of GARDASIL (Batch # NE47400/Lot #655127/0575F). The patient was with her mother and was very anxious because of vaccination. Within a few seconds following vaccination, the patient lost consciousness and fell onto the ground. Examination found mydriasis, incipient cyanosis, and tetany of the upper limbs. Pulse was not measurable. No work-up results were provided and no additional examination was performed concerning ruled out etiologies not related to drugs. The patient's legs were raised and she regained consciousness in a few seconds. The patient had total amnesia of her loss of consciousness and was disoriented. Subsequently, the patient recovered. The physician did not wish to continue vaccination. The events were considered to be immediately life-threatening. Additional information is not expected. The case is closed. Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Abdominal pain, Asthenia, Chest pain, Headache, Hepatic function abnormal, Menstruation irregular, Urinary tract infection, Vertigo

Symptom Text: Information has been received from a health authority (reference number DJ20080289) concerning a 16 year old female with no relevant medical history who on 22-NOV-2007 was vaccinated intramuscularly with GARDASIL. Subsequently, in the following days, the patient experienced cephalgia, vertigo, menstrual disturbance, abdominal pain, and very significant asthenia. On 15-JAN-2008, the patient developed urinary tract infection for which she received corrective treatment with MONURIL. On 21-JAN-2008, the patient experienced thoracic pain which induced hospitalization. On 22-JAN-2008, anomalies were found in the patient's hepatic work-up with ASAT at 1.3N, ALAT at 1.4N, alkaline phosphatase at 1.3N, creatine kinase at 168 and D-Dimers at 520. The patient's condition rapidly improved allowing her discharge. Since then, auto-immunity work-up was performed and was negative. Serologies for viral hepatitis A, B, and C, CMV and mononucleosis were negative and noncontributory. Creatine kinase were found back to normal, and hepatic work-up was relatively stable. Gamma GT were normal. The reporter specified that alkaline phosphatases are virtually always above normal until the age of 20 and thought that consequently it was not necessary to take them into account. The reporter added that the moderate increase in transaminases should be put under surveillance with no particular worry. The reporter also specified that as far as GARDASIL vaccine was concerned, only symptoms that appeared 48 hours after vaccination should be taken into account. According to the reporter, the patient could have possibly experienced unidentified virosis in January 2008, which could have induced both painful syndrome and hepatic impairment. D-Dimers were at 713 and seemed to regress. However there was an increase in type A immunoglobulins. As of 31-MAR-2008, asthenia had virtually resolved. Additional information has been requested. Other business partner numbers include E2008-04333.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Arthralgia, Autoimmune thyroiditis, Hypersensitivity, Oedema peripheral, Systemic lupus erythematosus

Symptom Text: Information has been received from a physician concerning a 17 year old female patient who on 03-SEP-2007 was vaccinated into the upper arm with the first dose of GARDASIL (Lot #1518F, batch #NF23330). There was no concomitant medication. One day post vaccination, the patient experienced generalised joint pains, followed by swelling of soft tissue of extremities. As the symptoms were lasting despite analgesics (ibuprofen), she was admitted to the hospital on 09-SEP-2007 for further check-up. A reaction due to the vaccination was supposed. A diagnosis of systemic lupus erythematosus with joint involvement and moderate activity as suspicion of lapsed Hashimoto thyroiditis and allergic reaction after GARDASIL were established on an unknown date. Anti-nuclear antibodies were negative, also BSR. Diagnostic laboratory tests performed in September 2007 included: leukocytes were 4.900/mcl, haemoglobin was 13.1 g/cl, erythrocytes were 4.42 Mio/mcl, BSR 2mm/1hour, thrombocytes were 211,000/mcl, creatinine was 0.9 mg/dl, serum thyroid-stimulating hormone test (TSH) was 1.56, free serum triiodothyronine test (FT3) was 3.06 mg/l, total serum thyroxine test (FT4) was 1.10 mg/dl, IgG was 1600 mg/dl, IgA was 108 mg/dl, IgM was 66 mg/dl, IgE 101 IU/ml, serum C-reactive protein (CRP) was 4 mg/l, serum rheumatoid factor test (RF) <3IE/ml, antistreptolysin 143 IE/ml. The patient was discharged on 12-SEP-2007. On 17-SEP-2007 the patient was instructed to present to the hospital since at that time the results for Diagnostic laboratory testing antinuclear antibodies (ANA), ANCA, urine status, and proteins were pending. It is to be noted that the information was not received regarding this check up. On 07-FEB-2008 the patient presented to an outpatient department. Examination showed no swelling of the hands, feet, or joints (recovered). The patient was medicated with DECORTIN, L-THYROXIN, JODID and QUENSYL. Diagnostic laboratory testing performed in February 2008 included: leukocytes were 9.500/mcl, haemoglobin was 14.5 g

MedDRA PT Complication of delivery, Drug exposure during pregnancy

Symptom Text: Initial and follow-up information has been received from a physician concerning a female with a history of obesity and no concurrent medical conditions, who on 22-MAR-2007 was vaccinated IM with a first dose of GARDASIL (Lot# 657006/0188U). Subsequently, the patient was pregnant. The physician reported that the patient was in her first trimester. The patient's last menstrual period was 16-FEB-2007 and her estimated delivery date was 23-NOV-20067 (also reported as 18-DEC-2007). On 10-JUL-2007 a Maternal Serum Alpha-Fetoprotein Screening (MSAFP) was performed and was low risk. On 17-JUL-2007 an ultrasound was performed and showed normal anatomy. The patient took prenatal vitamins throughout the duration of her pregnancy, calcium during the 2nd and 3rd trimester, and iron during the last month of her pregnancy. It was reported that the patient had one previous pregnancy and one spontaneous abortion at 5 weeks. No further information was available. Follow-up information indicated that 43 weeks from her last menstrual period (also reported as 38 weeks) on 15-DEC-2007 the patient delivered a female infant that weighed 7 pounds 4 ounces, and had an Apgar score of 8/9. It was reported there was a complication of fetal intolerance to labor during the delivery. The patient received routine prenatal testing during her pregnancy. It was reported that the infant was normal with no congenital anomalies, complications, or abnormalities. Additional information has been requested.

Other Meds: calcium (unspecified), iron (unspecified), vitamins (unspecified)

Lab Data: ultrasound, 07/17/07, normal anatomy screening; serum alpha-fetoprotein, 07/10/07, screening-low risk

History: Miscarriage

MedDRA PT Drug exposure during pregnancy, Haemorrhage, Herpes simplex, Urinary tract infection

Symptom Text: Initial and follow up information has been received for the pregnancy registry for GARDASIL from a registered nurse concerning a 26 year old female with allergies, bipolar, depression, Von Willebrand disease type 1 due to aspirin intake, genital herpes, irritable bowel syndrome, migraine headaches, panic attacks and allergies to Pseudophedrine, Ibuprofen and Aspirin who on 15-MAY-2007 was vaccinated IM with 0.5 mL GARDASIL (lot # 655205/1426F). Concomitant therapy included ZYRTEC and EFFEXOR. On 29-MAY-2007 the patient had a positive pregnancy test (LMP 21-APR-2007, EDD 26-Jan-2008) and therapy with venlafaxine HCL was discontinued. On 02-AUG-2007 an ultrasound revealed a subchorionic hemorrhage which resolved without intervention on unspecified date. A maternal serum alpha fetoprotein test on 15-AUG-2007 was normal. On 11-OCT-2007 the patient was diagnosed with a urinary tract infection and treated with Ceftin, 250 mg, PO, BID. On 03-JAN-2008 the patient began treatment with Acyclovir, 400 mg, BID for herpes simplex virus. On 05-JAN-2008 at 37 weeks the patient had a spontaneous rupture of membranes and gave birth to a normal male infant who weighed 7 lbs. 5 oz. His apgar scores were 9/9. The patient completed therapy with Acyclovir on 15-JAN-2008. Additional information has been requested.

Other Meds: ZYRTEC; EFFEXOR

Lab Data: Ultrasound, 08/02/07, subchorionic hemorrhage; Beta-human chorionic, 05/29/07, positive; Serum alpha-fetoprotein, 08/15/07, normal.

MedDRA PT Drug exposure during pregnancy

Symptom Text: Initial and follow up information has been received from a healthcare professional and a physician, via the Merck pregnancy registry, concerning a 20 year old female patient with no previous pregnancies, with gastrooesophageal reflux disease and papilloma viral infection and a history of anaemia, pneumonia, infectious mononucleosis, ulcer, Papanicolaou smear abnormal and colposcopy, who in May 2007, was vaccinated with the first dose of GARDASIL. The date of the LMP was approximately 01-May-2007, date of conception estimated as 15-MAY-2007. On 25-JUN-2007, an ultrasound confirmed the patient to be 8 weeks and 1 day into the pregnancy; the estimated date of delivery was 05-FEB-2008. Follow-up information was received from the physician's office. On 06-FEB-2008 the patient delivered a healthy 7 pound 2 ounces baby boy with an Apgar score of 8/9. The patient was 40 weeks from LMP. The patient was Group B streptococcus positive (GBS+). From 19-DEC-2007 to 22-JAN-2008 fetal activity both reactive was monitored for decreased fetal motion. Additional information is not expected.

Other Meds:

Lab Data: ultrasound, 06/25/07, 8 weeks 1 day; diagnostic laboratory, group B streptococcus positive; fetal activity test, 12/19/07, both reactive

History: Anaemia; Colposcopy; Infectious mononucleosis; Papanicolaou smear abnormal; Ulcer; Pneumonia

MedDRA PT Anaemia, Drug exposure during pregnancy, Postpartum haemorrhage, Upper respiratory tract infection, Urinary tract infection

Symptom Text: Information has been received from a Merck pregnancy registry for GARDASIL from a 25 year old female with a history of previous pregnancy/full term delivery and no drug allergies who on 24-JAN-2007 was vaccinated with her first dose of GARDASIL (lot# 654741/1208F). On 23-MAY-2007 the patient was vaccinated with her second dose of GARDASIL (lot# 654741/1208F). There was no concomitant medication. The patient is 19 weeks pregnant. Unspecified medical attention was sought. Follow up information received, indicated that the patient was on prenatal vitamins for all through the pregnancy, ferrous sulfate 28 to 40 weeks, 325 mg daily for anemia, BACTRIM as prescribed for urinary tract infection and Z-PACK for upper respiratory infection. On 18-Feb-2008, the patient delivered a normal female baby week from LMP 38. The baby weighed 7 pounds and 9.8 ounces with an Apgar score 7/8. The patient experienced postpartum haemorrhage during labour and delivery. The patient's outcome was not reported. Additional information has been requested.

Other Meds: vitamins (unspecified)

MedDRA PT Drug exposure during pregnancy, Premature labour, Umbilical cord abnormality

Symptom Text: Information has been received from a licensed practical nurse through the Pregnancy Registry for GARDASIL concerning a 16 year old, female smoker, with no previous pregnancies, who on 20-FEB-2007 was vaccinated intramuscularly with the first dose of GARDASIL (Lot # 654389/0961F). On 23-APR-2007, the patient was vaccinated intramuscularly with her second dose of GARDASIL (Lot # 655205/1426F). On 22-AUG-2007, the patient was vaccinated intramuscularly with her third dose of GARDASIL (Lot # 655620/0171U) and in addition was vaccinated with a VAQTA vaccine (MSD; not lot # reported). On 24-AUG-2007 the patient was seen at the doctor's office for a urine pregnancy test which was positive (LMP 13-JUN-2007). On 12-SEP-2007, the patient had an ultrasound for the purpose of dating which was normal and indicated that the fetus was 12 weeks and 4 days gestation. From November 2007 to January 2008, the patient was taking vitamins with iron daily. On 07-NOV-2007, the patient had an ultrasound for Level II screening which had the fetus at 20 weeks and 1 day gestation and showed an eccentric cord insertion (not further specified). The patient also has an MSAFP for screening purposes and the results were within normal limits. On 31-Jan-2008, the patient gave birth to a live 3 lb, 12 oz female infant (32 weeks and 6 days from LMP). It was also reported that the patient had preterm delivery at 32 weeks and 4 days. The baby had Apgar scores of 7 and 8, and there were no congenital anomalies. No additional information is expected.

Other Meds: Unknown

Lab Data: ultrasound, 09/12/07, normal (12 week 4 day); ultrasound, 11/07/07, Eccentric cord insertion; urine beta-human, 08/24/07, positive; serum alpha-fetoprotein, 11/07/07, within normal limits

MedDRA PT Cholestasis of pregnancy, Drug exposure during pregnancy

Symptom Text: Information has been received from a nurse through the Pregnancy Registry for GARDASIL concerning a 16 year old female, with a history of obesity (BMI 35), and no previous pregnancies, who on 29-MAR-2007 received her first vaccination with GARDASIL (Lot # 654702/0011U). On 31-MAY-2007, the patient received her second vaccination with GARDASIL (Lot # 654702/0011U). Subsequently, the patient became pregnant (LMP = 28-JUN-2007). On 18-SEP-2007, the patient had an ultrasound for dating purposes which was normal indicated a single IUP at 10 weeks. On 02-OCT-2007 and 01-NOV-2007, the patient had integrated screening for maternal serum alpha-fetoprotein which were negative. On an unspecified date, the patient developed cholestasis of pregnancy and was treated with URSO FORTE, outcome was not reported. It was reported that at 16 weeks (approximately 30-OCT-2007) through approximately 19 weeks (approximately 20-Nov-2007), the patient was treated with REGLAN. Other medications used during pregnancy included prenatal vitamins (not specified) and permethrin cream (not further specified). Additional information has been requested.

Other Meds: Unknown

Lab Data: ultrasound, 09/18/07, single IUP 10 weeks; normal; fetal monitoring tests, 10/02/07, MSAFP screening-negative; fetal monitoring tests, 11/01/07, MSAFP screening-negative

MedDRA PT Appendicectomy, Appendicitis, Drug exposure during pregnancy

Symptom Text: Initial and follow-up information has been received through the Merck pregnancy registry through a 25 year old female who on 21-SEP-2007 was vaccinated with intramuscularly with her first dose of GARDASIL. On 25-OCT-2007, the patient was vaccinated intramuscularly with her second dose of GARDASIL. There was no concomitant medication. The patient reported that after receiving her second vaccination on 25-OCT-2007 she discovered she was "4 weeks pregnant" (LMP approximately 27-SEP-2007). It was reported by the patient that "everything was fine" and she was probably going to have a cesarean section in June. On 21-APR-2008 the patient had an appointment and "everything looked great." The baby's weight was "fine" and her fungal height was normal. "A few weeks ago" the patient experienced appendicitis and was hospitalized in order to have her appendix removed. The patient did not think the appendicitis was related to the vaccine. The patient recovered and it was reported that the patient and the baby were doing fine. No further information was provided. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Drug exposure during pregnancy

Symptom Text: Information has been received through the Pregnancy Registry for GARDASIL through a nurse practitioner concerning a 15 year old white, non-smoker female, with acne and no previous pregnancies, who on 02-AUG-2007 was vaccinated intramuscularly with her first dose of GARDASIL (Lot #657006/0188U). Concomitant therapy included ORTHO EVRA and "minocycline". Subsequently, the patient found out she was pregnant (LMP = 22-JUN-2007). The patient had an ultrasound (not further specified). The patient sought unspecified medical attention. Follow-up information received 10-APR-2008 from the physician reported that on 01-NOV-2007, the patient had an ultrasound which was normal except "small venous lakes in the placenta". The reporter also indicated that the patient had stopped therapy with ORTHO EVRA (date not specified). From November 2007 until present, the patient has been on prenatal vitamins (not further specified). The patient discontinued treatment with minocycline for acne in November 2007. On 04-Jan-2008, the patient was given a flu shot (not further specified). There were no complications during pregnancy. On 02-Mar-2008, the patient delivered a female infant, 5 pounds, 7 ounces, 18 1/4 inches long, and an apgar score of 8/9. Delivery was 36 weeks and 2 days from LMP. The infant had no congenital anomalies, no complications or abnormalities, and there were no complications during labor and delivery. No additional information is expected.

Other Meds: ORTHO EVRA; Minocycline 50mg

Lab Data: Ultrasound, 11/01/07, small venous lake in placenta.

History:

Prex Illness: Pregnancy NOS (LMP = 6/22/2007); Acne; Non-smoker

MedDRA PT Drug exposure during pregnancy, Foetal disorder

Symptom Text: Information has been received from a certified medical assistant, for the Pregnancy Registry for GARDASIL, concerning a 17 year old female who on 30-OCT-2007 (also reported as 18-JUL-2007) was vaccinated intramuscularly with the first dose of GARDASIL (655165/1425F). Per the reporter, the patient was pregnant at the time of vaccination (Gestation = 36 weeks; LMP approximately 04-Mar-2007). The pregnancy was confirmed by a pregnancy test. Concomitant therapy included vaccination with the first dose of VAQTA (653616/0511F) on 18-SEP-2006 and the second dose of VAQTA (654514/0304U) on 30-OCT-2007 (dose, duration not reported). The patient is not experiencing any known symptoms. No further information is available. It was reported that on 02-DEC-2007 the patient delivered a baby girl via vaginal delivery that is normal, no congenital anomalies. "but has had some illnesses". Birth weight was 6lbs 10oz, Apgar scores were 9 and 9. The baby did have a right parietal cephalohematoma at birth due to probable vacuum use during delivery. The baby also experienced some illnesses, most respiratory issues including RSV pneumonitis which has resolved. The reporter indicated that the patient has a high level of exposure to school aged children family members. There was also some jaundice at birth which has also resolved. The baby has also had some thrush. On 04-APR-2008 it was indicated by the physician that the baby was a "healthy baby girl with some eczema. No additional information is expected.

MedDRA PT Nausea

Symptom Text: Information has been received from a medical assistant concerning a female in her teens with no pertinent medical history who in March 2008, was vaccinated with a first dose of GARDASIL from her OB/GYN. There was no concomitant medication. Subsequently, "soon after administration" the patient developed persistent nausea for the last 2 weeks. The patient has an appointment to see the office (her primary physician). At the time of reporting the patient had not recovered. Additional information has been requested.

MedDRA PT Local swelling, Rash

Symptom Text: Information has been received from a physician's assistant concerning a 20 year old female with no drug reactions/allergies and no pertinent medical history who on 11-JAN-2008 was vaccinated with GARDASIL (lot#653938/0954F) 0.5 mL IM. Concomitant therapy included hormonal contraceptives (unspecified). On approximately 12-JAN-2008 or 13-JAN-2008 the patient experienced swelling of neck with a rash and bumps on the neck, no difficulty breathing. Unspecified medical attention was sought in the office. On an unspecified date the symptoms resolved in a few days. No additional information at this time. Additional information has been requested.

MedDRA PT Loss of consciousness, Migraine

Symptom Text: Information has been received from a nurse practitioner concerning a 14 year old female who on 31-JAN-2008 was vaccinated with the first dose of GRADSIL, 0.5 mL, IM. Concomitant medication was not reported. On an unspecified date in 2008, the patient had "periods of blacking out" after she received the vaccination. It was also reported that the patient was having migraine headaches. The reporting nurse practitioner stated that the neurologist felt that the symptoms were not related to GARDASIL. The patient will not complete the series of vaccinations. Additional information is not expected.

MedDRA PT Injection site papule, Injection site swelling, Pyrexia, Urticaria

Symptom Text: Information has been received from a health professional concerning a 14 year old female with depression who on 14-FEB-2008 was vaccinated with a second GARDASIL (lot# 659657/1487U) injection. Concomitant therapy included CELEXA and LOESTRIN. On 15-FEB-2008 the patient developed fever. On 16-FEB-2008 the patient developed hives. On 19-FEB-2008 the patient had swelling at the injection site about the "size of a fist". On 20-FEB-2008 the patient came into the office and only had a "pin head size papular at the injection site". All other symptoms were gone. At the time of reporting the patient had recovered. It was reported that the patient had no reaction to the first dose and the patient will not be receiving the third dose. No further information was provided. Additional information has been requested.

MedDRA PT Musculoskeletal pain, Neck pain, Vaccine positive rechallenge

Symptom Text: Information has been received from a registered nurse concerning a 13 year old female who on 19-SEP-2007 was vaccinated with the first dose of GARDASIL (Lot #658556/1060U). On 29-NOV-2007, the patient was vaccinated with the second dose of GARDASIL (Lot #659435/1265U). On 02-APR-2008, the patient was vaccinated with the third dose of GARDASIL (Lot #659653/1448U). Concomitant medication was reported as none. On an unspecified date in December 2007 a few days after the second vaccination, the patient experienced severe neck and shoulder pain. The pain was severe enough that the patient was examined at the emergency room, but not admitted. On 02-APR-2008 the evening of the third vaccination, the patient developed neck and shoulder pain which was not as severe as the pain following the second vaccination. There was no local reaction at the injection site. Unspecified medical attention was sought as the patient contacted the physician's office. The patient's neck pain and shoulder pain persisted. No product quality complaint was involved. Additional information has been requested.

MedDRA PT Flank pain, Herpes zoster, Pain in extremity

Symptom Text: Information has been received from a registered nurse concerning a 19 year old female with a history of "absent periods" who on 18-JAN-2008 was vaccinated with the first dose of GARDASIL (lot # not reported). Concomitant therapy included YASMIN. On 02-FEB-2008 the patient thought she had a bug bite. On 04-FEB-2008 the patient went to the doctor's office and was diagnosed with herpes zoster. The patient was prescribed ZOVIRAX and recovered a few days later. Follow up information was received. A nurse called to report patient received the second dose of GARDASIL (lot # not reported) 0.5 mL IM in the left deltoid on 04-APR-2008 and experienced left arm pain for 2 days. On days 3 through 5 the patient was pain free. On day 5 the patient had increased pain down her left arm. The patient was concerned the herpes zoster had come back because she was experiencing the same type of pain. The patient also noticed one mark on her back but a physician later determined this was an old lesion from the initial herpes zoster occurrence. The patient was given NAPROSYN for the pain. The patient was seen in the physician's office on 14-APR-2008 and informed the nurse the NAPROSYN was not helping with the pain. The patient had a "CBC, chem scan and herpes zoster panel done on 14-APR-2008 - results unknown. The nurse mentioned after the first dose of GARDASIL (lot # not reported), the location of what the patient thought was bug bites was on the middle of her back and on the side. There was also pain on the side. Unspecified which side it was. Additional information has been requested.

MedDRA PT Injection site bruising, Pain

Symptom Text: Information has been received from a 16 year old female consumer regarding herself with a history of kidney problems when younger and no known allergies who 6 months ago was vaccinated with the first dose of GARDASIL and on 11-MAR-2008 was vaccinated with the third 0.5 ml dose of GARDASIL (no lot number provided). On 31-MAR-2008 the patient noticed a bruise at the injection site. Everytime the patient puts ice on the bruise it feels like her arm is "throbbing". There was no concomitant medication. Unknown medical attention was sought. Patient outcome was not recovered. No product quality complaint was involved. Additional information has been requested.

MedDRA PT Skin papilloma

Symptom Text: Information has been received from a physician concerning a 20 year old female who on 09-JAN-2007 was vaccinated in the right arm with the first dose of GARDASIL (lot# not reported). On 09-MAR-2007 the patient was vaccinated in the left arm with the second dose of GARDASIL (lot# not reported). On 11-JUL-2007 the patient was vaccinated in the right arm with the third dose of GARDASIL (lot# not reported). Per the reporter, the patient experienced one large plantar wart on her right heel immediately following the second dose of GARDASIL. The patient was treated by a podiatrist and had the wart burned off, but 7 more warts branched out on the heel. These were treated with a combination of burning or surgical removal. The patient is still being treated by the podiatrist who feels this is related to GARDASIL. The primary care physician does not feel this is related to GARDASIL. The patient's warts have persisted. No additional information is available at this time. Additional information has been requested.

MedDRA PT Body temperature fluctuation, Feeling hot, Headache, Injection site pain, Nausea, Pyrexia

Symptom Text: Information has been received from a consumer, who is the mother of the patient, concerning a 14 year old female who on 02-APR-2008 was vaccinated with the first dose of GARDASIL (lot# not reported). On 02-APR-2008 the patient experienced pain at the injection site. The mother reported that the next day the patient came home and had a bad headache, so she was given TYLENOL and was lying around the house. The consumer reported that later on that night, the patient was still complaining of the headache and that she felt nauseous, so the mother had taken the patient's temperature and it was 98.7 degrees. The mother stated that the patient was lying around the house and around 10:30 PM the patient had felt unusually warm and she had a fever of 101.3. The consumer reported that throughout the night, the patient's temperature went up and down, but she was warm all night. Per the consumer, on 04-APR-2008, the patient stayed home from school and she still feels a little warm. The consumer has not yet spoken with the physician. No further information is available and the patient has not yet recovered. Additional information has been requested.

MedDRA PT Hypoaesthesia, Syncope

Symptom Text: Information has been received from a nurse concerning a "high school age" female who was vaccinated on an unspecified date with her first dose of GARDASIL (lot# not reported). Subsequently the patient experienced numbness in her hands and arms and fainted in school. The patient was brought to the ER but was not admitted. Per the nurse, the healthcare provider in the ER did not think there was anything wrong with the patient. The patient was then taken to her family practice physician and she had an MRI which came back normal. The numbness lasted 2 - 3 weeks and the patient is now fine. The nurse stated that the patient will not be continuing with the GARDASIL series. Additional information has been requested.

MedDRA PT Drug exposure during pregnancy, Foetal disorder, Premature labour

Symptom Text: Information has been received from a consumer concerning her 18 year old granddaughter, who, on an unspecified date, was vaccinated with a dose of GARDASIL. Concomitant therapy included hormonal contraceptives (unspecified). Subsequently, the patient was pregnant when vaccinated. The patient did not seek medical attention and did not received prenatal care. It was reported that bloodwork was performed. On 06-APR-2008 the baby was born prematurely at approximately 36 weeks and was diagnosed with a terminal illness Trisomy 18. At the time of the report the outcome of the patient was unknown. No product quality complaint was involved. Additional information is not available.

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Initial and follow-up information has been received from a licensed practical nurse concerning an 18 year old female patient with a history of human papilloma viral infection, who on 02-FEB-2007 was vaccinated with an 0.5ml, IM dose of GARDASIL (Lot # 654535/0960F). There was no concomitant medication. The nurse reported that the patient "subsequently determined she is pregnant." The date of the LMP was 15-DEC-2006, with an estimated due date of 22-OCT-2007. The nurse added that there were "no problems reported." Follow-up information indicated that the nurse thought the abortion was an elective termination. Although it was also reported that "the patient wasn't truthful about many things with them." The patient sought unspecified medical attention. Additional information has been requested.

MedDRA PT Coeliac disease, Contraception, Muscle spasms, Musculoskeletal stiffness, No reaction on previous exposure to drug, Oedema peripheral, Pain, Rash, Rash pruritic, Vasculitis

Symptom Text: Information has been received from a nurse concerning a 17 year old female with codeine intolerance who on 31-JAN-2008 was vaccinated intramuscularly with a 0.5 mL first dose of GARDASIL (lot # 659657/1487U). On 01-APR-2008 the patient was vaccinated intramuscularly with a 0.5 mL second dose of GARDASIL (lot # 659180/1758U). Concomitant therapy included hormonal contraceptives (unspecified). On 04-APR-2008, "three days later", the patient developed a rash on her legs. It was reported that she went to the emergency room. On 07-APR-2008 the patient was followed up at her doctor's office and was diagnosed with vasculitis. On 09-APR-2008 the patient "had a flare up again". The nurse reported that she had "many tests done". At the time of this report the vasculitis persisted. The patient is being treated with prednisone. Laboratory tests performed on an unspecified date showed an "elevated sed rate" and an "elevated white count". Additional information has been requested. 6/3/08 Reviewed PCP medical records for 4/7-5/1/2008. FINAL DX: vasculitis Records reveal on 4/7 visit, patient experienced itchy rash over bilateral LEs, aching in bilateral LEs & muscle spasms. Had been seen in ER on 4/4, 2 days s/p 2nd HPV vax, & diagnosed w/vasculitis, unclear etiology. Had undergone tanning session on day of ER visit. Intolerant of steroids. Tx w/antihistamine. Had no reaction s/p 1st HPV vax. Exam revealed bilateral LE multiple erythematous round macules & plaques generalized over lower pretibial area. Returned to office 4/9 w/worsening symptoms of rash & calf pain. Exam at that time revealed tenderness of bilateral calves w/trace edema, diffuse nodular urticarial erythematous lesions, coalescent purpura mostly over distal tibial area w/sparse involvement over thighs. Attempted tx w/steroids & additional labs. Testing for celiac disease (+) on 5/1/08. 6/3/08 Reviewed ER medical records of 4/4/2008. FINAL DX: vasculitis Records reveal patient experienced rash which started at ankles & progressed

MedDRA PT Arthralgia, Hepatic enzyme increased, Joint swelling, Myalgia, Nausea, Pain, Pyrexia, Rash, Vomiting, Weight increased

Symptom Text: Information has been received from a certified medical assistant concerning a 22 year old female with a history of removal of condylomas/genital warts, and a family history of breast cancer, who on 02-APR-2008 was vaccinated IM in the left upper quadrant of the thigh with a dose of GARDASIL (Lot# 659437/1266U). Concomitant therapy included PROVERA. On 04-APR-2008 the patient felt ill, feverish and achy. On 05-APR-2008 the patient developed a rash and swollen joints which were painful. The patient went to the emergency room and it was suspected that the patient had chicken pox, which was later ruled out. At this time the patient was not admitted to the hospital. On 09-APR-2008 the patient was admitted to the hospital for possible inflammatory arthritis, possible lupus, or possible rheumatoid arthritis. The patient experienced nausea, vomiting, and a rash with myalgia and arthralgias. Other symptoms included swelling and aches in her joints, elevated liver enzymes, fever, malaise, body aches, a rash over her trunk, arms, and legs, and an immediate weight gain of 20 pounds. It was unknown when the weight gain actually started. Rheumatoid studies were conducted. The patient's phosphatase level was 283 and her Creatinine reactive protein test was high. The patient's electrolytes, glucose, and abdominal ultrasound were normal and the blood culture was negative for infection. The patient was treated with intravenous fluid, intravenous pain medications, SOLU-MEDROL and MOTRIN. The patient was admitted to the hospital for three days and discharged with a diagnosis of a possible reaction to the vaccination. It was reported that there was a 75% resolution of acute symptoms with the use of SOLU-MEDROL and MOTRIN. The patient recovered on an unspecified date. No product quality complaint was involved. Additional information has been requested.

Other Meds: PROVERA

Lab Data: abdominal ultrasound, 04/??/08, normal; serum alkaline, 04/??/08, 283; serum C-reactive, 04/??/08, high; blood culture, 04/??/08, negative for infection; serum electrolytes test, 04/??/08, normal; serum glucose, 04/??/08, normal

MedDRA PT Arthralgia, Purpura, Vasculitis

Symptom Text: Information has been received from a dermatologist concerning an 18 year old female, who in April 2008, was vaccinated with a second dose of GARDASIL. The route and site of administration were not reported. Ten days post vaccination the patient developed significant arthralgia in the knees and the hip, and a purpuric rash on the lower limbs. A biopsy revealed vasculitis and tests also showed speckled-type antinuclear antibodies at a rate of 1/320. At the time of the report, the patient had not recovered. The reporter considered the arthralgia, vasculitis, and purpuric rash to be other important medical events. Other business partner numbers included: E2008-04408. Additional information is not available.

MedDRA PT Arthralgia, Joint swelling, Leukocytosis, Myalgia, Oedema peripheral

Symptom Text: Information has been received from an agency concerning a 16 year old female occasional tobacco user with a history of acne and hypersensitivity who on 11-JAN-2008 was vaccinated with GARDASIL. Concomitant suspect therapies included minocycline and JASMINE. On 12-FEB-2008 the patient developed muscle soreness with myalgia, oedema of the fingers, swelling knees and joint pain and was hospitalized. Laboratory results revealed a transient hyper leucocytosis (11000 leucocyte and then 7500 leukocyte) and an increase of the inhibitor of component C1-INH test at 0.43 and of component C4 test at 0.4. Laboratory results for cryoglobulinemia, antinuclear factors and hematology laboratory test were all negative. No etiology was found. On an unspecified date the patient was considered to have recovered from the events. Additional information has been requested. Other business partner numbers included: E2008-04334.

MedDRA PT Cerebral haemorrhage, Dizziness, Fall, Head injury, Loss of consciousness, Vomiting

Symptom Text: Information has been received from a physician concerning a 25 year old Asian female who on 09-MAY-2008 was vaccinated with GARDASIL. Right after vaccination with GARDASIL at approximately 14:30 on 09-MAY-2008, the patient experienced loss of consciousness and fell down. When falling down, the patient hit the back of her head on the floor. The patient was treated with 5% glucose 500 ml and SOLU-CORTEF injection. After 1 minute after loss of consciousness, the patient regained consciousness. However she complained dizziness and vomiting. The patient went home at 18:00 after 3 hour and 30 minute-bed rest. The physician made a call to the patient's parent at night on the same day and found dizziness and vomiting persisted. The physician recommended the patient to visit the hospital. The patient visited to a general hospital for the further evaluation on 10-MAY-2008 and received the CT. The CT result showed the brain hemorrhage due to hitting her head on the floor and the patient was hospitalized on 10-MAY-2008. The dizziness and vomiting still persisted on 13-MAY-2008. The patient was treated for the brain hemorrhage and follow up CT will be performed soon. The causality with GARDASIL was not reported so far. Additional information has been requested.

MedDRA PT Alopecia areata, Inappropriate schedule of drug administration

Symptom Text: ALOPECIA AREATA:I received my first shot of Gardasil in January 2007. About a month later we noticed a bald spot in the back of my head. I went back to my ObGyn and asked her if the Gardasil could be the cause as nothing else had recenlty changed and I was not taking any ther medications. She said that she had not heard of this, but she referred me to a dermatologist. I asked him if my hair loss had anything to do with the Gardasil. He replied that I had Alopecia areata and one thing had nothing to do with the other. He advised that I continue with the Gardasil and that he would start treating me for the alopecia. I believe that the Gardasil is the cause of my Alopecia, now over half of my head is bald. I don't know what to do. I keep going back to the dermatologist for treatments for the alopecia, but it just keeps getting worse.

MedDRA PT Burning sensation, Paraesthesia, Pruritus

Symptom Text: This case was reported by a regulatory authority (vaccines, biologicals) # DE-PEI-PEI2008006370) and described the occurrence of burning sensation in a 17-year-old female subject who was vaccinated with TD-RIX (GlaxoSmithKline). Co-suspect vaccination included GARDASIL (Sanofi Pasteur MSD). Previous vaccination included a booster dose of TD-RIX (GlaxoSmithKline) given in 1996 and GARDASIL (Sanofi Pasteur MSD) given on 25 February 2008. On 21 April 2008 the subject received a dose TD-RIX (unknown route, right upper arm) and a dose of GARDASIL (unknown route, left upper arm). Few hours after co-administered vaccination with GARDASIL and TD-RIX, the subject experienced burning sensation, tingling and itching of both feet, lower legs, both hands and arms over a period of 10 days. The subject was hospitalised. No further information will be available.

MedDRA PT Burning sensation, Paraesthesia, Pruritus

Symptom Text: Information has been received via a health authority concerning a 17 year old female patient booster vaccination with TD-RIX in 1996 was well tolerated who on 25-FEB-2008 was vaccinated with a first dose of GARDASIL (lot # not reported) which was well tolerated. On 21-APR-2008, the patient was vaccinated with a second dose of GARDASIL (Batch # NG34780) (lot # 0513U) into the left upper arm (route not reported). Simultaneously the patient was vaccinated with a booster dose of TD-RIX (lot # AC12B016GA) into the right upper arm (route not reported). A few hours p.v. the patient experienced a burning sensation, tingling and pruritus of feet, hands, arms and lower legs. Without medical advice the patient treated the reactions with cetirizine which led to intermittent improvement. The patient recovered completely after 10 days. Other business partners numbers included: E2008-04451. This report was also received from FDA through the freedom of information act. It is also reported "the patient was hospitalised". No further information is available. File closed. The VAERS ID # is 313042.

MedDRA PT Injection site pain

Symptom Text: Information has been received from a physician concerning a 11 year old female who in approximately January or February 2008, was vaccinated with the first dose of GARDASIL. The patient recently (approximately April 2008) came in for her second dose of GARDASIL. The patient experienced excruciating pain at the injection site after the first dose of the vaccine. The patient outcome was recovered. The duration of the pain was not provided. It is unknown whether medical attention was sought. Additional information has been requested.

MedDRA PT Acne, Anxiety, Cough, Decreased appetite, Depression, Diarrhoea, Dizziness, Fatigue, Formication, Inappropriate schedule of drug administration, Menstruation irregular, Metrorrhagia, Nasopharyngitis, Nausea, Palpitations, Paraesthesia, Peripheral coldness, Presyncope, Upper respiratory tract congestion, Weight decreased

Symptom Text: Information has been received from a physician concerning a 27 year old female with no previous medical history or no known drug allergies, who on 15-FEB-2008 was vaccinated IM with a 0.5 ml first dose of HPV rL1 6 11 18 VLP vaccine (yeast) (lot# 655327-1287U). There was no concomitant medication. On 16-MAR-2008 the patient experienced tingling and formication of both hands, feet, and bilateral anterior thighs. The patient was examined in the office on 21-MAR-2008. Neurological exam was normal. Complete blood count, metabolic panel, and thyroid stimulating hormone levels were normal. The patient was examined by an unspecified neurologist in early April 2008. Nerve conduction testing on the right leg and neurological exam were normal. The physician added that the patient received an unspecified steroid injection in the sacr-iliac joint 2 weeks prior to the onset of symptoms. Medical attention was sought in the office. At the time of reporting the patient was recovering. No product quality was involved. 5/27/08-records received-office visit 2/15/08-Current problems: acne vulgaris, depression with anxiety, dizziness. 3/21/08-C/O tingling sensation began 5 days ago, mild intensity, constant. Paresthesia in both hands (stocking glove distribution) both feet and both anterior thighs. Not associated with numbness or weakness just odd sensation. Two weeks prior had steroid injections in back followed by week of nocturia now resolved. Currently fighting a cold. May likely be a side effect from steroid injections. Two weeks later seen for C/O nausea and wave of dizziness, intermittent, decrease in appetite and weight loss, diarrhea. Currently on Flexeril. Heart races when dizzy. Mild cough and chest congestion. Felt like passing out. Feet seem more cold, although hands and feet are always cold. Irregular period, 2 weeks early. spotting for 7-8 days. Skin crawling sensation intermittent 1 month after first HPV vaccine.Symptoms worsen with fatigue and when anxious. Feels worse after eating cake. Neuro consult 4/4/08-Sensor

Other Meds: None

Lab Data: Nerve conduction study normal. Neurological exam normal. Complete blood cell count normal. Full chemistry normal. Serum TSH normal. 5/27/08-records received-Labs WNL. EMG normal, Brain MRI normal. Neurological exam normal.

History: None 5/27/08-records received-PMH: abnormal pap smear. TMJ-wears splint at night. Chronic low back pain/SI since 2003. Facet joint dysfunction. Pulsing sensation in ear. frequent otitis media as child.

MedDRA PT Syncope

Symptom Text: Information has been received from a registered nurse concerning an "18 to 19 year old" female consumer who on an unspecified date in April 2008, was vaccinated intramuscularly with a "second dose" of GARDASIL (lot # not reported). There was no concomitant medication. The nurse reported that the patient "fainted ten minutes after vaccination". The nurse noted that "the patients who read the GARDASIL fact sheet prior to vaccination seemed more prone to fainting". It was also reported that "most of the patients did not have breakfast and this may play a role because the vaccinations were given early in the day". The patient sought unspecified medical attention during an office visit. The patient recovered from fainting "on the same day". This is one of several reports from the same source. Additional information has been requested.

MedDRA PT Hypokinesia, Muscle spasms, Musculoskeletal pain, Neck injury, Neck pain, Rhinorrhoea, Torticollis

Symptom Text: Initial and follow up information has been received from a physician and emergency room records concerning a 17 year old female student who at 3:45PM on 07-APR-2008, was vaccinated into the right arm with her second dose of GARDASIL (lot# 659964/1978U). The patient had an upper respiratory infection at the time of vaccination. On 08-APR-2008 (reported as 2:00PM and also as "in the AM") the patient experienced severe pain in the left shoulder and had a hard time moving her neck. She was sent to the ER where she received IV fluids. Follow up information from the physician indicated that the patient woke up in the AM on 08-APR-2008 with a severe spasm of her left neck and left shoulder. The emergency room records indicated that the patient presented at 14:45 with right side neck spasm which had progressively worsened through out the day. Torticollis along with palpable muscle spasms were noted in the emergency room evaluation. There was no known trauma or abnormal activities. The patient had pain with movement and no systemic symptoms, no fever, no nausea, vomiting or diarrhea. She denied paresthesia/weakness. She was reported to have tried heat and BENGAY with relief. Emergency room diagnosis was neck strain. The patient was treated with one shot of TORADOL, 30 mg IV and VALIUM, 20 mg IV. She was discharged to home with instructions to take either ibuprofen or TORADOL, apply heat and follow up with primary physician. The reporting physician also indicated that patient stayed on TORADOL for a few days and did well. Further information is not expected. 5/29/08-records received for DOS 4/8/08-DX: Neck strain. ER visit with C/O right side neck pain began morning of ER visit and worsened throughout day. Now with Torticollis. Pain with movement. Denies paresthesia and weakness. URI symptoms recently. PE: yellow discharge from nose. Palpable muscle spasm neck left neck.

MedDRA PT Syncope

Symptom Text: Information has been received from a health professional concerning a 14 year old female with no pertinent medical history or drug reactions/allergies who in June 2007 was vaccinated with a first dose of GARDASIL 0.5 mL IM. There was no concomitant medication. On 04-APR-2008 the patient was vaccinated with a second dose of GARDASIL 0.5 mL IM. The patient was at the physician's office when she experienced syncope and she remained there until she recovered and was able to leave. Unspecified medical attention was sought at the physician's office. On 04-APR-2008 the patient recovered. No further information was available. Additional information has been requested.

MedDRA PT Immediate post-injection reaction, Syncope

Symptom Text: Information has been received from a nurse concerning an "18 to 19 year old" female consumer who on unspecified date in April 2008, was vaccinated with a "second dose" of GARDASIL (lot # not reported). There was no concomitant medication. The nurse reported that the patient "fainted ten minutes after vaccination." The nurse noted that "the patients who read the GARDASIL fact sheet prior to vaccination seemed more prone to fainting". It was reported that "most of the patients did not have breakfast and this may play a role because the vaccinations were given early in the day". The patient sought unspecified medical attention during an office visit. The patient recovered from fainting "on the same day". This is one of several reports from the same source. Additional information has been requested.

MedDRA PT Abdominal pain, Eye rolling, Influenza like illness, Lip discolouration, Loss of consciousness, Muscle contracture, Nausea, Pallor, Syncope vasovagal

Symptom Text: Information has been received from a pharmacist concerning an eighteen year old female patient who received a first dose of GARDASIL (batch number not reported) on 25-FEB-2008, administered intramuscularly in the left arm. The morning after on 26-FEB-2008, during her breakfast, the patient looked white, had nausea and had a loss of consciousness. The patient's mother reported an impressive reaction. The patient went to the emergency at the hospital and the diagnosis was a vagal malaise. Follow up information indicated that the patient had loss of consciousness, eye rolling and black lips 23 hours after injection. She also experienced contractures in the arms and the body and abdominal pain, "like in flu-like syndrome", 28 hours after injection. Contractures were reported as moderate and abdominal pain was reported as severe. The three events were reported as serious and severe. The events of nausea and pallor were no longer mentioned. One hour after her syncope, the patient was transferred to the emergency unit where vasovagal syncope was diagnosed. The patient recovered (date not reported). The reporter considered the patient's vagal reaction, contracture and abdominal pain as other important medical events. Other business partner numbers included E2008-02391.

MedDRA PT Abdominal pain upper, Breast abscess, Breast swelling, Cellulitis, Erythema, Fatigue, Injection site pain, Malaise, Nausea, Pyrexia, Scar

Symptom Text: Information has been received from a mother concerning her 13 year old daughter who on 02-OCT-2007 was vaccinated with her first dose of GARDASIL, (lot # not available). Subsequently, on approximately 02-OCT-2007 the patient experienced soreness at the injection site for 3 - 5 days. On 11-DEC-2007 the patient was vaccinated with her second dose of GARDASIL, (lot # not available). Subsequently, on approximately 11-DEC-2007 the patient experienced soreness at the injection site for 3 - 5 days. On 21-APR-2008 the patient was vaccinated with her third dose of GARDASIL, (lot # not available). The mother reported that on 22-APR-2008 the patient did not feel well - her stomach hurt and she felt queasy and tired, plus she had a slight fever and a small red spot on her breast. On 23-APR-2008 the patient's temperature was higher and her whole breast was very swollen and red. It was reported that the patient was taken to her physician who recommended that she go to the hospital. The patient was hospitalized from 23-APR-2008 to 27-APR-2008, given IV antibiotics and diagnosed with an abscess in he breast and got cellulitis. The mother reported that the patient now has scar tissue in her breast. It was reported that the physicians at the hospital believed that abscess in her breast and got cellulitis and now has scar tissues in her breast were not related to therapy with GARDASIL. Additional information has been requested.

MedDRA PT Fall, Heart rate irregular, Loss of consciousness, Pain, Pallor, Shock

Symptom Text: Information has been received from a nurse concerning a 13 year old female who in early April 2008, was vaccinated with GARDASIL during the physical check-up in a general hospital. On a same day right after the vaccination with GARDASIL, the patient fell down and her face became pale. The patient experienced pain shock and loss of consciousness. The nurse checked her consciousness, but the patient did not respond and her pulse was unstable. The nurse was about to bring the patient to the emergency room, but the patient became conscious within 30 to 60 seconds after the patient fell down. Subsequently, the patient recovered from pain shock and loss of consciousness for about 30 - 60 seconds and unstable pulse. Her pulse became stable. The patient just remembered that she felt severe pain after vaccination. Thereafter the patient had no significant finding and went home. No follow up information has been reported from the patient so far. The causality with GARDASIL was not reported. The patient's pain shock and loss of consciousness for about 30 - 60 seconds and unstable pulse were considered as other important medical events. Additional information is not expected.

MedDRA PT Abdominal tenderness, Arthralgia, Arthritis reactive, Asthenia, Fatigue, Gait disturbance, Immunisation reaction, Joint swelling, Joint warmth, Mouth ulceration, Presyncope, Pyrexia, Rash erythematous, Rash generalised, Rash macular, Serum sickness, Urticaria

Symptom Text: Initial and follow up information has been received from a physician and by telephone call from the healthcare professional concerning a 22 year old female patient with family history of rheumatoid arthritis and autoimmune disease who on 03-APR-2008 was vaccinated IM with a dose of GARDASIL (lot # not available). The physician reported that the patient experienced serum sickness, full body rash, and severe arthritis and joint pain. She was taken to the emergency room and was admitted to the hospital. In follow up telephone call the health care professional reported that on 04-APR-2008 patient developed fatigue, temperature of 102, weakness, near syncope episode at work, blanchable rash all over body, very achy joints hands, knees and ankles, and had trouble walking. She went to the emergency room (E.R.) on 04-APR-2008 and was sent home. On 05-APR-2008, she went to the ER and was told she had chicken pox and was sent home. On 08-APR-2008 the patient went to the ER and was sent home. On 09-APR-2008 the patient was admitted to the hospital. The patient's final diagnosis was reactive arthritis, possible reaction to GARDASIL, urticaria associated with reactive arthritis, abnormal liver function test (LFT's) possibly related to fatty liver or polycystic ovary syndrome or possibly related to reactive arthritis. Her hepatitis A, hepatitis B and hepatitis C, Lyme, Rocky Mountain fever, serum antinuclear antibodies (ANA), serum antineutrophil cytoplasmic antibody (ANCA) test was normal. Her Rheumatoid factor tests were all normal and her sed rate was slightly elevated. Serum C Reactive protein test was 29.9. The patient was treated with intravenous (IV) steroids and improved. She was in the hospital for four days. On 21-APR-2008, the patient was seen in the office and it was noted that she was "remarkably better". Skin rash was resolved, ache in joints/stiffness still there especially after sleeping. Fever was gone. The patient was recovering. Additional information has been requested. 06/04/2008 MR re

MedDRA PT Injection site reaction, Pallor, Rash papular

Symptom Text: Information has been received from a nurse concerning a 15 year old female with a history of scarring from a motor vehicle accident and no known drug allergies who on 06-OCT-2007 was vaccinated IM in the left arm with the first dose of GARDASIL. There was no concomitant medication. On 06-OCT-2007 the patient experienced injection site reaction described as covering a 2 to 3 inch area around the injection site that was blanched with small pea sized elevations. The reaction occurred several hours after the injection and lasted for about 2 months. The rash subsided without any treatment. The patient reported the reaction about six months after receiving the vaccination. No other symptoms reported. Unknown medical attention was sought in the office. No product quality complaint was involved. Additional information has been requested.

MedDRA PT Medical device complication, Pain in extremity

Symptom Text: Information has been received from a physician concerning a 21 or 22 years old female with unknown medical history, who on 04-APR-2008 was vaccinated (route unknown) with a second dose of GARDASIL (Lot # 655604/0052X). The date and lot number of the first vaccination were not reported. The physician reported that the patient was "stuck" twice with two different prefilled syringes, because the first syringe did not function properly and did not release the vaccine. The patient reported arm pain to the physician. No laboratory diagnostic studies were performed. The patient sought unspecified medical attention at the physician's office. Subsequently, on an unspecified date the patient recovered. This is one of several reports from the same source. Additional information has been requested.

MedDRA PT Injection site induration, Injection site pain, Injection site pruritus, Nausea

Symptom Text: Information has been received from a 25 year old female who was vaccinated on unspecified dates with the first and second doses of GARDASIL (lot #'s not reported) and experienced nausea, pain and itching at the injection. About one month later she developed a "knot" at the injection site that lasted for about 2-3 months. After getting the third dose of GARDASIL (lot # not reported) she did not have any adverse reactions. The first two doses were given by the same nurse and the third dose was given by another nurse at the same office. Subsequently, the patient recovered from nausea, pain, itching at the injection site and knot at the injection site. Additional information has been requested.

MedDRA PT Drug exposure during pregnancy

Symptom Text: As I was injecting the 3rd vaccine ordered for this patient-the patient's mother asked me if we did a pregnancy test on patient. I told her no and asked if a pregnancy test was needed. Mother stated yes. I then asked pt if she was sexually active and she said no. I notified doctor immediately and she ordered a urine pregnancy test. The result of the pregnancy test was positive. I notified doctor immediately. The vaccines that the patient received were Varivax, Gardasil and Menactra. Doctor ordered a referral to OB/GYN. I called doctor's office to get patient an appointment as soon as possible. The receptionist informed the doctor of the situation and he stated patient needed checked in mid-June 08 due to the fact patient states is about 10 days late for menstrual cycle. The receptionist informed med that this patient also had a history of miscarriage in 2007. I informed doctor of this. Patient has an appointment with doctor June 18, 2008. Referral for the appointment was given to Mother and I stressed importance of keeping the appointment as scheduled. Mother verbalized understanding.

Symptom Text: Information has been received from a nurse practitioner concerning a female (age unknown), who, on an unspecified date, was vaccinated with a first dose of GARDASIL. Subsequently, the patient developed redness at the injection site in the "shape of a band aid." It was reported that the patient would put a band aid on the area and the mark was still there. On an unspecified date the patient returned to the office for her second dose of GARDASIL and the redness at the injection site had not resolved. The patient sought unspecified medical attention. At the time of the report, the outcome of the patient was unknown. No product quality complaint was involved. This is one of two reports from the same source. Additional information has been requested.

MedDRA PT Asthenia, Syncope

Symptom Text: Information has been received from a billing manager concerning a 14 year old female who on 25-SEP-2007 was vaccinated with a 1st dose of GARDASIL (lot# 658282/0929U). On 10-DEC-2007 the patient was vaccinated with a 2nd dose of GARDASIL (lot# 656372/0243U). On 14-APR-2008 the patient was vaccinated with a 3rd dose of GARDASIL (lot# 659441/1446U). Concomitant therapy included HAVRIX, lot# AVB223AA). Subsequently, on 14-APR-2008 the patient fainted 5 minutes after receiving her 3rd dose. The nurse held the patient. The patient felt weak so she laid down for 10-15 minutes. The patient was given water and after 15 minutes, she was fine. The patient had no symptoms following the previous 2 doses. Additional information has been requested.

MedDRA PT Cold sweat, Deafness, Dizziness, Flushing, Injection site pain, Visual disturbance

Symptom Text: Information has been received from a physician concerning a 19 year old Caucasian female student with moderate dysplasia, HPV, and abnormal pap smear (CIN 2 with high risk HPV types) who on 24-APR-2008 was vaccinated IM in the left deltoid with the first 0.5 ml dose of GARDASIL (Lot# 659437/1266U). Concomitant therapy included DEPO-PROVERA. On 24-APR-2008 the patient became dizzy, clammy, flushed and reported that the injection was painful. Subsequently, the patient recovered on 24-APR-2008 from dizzy, clammy, flushed and injection pain. Unknown medical attention was sought in the office. No product quality complaint was involved. Follow up information was received that indicated that immediately following the injection, the patient became very dizzy, clammy, and her cheeks were flushed. The patient felt as though she was going to lose consciousness. She also reported visual and audible "waves". The symptoms lasted approximately 8 - 10 minutes. On 24-APR-2008, the patient was recovered. Additional information has been requested.

Other Meds: DEPO-PROVERA

MedDRA PT Injected limb mobility decreased, Injection site pain

Symptom Text: Information has been received from a nurse concerning her 12 year old daughter who on 02-MAR-2007 was vaccinated IM with the first dose of GARDASIL. On 27-APR-2007, the patient was vaccinated IM with the second dose of GARDASIL and on 17-AUG-2007, the patient was vaccinated IM with the third dose of GARDASIL. The patient reported pain in the arm at the injection site for 3 days after the vaccination was given. The pain in the arm included not being able to lift the arm. The nurse also reported that since multiple patients (3 patients) reported pain in their arms, they started giving the vaccination in the buttocks to an unspecified number of patients. Unknown medical attention was sought through contact with the nurse. Patient outcome was unknown. No product quality complaint was involved. This is one of the multiple cases from the same source (WAES # 0805USA01521 and 0805USA01522). Additional information has been requested.

MedDRA PT Abdominal pain, Abdominal pain upper, Amenorrhoea, Diarrhoea, Nausea, Rash, Vaccine positive rechallenge

Symptom Text: Information has been received from a consumer concerning her sister who on an unspecified date in October 2007, was vaccinated "by injection" with a 0.5 mL first dose of GARDASIL (lot # not reported). On an unspecified date in November 2007 the patient was vaccinated with a second dose of GARDASIL (lot # not reported). On an unspecified date in April 2008, the patient was vaccinated with a third dose of GARDASIL (lot # not reported). There was no concomitant medication. The consumer reported that "the patient experienced nausea, stomach ache, diarrhea, abdominal pain and rash after getting all three doses". It was also reported that the "patient's LMP was in November 2007 and did a pregnancy test but she is not pregnant". The patient sought unspecified medical attention. The nausea, stomach ache, diarrhea, abdominal pain, rash and amenorrhea persisted. Laboratory tests included a CT scan, blood test and urine test. The results of the CT scan, blood test and urine test were not reported. No further information is available.

MedDRA PT Injection site mass

Symptom Text: Information has been received from a licensed practical nurse concerning a 25 year old female patient with no medical history and a penicillin allergy who on 01-APR-2008 was vaccinated intramuscularly into the left arm with the first 0.5 ml dose of GARDASIL (Lot # 659962/1740U). Concomitant therapy included hormonal contraceptives (unspecified), ACIPHEX and minocycline. On approximately 08-APR-2008, about one week after receiving the vaccination, the patient developed a hardened knot at the injection site. On 27-APR-2008 the patient reported that the hardened knot had increased by five times. The patient was examined by the physician on 28-APR-2008 and the adverse injection site reaction was palpable and the size of a marble. The area was not reddened, painful or swollen. The nurse reported that she did not know if the patient had a hematoma. The nurse called the patient on 06-MAY-2008 to inquire if the patient recovered. The patient did not return the nurse's phone call. It was reported that there are no other symptoms. No treatment was provided. No diagnostic laboratory studies were performed. At the time of this report the patient's outcome had not recovered. No product quality complaint was involved. Additional information has been requested.

MedDRA PT Injection site swelling

Symptom Text: Information has been received from a health care worker concerning a 17 year old female with pertinent medical history and concomitant medications reported as unspecified, who on approximately 29-FEB-2008 (2 months ago), was vaccinated with her first dose of GARDASIL, IM, (Lot# not reported). A few hours after her vaccination, she developed injection site swelling and sought unspecified medical attention. It was reported that the swelling measured 6 inches by 3 inches, and resolved about 5 days later (approximately 05-Mar-2008). No product quality complaint was involved. Additional information has been requested.

MedDRA PT Condition aggravated, Gaze palsy, Headache, Muscle rigidity, Opisthotonus, Posturing, Syncope

Symptom Text: Information has been received from a nurse concerning a 12 year old female with a history of "fainting incidence with medical procedures" (the patient's mother stated that the patient has had "3 previous fainting incidence with medical procedures throughout her life; the patient had fainted once when she was 3 years old when she skinned her knee and it was being cleaned by her mother), who on 10-SEP-2007 was vaccinated with the first dose of GARDASIL, (Lot# dose, and route not reported) and VARIVAX, (Lot #, dose and route not reported). On 16-APR-2008, the patient was vaccinated with her first dose of VAQTA, second dose of GARDASIL (Lot# dose, and route not reported) and VARIVAX, (Lot #, dose and route not reported), the patient fainted after the injections as per the physician report. The nurse reported that when she was called into the room by the physician the patient was sitting in the chair. Her back arched, eyes were opened and rolled back. She had posturing of the left hand and her body was rigid. The patient was lowered to the floor and came to. The incident lasted a total of one minute. The patient had not eaten breakfast, she was given something to eat, observed in the office, and was released home with her mother. The next day the patient suffered from a headache that she was kept home from school for. It was reported that the patient recovered on 18-APR-2008. No product quality complaint was involved. Additional information has been requested.

MedDRA PT Depression, Feeling abnormal, Mood swings, Panic attack

Symptom Text: Information has been received from the mother of a 19 year old female consumer who in early January 2008, was vaccinated with the first dose of GARDASIL (lot not reported), In later February 2008 the patient was vaccinated with the second dose of GARDASIL (lot not reported). There was no concomitant medication. In January 2008, the patient began to experience depression and a feeling of "just not being herself with no known reason". Two weeks after her second dose of GARDASIL (lot not reported), she experienced a panic attack. Her current condition was described as resembling a "hormonal mood swing reaction." There does not seem to be an explanation for these feelings. She experienced these feeling away at college as well as at home. She is being seen by a physician and has an upcoming appointment in early May 2008 for these symptoms. The patient's status was reported as not recovered. No further information is available.

Symptom Text: Information has been received from a physician concerning a 17 year old female who on 11-Mar-2008 was vaccinated with the first dose of GARDASIL (lot # 659182/1757U). There was no concomitant medication. On 11-MAR-2008 within 15 minutes of sitting after the vaccination, she became pale and started to sweat for 2 to 3 minutes. It was reported that the patient is an athlete and had practice prior to vaccination. The patient's blood pressure and heart rate were taken yielding normal results. The patient recovered on 11-MAR-2008. Additional information has been requested.

Other Meds: None

Lab Data: Blood pressure - normal; diagnostic laboratory - heart rate (normal).

MedDRA PT Ear pain, Hypoaesthesia, Inappropriate schedule of drug administration, Pain of skin, Paraesthesia

Symptom Text: Information has been received from a physician's assistant concerning a 29 year old female who on 14-APR-2008 was vaccinated in the left arm with her first dose of GARDASIL (Lot # not provided). Concomitant therapy included ORTHO TRI-CYCLEN LO. The patient experienced a left ear ache and pain at the left scalp. On or around 20-APR-2008, the patient developed numbness and/or tingling of the left arm. The pain on the ear and scalp did resolve, but the arm sensation still persisted. The patient was treated with VALTREX (time unspecified by reporter) by the primary physician because he suspected that it was shingles, but later ruled that out. The patient sought unspecified medical attention by seeing her primary physician. No other details were provided. Additional information has been requested.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Information has been received from a physician for the pregnancy registry for GARDASIL, concerning a female (age not reported) who on an unspecified date was vaccinated with a dose of GARDASIL. The physician reported that the patient did not know she was pregnant, she had a miscarriage. Follow up phone call information provided by a physician's assistant reported that the patient experienced a spontaneous abortion sometime after the first dose of GARDASIL, and prior to the second dose of GARDASIL. The physician's assistant was unable to provide the administration date, dose, or lot numbers. It was reported that the patient's outcome was unknown. Upon internal review, spontaneous abortion was determined to be an other important medical event. No product quality complaint was involved. Additional information has been requested.

MedDRA PT Abdominal pain, Abdominal pain lower, Anaemia, Colitis ulcerative, Fatigue, Haematochezia, Vomiting

Symptom Text: Information has been received from a physician concerning a 14 year old female patient with no medical history or drug allergies reported, who on 27-JUL-2007, 02-SEP-2007 and 06-FEB-2008 (3rd dose also reported as 27-JUL-2008 administered intramuscularly) was vaccinated with the first, second and third doses of GARDASIL, respectively. There was no concomitant medication. In August 2007, after the physician reviewed the patient's past medical history, he noticed that the patient experienced bloody stools in the beginning of August 2007 after her first dose of GARDASIL. On 04-JAN-2008 the patient saw her physician and stated that she was experiencing constant fatigue and tiredness. A blood test was taken and showed that the patient was anemic. The patient was diagnosed with ulcerative colitis and was hospitalized on 08-MAY-2008 (the number of days spent in the hospital were unspecified). At the time of this report the patient has not recovered. No product quality complaint was involved. Ulcerative colitis was considered to be disabling. Additional information has been requested. 6/20/08-records received for DOS 5/7-5/12/08-DC DX:Ulcerative colitis. Blood in stools. Admitted for a flare with worsening bloody stools and crampy lower abdominal pain over past 2-3 weeks.Emesis, diminished urine output. Diagnosed with ulcerative colitis 2/08. Began having blood in stool in 7/07, hid her symptoms, determine to be anemic.

MedDRA PT Cyanosis, Fall, Jaw fracture, Syncope

Symptom Text: Information has been received from a physician concerning a 11 year old female with a history of fainting, who on 12-MAY-2008 was vaccinated with a first dose of GARDASIL. Concomitant vaccination included diphtheria toxoid (+) pertussis acellular vaccine (unspecified) (+) tetanus toxoid. On 12-MAY-2008 the nurse had the patient wait for around five minutes post vaccination. The nurse left the room for a second. The patient fainted and fell off of the exam table. The patient was found lying face down and started to turn blue, but had a pulse. The patient was rushed to the hospital and ended up having a maxillary fracture. At the time of the report, the outcome of the patient was unknown. No product quality complaint was involved. The physician considered the fainting, fall off the exam table, turning blue, and maxillary fracture to be other important medical events. Additional information has been requested.

MedDRA PT Breech delivery, Caesarean section, Drug exposure during pregnancy, Foetal disorder

Symptom Text: Information has been received for the Pregnancy Registry for GARDASIL from a registered nurse concerning a 17 year old female who on 21-MAY-2007 was vaccinated with a first dose of GARDASIL (lot # unknown). On 21-MAY-2007, a cervical smear was performed and the results were within normal limit. A gonorrhea test, HIV test and a rapid plasma reagin card (RPR) test was performed and the results were negative. A Chlamydia test was performed and the results were positive. The date of the patient's last menstrual period was 31-MAY-2007. Medical attention was sought. On 24-JUL-2007, the patient had a beta-human chorionic gonadotropin test (unspecified) that showed positive results for pregnancy. On 24-Jul-2007, the patient was vaccinated with a second dose of GARDASIL (lot# unknown). On 24-JUL-2007, the patient was treated with one gram of ZITHROMAX and 125 mg of ceftriaxone sodium for Chlamydial infection. An HIV and rapid plasma reagin card (RPR) test were also performed and results are pending. The estimated date of delivery is 6-MAR-2008. Follow-up information was received from the physician's office from a health professional. It was reported that the patient delivered a normal, healthy baby girl on 18-FEB-2008 via C-section (baby was breech). The baby weighed 6 pounds 7 ounces. The patient did not breastfeed the infant. The infant developed reflux shortly after birth. No additional information was available. Upon internal review breech presentation was considered to be an other medical event. Additional information is not expected.

MedDRA PT Breech presentation, Caesarean section, Drug exposure during pregnancy

Symptom Text: Initial and follow up information has been received through the pregnancy registry from a certified nurse midwife concerning an 18 year old female, with no pertinent medical history, who in November 2006, was vaccinated with a dose of GARDASIL. In January 2006, the patient was vaccinated with a second dose of GARDASIL. On 20-MAY-2007, the patient was vaccinated with a third dose of GARDASIL. There was no concomitant medication. Subsequently, the patient became pregnant. In follow up it was reported that on 28-JUN-2007 patient had an ultrasound which was within normal limits. Prenatal lab testing was done, results not reported. The last menstrual period was 20-MAR-2007, with an estimated date of delivery was 25-DEC-2007. Ultrasound done on 28-JUN-2007 for date was reported to be within normal limits. Follow up information was received from a health care professional at the nurse midwife's office on 04-APR-2008. She reported that the baby was normal and healthy. The birthdate was 05-DEC-2007. She didn't have any more information. Follow up information was received from the doctor's office that on 07-DEC-2007, patient had a cesarean section for breech presentation and delivered 39 weeks from her last menstrual period. This information was conflicting with the previously reported information that patient had a normal delivery on 05-DEC-2007. Upon internal review patient's breech baby delivery which required a cesarean section delivery was determined to be an other important medical event. Additional information is not expected.

MedDRA PT Abortion, Drug exposure during pregnancy

Symptom Text: Information has been received from a licensed practical nurse concerning a 14 year old female with no pertinent medical history or drug reactions/allergies on 27-FEB-2007 was vaccinated with a first dose of GARDASIL (lot# 654335/0960F) 0.5mL. The date of the last menstrual period was 03-JUN-2007. On 26-JUN-2007 the patient was vaccinated with a second dose of GARDASIL (lot# 658094/0524U). On the same day a urine pregnancy test was performed prior to vaccination and the results was negative for pregnancy. On 12-JUL-2007 a urine test was performed and the results was positive for pregnancy. Medical attention was sought. The estimated date of delivery is 09-MAR-2008. No symptoms have been reported. Follow-up information was received from a health care professional. The HCP indicated that the patient either had a miscarriage or an elective abortion on 02-AUG-2007. No additional information was available. Upon internal review unspecified abortion is considered to be an other medical event. Additional information is not expected.

MedDRA PT Abnormal labour, Anaemia, Caesarean section, Drug exposure during pregnancy, Vomiting

Symptom Text: Information has been received from a nurse practitioner for the Pregnancy Registry for GARDASIL, concerning a 15 year old female with asthma, infection, nausea and oppositional defiant disorder (ODD). On an unspecified date the patient was vaccinated with the first dose of GARDASIL (lot number unknown). Follow up information was received. The nurse practitioner reported that on 11-MAY-2007 the patient received her second dose of GARDASIL (lot# 653736/0014U) and then became pregnant. The date of the last menstrual period was approximately 20-APR-2007. Concomitant therapy included XOPENEX, ZITHROMAX and PENERGAN TABLETS/SUPPOSITORIES. There was no adverse event reported. Medical attention was sought. On 15-JUN-2007 the patient had an ultrasound that revealed 8 weeks on date. Additional information was not provided. The estimated date of delivery is 25-JAN-2008. Follow-up information was received from a nurse practitioner. The NP reported that on 22-JAN-2008 the patient had a healthy baby boy weighing 7 pounds 13 ounces and 39 3/7 weeks from LMP. The patient had a primary c-section for failure to descend. The patient also had anaemia during pregnancy. Other medications used during the pregnancy included CLARITIN for allergies, ZOFRAN for hyperemesis and ferrous sulfate for anaemia. Upon internal review primary c-section for (failure to descend) was considered to be an other medical event. Additional information is not expected.

MedDRA PT Injection site erythema, Injection site induration, Injection site pain, Injection site pruritus, Injection site swelling

Symptom Text: Information has been received from a registered nurse concerning a 17-year-old female with no pertinent medical history or allergies who on 27-APR-1998 was vaccinated subcutaneous with her first 0.5 ml dose of varicella virus vaccine live (Oka/Merck) (lot # 658406/1175U) and her second dose on 17-SEP-2007. Concomitant therapies included amitriptyline hydrochloride (MSD), ethinyl estradiol/norgestimate (TRI-SPRINTEC) and another vaccine administered on 17-SEP-2007. On 20-SEP-2007 the patient experienced redness, pain, swelling and itching at the injection site of the left upper arm. The patient was examined in the office later the same day and the exam revealed 8x7 cm area of redness with a central 1.5x1.5 cm induration. The physician recommended cool compress and BENADRYL. No diagnostic labs were performed. At the time of the report the patient's status was unknown. A product quality complaint was not involved. Follow-up information received on 07-DEC-2007 indicated the patient was vaccinated at 15:00 subcutaneous in the left arm on 17-SEP-2007 with a second dose of varicella virus vaccine live (Oka/Merck) (lot # 658406/1175U) (lot # 658406/1175U was previously reported as the first dose). There were no illnesses at the time of vaccination. Concomitant vaccines administered on 17-SEP-2007 at 15:00 included a first intramuscular dose of BOOSTRIX (lot # AC528015AA), a first intramuscular dose of MSD vaccine (yeast) (lot # 658560/1062U) and a fifth intramuscular dose of FLUZONE vaccine inactivated (lot # U2436AA). On 19-SEP-2007 (previously reported as 20-SEP-2007) the patient experienced 8x7 cm area of redness with a 1.5x1.5 cm induration on the left post arm at the site of the varicella virus vaccine live (Oka/Merck) injection. The patient was seen in the office of the 20-SEP-2007 for red, swollen itch. On 01-OCT-2007 the patient was seen at a "visit" and was "okay". Additional information is not expected.

MedDRA PT Caesarean section, Cervix disorder, Drug exposure during pregnancy, Foetal disorder, Thrombosis

Symptom Text: Initial and follow-up information have been received from a registered nurse and a licensed practical nurse through a Merck pregnancy registry concerning a 19 year old female with papanicolaou smear abnormal and a history of hypothyroidism who on 22-DEC-2009 was vaccinated with the first dose of GARDASIL (Lot #653938/0954F). On 08-MAR-2007, the patient received the second dose of GARDASIL (Lot #655618/0186U). Concomitant medication was not reported. In approximately April 2007, it was determined that the patient was pregnant. On an unspecified date, the patient had a positive urine pregnancy test. The date of the patient's last menstrual period was 19-APR-2007 and estimated delivery date is 24-JAN-2008. On 01-JUN-2007 and 17-JUL-2007, ultrasounds performed were normal. On 31-AUG-2007, was third ultrasound performed showed funneling of the cervix. On 13-SEP-2007, a fourth ultrasound showed a blood clot only. On 03-OCT-2007 at 26 weeks and 2 days of pregnancy, the patient had an emergency caesarean section performed due to the funneling of the cervix. At this time, the patient delivered two normal male infants one weighed 1 lb 12 oz and the second weighed 1 lb 13 oz with no congenital anomalies. Apgar scores were 6/7 for both infants. The infants experienced the following complications or abnormalities prematurity, bronchopulmonary dysplasia and ductus arteriosus. It was reported that there were no infections or illnesses during pregnancy and no complications during labor/delivery. The outcome and causality of these events were not reported. Upon internal review the following were considered to other important medical events: premature baby, bronchopulmonary dysplasia, caesarean section, ductus arteriosus and small for dates baby. Additional information has been requested.

Other Meds: Unknown

Lab Data: ultrasound, 06/01/07, norma; ultrasound, 07/17/07, norma - Twins/cervix length; ultrasound, 08/31/07, abnor - showed funneling; ultrasound, 09/13/07, abnor - showed blood clot only; urine beta-human - positive

History: Hypothyroidism

MedDRA PT Dehydration, Headache, Inappropriate schedule of drug administration, Lip dry, Nausea, Pain, Pain in extremity, Pyrexia, Urine output decreased, Vomiting

Symptom Text: Initial and follow up information has been received from a physician and by telephone from a registered nurse (R.N.) concerning a 17 year old female patient who on 28-APR-2008 was vaccinated with a first dose of GARDASIL lot # 659180/1758U. Concomitant therapy included DTAP-IPV, MENACTRA and ACCUTANE. On 01-MAY-2008 the patient experienced severe headache and nausea and after getting the first injection and went to the emergency room (ER). The next day, on 02-MAY-2008 she went to her physician's office and her physician sent her to the hospital. While at the hospital she was given Intravenous (IV) Fluids and narcotics for the pain. Unspecified laboratory blood work was done. In follow up telephone call to the office the nurse reported that there was no documentation regarding patient's hospitalization. No additional information was provided. The patient was reported as recovered at the time of this report. Additional information has been requested. 8/15/08 Reviewed hospital medical records of 5/2/2008. FINAL DX: acute HA; fever; vomiting; & dehydration Records reveal patient experienced severe vomiting, HA, low grade fever & dehydration. Patient admitted to HA prior to vaccination & was on Accutane. Also had leg pain. Seen in PCP office where she could not stand w/o vomiting. Had been seen in ER on 5/1 as well w/decreased urine output & dry lips. Tx w/IVF & improved. D/C to home on same day.

Seriousness: ER VISIT, HOSPITALIZED, SERIOUS

MedDRA PT Blood pressure, Dehydration, Headache, Pyrexia, Vomiting

Symptom Text: Initial report was received on 02 May 2008 from a physician. A 17-year-old female patient, who had no known allergies, or concurrent illnesses, but who had a history of chronic constipation, had received on 28 April 2008 a first intramuscular dose of MENACTRA (Lot # U2604AA); a dose of "Tdap" (trade name and manufacturer name not provided, Lot # AC52B016BA [not a valid Sanofi Pasteur lot number]); and a first dose of GARDASIL (manufacturer Merck, Lot # M1758A). The routes and sites of administration were not provided for the "Tdap" or GARDASIL; and the site of administration was not provided for the MENACTRA. Three days post-vaccination, the patient complained of severe headache and fever of 102.2 degrees Fahrenheit. The patient was taken to the emergency room that day. A CAT scan of the head was performed that was negative; and the patient was treated with DARVON for her severe headache. The following day, the patient was seen in the physician's office with continued severe headache and fever of 101.6 degree Fahrenheit. Diagnostic tests and treatments received were not provided. At the time of this report, the patient had not recovered. Follow-up information was received on 27 May 2008 from the original reporting physician. On 28 April 2008 the patient had received a first intramuscular right deltoid injection of MENACTRA, lot # U2604AA; a first intramuscular left deltoid injection of BOOSTRIX (previously reported as "Tdap"), manufacturer GlaxoSmithKline, Lot # AC52B06BAA also reported as AC52B020AA (previously reported as AC52B016BA); and a first intramuscular right deltoid injection of GARDASIL, manufacturer Merck, Lot # M1758U (Lot # previously reported as M1758A). On 01 May 2008, i.e. three days post-vaccination, the patient went to the emergency room as reported in the above narrative. During that emergency room visit, the patient had blood work completed that included a Complete Blood Count and a Complete Metabolic Panel, in addition to the CAT scan of the head which was negative. The results

Other Meds: "ACCUTANE"

Lab Data: 01 May 2008: CT scan of head was negative, Complete Blood Count and a Complete Metabolic Panel-results not provided. 02 May 2008: A Complete Metabolic Panel revealed blood urea nitrogen 5 mg/dL, and creatinine 0.8mg/dL. A Complete Blood Cou

History: The patient has a history of chronic constipation and no known allergies (NKA). She denied having any illnesses at vaccination time or adverse events following prior vaccination. The patient had not received any other vaccinations within four weeks of 28 April 2008.

MedDRA PT Anxiety, Chest pain, Fear of death, Neurological examination normal, Pain, Paraesthesia, Psychosomatic disease

Symptom Text: Information has been received from a physician concerning a 25 year old female who in the beginning of April 2008 was vaccinated with a dose of GARDASIL. One day post-vaccination, the patient experienced paraethesia and stinging chest pain, the symptoms continued in the course and she developed severe anxiety with fear of death. Exhaustive examinations were carried out including a neurological check-up. All findings were normal. The neurological evoked psychosomatic causes. This was contraindicated by the patient. She presented to the reporter who is specialized in homeopathic medicine. He started a therapy to divert the vaccine which temporarily led to improvement. The patient's paraesthesia and severe anxiety with fear of death and stinging chest pain persisted. Severe anxiety with fear of death, paraesthesia, and tingling chest pain were considered to be other important medical events. Other company numbers include: E200804494. No further information is available.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Breech delivery, Drug exposure during pregnancy, Foetal disorder, Pain, Premature baby, Sinusitis

Symptom Text: Information has been received through the Merck pregnancy registry from a health professional and medical records concerning a 26 year old female with sulfonamide allergy who on 06-OCT-2006 was vaccinated with a first dose of GARDASIL. On 21-DEC-2006, the patient was vaccinated with a second dose of GARDASIL. Subsequently the patient became pregnant. Last menstrual period was on 21-FEB-2007 and the estimated date of delivery was 28-NOV-2007. Unspecified medical attention was sought. The patient underwent "prenatal labs" (results not reported). On 05-NOV-2007 a male infant was born (5 pounds 7 ounces, 17 1/2 inches long) (reported as pre-mature birth at 36 weeks). The only complication was the infant was in the breech position. The pregnancy included ZITHROMAX Z-PACK on 08-MAY-2007 for a sinus infection (4 days), KEFLEX on 21-AUG-2007 for a sinus infection (TID x 5 days) and TYLENOL #3 on 04-OCT-2007 for pain. On 05-NOV-2007, the infant's total serum bilirubin test at 12 hours of life was 7.2. At 24 hours of life it was reported as 7.3. The infant was jaundice but was reported to be recovering. It was reported in the physician's notes that the infant was at a high risk for rebound hyperbilirubinemia. On 09-NOV-2007, the infant's total serum bilirubin was 13.1. Instructions were given to the infant's mom that there would be no more bili checks but to call of the infant's appetite decreased. On 14-NOV-2007 the infant had newborn screening tests done. They were reported as normal. On 19-NOV-2007, the infant's parents noticed a lump on the left side of the infant's neck. The physician noted it was not tender or red. It measured 1 to 2 cm and his range of motion was OK. The physician assessed the lump as torticollis. On 27-NOV-2007, the infant was seen by the physician and it was reported that he had an upper respiratory infection. The mother was instructed to call if the infant had an increase in cough, difficulty breathing, emesis or if he was not eating. On 29-NOV-2007, the infant experienced

MedDRA PT Erythema, Induration, Skin warm, Urticaria

Symptom Text: Information has been received from a registered nurse concerning a 11 year old female with no pertinent medical history, with an allergy to amoxicillin (+) clavulanate potassium (AUGMENTIN) who on 04-SEP-2007 was vaccinated subcutaneously into the left arm with a second dose varicella virus vaccine live (Oka/Merck) (Lot # 658422/1030U). Concomitant vaccine therapy that same day included a first dose of human papillomavirus vaccine, for the treatment of prophylaxis, administered intramuscularly into the left thigh (Lot # 658558/1061U), a first dose of hepatitis A vaccine (inactive) (HAVRIX) administered intramuscularly into the left thigh (Lot# AHAVB196AA), a fifth dose of diphtheria toxoid (+) pertussis acellular 3-component vaccine (+) tetanus toxoid (BOOSTRIX) administered intramuscularly into the right arm (Lot# AC52B024AA) and a first dose of meningococcal ACYW conj vaccine (dip toxoid) (MENACTRA) administered intramuscularly into the right thigh (Lot # 1061U). On 06-SEP-2007 the patient developed a red, hard, welt "about the size of a silver dollar", which was warm to touch. There was no illness at the time of vaccination. There were no diagnostic tests performed. The patient had no prior history of adverse events following prior vaccinations. The patient recovered on an unspecified date. No further information is expected.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Condition aggravated, Diplopia, Dizziness, Headache, Hyperventilation, Hypoaesthesia, Migraine, Syncope, Tension headache

Symptom Text: Information has been received from a health authority concerning an 18 year old female patient with a history of diplopia that occurred first at the age of four and headaches since the age of two and a half years, who on 28-SEP-2007 was vaccinated intramuscularly into the left upper arm with the second dose of GARDASIL (Lot #1518F, batch # NF27880). In the discharge summary it was reported that the patient was hospitalized from 16-DEC-2007 to 21-DEC-2007. She complained about headaches for two years which aggravated in the course of time. She experienced numbness, dizziness and increasing headache one month ago. She experienced the first syncope five days before admission. On 16-Dec-08 she experienced syncope twice. The diagnostic and clinical investigations showed no pathologies and gave no indication for physical cause of the symptoms. The diagnosis of tension headache and migraine were established. It was intended to refer the patient to the adolescent psychologist and to the electrophysiological outpatient department. On 18-Jan-2008 the diagnosis of hyperventilation syndrome was established and the physicians assumed that syncope and dizziness were caused by hyperventilation syndrome. Further information received first, (11-FEB-2008) and a second report on (05-Mar-2008) from the outpatient ophthalmological and neurological department. It was reported that the patient complained of diplopia in January 2008 which persisted. At the age of four years the patient experienced diplopia for the first time. Treatment included specialized glasses containing prisms, which improved the diplopia. Diagnostic studies performed included a second cranial magnetic resonance imaging (MRI) (first MRI not reported) showed little unspecific lesions in the occipital area of the white matter. Electroencephalography (EEG), echocardiography and ear, nose and throat (ENT) examination showed no pathologies. The patient's mother assessed the symptoms as a causal relation to the vaccine. There was no indication for epilep

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Abdominal pain, Gaze palsy, Influenza like illness, Lip discolouration, Loss of consciousness, Malaise, Nausea, Pallor, Syncope vasovagal

Symptom Text: Information has been received from a pharmacist concerning an 18 year old female who on 25-FEB-2008 was vaccinated with a dose of GARDASIL (batch # was unknown because the package was discarded after the injection) IM in the left arm. On 26-FEB-2008, the morning after vaccination during her breakfast, the patient looked white, had nausea, and had a loss of consciousness. The patient's mother reported an impressive reaction. The patient went to the emergency unit at the hospital and the diagnosis was a vagal malaise. The patient recovered. Follow-up information was received on 13-MAY-2008. The case was upgraded to serious: the reporter considered the loss of consciousness, rolling eyes and black lips as serious events (Other Important Medical Events). The three events were reported as serious and severe. She also experienced contractures in the arms and body 28 hours after injection, and abdominal pain like in flu-like syndrome. Contractures were reported as moderate and abdominal pain was reported as severe. The events of nausea and pallor were no longer mentioned. One hour after her syncope, the patient was transferred to the emergency unit where vasovagal syncope was diagnosed. The patient recovered. The case is closed. Other business partner numbers included: E2008-02391. No further information is expected.

MedDRA PT Swelling

Symptom Text: Information has been received from a registered nurse concerning an 18-year-old 200 lb. 69 in. female with a history of benign neoplasm of the pituitary gland and craniopharyngeal duct with no known drug reactions/allergies who on 19-OCT-2007 was vaccinated SC with a 0.5mL second dose of varicella virus vaccine live (Oka/Merck). Concomitant vaccinations included Gardasil and diphtheria toxoid (+) pertussis acellular vaccine (unspecified) (+) tetanus toxoid (manufacturer unspecified). Concomitant medications included replacement hormones (therapy unspecified) and numerous medications (therapy unspecified). There was no reported illness at the time of the vaccinations. On 19-OCT-2007 at 20:00 hours, (also reported as "two days later"), the reporter indicated that the patient's worse day was 20-OCT-2007. She presented to the physician on 22-OCT-2007, who indicated the area was the "size of 2 inches all around "(also reported as about 3" in diameter). The patient was treated with cold compresses, OTC Benadryl cream and ice. There were no laboratory or diagnostic studies performed. The patient's vaccination history included: 26-JUN-1989, diphtheria toxoid (+) pertussis acellular vaccine (unspecified) (+) tetanus toxoid (manufacturer unspecified), and OPV (manufacture unspecified); 25-AUG-1989, a second dose of diphtheria toxoid (+) pertussis acellular vaccine (unspecified) (+) tetanus toxoid (manufacturer unspecified), and a second dose of OPV (manufacture unspecified); 27-OCT-1989, a third dose of diphtheria toxoid (+) pertussis acellular vaccine (unspecified) (+) tetanus toxoid (manufacturer unspecified) and a third dose of OPV (manufacture unspecified); 13-JAN-1990, a fourth dose of diphtheria toxoid (+) pertussis acellular vaccine (unspecified) (+) tetanus toxoid (manufacturer unspecified); 09-FEB-1990, rubella virus vaccine (therapy unspecified); 11-AUG-1990, a first dose of measles virus vaccine live(Enders-Edmonston) (+) mumps virus vaccine live (Jeryl Lynn) (+) rubella virus vaccine live (Wistar RA 27/3), and

MedDRA PT Injection site erythema

Symptom Text: Information has been received from a nurse concerning a 12 year old female who on 22-OCT-2007 was vaccinated with a dose of varicella virus vaccine live (Oka/Merck) (lot number: 658287/1173U). Concomitant therapy that day included Gardasil, Hepatitis A vaccine (inactive) (MSD), Fluzone (manufacturer unknown) Menactra (manufacturer unknown). On 24-OCT-2007, the "patient reported redness surrounding the injection site approximately 48 hours after receiving the vaccination." No further information was given. The outcome was reported as recovered on 26-OCT-2007. There was no product quality complaint. Additional information has been requested.

MedDRA PT Caesarean section, Drug exposure during pregnancy, Failed trial of labour

Symptom Text: Information has been received through the Merck pregnancy registry from the mother of a 17 year old female who on 22-MAR-2007 was vaccinated with GARDASIL. The mother reported that her daughter was pregnant at the time of vaccination. She experienced no adverse experiences. at the time of this report, the patient was 18 weeks pregnant. Date of LMP was 30-DEC-2006, estimated delivery date is 06-OCT-2007. Follow-up phone call information from a registered nurse reported that the patient had spontaneous rupture of membranes and arrest of first stage of labor which led to a primary cesarean section at 37 weeks gestation (full term) on 01-OCT-2007. The patient delivered a healthy, normal, baby. Upon internal review arrest of first stage of labour leading to a cesarean section was considered an other important medical event. No additional information is expected.

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a health professional concerning a 17 year old female who on 06-NOV-2006 was vaccinated with the first dose of GARDASIL (lot #653735/0688F). On 03-JAN-2007, the patient was vaccinated with the second dose of GARDASIL (lot #653735/0688F). On 02-MAY-2007, the patient presented for the third dose of GARDASIL. Prior to the vaccination, a pregnancy test was performed, which was positive. The patient last menstrual period was in February 2007, with an expected delivery date of November 2007. In follow up telephone call to the doctor's office the nurse reported that the patient terminated her pregnancy. No further information was provided. Upon internal review "abortion induced" was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Breech presentation, Caesarean section, Drug exposure during pregnancy, Premature labour, Uterine contractions during pregnancy

Symptom Text: Information has been received from a physician concerning a 16 year old female who on 03-JAN-2008 was vaccinated IM into the upper arm with a third dose of GARDASIL. On 21-JAN-2008, the physician diagnosed the pregnancy at 10 weeks. Last menstrual period was on 17-NOV-2007. It was reported that the pregnancy was timely and normal. On 03-MAY-2008, the patient was admitted to the hospital by ambulance due to regular increased uterine contractions and breech presentation. An emergency cesarean section was performed due to a completely opened cervix and a prolapsed amniotic sac. A premature female was born in week 24 with a weight of 784 grams. The APGAR score was 5/6/7. The child was transferred to a pediatric hospital on 03-MAY-2008. On 07-MAY-2008 the patient was discharged in good condition. It was reported that the first and second vaccination with GARDASIL were well tolerated. Other business partner numbers include: E2008-00657. No further information is available.

MedDRA PT Anorexia, Aspartate aminotransferase increased, Asthenia, Blood cholesterol increased, Constipation, Helicobacter infection, Hepatic haemorrhage, Red blood cell sedimentation rate increased, Splenomegaly

Symptom Text: Information has been received from a physician concerning an 18 year old female with no medical history reported who in December 2007 was vaccinated with the first dose of GARDASIL. Concomitant medication was not reported. In approximately January 2008, 4 week post vaccination, the patient developed weakness, constipation and wasn't able to eat. The patient was hospitalized for 4 days. The findings showed increased liver parameters especially serum aspartate aminotransferase test (SGOT); increased cholesterol; and blood sedimentation (35/70). Further to this an abdominal sonography was performed and it showed a splenomegaly and the liver showed haemorrhagic bleeding. A gastroscopy showed an infection with helicobacter, so treatment with PANTOLOC was started. Subsequently on an unspecified date, the patient recovered from weakness, constipation and wasn't able to eat. Other business partner numbers included E2008-04606. It was also reported that the patient was vaccinated with a second dose of GARDASIL and experienced adverse events (E2008-04621). Additional information has been requested.

MedDRA PT Convulsion, Nervousness, Tongue biting

Symptom Text: Information has been received from a nurse practitioner concerning a 22 year old female who on 13-MAY-2008 was vaccinated with a first dose of GARDASIL IM. On 13-MAY-2008 the patient experienced a seizure after receiving GARDASIL. The patient was found on the floor, in the fetal position with her hands drawn up to her chest, was shaking and bit her tongue after receiving GARDASIL. The same thing occurred when the patient was at the dentist. The nurse practitioner suggested that the patient go to the emergency room (ER), but declined. The patient was fine before leaving the office and drove home. At the time of reporting the patient had recovered on an unspecified date. Upon internal review seizure is considered to be an other medical event. Additional information has been requested.

MedDRA PT Aphasia, Dyspnoea, Malaise, Paraesthesia, Sensation of heaviness, Skin warm

Symptom Text: Information has been received from a physician concerning a 16 year old female who on 09-MAY-2008 was vaccinated in the shoulder (route not reported) with the third dose of GARDASIL. On 17-MAY-2008 (eight days after the vaccination), the patient experienced severe malaise with loss of speech and paresthesia in the left lower limb. She was brought to the hospital. A doppler ultrasound was performed for suspected phlebitis. The result was negative and the patient was discharged the same day. on 18-MAY-2008, the patient experienced a second episode of malaise and paresthesia and was brought to the hospital again. The patient also experienced dyspnea. A chest CT scan was performed as pulmonary embolism was suspected. The result was normal. A head CT scan was performed and had normal results. The patient was seen by a cardiologist and a neurologist who both found nothing. All reflexes were present, however the patient had sequelae of paresthesia in the left lower limb: she felt heaviness and warmth in the leg. Complete blood work-up was performed. No diagnosis was reported further to hospitalization. No local reaction was observed. Noted was that the patient was coming back from a trip to a foreign country. The patient also experienced (vasovagal reaction 10 to 15 days after first and second injection of GARDASIL (dates not reported) (cf. linked case E2008-4653). Other business partner numbers include E2008-04583 and E2008-04653.

MedDRA PT Epilepsy, Grand mal convulsion

Symptom Text: Information has been received from a physician concerning a 16 year old female, who on 13-JUL-2007 was vaccinated with a first dose of GARDASIL (Lot# 654948/0903F; Batch# NE47410). The first dose was well tolerated. On 06-SEP-2007 the patient was vaccinated in the upper arm with a second dose of GARDASIL (Lot# 1475F; Batch# NF37120). The route was not reported. On 12-DEC-07 the patient experienced her first epileptic fit. A second fit occurred on 15-JAN-2008 and was treated with anticonvulsants, LAMOTRIGIN 250mg daily by mouth. It was reported that under this treatment no further epileptic fits appeared. During a former hospitalization (admission date not reported) an electroencephalography (EEG) showed distinct spike wave complexes and the diagnosis of epilepsy grand mal was established. On 19-FEB-2008 the patient was vaccinated with a third dose of GARDASIL (Lot# 0510U; Batch# NG20180). The patient recovered with sequelae. Upon internal review epilepsy grand mal was considered to be an other important medical event. Epileptic fit was considered as a comanifestation of epilepsy grand mal. Other business partner numbers included: E2008-03454. Additional information is not expected. The case is closed.

Other Meds: Unknown

Lab Data: electroencephalogram, Comment: distinct spike wave complexes

MedDRA PT Abasia, Abdominal pain, Asthenia, Cough, Dizziness, Dyspnoea, Fatigue, Feeling abnormal, Gait disturbance, Immediate post-injection reaction, Injection site pain, Myalgia, Pain in extremity, Paraesthesia, Presyncope, Sinus disorder

Symptom Text: Information has been received from a consumer concerning her 11 year old daughter with no medical history or drug allergy who on 22-JAN-2008 was vaccinated with the first dose of GARDASIL, 0.5ml, IM. On the same visit as GARDASIL, the patient administered MENACTRA, ADACEL, and her second dose of VARIVAX (Oka/Merck). Immediately after receiving GARDASIL, the patient experienced upper arm pain, dizziness and "did not feel right". The patient's symptoms progressed into chronic fatigue, chronic abdominal pain, allergy symptoms ("sinus issues") and roaming muscle pain. At one point the patient was unable to walk. The patient was treated with NEURONTIN, and her symptoms have since improved. However if the NEURONTIN dose was decreased or stopped the symptoms return. The patient sought medical attention by office visit. Follow-up information has been received from a registered nurse who confirmed that on 22-JAN-2008, the patient received GARDASIL (lot # 659435/1265U), VARIVAX (Oka/Merck) (lot # 658589/1274U), MENACTRA and ADACEL. Follow-up information was received on 26-JAN-2009 and 29-jan-2009 from a physician via medical records concerning a female student gymnast with "no chronic medical conditions and no known drug allergies". On 22-JAN-2008 the patient was vaccinated intramuscularly in the upper right arm with a first dose of GARDASIL (lot # 659435/1265U). On the same day, she also received a second dose of VARIVAX (Oka/Merck) (lot # 658589/1274U) subcutaneously in the upper right arm, a first dose of MENACTRA (Lot #U2418AA) intramuscularly in the upper left arm and a first dose of ADACEL (Lot #C2775AA) intramuscularly in the upper left arm. There was no illness at time of vaccination. On 13-JAN-2008 (previously reported as 22-JAN-2008) the patient experienced abdominal pain. On 22-JAN-2008 the patient experienced pain at injection site and intermittently pre-syncope. On 22-JAN-2008 the patient experienced weakness, myalgia and fatigue. On 15-MAR-2008 the patient developed intermittent difficulty breathing and troub

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Initial and follow-up information has been received from the Merck Pregnancy Registry from an 18 year old female with a penicillin allergy who in May 2007 was vaccinated with a dose of GARDASIL. Concomitant therapy included hormonal contraceptives (unspecified). Subsequently the patient became pregnant. A pregnancy test was performed to confirm the patient's pregnancy. The patient's last menstrual period was on 23-MAY-2007. The patient's estimated date of delivery was 27-FEB-2007. The patient did not continue series of GARDASIL during her pregnancy. Unspecified medical attention was sought. At the time of the initial report, the patient was nine weeks gestation. Follow-up reported that on approximately 07-AUG-2007, the patient miscarried at 11 weeks. It was reported that had no procedures done and was doing "fine." At the time of the follow-up report, the patient was pregnant again (WAES #0805USA06056). Upon internal review, miscarried at 11 weeks was considered to be an other important medical event. Additional information has been requested.

MedDRA PT Abortion spontaneous, Condition aggravated, Drug exposure during pregnancy, Haemorrhage, Herpes virus infection, Ureaplasma infection

Symptom Text: Initial and follow-up information has been received from a certified medical assistant, for the Pregnancy Registry, concerning a 25 year old female with anxiety, herpes, and no drug allergies, and with a history of pyelonephritis (reported as phylonephritis), caesearean section in 2002, chlamydia, 3 previous pregnancies, 1 full term delivery, 2 elective terminations, who on 29-NOV-2007 was vaccinated IM with a first dose of GARDASIL (lot # 659437/1266U) and on 05-FEB-2008 was vaccinated IM with a second dose of GARDASIL (lot # 659653/1448U). Concomitant therapy included EFFEXOR, KLONOPIN, and VALTREX. The patient was pregnant. The patient's last menstrual period was 06-FEB-2008 and her estimated delivery date was 13-NOV-2008. The patient saw her physician for medical attention. On 19-MAR-2008 an ultrasound was performed for viability and the results were viable, the fetal heart tones were positive. On 25-MAR-2008 an ultrasound was performed for a threatened Ab and the results were viable. On 07-APR-2008 an ultrasound was performed due to first trimester bleeding and the results nonviable and a probable spontaneous abortion. On 07-APR-2008 at 8 4/7 weeks from her last menstrual period the patient experienced a spontaneous abortion. The products of conception were not examined. It was unknown if the fetus was normal. The complications during the pregnancy was first trimester bleeding. Illnesses during the pregnancy were Herpes and Ureaplasma urealyticum. The patient's outcome was unknown. A product quality complaint was not involved. Upon internal review the spontaneous abortion was considered to be an other important medical event. Additional information is not expected.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Abdominal pain, Abortion induced, Drug exposure during pregnancy, Menstruation delayed

Symptom Text: This is a case of pregnancy follow-up reported on 14-APR-2008 by a consumer through the pregnancy registry. Information has been received from a 19 year old female who on 14-JAN-2008 was vaccinated with a first dose of GARDASIL. Concomitant therapy included hormonal contraceptives (unspecified). The patient started a spontaneous pregnancy (estimated date of conception: 23-MAR-2008) 9 days after receiving the second dose of GARDASIL (batch number not reported) on 14-MAR-2008. No adverse reaction was reported. The patient had her last menstrual period on 11-MAR-2008. To be noted that the two doses of vaccine were administered by the patient's mother who was a nurse. It was reported that due to pimple observed by her dermatologist, the dosage of the patient's contraceptive pill was reduced. on 12- or 13-APR-2008, the patient noticed a delay in her menstruation and experienced abdominal pain. In April 2008 an ultrasound was performed and revealed incipient pregnancy. The patient had a voluntary termination of pregnancy on 25-APR-2008. The reason was that vaccination was performed about one week before ovulation. The patient chose abortion because she was not 100% sure that there was no risk. In hospital, she was also advised to abort. At the time of vaccination, the patient was on contraceptives, however she had gastroenteritis shortly before, then reducing the efficiency of the pill according to the mother. The outcome was not reported. The case is closed. The reporter felt that abortion was an other medical event. Other business partners included are: E2008-03459. No further information is available.

MedDRA PT Chest pain, Dyspnoea, Pericardial effusion, Pericarditis

Symptom Text: This report was identified from a line listing obtained on request by the Company from an agency under the Freedom of Information Act. A 16 year old female with a medical history of asthma, bronchial asthma, penicillin allergy, peanut allergy and allergy to pertussis vaccine ("screamed for hours"), was vaccinated with the first dose of GARDASIL (Lot #660393/0067X) IM in the left arm on 22-MAY-08. Concomitant therapies include Ventolin, Zithromax, ibuprofen and prednisone. On 24-MAY-2008, the patient experienced chest pain and pericarditis. The patient went to the emergency room and was hospitalized. On 31-MAY-2008, the patient experienced chest pain and dyspnoea. On 01-JUN-2008, the patient experienced chest pain, pericardial effusion, and pericarditis on 03-JUN-2008. The patient went to the emergency room and was hospitalized. The diagnosis was pericarditis. The patient presented with chest pain for about 10 days and 2 days after vaccination with GARDASIL. No further information is available. The patient's chest pain and pericarditis were considered immediately life threatening. The originally reported source was not provided. The VAERS ID is 314559. A standard lot check investigation was performed. All in-process quality checks for the lot in question were satisfactory. In addition, an expanded lot check investigation was performed. The testing performed on the batch prior to release met all release specifications. The lot met the requirements of the center and was released. No further information is available.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Cold sweat, Dizziness, Loss of consciousness, Muscle rigidity, Oral contraception

Symptom Text: On 06/02/2008 at approximately 11:20 a.m. client, Dora Hugo (20 years of age)lost consciousness after she received four vaccines (HPV #1; Adult dose of Hepatitis A; Adult dose of Hepatitis B; and Meningococcal Conjugate). Client stated that she was feeling light-headed after receiving the vaccines. She was instructed to lower her head beneath the level of the heart when she leaned over. She was escorted to the floor when her feet were elevated above the level of her head. Client did not strike her body or her head to the ground. Client's body was fully extended and rigid like fashion for a couple of seconds. The episode lasted for approximately 8-10 seconds and client regained consciousness. She immediately asked for a cookie. Client was asked if she had lost consciousness and she stated "yes". Client was asked to remain on the floor for a little while. Her feet were cold and her head was clammy. Client was asked if she could sit up. She was assisted to a sitting position and then she was sat in a chair. Client stated that she does not have a history of seizures; however, she stated that it was common for her to pass-out when she is hypoglycemic. Client stated that she had not eaten anything for breakfast. Client recovered and stated that she was well. She did refuse medical attention. Client is currently taking birth control pill (Drospirenone/Ethinyl Estradiol 3mg/.02mg once daily by mouth. Also, she stated that she completed a six day regimen of Azithromycin 250 mg once daily by mouth for a throat infection. Azithromycine was last taken on 06/01/2008. Client stated that she is not currently under a doctor's care and has no medical history. Client was escorted to the lobby where she waited 20 minutes before leaving the clinic.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Acne, Chills, Condition aggravated, Fatigue, Folliculitis, Headache, Lymphadenopathy, Migraine, Pain, Petit mal epilepsy, Rash, Scab, Stomatitis, Vaccine positive rechallenge

Symptom Text: Shot 1: Headache lasting several days; Shot 2: Headache lasting several days; Shot 3: Starting with 1 "pimple" on the day of the shot, there is a gradual developing folliculitis or rash on face and upper neck and hairline. This was treated as acne initially, because it took 2 weeks for me to realize my symptoms were from the shot. I suddenly began getting very frequent migraines almost immediately after the shot and they are ongoing. I also had a petit mal seizure after 1 week. I haven't had a seizure in years; the timing is proof that it is related to the shot. I have increasingly swollen glands, after a week and a half I developed sores on my gums, chills, fatigue, and now after 2 weeks I am unable to tame this painful scabbing rash all over my face.

Other Meds: Yaz, Adderall, Ambien, Ranitidine, Diflucan

Lab Data: I was given a strep test a week after the shot, as well as being examined for allergies, and diagnosed with migraines. A return visit to my GP resulted in an antibiotic prescription for Keflex, and a steroid shot.

History: Milk allergy, Dilantin allergy, Benzoyl Peroxide allergy

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Asthenia, Hypotonia, Musculoskeletal stiffness, Pain, Unresponsive to stimuli

Symptom Text: Vaccines given at 11:20AM which consisted of HPV, MENACTRA and Tdap. MENACTRA given first then GARDASIL and finally Tdap. Child complained of pain even after first vaccine was given. After administering Tdap mother child called out to mother and went limp. Eyes were open the whole time but unresponsive. Arms tightened and clutched together. Patient came to after about 20 seconds.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Incontinence, Muscle contractions involuntary, Pain, Syncope, Unresponsive to stimuli

Symptom Text: Information has been received from a medical assistant concerning a 12 year old female with no medical history, who on 02-JUN-2008 at 11:20 was vaccinated IM in the left arm with a first dose of GARDASIL (Lot# 659962/1740U). Concomitant vaccinations included a first dose of MENACTRA (Lot# U2552AA), administered IM in the left arm, and a first dose of ADACEL (Lot# C2825AA) administered IM in the right arm. There were no illnesses at the time of vaccination. It was reported that the MENACTRA had been administered first, then GARDASIL, and then ADACEL. The child complained about pain after administration of GARDASIL. The medical assistant proceeded to administer the ADACEL and at 11:20 the child fainted upon the needle being withdrawn. The child's eyes were open and glossy, but was unresponsive. The child's arms were tightened and clutched together. The child also voided during this time. The child "came to" after about 20 seconds. No laboratory diagnostics were performed. The patient recovered on 02-JUN-2008. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Injection site induration, Injection site oedema, Injection site reaction, Injection site swelling

Symptom Text: Information has been received from a registered nurse concerning a 13 year old female with a sulfa and erythromycin allergy with no additional pertinent medical history who on 16-AUG-2007 was vaccinated SC with a 0.5 mL dose of varicella virus vaccine live (Oka/Merck). On approximately 16-AUG-2007, (within 24 hours of vaccination), the patient experienced an injection site reaction. The patient had a hard raised swelling area the size of a "half dollar" following the varicella virus vaccine live (Oka/Merck) vaccination. The overall size of the swelling was about 6 to 8 inches in diameter on the arm. It was reported the patient contacted their physician. No diagnostic laboratory tests were performed. At the time of the report the patient was recovering. A product quality complaint was not involved. Follow-up information has been received from a registered nurse concerning a 13-year-old white female with Biaxin, sulfa and erythromycin allergy who on 16-AUG-2007 was vaccinated subcutaneous with a second 0.5 mL dose of varicella virus vaccine live (Oka/Merck) (lot # 657784/0645U). There were no illnesses at the time of vaccination. Concomitant vaccines administered on 16-AUG-2007 included a first intramuscular dose of Menactra administered intramuscular in the right thigh, a first dose of Havrix administered intramuscular in the right thigh, a dose of Boostrix and a dose of Gardasil (MSD). On 20-AUG-2007, the patient experienced an "injection site reaction; hard, raised edematous area the size of a quarter with outside area 6 to 8 inches in diameter". No diagnostic labs were performed. On an unspecified date the patient recovered from all adverse events. This is one of several reports received from the same source. Additional information is not expected.

MedDRA PT Erythema, Fatigue, Groin pain, Injection site induration, Injection site reaction, Injection site swelling, Lymphadenopathy, Oedema

Symptom Text: Information has been received from a registered nurse concerning a patient who was vaccinated SC with a 0.5 mL dose of varicella virus vaccine live (Oka/Merck). Within 24 hours of the vaccination the patient experienced an injection site reaction. The patient had a hard raised swelling area the size of a "half dollar" following the varicella virus vaccine live (Oka/Merck) vaccination. The overall size of the swelling was about 6 to 8 inches in diameter on the arm. It was reported the patient contacted their physician. At the time of the report the patient was recovering. A product quality complaint was not involved. Follow-up information was received on 13-SEP-2007. Follow-up information has been received from a registered nurse concerning a 12-year-old female with no pertinent medical history or allergies who on 24-AUG-2007 was vaccinated subcutaneous with a second 0.5 mL dose of varicella virus vaccine live (Oka/Merck) (Lot # 657192/0362U). Concomitant vaccines administered on 24-AUG-2007 included a first dose of Gardasil (MSD) (Lot # 6469U), sixth dose of diphtheria toxoid (+) pertussis acellular vaccine (unspecified) (+) tetanus toxoid (GlaxoSmithKline) (Lot # AC52B02AA), first dose of Menactra (Sanofi Pasteur) (Lot # U2391BA), and first dose of hepatitis A virus vaccine (unspecified) GlaxoSmithKline) (lot # AHAVB186AA). On 24-AUG-2007, the patient developed severe increased left thigh left groin pain; 2 inch edematous; reddened area noted on left thigh; lymph node in groin area enlarged and fatigue. The patient returned to the clinic for medical attention on 27-AUG-2007 and had a mean platelet volume of 10.0 fluid (normal range 0.0-9.9 fl). Subsequently, the patient recovered from all adverse experiences on 29-AUG-2007. This one of several reports received from the same source. Additional information is not expected.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Condition aggravated, Convulsion, Vaccine positive rechallenge

Symptom Text: Information has been received from a certified medical assistant concerning a 11 year old female with seizure activity, temporal lobe lesion (is taking topiramate), no history of drug reactions/allergies, and a history of headache and migraine who on 18-MAR-2008 was vaccinated with a first dose of GARDASIL (lot # 659962/1740U) 0.5 ml IM In the left deltoid. Concomitant therapy also given on 18-MAR-2008 included MENACTRA, diphtheria toxoid (+) pertussis acellular vaccine (unspecified) (+) tetanus toxoid. Other concomitant therapy included TOPAMAX. On 19-MAR-2008, the day after the first dose of GARDASIL, the patient experienced seizure activity at school, but it was not reported to the doctor's office at that time. On 19-MAY-2008, the patient was vaccinated with a second dose of GARDASIL (lot # 659962/1740U) 0.5 ml IM in the left deltoid. That evening, the patient had a seizure. Medical attention was sought in the office. Spectrascopy test result was normal; unknown when the test was performed. There was no fever post vaccination. Subsequently, the patient recovered from the seizure. Upon internal review, the seizures were considered to be Other Important Medical Events. Additional information has been requested.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Dizziness, Headache, Herpes zoster, Malaise, Nerve injury, Pain, Rash

Symptom Text: Information has been received from the health authority agency (ref. # PEI2008006875) concerning a 14 year old female who on an unspecified date was vaccinated with a first dose of GARDASIL (lot # not reported). On an unspecified date, the patient was vaccinated with a second dose of GARDASIL (lot # not reported). Subsequently, after the first vaccination with GARDASIL, the patient felt unwell and experienced dizziness, headache, and body pain. The outcome was not reported. These events were reported as non-serious. After the second dose of GARDASIL, on an unknown date, the patient developed severe skin rash, facial herpes zoster (twice), body pain and severe "nerve impairment in the knee" as reported by the patient's mother. She was hospitalized for several weeks. At the time of reporting, the patient had not yet recovered. Treatment with antiepileptic garbapentin was started on an unknown date. Other business partner numbers included: E2008-04768 and E2008-04680. No further information is available.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Blister, Erythema, Paraesthesia, Pruritus, Rash

Symptom Text: Information has been received from a physician concerning a 22 year old female, with no relevant history reported, who on 08-MAY-2007 was vaccinated with the first dose of GARDASIL, lot #, route and site not reported. Ten days post vaccination (18-MAY-2007), the patient developed relapsing genital exanthema with blisters, redness and severe itching. Additionally she complained about underbelly paresthesia. The second dose of GARDASIL, was given 02-JUL-2007, and the third dose of GARDASIL was given on 03-NOV-2007. The patient had been examined by several gynecologists and dermatologists who obtained diagnostic testing. Allergological tests (not otherwise specified) were carried out with no pathological findings. Relevant laboratory test data revealed the following: Herpes Simplex Virus Type 1/2 IgM was equal to 1.05 (slightly positive); serum immunoglobulin G (IgG) was negative; c-reactive protein was 39 mg/dl; varicella zoster immunoglobulin G antibody test (VZV IgG) was increased; and a vulvular biopsy on an unspecified date showed non-specific signs of inflammation. No cause was found for the patients experiences. Treatment with (acyclovir) was started on an unknown date with no improvement of symptoms. At the time of reporting the patient has not yet recovered. The reporting physician determined the genital rash and paresthesia to be an other important medical event and assessed the relation to GARDASIL as unlikely, he pointed out, just the temporal relation. The file has been closed. Other business partner numbers include E20080-04739. No further information is available.

Other Meds: Unknown

Lab Data: vulvar biopsy, non-specific signs of inflammation; allergy test, no pathological findings; diagnostic laboratory test, VZV IgG Ab; HSV type 1 and/or 2 identification PCR, 1.05, slightly positive; serum C-reactive protein, 39 mg/l; serum imm

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Abasia, Asthenia, Condition aggravated, Dizziness, General physical health deterioration, Headache, Loss of consciousness, Post lumbar puncture syndrome, Speech disorder

Symptom Text: Information has been received from an agency (Ref. #PEI2008006874) via a letter from the mother of a 15 year old female patient with a history of Epstein-Barr Virus (EBV) infection (2005) and reduced general condition who on 21-AUG-2007 was vaccinated with the first dose of GARDASIL. On 14-NOV-2007, the patient was vaccinated with the second dose of GARDASIL. Concomitant medication was not reported. It was worth noting that the patient already had a reduced general condition since the EBV infection and often felt asthenic and dizzy. In approximately November 2007 (exact date was not reported), the patient was treated for borreliosis (although Borrelia was not detected) with rifampicin after the second vaccination. Since the second vaccination the patient often experienced a loss of consciousness and sudden speech disorder attacks and she was admitted to the hospital (dates not reported). All examinations performed (EEG, MRI and CSF) were normal. Symptoms did not improve and the patient was again hospitalized in December 2007 with the same results. From December 2007 until mid February 2008, the patient's condition was good. On 19-FEB-2008, the patient developed again attacks of dizziness and she felt asthenic. She also experienced headache which was probably caused by the lumbar puncture. On 21-FEB-2008, the patient was not able to walk, although she had no sensory disorder nor paresis and was again hospitalized. A neurological examination was performed which was normal and psychosomatic disorder was suspected. The causality and outcome of the events were not reported. Other business partner numbers included: E2008-04673. Additional information is not expected.

MedDRA PT Condition aggravated, Multiple sclerosis relapse, Paraesthesia oral

Symptom Text: Information has been received from a physician concerning a 22 year old female with multiple sclerosis (since 2001 following a hepatitis B vaccine) (manufacturer unknown) who in April 2008, was vaccinated with a first dose of GARDASIL. Three to four weeks after the vaccination with GARDASIL, the patient experienced a new flare of multiple sclerosis associated with circumoral paraesthesia and a left upper limb paresthesia. She was given 80 mg of PREDNISOLON and 15 days later she recovered from paraesthesia except mild circumoral paresthesia. It was also reported that in 2001, a lumbar puncture revealed an inflammatory CSF, an magnetic resonance imaging (MRI) showed hypersignals and evoked potentials that were normal. From 2001 to 2004, she was prescribed AVONEX but it was not well tolerated, then from June 2006 to March 2007 she was prescribed COPAXONE but she had allergic problems. In 2006 she had 4 flares of sensitivity to corticotherapy. In the beginning of 2007 she was prescribed IMUREL. A new flare of multiple sclerosis without any stimulus in 2007 was treated with corticosteroids. Upon internal review, multiple sclerosis relapse was considered an other important medical event. No further information is available.

Seriousness: PERMANENT DISABILITY, SERIOUS

MedDRA PT Hypoaesthesia, Inappropriate schedule of drug administration, Multiple sclerosis, Optic neuritis

Symptom Text: Information has been received from a physician concerning a 29 year old female with no pertinent medical history or drug reactions/allergies who in July 2007, was vaccinated with a first dose of GARDASIL. There was no concomitant medication. In September and December 2007 the patient was vaccinated with a second and third dose of GARDASIL respectively. The physician reported that on an unspecified date the patient was diagnosed with multiple sclerosis and it may be related to GARDASIL. The patient has had optic neuritis and numbness on half of her body. At the time of reporting the patient had not recovered. No additional information has been reported by the physician. The physician felt that multiple sclerosis was considered to be disabling. Additional information has been requested.

MedDRA PT Asthenia, Cataplexy, Dizziness, Dysarthria, Dyspnoea, Fatigue, Hallucination, Hypersomnia, Loss of control of legs, Movement disorder, Narcolepsy, Sleep disorder, Syncope, Tremor

Symptom Text: Information has been received from a physician concerning an 11 year old female with penicillin allergy and no pertinent medical history who in January 2008, was vaccinated with a third dose of GARDASIL. There was no concomitant medication. In January 2008, the patient developed cataplexy 1 to 3 days after vaccination. About 2 months later in March 2008, the patient developed narcolepsy with hallucinations and a limb movement disorder. The patient was seen in the physician's office and was treated with an unknown stimulant. On unspecified dates the patient had a computed axial tomography, poly sleep latency tests and an magnetic resonance imaging (MRI) was ordered. At the time of reporting the patient had not recovered. The physician considered the patient's cataplexy and narcolepsy with hallucinations and limb movement disorder were considered to be disabling and other medical events. Additional information has been requested. 8/13/2008 Outpatient records received from 3/2008 to 6/2008 with fnal dx: narcolepsy. Pt initially developed sx of dizziness, fatigue, decreased energy, interupted sleep and episodes offalling asleep/losing bodily control but not fully passing out following 3rd HPV shot in 1/2008. Initially thought to be vasodepressive sx tx'd with increased salt and fluids without improvement. Seen once in ER in 2/2008 for episode of shuddering, weakness, excessive sleepines/syncope without dx. Seen by neuro with w/u WNL. Has had episodes of slurred speech and difficulty catching breath. Picture more c/w cataplexy/narcolepsy.

Other Meds: None

Seriousness: ER VISIT, EXTENDED HOSPITAL STAY, HOSPITALIZED, PERMANENT DISABILITY, SERIOUS

MedDRA PT Dyskinesia, Gait disturbance, Headache, Motor dysfunction, Paraesthesia, Paralysis, Quadriparesis, Sensory loss

Symptom Text: Information has been received from a nurse practitioner concerning a female (age not reported) who on an unspecified date was vaccinated with her first and only dose of GARDASIL 0.5 mL. There was no concomitant medication. Subsequently "one week after vaccination" the patient developed total body paralysis and was hospitalized and all the lab tests which included a complete blood cell count came back negative. Several days after the hospitalization, the patient got better and was released. The reporter considered that total body paralysis to be disabling. Additional information has been requested. 6/25/2008 MR received for ER visit 3/26/2008 with DX: Quadriparesis-resolved. Pt developed a h/a, took a nap and awoke with inability to move all 4 extremities. Parent reports that this is the 3rd episode of these sx. During triage, unable to move 4 extremities. 1 hr later continued to have some motor and sensory deficits. Tingling reported in legs. Able to move toes after several hours and ambulating with slow unsteady gait and jerky movements in several more. D/C with resolution of sx in ~6 hrs from arrival.

Other Meds: None

Lab Data: diagnostic laboratory, negative; complete blood cell, negative. Labs and Diagnostics: CT Brain scan unremarkable. MRI cervical spine w/ straightening of cervical lordosis and incidental adenoidal hypertrophy. CXR WNL. CBC, UA and Chem WNL.

History: Unknown. PMH: asthma.

MedDRA PT Dizziness, Dysphonia, Fall, Headache, Heart rate decreased, Loss of consciousness, Malaise, Musculoskeletal stiffness

Symptom Text: ADMINISTERED AN HPV AND MENINGOCOCCUS AS FIRST TIME DOSES TO 21 YEAR OLD FEMALE. ADVISED CLIENT THAT IF SHE DID NOT EAT LUNCH SHE MAY FAINT AS IT IS A SIDE EFFECT OF BOTH VACCINES. SHE STATED SHE DID NOT EAT LUNCH. ADVISED CLIENT TO WAIT 15 MINUTES IN CASE SHE DID FEEL FAINT. AFTER RECEIVING THE IMMUNIZATIONS THE CLIENT STAYED IN THE CHAIR AND DID NOT GET UP. AFTER 5 MINUTES TELLS NURSE SHE IS FEELING BAD. I TELL HER IF SHE IS FEELING BAD TO STAY IN THE CHAIR. A FEW SECONDS AFTER STATING THIS SHE STARTS TO MOVE AND BECAME STRAIGHT AS A BOARD AND STARTED TO TURN FACE DOWN TOWARD THE CHAIR THEN FELL OFF THE CHAIR TO THE FLOOR LANDING ON HER LEFT SIDE OF HER BODY. SHE MADE A GROWLING SOUND AS SHE WAS MOVING. ON THE FLOOR SHE DID NOT MOVE AND I WENT TO SHAKE HER TO SEE IF SHE WAS BREATHING. I TOLD THE CLERK TO CALL 911 AND WAS CALLING HER NAME AND SHE STARTED TO MOVE AND TOLD ME "I AM ALL RIGHT". I ASKED HER AGAIN TO BE SURE AND SHE STARTED TO SIT UP AND SAID AGAIN "I AM ALL RIGHT". I TOOK HER PULSE AND IT WAS SLOW AND SLIGHTLY IRREGULAR. I ASKED HER IF SHE EVER HAD HER HEART CHECKED AND SHE SAID SHE DID WHEN SHE WAS YOUNGER BUT THEY DID NOT FIND ANYTHING. I ASKED HER IF SHE EVER HAD THIS HAPPEN BEFORE AND SHE TOLD ME WHEN SHE WAS LITTLE IT HAPPENED BUT THE LAST TWO TIMES SHE WAS IMMUNIZED NOTHING HAPPENED. SHE TOLD ME THEY USUALLY GAVE HER IMMUNIZATIONS WHEN SHE WAS LYING DOWN. SHE TOLD ME RECENTLY SHE WAS HAVING BLOOD DRAWN AND SHE PASSED OUT. I ASKED HER IF SHE SAW LIGHTS OR ANYTHING AND SHE TOLD ME SHE SAW A CARTOON LIKE THE ONE SHE WAS WATCHING IN THE WAITING ROOM BEFORE SHE WAS IMMUNIZED THEN EVERYTHING WENT BLACK THEN SHE SAW MY FACE. SHE SAID SHE DID NOT REMEMBER WHAT HAD HAPPENED. SHE SAID THAT HER LEFT UPPER FOREHEAD HURT BUT THAT WAS ALL. NOTHING ELSE HURT. SHE WAS ABLE TO SIT UP ON HER OWN AND FINALLY WAS ABLE TO STAND AND GET INTO THE CHAIR. THE CLIENT WAS VERY LARGE AND IT WAS NOT POSSIBLE TO KEEP HER FROM FALLING OUT OF THE CHAIR TO THE FLOOR BECAUSE OF HER SIZE. I GAVE HER A WET TOWEL AND SHE RUBBED I

MedDRA PT Contraception, Dizziness, Paraesthesia, Stress, Vitreous floaters

Symptom Text: One month after 2nd vaccine in Gardasil series (in Dec. 2007), began having tingling and numbness on and off in the hands, feet, arms, and legs, including right arm (site of injection). After third vaccine (in April 2008), immediately noticed an abundance of eye "floaters," including a dark, shadowy floater. Tingling has continued intermittently through the present date (June 5, 2008). I have seen numerous doctors, a neurologist, an ophthalmologist, and counselors to deal with the stress of the ordeal. I have received clean tests for Lyme, B12 deficiency, rheumatoid arthritis, high cholesterol/diabetes, anti-nuclear antibodies, TSH RPR, and segmentation westergreen. I have also had an EMG, a full battery evoked potentials test, and an MRI. All test have come back normal, but symptoms are persisting. 6/6/08 Patient w/numbness & tingling of hands/feet. BCP changed. 6/20/08 Reviewed PCP medical records of 1/9/08-5/8/08 which included neurology consult. FINAL DX: sporadic paresthesias Records reveal patient experienced hand tingling & numbness for 2-3 days, more on the right, in early January. Developed dizzy spells w/lightheadedness intermittently. Referred for second neuro opinion.

Other Meds: Sprintec

Lab Data: Blood tests (all came back clean/no detection of): Lyme, B12, rheumatoid arthritis, diabetes, anti-nuclear antibodies, TSH RPR, Segmentation Westergreen. Also had an EMG, full battery evoked potentials, and an MRI. All results normal. L

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Eye movement disorder, Fall, Head injury, Heart rate normal, Hypotonia, Injection site pain, Loss of consciousness, Respiratory rate

Symptom Text: Patient came to pharmacy to recieve the third in a series of Gardasil Shots. She confirmed she had no ill responses from her first two shots (I had asked her as I had not given the first two shots). I administered the vaccination, applied a bandaid to the injection site, and massaged the site briefly. We stood there for a few minutes, so I could observe the patient, talking about her work. After a few minutes she started to rub her arm, I asked her if it was bothering her more then the first two shots, and she said yes, that it was stinging a little more then the first two. Her eyes began to flutter so I grabbed her by her wrists. She begain to buckle at the knees and was falling towards the counter. I caught her head with my forearms, then she went completly limp. She then went backwards as she landed in a sitting position. i tried to lay her out softly but lost my grip, falling the rest of the way and hitting the back of her head on the floor. We raised her feet and called 911. She had normal breaths and pulse until emergancy help arrived a few minutes later. She came to and was coherent shortly after she had passed out.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Asthenia, Blindness transient, Bradycardia, Dizziness, Fatigue, Headache, Migraine, Orthostatic hypotension, Presyncope, Pupils unequal, Syncope vasovagal

Symptom Text: 05/29/08 - 8 pm - notice different size pupils, headache. 5/30/08 - 1 pm - dizziness, 30 second loss of vision, headache, uneven pupils. 6/4 uneven pupils, headache. 8/26/08 Reviewed ER medical records of 6/05/2008. FINAL DX: probable migraine HA Records reveal patient experienced HA, transient visual disturbance & intermittent unequal pupils. Referred to neuro & neuro-opthalmologist & those reports are included. Neuro exam was WNL. Neuro-Ophtho exam of 6/19/08 revealed significant orthostatic blood pressure changes with normal neuro/eye exam. Recommended additional cardiology w/u to include transesophageal echocardiogram, tilt table test & catecholamine blood test. 6/6/08 Reviewed PCP medical records. FINAL DX: vasovagal syncope Records reveal patient experienced good health on day of vax. Only complaint re BCP which caused nausea. Seen in ER on 5/30 w/episode of bilateral loss of vision that day. Had seen chiropractor & also exercised earlier that day. While stretching her neck during exercise, felt lightheaded & weak then lost vision in both eyes & felt faint. Symptoms resolved spontaneously in approx 20 seconds. Seen by PCP & sent to ER. Neuro consult done. Continued to feel lightheaded while in ER otherwise asymptomatic. Placed in cervical collar. F/U visit to PCP on 6/2 for continued vision difficulties & dizziness. Optho eye examination WNL. Eye exam on 6/2 revealed PERL. Concured w/ER diagnosis 6/13/08 Reviewed ER medical records of 5/30/2008. FINAL DX: near syncope Records reveal patient had seen chiropractor 5/30 for neck manipulation then went to gym for work out. While stretching neck laterally, had lightheadedness & felt weak then gradually lost vision in both eyes & became very light headed & felt like she was going to pass out. In ER, placed in cervical collar & felt better. 7/11/08 Reviewed opthamologist & neurologist medical records of 6/2-6/19/2008. FINAL DX: transient vision loss Records reveal patient experienced sudden onset dizziness & loss of visio

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Blindness, Convulsion, Fatigue, Headache, Pupils unequal, Tunnel vision

Symptom Text: Information has been received from a health professional concerning a 22 year old female patient with a history of dysmenorrhoea and metrorrhagia who on approximately 19-MAY-2008, past week or two, was vaccinated IM with a 0.5ml dose of GARDASIL. Concomitant therapy included hormonal contraceptives (unspecified) and MICROGESTIN FE. On approximately 21-MAY-2008, 2 days after the vaccination, the patient experienced unequal pupils. She saw a chiropracter. The next day she had total blindness for 30 seconds and darkness and tunneling of vision. The patient was taken to the emergency room the weekend of 30-MAY-2008 to 01-JUN-2008. The following day she had a headache with fatigue. The patient's mother questions whether this was a seizure from GARDASIL. On 02-JUN-2008, the patient saw an opthamologist. At the time of this report, the patient's outcome was unknown. Upon internal review, total blindness and seizure were considered to be an other important medical event. Additional information has been requested.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Autoimmune disorder, Chemotherapy, Condition aggravated, Wegeners granulomatosis

Symptom Text: Information has been received from a physician concerning an 18 year old female with an unspecified autoimmune disorder (onset 4 years ago) who in January 2008, was vaccinated with the third dose of GARDASIL. In February 2008, the patient developed the autoimmune disease, Wegener's granulomatosis, and was hospitalized for an unknown period of time. The patient was treated with two unspecified chemotherapies. At the time of this report, the patient was not recovered. Neither the reporter nor the treating physicians of the hospital suspect any correlation between GARDASIL and the disease. No further information is available. Other business partner numbers include E2008-04932.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a registered nurse through a Merck Pregnancy Registry concerning a 22 year old female with a drug reaction to erythromycin (vomiting) with no pertinent medical history. The patient had done a few home pregnancy tests prior to the administration of the GARDASIL. On 09-APR-2007 prior to vaccination, the patient had a pregnancy test in the physician's office and was vaccinated intramuscularly, into the left arm with a 0.5 mL dose of GARDASIL, (Lot # 657617/0384U). There was no concomitant medication. It was reported that the patient was pregnant after receiving the vaccine. Follow up phone call information obtained from a registered nurse reported that the patient had an early termination of pregnancy. No complications were reported, and the patient subsequently finished the GARDASIL series. Upon internal review, early termination of pregnancy was considered to be an other important medical event. No further information is expected.

Other Meds: Unknown

MedDRA PT Convulsion

Symptom Text: Information has been received from a physician who reported to the company representative that she heard multiple patients who received GARDASIL and experienced seizure after the vaccination. In a follow up telephone call to the physician she reported that "there was a little problem". "This was all from rumors from her patients who heard kids at their school were receiving GARDASIL and having seizures." The physician reported that not all the kids at the high school who had the seizures even received the GARDASIL vaccination. The physician said "again a rumor going around." She mentioned that she called the high school principal requesting further information about the events but she had not got any more information about patients and the events. She reported that she had no problems with GARDASIL. The physician would fax the local newspaper that talked about this incidence. No further information was available at the time of this report. The outcome was unknown. Upon internal review seizure was determined to be an other important medical event. Attempts are being made to obtain additional identifying information to distinguish the individual patients mentioned in this report. Additional information will be provided if available. Additional information has been requested.

MedDRA PT Liver function test abnormal, Pyrexia

Symptom Text: This case was reported by a physician and described the occurrence of elevated liver function test in a 15-year-old female subject who was vaccinated with HAVRIX (GlaxoSmithKline). Concurrent vaccination included GARDASIL given on 27 May 2008. There were no concurrent medications. On 27 May 2008 at 16:45 the subject received 2nd dose of HAVRIX in the left arm. On 30 May 2008, 3 days after vaccination with HAVRIX, the subject developed a fever of 102 degrees. On 02 June 2008, the subject's fever had not resolved and the reporting physician sent the subject for blood work. Her CBC was 6300, epstein barr test was negative, all chemistries were normal with the exception of the following elevated liver function tests: GGT: 104, AST: 428, ALT: 352, LD: 786, bilirubin was 0.6 and her alkaline phosphatase was 92. This case was assessed as medically serious by GSK. At the time of reporting the subject fever was resolved (June 2008) and the outcome of the other events was unspecified. The physician considered the events were possibly related to vaccination with HAVRIX.

Other Meds: No concurrent medication

Lab Data: Alanine aminotransferase, 02Jun2008, 352; Alkaline phosphatase, 02Jun2008, 92; Aspartate aminotransferase, 02Jun2008, 428; Bilirubin, 02Jun2008, 0.6; Body temperature, 30May2008, 102; CBC, 02Jun2008, 6300; Epstein-Barr virus test, 02Jun2008

History: It was reported that the subject was sick in January 2008, but her liver function tests were normal. The subject has no history of adverse events following previous vaccinations.

MedDRA PT Drug exposure during pregnancy

Symptom Text: Information has been received through the Merck pregnancy registry from a nurse practitioner concerning a 20 weeks pregnant 14-year-old female whose last menstrual period was 19-Jun-2007 (she had a full period throughout) with a concurrent condition of asthma and has no known allergies. On 10-JUL-2007 she was vaccinated at an unknown site with a subcutaneous injection of 0.5 milliliters varicella virus vaccine live (Oka/Merck). Suspected vaccinations included Gardasil (MDS), (duration and dose not reported), hepatitis A virus vaccine inactivated (manufactured unspecified), (duration and dose not reported) and Menactra. On 14-JUL-2007, the patient found out she was 20 weeks pregnant. Medical attention was sought. No product quality complaint was involved. Additional information has been requested.

MedDRA PT Mass, Skin warm

Symptom Text: Information has been received from a consumer concerning her 15 year old female daughter, with no pertinent medical history, drug reaction or allergies, who on 18-JUN-2007 was vaccinated subcutaneously into the right arm with 0.5 mL varicella virus vaccine live (Oka/Merck). Concomitant therapy that same day included meningococcal vaccine (unspecified) and Gardasil. The following day, on 19-JUN-2007, the patient developed a large knot, the size of a baseball, on right arm. The right arm was the arm the patient received both varicella virus vaccine live (Oka/Merck) and meningococcal vaccine (unspecified). It was very hot to touch and looked like a huge red mound, which ran in a oblong pattern down her arm to two inches from her elbow. She received the human papillomavirus vaccine in her left arm. At the time of reporting the patient was considered recovered as of 25 JUN 2007. Unspecified medical attention was sought. There were no diagnostic studies performed. There was no product quality complaint. Additional information is not expected.

MedDRA PT Injection site erythema, Injection site oedema, Injection site pain, Injection site swelling

Symptom Text: Information has been received from a registered nurse concerning a 13 year old white female with phenylketonuria who on 29 JUN 2007 at 9:00 was vaccinated subcutaneously into the left arm with a second dose of varicella virus vaccine live (Oka/Merck) (Lot # 657405/0531U). Concomitant therapy that same day included an intramuscular first dose vaccination of hepatitis A vaccine (inactive) (Lot # "0282F") and intramuscular first dose vaccination of human papillomavirus vaccine (GARDASIL), (Lot # 655618/0186U). There was no illness at the time of vaccination. On 30-JUN-2007 the patient developed a three inch area of redness, swelling and pain at the injection site of "Varivax" (left arm) the patient's guardian elected to have the patient seen in the emergency room. On 02 JUL 2007 the site was observed to be only slightly red and tender to touch, with slight edema. No treatment was given. The patient was recovered on 02 JUL 2007. There were no lab diagnostic studies performed. There were no known adverse events following prior vaccinations. There was no product quality complaint. This is one of several reports received from the same source. Additional information has been requested.

MedDRA PT Injection site erythema, Injection site induration, Injection site rash, Injection site warmth, Pain, Pyrexia

Symptom Text: Information has been received from a nurse practitioner concerning an 11 year old female who on 16-JUL-2007 was vaccinated subcutaneously with a second single dose of varicella virus vaccine live (Oka/Merck) (Lot# 657620/0536U). Additional suspect vaccination included Gardasil vaccine (MSD). Other concomitant therapy included Menactra and diphtheria toxoid (+) pertussis acellular vaccine (unspecified) (+) tetanus toxoid (manufacturer unknown). Within 12 hours of being vaccinated the patient developed a severe injection site reaction that continued to become "more severe." The injection site rash was about 7 inches in diameter and wrapped around the patients arm, was warm, hard to touch in the middle and was less red on the outside of the rash. On a follow-up visit to the doctor the next day (on 17-JUL-2007) the patient had a low grade fever and a general feeling of achiness. Nurse practitioner was concerned that the patient might have cellulitis. On the third day following vaccination the patient returned for another follow up visit, the rash had stabilized. It was noted that the nurse practitioner treated the patient with Benadryl. Lab studies for a white blood cell count were normal. No other information was provided. There was no product quality complaint involved. Additional information has been requested. This is one of several reports from the same source.

MedDRA PT Herpes zoster, Injection site erythema, Injection site swelling

Symptom Text: Follow up information has been received from a health professional concerning an 18 year old black female student, with no medical history on drug allergies, who on 05-JUL-2007 was vaccinated with her second dose of varicella virus vaccine live (Oka/Merck). Concomitant vaccinations administered on that same day included the first dose of hepatitis A vaccine virus (inactive) (MSD) (Lot# 656966/0018U) in the right arm, the first dose of GARDASIL vaccine (yeast) (MSD) (Lot# 657868/0523U) in the right thigh, diphtheria toxoid (+) pertussis acellular vaccine (unspecified) (+) tetanus toxoid (AC52B005CA) in the right arm and the first dose of meningococcal ACYW conj vaccine (dip toxoid) (MENACTRA) (Lot# U2327AA) in the left thigh. There was no illness at the time of vaccination. On that same day, the patient developed a local reaction with 4.5 x 3.5 cm injection site swelling and 4.5 x 3.5 cm redness (left arm). It was also noted that the patient also developed zoster after vaccine earlier in life. It was unknown whether medical attention was sought. Subsequently, the patient recovered. Additional information has been requested.

MedDRA PT Headache, Pain in extremity, Pyrexia, Syncope, Visual acuity reduced

Symptom Text: Information has been received from a physician concerning a 14 year old female, who on 27-JUL-2007 was vaccinated with a first dose of GARDASIL (Lot# 658100/0525U) and a dose of VARIVAX. Concomitant vaccination included diphtheria toxoid (+) pertussis acellular vaccine (unspecified) (+) tetanus toxoid. On 28-JUL-2007 the patient called the physician's office to report that she experienced a fever of 101F, a sore arm (unspecified where), and a headache. The patient was treated with over the counter TYLENOL. On 26-SEP-2007 the patient was vaccinated with a second doe of GARDASIL (Lot # 0530U). There was no concomitant therapy. On 17-OCT-2007 the patient went to the emergency room. The patient's "eyes were getting dark" and her vision was fading. The patient experienced syncope. An EKG was performed with normal results except for borderline prolonged QT. The patient was referred to see a pediatric cardiologist on 15-NOV-2007. Another EKG was performed and was normal, and the QTC was also normal. The patient had been monitored. On 20-FEB-2008 the patient was vaccinated with her third dose of GARDASIL (Lot# 659962/1740U). There were no adverse reactions after the third dose. At the time of the report, the outcome of the patient was unknown. Upon internal review "eyes getting dark" vision fading was considered to be an other important medical event. Additional information has been requested.

Other Meds:

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy, Inappropriate schedule of drug administration

Symptom Text: Information has been received through the Merck pregnancy registry concerning a 29 year old female with no pertinent medical history or no drug reactions/allergies who on approximately 20-APR-2007 was vaccinated with a first dose of GARDASIL (lot # unknown) injection. On 20-JUN-2007 the patient was vaccinated with a second dose of GARDASIL. There was no concomitant medication used. The consumer reported that she had a positive pregnancy test on 10-AUG-2007 (home pregnancy test and blood test). Her last menstrual period date was 17-JUN-2007, and the estimated due date was 23-MAR-2008. At the time of the report, the patient reported she had not had any reactions. Initial and follow up information has been received from the nurse practitioner who indicated that the patient did not carry the pregnancy to term. She indicated that the patient "had significant problems and miscarried the pregnancy." No other records were available. Upon internal review, the patient's miscarriage was considered to be an other important medical event. Additional information has been requested.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Initial and follow-up information has been received from a registered nurse for the manufacturing registry of GARDASIL concerning a 20 year old female with bipolar disorder, depression, anxiety, polycystic ovaries and thalassaemia minor who on 28-FEB-2007 was vaccinated with first dose of GARDASIL (Lot #656049/0187U, expiration date 29-SEP-2009). There was no concomitant medication (client told the nurse she was not taking any medications at the time). Prior to vaccination on 28-FEB-2007, urine pregnancy test was performed and was negative. Client presented to the office of 23-MAR-2007 and urine pregnancy test performed was positive for pregnancy. The patient's last menstrual period was 28-JAN-2007. Estimated date of delivery was 04-Nov-2007. Follow-up information indicated that the patient had a miscarriage at approximately 9 weeks gestation on an unspecified date. It was reported that the pregnancy was a spontaneous triplet pregnancy. There were three empty gestational sacs. No fetal heart tones were ever detected and there was no further progression of development. It was reported that the gestational sac sizes were about three to four weeks of development. At the time of the report the patient was pregnant again (WAES# 0806USA00961). The outcome of the patient was unknown. Upon internal review the miscarriage was considered to be an other important medical event. This is one of two reports from the same source. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Caesarean section, Drug exposure during pregnancy, Labour complication

Symptom Text: Initial and follow-up information has been received through the Merck pregnancy registry from a consumer concerning her 19 year old daughter with no pertinent medical history who on approximately 15-OCT-2006 was vaccinated with a first dose of GARDASIL. There were no concomitant medications. On 18-DEC-2006, the patient was vaccinated with a second dose of GARDASIL. On 30-DEC-2006, the patient found out she was pregnant. Unspecified medical attention was sought. In September 2007, the patient gave birth to a healthy female via primary cesarean section because she "just couldn't push that baby out." The baby weighed 9 pounds and 1 ounce. At the time of the report, both mother and baby were well without any problems. Upon internal review, "just couldn't push that baby out" was considered to be an other important medical event. Additional information is not expected.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Abnormal behaviour, Amenorrhoea, Breast swelling, Bronchospasm, Dysphonia, Dyspnoea, Fluid retention, Injection site pain, Injection site swelling, Laryngeal oedema, Laryngospasm, Myocardial ischaemia, Pyrexia, Sinusitis, Stridor, Thyroiditis, Tracheal oedema

Symptom Text: Information has been received from an adult female dermatologist (probably older than 26 years old) with no allergies and no relevant medical history who on an unspecified date was vaccinated with a first dose of GARDASIL and on 25-MAR-2008 was vaccinated with a second dose of GARDASIL (batch number, route and site of administration not reported). She reported that on the day of vaccination (25-MAR-2008) she developed severe injection site pain and slight injection site swelling. She could not lie upon the spot. The pain lasted two weeks. One day after vaccination on 26-MAR-2008 she developed high fever and was almost hallucinating. After a few days, when she felt slightly better, her temperature was 39.6 centigrade. Since one day after vaccination she seemed to develop bronchospasm: shortness of breath and hoarseness developed, which increased in the days after that. She visited the General Practitioner (GP) after three days because she suspected upper respiratory tract infection, pneumonia or bronchitis. The GP said that her lungs were clean, but he prescribed ATROVENT. She visited a lung specialist who diagnosed that she did not have asthma but he did prescribed SYMBICORT and nasal spray. She received antibiotics as well as telephonic consultation with the GP. A few weeks after vaccination she developed sinusitis, which caused aggravation of the shortness of breath and hoarseness. She received a second time antibiotics and dexamethasone for ten days and a second nasal spray. She left to a foreign country on 24-APR-2008 and developed shortness of breath during the night, for which she was taken to the emergency room (ER) on 25-APR-2008. Her trachea was almost completely closed. Her diagnosis was stridor, tracheal oedema. An electrocardiogram (ECG) showed cardiac ischaemia. She received SOLUMEDROL 125 milligram, epinephrine and BENADRYL. She was monitor guarded in the hospital for five days (in the coronary care unit). On 30-APR-2008 she developed again laryngeal oedema and laryngeal spasms. The Ear Nose Throat

MedDRA PT Drug exposure during pregnancy, Premature baby

Symptom Text: Initial and follow up information has been received from a licensed practical nurse and a nurse through the Pregnancy Registry for GARDASIL vaccine regarding a 24 year old female with von Willebrand's disease, seasonal allergies, hypertension, allergies to BENADRYL and aspirin and migraines who on 25-JUL-2007 was vaccinated intramuscularly with her first dose of GARDASIL (Lot # 658094/0524U). Concomitant therapy included OVCON 35, BENICAR and ALLEGRA. The OVCON 35 was discontinued on 24-AUG-2007. On 24-AUG-2007, the patient took a home pregnancy test (test not specified) which was positive (LMP = 20-JUL-2007). No symptoms have been reported. The patient was scheduled for an office visit on 26-SEP-2007. On 25-MAR-2008, the patient delivered a pre-term baby at 35 weeks gestation (not further specified). The baby had some respiratory difficulty at birth and was placed in the ICU, otherwise appeared healthy. No other details available at this time. Additional information is not available.

Other Meds: OVCON 35; ALLEGRA; BENICAR

Lab Data: beta-human chorionic, 08/24/07, positive

MedDRA PT Drug exposure during pregnancy, Umbilical cord around neck

Symptom Text: Information has been received from the pregnancy registry for GARDASIL, via a registered nurse concerning a 19 year old female who on 01-AUG-2007 was vaccinated with her first dose of GARDASIL, (lot # 658094/0524U) 0.5ml, IM. Subsequently, a pregnancy test (blood test) was positive (LMP 25-JUN-2007, EDD 30-MAR-2008). The patient was placed on therapy with a prenatal vitamin, and amoxicillin 500mg for dental work, on an unspecified date. Follow up information from a physician reported that on 15-APR-2008, the patient delivered a 7.2 pound, normal, baby girl with an Apgar score of 6 and 8. The baby was delivered with a nuchal cord that was reduced and the baby was sent to the neo-natal intensive care unit for retractions. It was not reported if the baby was admitted to the NICU. No treatment or outcome information has been reported. Upon internal review, nuchal cord reduction was considered an other important medical event. Additional information has been requested.

Other Meds: amoxicillin; hormonal contraceptives; vitamins (unspecified)

Lab Data: beta-human chorionic, positive blood test

MedDRA PT Caesarean section, Drug exposure during pregnancy, Foetal malposition

Symptom Text: Information has been received from a physician and a 20 year old female consumer through a Merck pregnancy registry with no allergies and a history of 1 pregnancy and 1 live birth who on 30-APR-2007 was vaccinated with the first dose of GARDASIL (lot #0210U), 0.5 ml. Concomitant therapy included ALDARA. In approximately April 2007, it was determined that the patient was pregnant. The date of last menstrual period was 10-APR-2007 and estimated delivery date was reported as 15-JAN-2008. It was reported that the patient has had no ill effects. On 15-JAN-2008, the patient reported that she delivered a healthy baby girl weighing 7 lbs. 13 oz. via primary cesarean due to fetal malposition (baby was transverse). At the time of reporting, it was noted that mother and baby are both well, "without any problems." No further information is available.

MedDRA PT Abdominal pain, Condition aggravated, Gallbladder disorder, Malaise

Symptom Text: Information has been received from a nurse practitioner concerning her 27 year old daughter with haemolytic anaemia (requiring blood transfusions every 10 to 12 weeks) and drug hypersensitivity to codeine and a history of splenectomy at 18 months of age and cholecystectomy (December 2007) who on 17-APR-2007, 02-JUN-2007 and October 2007 was vaccinated IM with a first, second and third 0.5 ml dose of GARDASIL. Concomitant therapy included YASMIN, folic acid, PAXIL and vitamins (unspecified). In August 2007, the patient required blood transfusions every 2-3 weeks until March 2008. Since March 2008, the patient has required blood transfusions every 5 to 6 weeks. Laboratory diagnostic studies include a complete blood cell count, liver function tests and reticulocyte count. At the time of this report, the patient had not recovered. Frequent blood transfusions was reported as an other important medical event. Additional information has been requested. 6/20/08-records received-10/05/07-declined tranfusion. LFTs normal. 10/5/07-Feeling sick. Scheduled for cholecystectomy for problems with gall stones and abdominal pain.

Other Meds: YASMIN; folic acid; PAXIL; vitamins (unspecified) 6/20/08-records received- Yasmin for birth control switching to NuvaRing. 4/2/08-remains on Yasmin.

Lab Data: complete blood cell; hepatic function tests; blood reticulocyte

History: Splenectomy; Cholecystectomy 6/20/08-records received- PMH: Pyruvate kinase deficiency hemolytic anemia. Splenectomy, inguinal hernia repair, breast reduction. Allergy to codeine, latex and betadine.

Prex Illness: Haemolytic anaemia; Drug hypersensitivity

MedDRA PT Pharyngitis, Purpura

Symptom Text: Information has been received from a physician concerning a 15 year old female with a history of overweight and appendicectomy who on 14-MAR-2008 was vaccinated with GARDASIL (lot# 1146U; batch number NH00410) by intramuscular route in the deltoid. The patient had no concomitant treatment. On 09-APR-2008 i.e. approximately 3 weeks after vaccination the patient developed pharyngitis. The test for streptococcus was negative. On 22-APR-2008 i.e. approximately 5 weeks after vaccination, the patient developed purpura on the legs. The patient was seen at the emergency room, however she was not hospitalised. The events were reported as moderate. As of 24-APR-2008, the patient had fully recovered. No further information was available. The reporter considered the events of purpura and pharyngitis were other medical events. The other business partners included are: E2008-04902.

Other Meds: None

Lab Data: Diagnostic laboratory test, streptococcus, negative.

History: Overweight; Appendicectomy

MedDRA PT Drug exposure during pregnancy, Genital haemorrhage, Intra-uterine death, Muscle spasms, Uterine dilation and curettage

Symptom Text: Information has been received from the pregnancy registry for GARDASIL from a nurse concerning a 21 year old female with no known pertinent medical history, or drug reactions/allergies who on 12-MAR-2008 was vaccinated with the first dose of GARDASIL (lot # 659657/1487U), 0.5ml, IM to the left deltoid. Concomitant therapy included FEMCON FE and prenatal vitamins (unspecified). On 18-APR-2008 the patient had a positive home pregnancy test. Her last menstrual period was 11-MAR-2008. She was seen for her first prenatal examination on 20-MAY-2008. The patient developed cramping and vaginal spotting on 28-MAY-2008 and was diagnosed by ultrasound on 30-MAY-2008 with fetal demise of twins. The patient was scheduled to have dilation and curettage and evacuation procedure. No other symptoms or treatment were reported. Upon internal review fetal demise of the twins was considered to be an other important medical event. Additional information has been requested.

Other Meds: FEMCON FE; vitamins (unspecified)

Lab Data: Ultrasound, 05/30/08, fetal demise of twins; Beta-human chorionic, 04/18/08, positive home pregnancy test.

MedDRA PT Anaemia, Caesarean section, Drug exposure during pregnancy, Fungal infection, Placenta praevia haemorrhage, Premature labour

Symptom Text: Initial information has been received for the Pregnancy Registry for GARDASIL from a physician concerning a 20 year old female who was a smoker and allergic to peanuts who on 16-JUL-2007 was vaccinated with a first dose of GARDASIL. The physician reported that the patient was pregnant when she was given the first dose of GARDASIL vaccine. It was unknown if patient sought any medical attention. The outcome was unknown. Follow up information from the doctor's office received concerning a 21 year old (previous reported as 20 years old) female patient who was a smoker (one pack per day), had one Pregnancy and one elective termination (date and year not reported). The patient also had concurrent condition of peanut allergy, attention deficit disorder, questionable bipolar disorder (off therapy x 6 months), "asthma rare", thalassaemia trait ("B thal trait") and was rhesus antibodies negative. On 18-JUL-2007 (previous reported as 16-JUL-2007) she was vaccinated with a second dose of GARDASIL, lot # 653938/0954F. It was reported that on 22-AUG-2007 patient was treated with VITAFOL +DHA for prenatal care and on 18-JAN-2008 she was treated with REPLIVAA 21/7) for anemia. On 20-FEB-2008 she was treated with MONISTAT 7) for yeast infection. It was also reported that she was off of therapy CONCERTA, ABILIFY and KLONOPIN for six months. In follow up information from the physician's office it was reported that patient had an ultrasound on 14-SEP-2007 for validity and dating. The result showed intrauterine pregnancy and fetal heart was positive. On 01-NOV-2007 the maternal serum alpha-fetoprotein test was done and the result was within normal. On 15-NOV-2007 a diagnostic test level 11 was done which showed placenta previa anatomic evaluation was within normal limit. On 21-NOV-2007, 04-FEB-2008 and on 03-MAR-2008 patient received three doses of globulin, RHOGAM x1 for Rh negative bleeding. In follow up it was reported that patient had routine pregnancy laboratory tests and in November 2007 she had "MSQS" laboratory test and the r

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Initial and follow-up information has been received from the Merck Pregnancy Registry via a nurse practitioner concerning a 17 year old female who on 26-JUL-2007 was vaccinated with a third dose of GARDASIL. Subsequently, the patient became pregnant. The patient's last menstrual period was on 15-Jun-2007 and the estimated date of delivery is 21-Mar-2008. No adverse reactions were reported. In August 2007 the patient had an elective termination. At the time of the report the patient's outcome was unknown. Upon internal review elective termination was considered to be an other important medical event. Additional information has been requested.

MedDRA PT Colour vision tests abnormal, Eye pain, Headache, Hemianopia, Optic neuritis retrobulbar, Papilloedema, Scotoma, Visual acuity reduced, Visual disturbance

Symptom Text: Information was received from a local Health Authority (reference # NT20080226), concerning a 17 year old (also reported as 16 year old) female with a history of migraine, who on 14-JAN-2008 received a second dose of GARDASIL via IM route (injection site not reported). On 17-FEB-2008 (one month after vaccination) the patient experienced ocular pain cephalgia-like of moderate intensity more when mobilizing the eye. Then 72 hours after i.e. on 20-FEB-2008 she had visual acuity decreased and feeling of white spots. There was decreased visual acuity and papillary oedema with scotoma in the left inferior temporal face. On 31-MAR-2008 during her hospitalization neurological clinical examination was normal and biological test was normal, there was no cellular reaction, cerebrospinal (originally reported as cecervicospinal) fluid proteins were normal, electrophoresis revealed that there were no oligoclonal bands, inflammatory parameters and viral serologies were normal. Encephalic MRI showed no hypersignals. Evoked potentials were a little bit increased but still in normal ranges with no anomaly as to the amplitude. She was diagnosed an optic neuritis retrobulbar. She was prescribed SOLU-MEDROL IV during 3 days. On 17-APR-2008 examination revealed visual acuity of 6/10 for left eye and 10/10 for right eye. There was no diplopia. Examination with slit-lam was normal, pupillary reflex was normal. Mobilization of eyeball was normal and without any pain. Visual field TG2 found some nasal deficiencies on the right and a left nasal quadranopsia. Vision of colours was unsaturated and normal on the right and showed some anomalies of tritan type on the left. Fundus oculi showed bilateral papillary oedema decreasing. In May the patient was improving. Patient was recovering. Other business partner numbers included: E2008-05044. No further information is available. The file is closed.

MedDRA PT Paraplegia

Symptom Text: Information has been received from a physician concerning a 15-year-old female who received her first and second dose of GARDASIL (no information about the dates, sites, routes of administration and lot number available) and no adverse event was reported. On 22-MAY-2008, the patient received the third dose of GARDASIL (lot number unknown) by IM on her deltoid. On 23-MAY-2008, she experienced a paraplegia of her two legs. The patient's experience has been confirmed by a neurologist who confirmed that this patient has been hospitalized from 23-MAY-2008 until 30-MAY-2008 and completely recovered. In the beginning, he had some suspicion about a GBS case or mononucleosis but the results of the exams didn't confirm these hypothesis. The neurologist assessed the event as not related to the vaccine. The patient just had sessions of kinesitherapy since 30-MAY-2008 which are still ongoing. Other business partner numbers include E200805170.

MedDRA PT Blepharospasm, Dyskinesia, Dysphonia, Excessive eye blinking, Eyelid oedema, Facial spasm, Headache, Lip swelling, Muscle spasms, Muscle twitching, Rash, Swelling face, Visual disturbance

Symptom Text: The morning after vaccine receipt, she woke up with a round area of red and raised rash in the center of the forehead. She then noticed her left upper eyelid was swollen and it was hard for her to see. Shortly after that she noticed spasms around left periorbital area. She had a very mild HA. Her family reported facial swelling and mild hoarseness developed on 6/7/08, together with twitching/blinking of the eyes (rt more than lt) and occasional jerking of the arms. She was seen in the ED on 6/7/08 and the ED physician noted twitching of left eyelid and right shoulder. She was given Valium 10mg po and SOLUMEDROL 125mg IV. Twitching decreased and as she was getting d/c paperwork she started having more twitching. Eyes were closing Invot, R >L UE and LE were "twitching". This lasted 45 min and she received SOLUMEDROL 125mg, Valium 2mg IV and BENADRYL 25mg IV. This decreased the movements. She was then admitted for further evaluation and observation. She states the movements are not painful. She is able to stop them briefly but they recur and are more intense. She is still able to voluntarily use the extremities during these episodes.. Other than this episode, movements like this never occurred before. She does not have a h/o ticks or OCD traits. No recent fever, chills, SOB, CP, GI or GU sx, arthralgias. She denied any respiratory symptoms, coughing, nausea, etc. During hospitalization, she continued to have intermittent right or right and left eye twitching with occasional twitching of bilateral mouth. Sx are not painful. Pt felt like she could suppress these but felt uncomfortable during the suppressive episodes. 2 Episodes of jerking to involve right arm and leg, the last one was on the night 6/8/08. Right sided twitching did not last long or as severe as initial presentation. Baseline eye twitching also some what decreased. No further swelling of eye and lips. Pt was discharged on CONGENTIN and BENADRYL to be taken as needed. 08/19/2008 MR received for DOS 6/7-9/2008 with D/C DX: Twitching of eye and limbs.

Other Meds: Thuja oxydentralis tab (took 1 tab on 6/7/08 while in ED), Nature's defense for heavy metal cleansing (took 1 tab on day of vaccines, o/w did not take regularly

MedDRA PT Chest discomfort, Dizziness, Fatigue, Headache, Palpitations

Symptom Text: Initial report received on 06 May 2008 from a Nurse Practitioner in the United States. A 13 year-old-patient, with past medical history of mild depression, had received on 11 March 2008 an intramuscular right deltoid injection of MENACTRA (lot # U2546AA); a left deltoid dose of GARDASIL (Lot # 1487U); and a right deltoid dose of VAQTA vaccine (Lot # AHAVE215AA) The route and site of administration was not provided for the VAQTA and GARDASIL vaccines. Two days post-vaccination, the patient complained of lightheadedness, dizziness, headache, fatigue, tightness in her chest, and on episode of heart palpitations lasting about two minutes. The patient required evaluation by a physician, but no relevant diagnostic tests or laboratory data were performed. Treatments received were not reported. At the time of this report, the patient had recovered.

Other Meds: NONE

Lab Data: None were performed

History: The patient was not ill at the time of the vaccinations on 11 March 2008. Past medical history includes mild depression. The patient had not received any other vaccinations within four weeks of 11 March 2008.

MedDRA PT Asthenia, Body temperature increased, Flushing, Headache, Musculoskeletal stiffness, Nausea

Symptom Text: Initial report was received 17 May 2008 from a health care professional. A 22-year-old female patient had received an intramuscular right deltoid injection of MENACTRA, lot number U2568AA and an intramuscular left deltoid injection of GARDASIL (manufacturer Merck), lot number 1967U and on the evening of vaccination, she developed a low grade temperature, general weakness, headache, stiff neck, nausea and her face appeared flushed. At the time of vaccination, the patient had a history of mild asthma and seasonal allergies but no concurrent illnesses. Concomitant therapies included and Albuterol inhaler prn. According to the reporter, the patient had a temperature of 98.6 degrees Fahrenheit at the time of the report. The patient had not recovered from the event.

Other Meds: ALBUTEROL INHALER

Lab Data: None

MedDRA PT Abasia, Abdominal pain, Apallic syndrome, Autonomic nervous system imbalance, Blood pressure fluctuation, Blood product transfusion, Cardiac arrest, Cerebral infarction, Choreoathetosis, Coma, Diarrhoea, Dizziness, Dyskinesia, Dystonia, Encephalitis, Escherichia infection, Fall, Gastrointestinal tube insertion, Headache, Hemiparesis, Hypoaesthesia, Hypotonia, Intensive care, Lacunar infarction, Left ventricular hypertrophy, Lumbar puncture, Mechanical ventilation, Meningitis aseptic, Mental status changes, Nausea, Pyrexia, Renal cyst, Staphylococcal infection, Steroid therapy, Tracheostomy, Urinary incontinence, Urinary tract infection, Vomiting

Symptom Text: 21 y/o female seen in ER 13 May with C/O it hand & lt. foot numbness approximately 1 month post GARDASIL vaccine. She also C/O of nausea, vomiting and diarrhea. A heat CT demonstrated bilateral basal ganglion infarcts and a MRI showed with similar results with no acute process. She was admitted 20 May with left hemiballsmus. On 22 May her mental status declined. She received many doses of HALDOL and ATIVAN for agitation and was intubated on 28 May. She was transferred to medical center 28 may for w/u for encephalitis and has since become comatose. Symptoms: Nausea w/vomiting, Diarrhea, Nausea w/o vomiting, Numbness. 7/11/08 Reviewed hospital medical records for 6/11-6/23/2008. FINAL DX: aseptic meningo-encephalitis; choreoathetosis r/t meningo-encephalitis; paroxysmal autonomic instability w/dystonia; e. coli UTI. Records reveal pt transferred from military hospital. Military deployment 1-3/2008. On leave 5/2008 developed n/v/d, abd pain & bifrontal HA which continued to worsen. Sought medical help but no dx given. Developed left side weakness, flaccidity & several falls. Found 5/12 unable to ambulate & incontinent of urine. Taken to ER where MRI revealed possible basalganglia infarct. To ICU where subsequent MRIs were WNL. Ventilated & remains in persistent vegetative state. LPs done. PICC , trach & PEG tubes. Intermittently febrile, labile BP, asystole x2. Tx in multiple hospitals w/multiple meds including steroids, IVIG, antibiotics & antivirals. 12/11/08 Reviewed additional medical records of 5/08-7/08. FINAL DX: Records reveal patient experienced nausea/vomiting/diarrhea, dizziness & HA, left hand/foot numbness x 4-5 days. Seen in ER on 5/13 where labs were WNL but CT of brain revealed lacunar infarcts, bilateral basal ganglia & cavum verge. Numbness continued & developed involuntary jerking of LEs & difficulty walking. Admitted to MICU 6/08 w/encephalitis. Tx w/IVIG & steroids. Transferred to higher level of care & then to inpatient rehab program.

Other Meds: None Known

Lab Data: LABS: MRI of head & spine WNL. CT angiogram of head WNL. PET scan abnormal. Right side craniotomy for biopsy of right frontal lobe. EEGs slow but WNL. CSF: WBC 14 monos, protein 17, glucose 68, cytopathlogy revealed mostly normal lymph

History: None PMH: smoker.

MedDRA PT Drug exposure during pregnancy, Foetal disorder

Symptom Text: Initial and follow-up Information has been received through the Merck pregnancy registry from a physician concerning a 17 year old female with no pertinent medical history, no known allergies or adverse drug reactions and one prior pregnancy and child with no complication or problems. On 14-FEB-2007, the patient was vaccinated intramuscularly with the first 0.5 mL dose of GARDASIL (Lot# 655619/1427F). There were no concomitant medications reported. The physician reported that after the administration, the patient reported that she was pregnant. It was reported that the patient had a prenatal mid trimester sonogram performed and "slanted eyes" were noted. At that time it was suggested to the patient that the baby might have Down's syndrome. On 24-JUL-2007 the patient had a full term vaginal delivery. Her baby was diagnosed with Down's syndrome confirmed by chromosome analysis. The baby had been evaluated by a cardiologist for a patent ductus arteriosis which has closed and a "tiny" patent foramen ovale. The baby had an unspecified thyroid problem for which an endocrine follow-up was scheduled. At the time of the report, the outcome of the atrial septal defect, thyroid disorder and trisomy 21 were unknown. Additional information has been requested.

Other Meds: None

Lab Data: ultrasound, prenatally-"slanted eyes"; chromosomal analysis, Confirmed Down's syndrome (baby)

MedDRA PT Activities of daily living impaired, Arthralgia, Back pain, Condition aggravated, Drug administered at inappropriate site, Immediate post-injection reaction, Impaired driving ability, Injection site pain, Myalgia, Neck pain, Serum sickness

Symptom Text: Information has been received from a health professional and a physician concerning a 22 year old female with a family history of rheumatoid arthritis (great-aunt and great-grandmother) who on 10-NOV-2007 was vaccinated with GARDASIL (lot #, batch #"ONE26610") IM in the left buttock. Vaccination with GARDASIL was performed by the reporter in the absence of any pathological condition. Immediately after vaccination, she experienced intense pain at the site of injection. In the evening, she experienced arthralgia and myalgia in the vaccinated side of the body. The physician reported that the patient experienced very intense and disabling arthralgia and myalgia since vaccination. Work-up performed by an internist showed positive antinuclear antibodies at 1:640. Nothing was found on rheumatology and infectious fields. The physician added that the patient had no medical history and was convinced that the patient's events were related to the vaccine. Pain was increasing and prevented the patient from driving. Treatment with morphinic analgesic was implemented. Biological testing confirmed the absence of a biological inflammatory syndrome. Bone scintigraphy showed a few focal areas of increased radiotracer uptake. Hospital report concluded to probable serum sickness disease possibly secondary to vaccination. The reporting physician added that the patient had experienced violent pain at the site of injection at the moment of vaccination and that the first adverse events occurred a few days after vaccination. The physician reported that nocturnal pain regressed. He confirmed that the patient never experienced fever after the vaccination. Work-up showed non-specific antinuclear antibodies. MRI scan of sacro-iliac joints was planned. The physician reported a marked clinical improvement of her condition even though she was still hampered in her daily activities. Morphinics were replaced by level 3 analgesics on an unspecified date. It was noted that with in the hours following vaccination, pain that occurr

MedDRA PT Drug exposure during pregnancy, Foetal disorder, Induced labour, Postpartum state

Symptom Text: Initial and follow-up information has been received through the pregnancy registry from a 25 year old female office manager with no pertinent medical history who on 07-DEC-2006 was vaccinated with a 0.5 ml dose of GARDASIL (lot #653938/0954F). There was no concomitant medication. On 29-DEC-2006 the patient learned that she was pregnant. Unspecified medical attention was sought. On an unspecified date the patient underwent "blood work" and an ultrasound. There was no adverse experience. At the time of the initial report, the patient was 9.5 weeks gestation. It was reported that the patient was induced at 41 weeks estimated gestational age for a low amniotic fluid index. The patient had a primary cesarean section due to a non-reassuring fetal heart rate and failure to descend with minimal cervical dilation. She delivered a healthy normal female weighing 7 pounds and 2 ounces on 24-AUG-2007. It was reported that the mother had some difficulty "mentally" postpartum. At the time of the report, the mother and baby were "well." Upon internal review, non-reassuring fetal heart rate and failure to descend with minimal cervical dilation were considered to be other important medical events. Additional information is not expected.

Symptom Text: Initial information has been received from health authorities concerning a 20-year-old female patient with medical history of appendicectomy was vaccinated with a dose of GARDASIL on 06-APR-2008, via intramuscular route. On 08-APR-2008 the patient stopped oral hormonal contraceptives JASMINELLE and had implant of hormonal contraceptives IMPLANON. On 13-APR-2008 i.e. 7 days after vaccination the patient had erythemato-oedematous plaques hot on right knee and then on the right leg and on left elbow which developed with same colours of bruise. She also had pain burn-like worsened by chances of position and which were not resolved by analgesics. There was no significant change in her way of life. Clinical examination: temperature was at 37.5 degree centigrade. Hemodynamic revealed pulse normal. Blood pressure was at 138/88 mmHg. Heart rate was at 101/min. Vigilance was normal. Glasgow was at 15. Breathing was normal. On 23-APR-2008, cardiovascular examination, pulmonary examination, digestive examination, neurological examination, urologic examination, rheumatology were all normal. There was no arthralgia. There was no general signal. Dermatological examination was abnormal: erythematous nodules of different ages for both lower limbs and 2 nodules on elbows. There was no tonsillitis. There was no transit trouble. There was no adenopathy. There was no other particular functional anomaly. On 17-APR-2008 biological tests were performed: RP was normal. There was an inflammatory syndrome: ESR was increased at 44 mm the first hour. CRP was increased at 107 mg/L. Antibodied ASD and ASLO were negative. SGOT, SGPT and TSH were normal. Moderate leukocytosis at 12.85. Plasma protein electrophoresis showed a slight increase in Alpha-1 globulin. Tuberculin intradermal reaction was negative. She was prescribed DOLIPRANE in case of pain and she had to raise up her lower limbs. On 25-APR-2008 at 7 a.m. leukocytes were at 5.17 G/L, hemoglobin were at 11.7 g/dL, platelets at 318G/L, polynuclear neutrophilic leukocyte at 1.94 G/L, lymp

Other Meds: IMPLANON, 08Apr08 - UNK; drospirenone (+) ethinyl estradiol, UNK - 08Apr08

Lab Data: diagnostic laboratory test, 17Apr08, Antibodied ASD was negative; diagnostic laboratory test, 17Apr08, Antibodied ASLO was negative; diagnostic laboratory test, 17Apr08, Moderate leukocytosis at 12.85; cardiovascular evaluation, 23Apr08, no

MedDRA PT Confusional state, Dysarthria, Dysphonia, Eye swelling, Fall, Limb injury, Nervousness, Pallor, Speech disorder, Swelling face

Symptom Text: Patient received her vaccine then sat in a chair while her 14 year old brother got his second chicken pox shot, she was laughing and goofing around with her 12 year old brother. Then within minutes she was on the floor, her body started shaking and she started making noises. The nurse stated that this never happened before and ran out of the room to get Dr. After he was in the room a short time patient came to and he helped her back into the chair. He tried telling me that it was probably 'cause her blood sugar was low from not eating, not true she ate two hours before she got her vaccine. She was pale, confussed and talking slowly. Dr. then gave her some water and put an ice pack on the back of her neck, told me she'd be fine. For the next three hours at home patient was hoarse, had slurred speech and responded to everything very slowly. Her face ended up swollening as did her eyes, her face and eyes are still somewhat swollen today. She hurt her right thumb when she fell, Dr. said it is probably sprained, but never took an x-ray. We went back to see Dr. yesterday, patient still swollen and slow. She stated that maybe Patient just fainted because of being worked up about getting a shot but she has no idea why her speech would be slurred or why she would be hoars. I tried to explain to her that patient was not worked up about the shot and her and her brother were goofing around when patient ended up on the floor but she wouldn't listen. She said that when people have a siezure they will pee and poop their pants, however I have friends that have siezures and they never have done that. The paper I received after patient's reaction states that a reaction can happen within minutes to a few hours of the vaccine and the doctor keeps telling me it can't happen that fast. Patient is still swollen this morning,she just got up so I am not sure how her reactions are. Patient gets almost all staight A+'s in school I am worried how this will effect her.

Other Meds: zyrtec 10 mg daily

Lab Data: none was done and I did not receive any information on any possible side effects of the vaccine until after patient had a problem and we were ready to leave Dr. is our family doctor even though there were no doctors present when patient re

MedDRA PT Benign intracranial hypertension, Condition aggravated, Eye pain, Headache, Nausea, Oral contraception, Phonophobia, Photophobia, Vomiting

Symptom Text: Information has been received from a consumer concerning her 18 year old daughter with pseudotumor cerebri and scoliosis and no drug reactions or allergies, who on 15-APR-2008 was vaccinated with the first dose of GARDASIL. Concomitant therapy included YAZ and acetazolamide (MSD). The patient's mother stated that her daughter has the condition known as pseudotumor cerebri. As a result of this condition, she sometimes has a build up of intercranial and spinal pressure which causes severe headaches and problems with her eyes, such as pain and sensitivity to light. Prior to receiving the vaccine on 15-APR-2008, her last episode of this increase and build up of intercranial and spinal pressure took place in March 2007. On 11-MAY-2008 the patient had another one of these episodes which caused her to have severe headaches, and problems with her eyes such as pain and sensitivity to light. She was hospitalized for one day so that her physician could do a spinal tap. Subsequently, the patient recovered. No product quality complaint was involved. Additional information has been requested.7/21/08-records received for 5/16/08-DC DX: Pseudotumor cerebri. Presented to ED with 5 day history of intermittent headache and 1 day of nausea and vomiting. Headache worse at night and associated with phot and phonophobia. Nauseated and vomiting times two.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Initial and follow-up information has been received through the Merck Pregnancy Registry from a registered nurse concerning a 21 year old female who on 05-JUL-2007 was vaccinated IM in the left deltoid with a 0.5 ml dose of GARDASIL (lot # 654741/1208F). Concomitant therapy included hormonal contraceptives (unspecified), ibuprofen, cough, cold, and flu therapies (unspecified). On an unspecified date the patient took herself off of these modification due to financial difficulty, albuterol, metformin, and WELLBUTRIN. On an unspecified date the patient went to the emergency room (unspecified reason) and found out she was 3 weeks pregnant. She had an OB/GYN appointment on 05-SEP-2007, results not reported. Her last menstrual period was 14-Aug-2007, with an estimated date of delivery was 20-MAY-2008. In September 2007 the patient experienced a miscarriage. Upon internal review the miscarriage was considered to be an other important medical event. Additional information has been requested.

Other Meds: Albuterol; WELLBUTRIN; Cough, Cold, and Flu therapies; Hormonal contraceptives; Ibuprofen; Metformin

Lab Data: Beta-human chorionic, 3 weeks pregnant.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Initial and follow-up information has been received from a certified medical assistant and an other health professional through a Merck pregnancy registry concerning a 16 year old female with depression and a history of "female problems" (unspecified) and miscarriage (prior to 1st GARDASIL), who on 23-JAN-2007 was vaccinated intramuscularly with a 0.5 mL first dose of GARDASIL. Concomitant therapy included PAXIL. Subsequently the patient had a positive home HCG test. The patient was examined by her obstetrician on 29-JAN-2007 who ordered a serum HCG test. At the time of this report, results of test were pending. In early 2007, it was reported that at approximately 5-6 weeks gestation the patient had an "early" spontaneous abortion. On an unspecified date, the patient received the second dose of GARDASIL and subsequently she had another miscarriage (dates not reported). Subsequently on an unspecified date, the patient received the third dose of GARDASIL and conceived again (date not reported). The patient's last menstrual period was approximately November 2007 and her estimated delivery date August 2008. It was reported that the patient was doing well with no adverse events. The reporter stated that she did not think any of the events were related to GARDASIL. After internal review, abortion was considered to be an other important medical event. Additional information has been requested.

Other Meds: PAXIL

Lab Data: beta-human chorionic, 01/??/07, positive; total serum human, 01/29/07, results pending

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Information has been received through a pregnancy registry from a 21 year old female with penicillin allergy who on 24-APR-2007 was vaccinated with a third dose 0.5 mL of GARDASIL. There was no concomitant medication. On 24-APR-2007 the patient experienced vaccine exposure during pregnancy. The patient's last menstrual period was 24-MAR-2007 and the estimated due date was 29-DEC-2007. A blood test was positive for pregnancy. Follow up information has been received from the nurse who reported that the patient had a spontaneous abortion during her pregnancy. The nurse could not confirm the estimated gestational age at the time of the "miscarriage". Upon internal review, the patient's spontaneous abortion was considered to be an other important medical event. This patient experienced another adverse event reported in WAES# 806USA002235. Additional information has been requested.

MedDRA PT Drug exposure during pregnancy, Foetal disorder, Gestational diabetes

Symptom Text: Information has been received from a Nurse Practitioner concerning a 26 year old female with a history of 0 pregnancies and 0 live births and a history of ventricular tachycardia and Papanicolaou smear abnormal who on 12-JUN-2007 was vaccinated with her first dose GARDASIL (lot#0211U). Concomitant therapy included ORTHO TRI-CYCLEN LO). The patient later found out that she was pregnant with an LMP of 15-MAY-2007. The patient also had an HPV test which tested negative. Medical attention was sought. Follow-up information was received on 27-May-2008 from a nurse who indicated that the patient delivered a healthy baby girl on 15-FEB-2008. The baby was normal and healthy with no congenital anomalies. Follow-up information was received from an outcome pregnancy questionnaire. The patient weighed 8 pounds 4 ounces. The Apgar score was 9 and 9. The patient was 39 and 1/2 weeks from LMP. The infant was not normal and she had mild metatarsus adductus and mild curly toe deformities. On an unspecified date the patient had OB testing and labs revealed gestational diabetes which was under diet control. During pregnancy the patient received OBTREX for pregnancy. Medical records were received from the physician's office for the baby. On 10-APR-2008 the baby had a 6 week follow-up visit with the physician. The baby has a bilateral foot. The baby is almost 2 months of age. Overall the baby was doing well. Her mother does not have any new concerns or complaints. The baby has not had any recent fevers or other systemic signs of illness. The baby was well developed, well nourished, alert and no acute distress. An exam of the bilateral lower extremities reveals full range of motion of all joints, neurovascularly intact through out. Leg lengths were equal. Skin folds were symmetric. Barlow, Ortolani and Galeazzi tests were negative. Exam of the feet does reveal mild metatarsus adductus deformities. The calcancovalgus deformities are already correcting. Mildly curly toe deformities exist of the 4th toes bilate

Other Meds: ORTHO TRI-CYCLEN LO

Lab Data: physical examination, 04/10/08 - Barlow, Ortolani and Galeazzi tests were negative; diagnostic radiology, 04/10?/08 - see narrative; cervix HPV DNA assay - negative

History: Ventricular tachycardia; Papanicolaou smear abnormal

MedDRA PT Caesarean section, Drug exposure during pregnancy, Oligohydramnios

Symptom Text: Initial and follow-up information has been received for the Merck Pregnancy Registry from a medical assistant concerning an 18 year old female who on 18-JUL-2007 was vaccinated IM in the left deltoid with a 0.5 ml dose of GARDASIL (Lot# 657868/0523U). It was reported that the patient experienced no adverse symptoms. On 28-AUG-2007 the patient's urine beta-human chorionic gonadotropin test reported positive for pregnancy. On 28-AUG-2007 the patient had an ultrasound that showed no evidence that the patient was pregnant. At that time, the patient's HCG level was reported to be only 55. It was reported that it was "too soon to see anything." The patient's last menstrual period was 21-JUL-2007, the estimated conception date was 05-AUG-2007, and the estimated date of delivery was 28-APR-2008. The patient did not have any previous pregnancies. At the time of the report, the patient was 10 weeks pregnant. On an unspecified date the patient underwent an ultrasound which revealed oligohydramnios. On 14-APR-2008, the patient delivered a healthy, normal baby boy via caesearean section due to fetal intolerance to labor and nuchal cord at 38 weeks. The birth weight was 5 pounds 11 ounces, and the infant's apgar score was 9/9. The infant was normal with no congenital anomalies. Other medications that were taken during the pregnancy were unspecified prenatal vitamins and PROMETRIUM, 200 mg for low progesterone from 05-SEP-2007 to 05-OCT-2007. At the time of the report, the outcome of the patient was unknown. Upon internal review caesarean section due to fetal intolerance to labor and nuchal cord was considered to be an other important medical event. Additional information is not expected.

Other Meds: Unknown

Lab Data: ultrasound, 08/28/07 - no evidence of pregnancy, HCG was only 55; ultrasound - oligohydraminios; urine beta-human, 8/28/07 - positive; total serum human, 08/28?/07, 55

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy, Haemorrhage

Symptom Text: Initial and follow up information has been received from a registered nurse concerning a 19 year old female who on 09-JUL-2007 was vaccinated IM (site not reported) with a first 0.5ml dose of the GARDASIL (lot# 657736/0389U). The patient was not pregnant at the time of the 1st dose of the GARDASIL. The patient missed her second dose of the GARDASIL. The nurse contacted the patient in November 2007, to let her know she needed to come in for her second dose but the she never came. In December 2007 the patient called the office and said she needed to be seen for pregnancy. Last menstrual period listed in the office chart was "September or October 2007." On 12-DEC-2007 the patient called the office with bleeding. On 13-DEC-2008 the patient had a spontaneous abortion. The nurse reported that the patient has not resumed the series even though they had attempted many times to contact her. Upon internal review the spontaneous abortion was determined to be an other important medical event. Additional information has been requested.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Abdominal pain, Acute myeloid leukaemia, Ascites, Back pain, Blast cell count increased, Blood creatinine increased, Blood urea increased, Breath sounds abnormal, Computerised tomogram abnormal, Contusion, Dyspnoea, Fibroadenoma of breast, Full blood count, Haemoglobin decreased, Hepatosplenomegaly, Lymphadenopathy, Monocyte percentage increased, Pelvic mass, Petechiae, Platelet count decreased, Platelet transfusion, Pleural effusion, Pyrexia, Ultrasound abdomen abnormal

Symptom Text: Information has been received from a physician concerning a 15 year old female patient, with no relevant history, who in January 2008 and March 2008 received the first and second doses of GARDASIL, respectively. On 20-MAY-2008 the patient was diagnosed with acute myeloid leukemia and was hospitalised. On 02-JUN-2008 follow-up information was received from her general practitioner. The physician transmitted the hospital records of the patient from her hospitalization from 26-MAY-2008 to 27-MAY-2008. She was admitted for acute myeloid leukemia, questionable level IV. Around 20-MAY-2008 the patient had dorsal pain. On 23-MAY-2008 she had abdominal pain. When she was admitted for hospitalization her blood pressure was 128/83, heart rate was 120 and she had fever of 38C. Examination of her abdomen confirmed the pelvic mass and hepatosplenomegaly. Pulmonary examination revealed reduced vesicular whispering on the right base. Cardiac test was normal. Hyperhemia with adenopathies submandibular (it must be mentioned that she had surgical extraction of the left inferior third molar last week with concomitant lymphadenopathy submandibular). She also had inguinal lymphadenopathy, diffuse petechiae and bruising on her lower limbs. Right mammary examination showed tumourous infiltration with a hard lesion on the superficial level, with a depth of 6 centimeters at the level of the right inferior and superior interior quadrant. On 26-MAY-2008, during the night, she had increased blood pressure and breathing difficulty. She received treatment with FASTURTEC and a platelet transfusion. On 26-MAY-2008 the following diagnostic procedures were performed: echography of the abdomen revealed pelvic mass with abdominal adenopathies with ascites, with bilateral pleural effusion and hepatosplenomegaly. There was also an adenofibroma on the right breast of 2x1 centimeters; Computed Tomography scan of the thorax, abdomen and pelvic was performed and revealed a bilaterally pleural effusion of mild abundance and of more import

Other Meds: None

MedDRA PT Abdominal pain, Arthralgia, Gastroenteritis, Oedema peripheral, Pain, Pyrexia, Rash, Rash maculo-papular, Skin plaque, Vomiting

Symptom Text: Information has been received from a health professional (local health authorities on 03-JUN-2008 under reference number PC20080124) concerning an 18 year old female with no medical history who on 15-MAR-2008 was vaccinated with GARDASIL (lot# 0484U; batch number NG29170) in the left arm via intramuscular route. On 30-MAR-2008 the patient experienced vomiting and abdominal pain which evoked a non febrile gastroenteritis picture. On 01-APR-2008 the patient was presented with arthralgia in the ankle. On 02-APR-2008 joint symptoms worsened leading to 3 days hospitalisation: pain increased, oedema occurred to legs maculo-papular-oedematous skin eruption occurred (violine aspect), with the form of plaque at lower limbs and trunk and fever at 39 degrees Celsius with no chills. On an unspecified date, further examinations were performed and found: absence of leukocytosis: C-reactive protein at 84 mg/l with erythrocyte sedimentation rate at 38mm at first hour; serum rheumatoid factor test (latex waler rose) was negative, cyclic citrullinated antipeptide antibody test, antineutrophil cytoplasmic antibody test, type 2 serum antimitochondrial antibody test were negative; hepatitis A, B and C serologies were ongoing; B19 Epstein-Barr virus and Cytomegalovirus (CMV) parvovirus serologies were negative; chlamydia and salmonella serologies were negative and syphilis (results not provided) and chest X-ray was normal. Corrective treatment with analgesics was given and it was observed that the outcome was slowly favorable. On 08-APR-2008, standing was still painful at the feet. The case is closed. No further information is available. Other business partners included are: E2008-05064.

Other Meds: Unknown

Lab Data: chest X-ray, normal; body temp, 02Apr08, 39 C; Epstein-Barr virus antibodies, negative; parvovirus B19 PCR, negative; serum ANCA, negative; serum C-reactive protein, 84 mg/l; serum cyclic citrulline peptide IgG Ab, negative; serum rheumatoi

MedDRA PT Aphasia, Contraception, Headache, Hyperreflexia, Paraesthesia, Sensation of heaviness

Symptom Text: Information has been received from a gynecologist concerning a 22 year old female with a history of migraine, food allergy, unilateral right leg pain and back pain since MAY-2007 who on 16-NOV-2007 was vaccinated with the first dose of GARDASIL, (lot # 0253U/batch # NF58540) into the left upper arm. Concomitant therapy included hormonal contraceptives (unspecified). Two weeks post vaccination on approximately 30-NOV-2007, with GARDASIL, the patient experienced paraesthesia of fingers and feet, headache, aphasia and heavy feeling of both legs. MRI of lumbar spine on 13-NOV-2007 showed intervertebral disc protrusion. The patient was hospitalized from 30-NOV-2007 to 06-DEC-2007. Neurological examinations including magnetic resonance imaging (MRI) of the crania and cervical spine, visual evoked potential (VEP), somatosensory evoked potential (SEP), MEP, lumbar puncture, extracranial doppler sonography and doppler of A. carotis and A. temporalis showed normal results. Physical examination showed hyperreflexia of all extremities. Inflammatory disease of CNS was assumed "although this could not be verified currently". The patient was treated with Soludecortin H and symptoms improved. On 06-JUN-2008 the reporter was contacted by phone. The patient recovered except for ongoing slight increase of reflexes. Exact duration of symptoms was unknown. Despite ongoing symptoms the second vaccination with GARDASIL, was given on 14-JAN-2008. The third vaccination with GARDASIL, (lot # 0467U/batch # NG14290) was given on 09-MAY-2008. No additional information is available. Other business partner numbers include E2008-05133.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Blindness transient, Headache, Pupils unequal, Vision blurred

Symptom Text: Information has been received from a consumer concerning a 22 year old female who on approximately "03-JUN-2008 or 04-JUN-2008" was vaccinated IM with a first 0.5 ml dose of GARDASIL. There was no concomitant medication. On 04-JUN-2008, the patient's mother noticed that one of the patient's pupils "was large and the other was small." The next day "they switched and the small one was large and the other was small." It was reported that sometimes "both are huge." Her vision was blurry and she had a steady headache since receiving the vaccine. "At one point" she "lost her vision for 30 seconds and it came back." Diagnostic studies performed included: MRI and carotid artery test" (results not reported). The patient will not be continuing the series. At the time of the report, the patient had not recovered. Upon internal review, transient blindness was considered to be an other important medical event. Additional information has been requested.

MedDRA PT Convulsion, Grand mal convulsion

Symptom Text: At midnight on the day she received the vaccine, she experienced a seizure and was taken by ambulance to the ED. She was then stable and was discharged home. She had a second seizure at 6am and was again taken by ambulance to the ED. She was then kept for 48 hr. observation. 7/2/08-records received for DOS 6/10-6/11/08-DC DX: Seizures, new onset. Status post Gardasil vaccination. Neurologically intact. Evening of vaccination started seeing bright lights, generalized tonic-clonic seizure, seen in ED without incident. Following morning had second seizure, generalized tonic-clonic seizure with eyes rolled up.

Other Meds: None

Lab Data: CT scan, MRI, Lab tests, and EEG were all within normal limits. 7/2/08-records received- MRI, CT negative. EEG:abnormal indicated possible abnormality in left frontotemporal region, probably slowing secondary to seizure.

History: None 7/2/08-records received-PMH: migraines. Severe concussion 4 1/2 years ago when patient hit a tree while skiing.

Prex Illness: None. Had normal physical exam that day.

MedDRA PT Convulsion

Symptom Text: Information has been received from a physician concerning a 14 year old female patient who on 09-JUN-2008, was vaccinated with a second dose of GARDASIL (Lot reported as "0070X"). About 12 hours later, by midnight, the patient had a seizure and went to the emergency room (ER). She had a CT scan and bloodwork done while in the ER and the results came back normal for both tests, so the patient was sent home. On 10-JUN-2008 at 0600, the patient experienced a second seizure and this time the ER chose to admit the patient for a 48 hour observation. The patient had an EKG, an MRI and a neurology consult while in the hospital. At the time of this report, the patient's outcome was unknown. It was also reported that the patient received her first dose of GARDASIL on 07-APR-2008. Upon internal review, seizure was considered to be an other important medical event. Additional information has been requested.

MedDRA PT Caesarean section, Drug exposure during pregnancy, Labour complication, Smear cervix abnormal

Symptom Text: Information has been received from a physician assistant concerning a female (age not reported) with a history of abnormal Papanicolaou smear (CINI) who on 25-JUL-2007 was vaccinated with a dose of GARDASIL (lot # 654741/1208F) and was 5 weeks pregnant. The patient's last menstrual period was reported to be on 24-JUN-2007 and an estimated delivery date of 30-MAR-2008. Concomitant therapy vaccination included MMR, vitamins (unspecified), hepatitis B virus vaccine (unspecified) and meningococcal vaccine (unspecified). On 23-AUG-2007 an ultrasound was performed with normal results. A "full prenatal panel" was also performed with an abnormal PAP smear. The patient's status was reported as "good". Follow up information received on 09-JUN-2008. The physician assistant reported that the patient gave birth to a baby boy at 40 weeks gestation. He was 8lbs 8oz and Apgars were 7 and 8. He is healthy and normal and there were no gross anomalies listed. It was reported that the mother did have a c-section for failure to progress and no dilation, but there were no complications. Upon internal review c-section for failure to progress and no dilation was considered to be an other medical event. Additional information is not expected.

Other Meds: vitamins (unspecified)

MedDRA PT Fall, Haematoma, Head injury, Immediate post-injection reaction, Loss of consciousness, Syncope, Tympanic membrane perforation

Symptom Text: Initial and follow-up information has been received from a physician concerning a 17 year old female, who on 04-MAY-2008 was vaccinated IM in the left deltoid with a first dose GARDASIL (Lot# 1113U; Batch# NH08990). There was no concomitant medication. Four minutes post vaccination the patient experienced sudden syncope of severe intensity. Loss of consciousness induced a fall, which caused head trauma and a haematoma behind the ear. The physician did not describe the event as a vasovagal syncope. The syncope lasted a "few minutes." The patient experienced a head injury and a perforated ear-drum. The patient stayed at home for 48 hours under the physician's surveillance, who was also her mother. A consultation with a ear-nose-throat specialist was scheduled to check the patient's condition. The ear, nose, and throat surveillance was ongoing for the perforated eardrum. It was reported that the patient felt better. At the time of the report, the patient was recovering. The reporter thought that syncope was not of vagal aetiology. No complementary examinations were performed to document the syncope. It was reported that the patient had no adverse reaction to other unspecified vaccines. The physician considered syncope, head injury, and perforated eardrum to be an other important medical event. Other business partner numbers included: E200804340. Additional information is not available.

MedDRA PT Migraine, No reaction on previous exposure to drug, Paraesthesia, Weight decreased

Symptom Text: Information has been received from a physician (who received the information from a patient's mother) concerning a 14 year old female who on 30-NOV-2007 was vaccinated with the first dose of GARDASIL (lot# not reported), which was well tolerated. On 03-JAN-2008 the patient was vaccinated intramuscularly into the upper arm with the second dose of GARDASIL (lot# not reported). In the beginning of May 2008, the patient developed paresthesia, migraine and weight loss and was hospitalized for diagnostics. No reports on findings were made available to the reporter. The events were ongoing at the time of reporting. The physician noted that according to the patient's mother "the symptoms improve while her daughter listens to loud music via an MP3 player". The reporting physician does not see a causal relationship to the vaccination. Other business partner numbers included: E2008-05224. No further information is available.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Butterfly rash, Systemic lupus erythematosus

Symptom Text: Information has been received from a dermatologist concerning a 20 year old female patient with no relevant medical history reported, who on 10-MAR-2008 was vaccinated with a first dose of GARDASIL. On approximately 25-MAR-2008, 15 days after the vaccination, the patient developed a butterfly rash. A cutaneous biopsy showed lupus band at indirect fluorescent antibody test. From a biological point of view, it was reported that antinuclear antibodies were positive and at 1/320 without any anti-DNA and anti RNA antibodies. Urine culture showed no proteinuria. Clinical examination revealed no arthralgia and no neurological signs. She was diagnosed with a disseminated lupus erythematous. She was prescribed PLAQUENIL. At the time of reporting, the patient had not recovered. The reporter considered disseminated lupus erythematosus to be an other important medical event. Other business partners numbers include: E200805196. No further information is available.

Other Meds: Unknown

Lab Data: physical examination, no arthralgia; no neuro signs; skin biopsy, skin: lupus band at indirect fluorescent antibody test; serum ANA, 1:320, positive and without any anti-DNA and anti RNA; urine culture, no proteinuria

History: None

MedDRA PT Convulsion, Incorrect route of drug administration, Loss of consciousness

Symptom Text: Information has been received from a general practitioner concerning a female patient with anxiety, who in May 2008, was vaccinated subcutaneously with the first dose of GARDASIL. A few seconds after the vaccination, the patient experienced loss of consciousness and convulsive movements. The patient spontaneously recovered in a few minutes. It was specified that the patient was anxious because of the vaccination. The reporter considered loss of consciousness and convulsive movements to be other medically important events. Other business partners numbers include: E200805165. No further information is available.

MedDRA PT Injected limb mobility decreased, Laboratory test, Pain in extremity, X-ray

Symptom Text: Information has been received from a nurse concerning a 25 year old female who on 16-APR-2008 was vaccinated in the left arm with a dose of GARDASIL (uncertain if it was the first dose). Concomitant therapy included YAZ for birth control. On 18-APR-2008 the patient experienced persistent pain in the left arm that prevented the arm from being raised. There was no swelling and no induration. The patient still had the arm pain as of 06-JUN-2008 when the patient was seen in the office. The patient was told to use ice therapy, but the ice was reported to make the pain worse. The patient had been placed on DIFLUCAN and VOLTAREN. On an unknown date, x-ray and unspecified lab tests were performed and no result was provided. The patient's persistent pain in the left arm was considered to be disabling. Additional information has been requested.

MedDRA PT Pain in extremity

Symptom Text: Information has been received from a registered nurse concerning a 25 old female who on 16-APR-2008 was vaccinated with a first dose of GARDASIL in the left deltoid. On 18-APR-2008, the patient complained of a sore left arm. On 02-MAY-2008, the sore left arm was treated with heat. On 06-MAY-2008, the arm was still very sore and was treated with ice, heat and ibuprofen. On 12-MAY-2008, the sore left arm was not improving and the patient was referred for an x-ray. The x-ray showed a normal result. On 27-MAY-2008, the patient still complained of a sore left upper arm and was referred to orthopedics for an evaluation of possible unrelated bursitis. It was reported the patient did not go for the evaluation. On approximately 16-JUN-2008, the left arm starting to not be as sore. At the time of the report the outcome of the sore left arm was recovering. The outcome of the possible unrelated bursitis was unknown. Additional information is not expected.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Anxiety, Arthralgia, Fatigue, Headache, Hot flush, Hypoaesthesia, Insomnia, Irritability, Laboratory test normal, Lymphadenopathy, Malaise, Mononucleosis heterophile test negative, Musculoskeletal discomfort, Myalgia, Paraesthesia, Pharyngolaryngeal pain, Streptococcal identification test negative, Tinnitus, Viral infection

Symptom Text: Pt states that for the past 5-6 days she has had a HA in mid forehead. HA always present to some degree but does vary considerably in intensity. Pt also c/o anterior neck discomfort earlier in day (not necessarily worse w/ swallowing) that has improved on its own. She denies stiff neck or posterior neck pain. She also c/o generalized fatigue, numbness and tingling in both her legs, "hot flashes", and sore muscles throughout her body. She states her skin feels very sensitive to touch. She states she has had increased anxiety in recent days (unsure why) and has been very irritable. She adamantly denies any suicidal or homicidal thoughts/plans. LMP 1 1/2 weeks ago > normal. This 18-year-old has been in a couple of times now for this complaint. She has seen Dr. All of these symptoms started directly after her HPV vaccination. This is discussed in detail in Dr's notes. The patient's current symptoms include numbness, malaise, swollen glands, joint pain, muscle pain, fatigue, increase in her headache frequency and hot flashes. She even noticed that her right ear clicks after the injection. In general, she does not feel well. The respite from school has helped somewhat. She is less stressful, but still, according to her and her mother, continues to be very anxious with lots of mood irritability. She still does go to the gym daily and run. She enjoys visiting with her friends. Her sleep is still quite poor. The AMBIEN has helped. This recent episode was overlaid with a viral illness. I reviewed her blood work from a couple of weeks ago with them again and that all looked normal. This 18-year-old was seen by me last week in the same-day clinic. I felt she might be depressed. She was reacting to sore throat, fatigue, and insomnia. Her lab studies are all perfectly normal. Her strep screen was negative. Her monotest was negative as well as a CBC and thyroid testing. Today, she presents with her mother and history is more complete in that she had GARDASIL vaccine in October and then in December

MedDRA PT Anogenital warts

Symptom Text: Information has been received from a certified nurse midwife concerning five or six 18 to 19 year old females, concomitant medications and pertinent medical histories not specified, who were vaccinated (dates unspecified) with the first doses of GARDASIL vaccine (yeast) (Lot #'s, and routes unspecified). It was reported that several weeks after receiving the GARDASIL vaccine (yeast) 5 or 6 patients unfortunately came back with hundreds of genital warts. At first they thought it may be just a chance occurrence not only did the nurse midwife see these , the doctor saw a few of these instances as well. The patients came in and had a pap, the pap smears came back and after that the first dose of GARDASIL vaccine (yeast) was administered, and after that they saw these outbreaks of genital warts come back. "It was so bad that these girls needed laser therapy and sometimes they continued laser therapy and even after that continued laser therapy. The patients still had genital warts." Some continued to receive the second and third dose and some may not, but at least some did finish the doses. Additional information has been requested.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Information has been received from a licensed visiting nurse through the Merck pregnancy registry concerning a 17 year old female patient with no history or allergies to medication, who on 09-APR-2007 was vaccinated intramuscularly into the right deltoid, with a dose of GARDASIL (Lot# 654885/1424F). Concomitant therapy administered into the left deltoid on included a dose of MENACTRA and a dose of VAQTA (MSD). It was noted the patient was not taking other medications. On 13-MAY-2007, a home pregnancy test was performed. On 14-MAY-2007, the patient was determined to be two months pregnant via information from the patient's mother. In June 2007, the patient had a miscarriage and was reported to be approximately 2 months pregnant at the time of the miscarriage. Unspecified medical attention was sought. At the time of this report, the patient's outcome was unknown. No product quality complaint was involved. Upon internal review, miscarriage was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Drug exposure during pregnancy, Premature labour, Premature separation of placenta

Symptom Text: Initial and follow-up information has been received from a health professional through the Merck pregnancy registry concerning a 23 year old female smoker with no drug allergies, who on 30-JAN-2007 was vaccinated intramuscularly with a 0.5mL first dose of GARDASIL. On 30-MAR-2007 the patient was vaccinated with a second dose of GARDASIL. On 31-JUL-2007 the patient was vaccinated with a third dose of GARDASIL (Lot# 658222/0927U). There was no concomitant medication. Subsequently, the patient was pregnant and reported to be in her first trimester. The patient took a home pregnancy test that was positive. On 10-SEP-2007 prenatal blood work was taken and an ultrasound was performed that was normal. The patient's last menstrual period was 03-JUL-2007 and her estimated delivery date was 09-APR-2007 (also reported as 11-APR-2008). The patient called the office. The patient had one previous pregnancy that resulted in a spontaneous abortion. At the time of the report, the patient's outcome was unknown. No product quality complaint was involved. On 02-MAR-2008 the patient went into pre-term labor at 34 weeks with abruptio placenta and delivered a male baby that weighed 2175 grams. It was reported that the baby was in the hospital NICU on oxygen and was receiving unspecified antibiotics. The mother was bottle-feeding the baby. The length of stay in the NICU, and the reason for the infant being treated with oxygen and unspecified antibiotics was not reported. No further information was available on the baby's condition. This is an amended report. The serious criteria for hospitalization has been changed to yes for premature baby and birthweight low. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Diarrhoea, Dysaesthesia, Guillain-Barre syndrome, Hypoaesthesia, Nausea, Pain, Pain in extremity, Paraesthesia, Peripheral sensory neuropathy, Pharyngitis streptococcal, Viral infection

Symptom Text: Initial information received from a health care professional on 11 June 2008. A 17-year-old female patient with a past history of Bell's palsy and asthma, received an intramuscular injection of MENACTRA, lot number U2330AA, in the left deltoid, and an intramuscular injection GARDASIL (manufacturer Merck), lot number 1060U, in the right deltoid on 22 August 2007. 224 days later, on 02 April 2008, the patient presented to the physician's office with painful dysesthesias in her feet and legs. She also complained of numbness and tingling in her feet, which was reported to have been "going on for awhile". The numbness and tingling had progressed to her fingers and forearm. She was treated with gabapentin with no success. Subsequently, she was seen by a neurologist and was diagnosed with Guillain-Barre syndrome. Laboratory work was completed on an unspecified date and showed a sed rate of 30 and Rheumatoid factor greater than 15. At the time of this report, the patient had not recovered from the events. 11/4/08-records received-office visit 4/9/08-C/O numbness in both feet for 2-3 weeks progressively worse. Present in bottoms of feet only with pins and needles sensation and sharp stabbing pain. Able to walk and run without any problems. Assessment:sensory polyneuropathy subacute onset-probably Guillain-Barre syndrome. Office visit 4/11/08-more pain in feet and numbness is a little bit worse, denies weakness. Presented 4/15/08 with C/O either a viral syndrome or streptococcal pharyngitis, diarrhea, nausea and purulent pharyngitis. Impression: subacute sensory polyneuropathy of undetermined etiology, possibly Guillain-Barre variant.Office visit 5/20/08-largely asymptomatic since 4/21/08-working diagnosis is sensory variant of Guillain-Barre syndrome resolving.

Other Meds: ALBUTEROL, NASONEX

Lab Data: Sed rate 30, Rheumatoid factor greater than 15. 11/4/08-records received-4/11/08-EMG and nerve conduction studies consistent with mild predominantly sensory neuropathy. Motor conduction studies normal but motor distal latencies prolonged

History: The patient had a past medical history of asthma and Bell's palsy. On 07/Feb/2007, she presented to the physician's office with left sided facial numbness and swelling, and was diagnosed with Bell's palsy. 11/4/08-records received-PMH: breast infection, chicken pox and reactive airway disease.

MedDRA PT Injection site pain, Injection site swelling

Symptom Text: Immediately after administering the Hepatitis B vaccine in the left arm, which was the second vaccine administered in the left arm, the patient and I noticed swelling in the arm. No redness was noted in the left arm, but the patient did complain of some discomfort and pain. I asked the patient to wait in the waiting room for 15 minutes so that I could monitor any further swelling or reactions. After 15 minutes the swelling was not as significant as first noted. Yet, slight swelling remained. The patient was given two 200mg tablets of Ibuprofen.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Arrested labour, Caesarean section, Drug exposure during pregnancy, Foetal distress syndrome, Foetal heart rate decreased

Symptom Text: Initial and follow up information has been received from a certified nurse midwife and a nurse for the Pregnancy Registry for GARDASIL concerning a female (age not reported) who in July 2007, was vaccinated intramuscularly with the first 0.5 mL dose of GARDASIL. The certified nurse midwife reported that the patient was already pregnant (about 20 weeks gestation) when she received her first dose of GARDASIL. The patient sought unspecified medical attention. No other symptoms were noted. There was no product quality complaint involved. On 06-JUN-2008 a follow up telephone call was made to the doctor's office to know the patient's pregnancy outcome information and a telephone message was left. ON 11-JUN-2008 a nurse called back and reported that the patient had a primary cesarean section at term on 31-JAN-2008 and delivered a healthy and normal male baby weighing 7 lb, 10 oz. The baby's apgar score was 9/9. It was reported that the reason for the C-section was arrested descent in second stage with fetal intolerance to labor resulting in multiple deep variable decelerations. No complication was reported. Upon internal review patient having arrested descent in second stage of labor and fetal intolerance to labor resulting in multiple deep variable decelerations which required a cesarean section delivery were determined to be other important medical events. Additional information is not expected.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Information has been received from the Merck Pregnancy Registry for GARDASIL via a 25 year old female with depression, on CELEXA 20 mg daily, who on 29-OCT-2007 was vaccinated with the first dose of GARDASIL, 0.5 ml, injection form (lot# not specified). The second dose of GARDASIL, (Lot# not specified) was administered on 04-FEB-2008, and the third dose of GARDASIL, (Lot# not specified) was administered on 05-MAY-2008. On an unspecified date, she sought medical attention and had blood and urine tests performed (dates, test names and results were not noted). The patient reported that she was pregnant and her last menstrual period was 10-APR-2008, her estimated due date was calculated to be 16-JAN-2009. Follow-up information reported on 20-MAY-2008, 4 to 6 weeks from her last menstrual period, the patient had a spontaneous abortion. It was reported that the products of conception were not examined and it was unknown if the fetus was normal. Upon internal it was reported that spontaneous was an other important medical event. Additional information has been requested.

Other Meds: CELEXA mg

Lab Data: diagnostic laboratory - no results; diagnostic urinalysis - no results

MedDRA PT Asthenia, Confusional state, Convulsion, Dehydration, Hypothyroidism, Syncope vasovagal

Symptom Text: Information has been received from a certified medical assistant concerning a 17 year old female with no drug reactions/allergies who on 05-JUN-2008 was vaccinated with GARDASIL (lot number 659962/1740U) 0.5 mL IM. Concomitant therapy included SYNTHROID, LEXAPRO and LUNESTA. On 06-JUN-2008 at about 4 AM the patient experienced 2 seizures a few minutes apart. The patient was taken to the emergency room (ER), evaluated, released and referred to a neurologist. On an unspecified date a magnetic resonance imaging (MRI) and electroencephalography (EEG) was performed but results were not available. No other information was available. Upon internal review seizure was considered to be an other medical event. Additional information has been requested. 6/24/08 Reviewed PCP vax rec & medical record of 6/5/08 which reveal pt w/dysmenorrhea & on Yasmin. Otherwise in usual state of good health. 7/4/08 Reviewed ER medical records of 6/6/08. FINAL DX: weakness, dehydration & hypothyroidism & vasovagal syncope. Records reveal patient experienced syncope x 2 followed by seizure activity & then confusion while at home. No further seizure activity while in ER & d/c to home.

Other Meds: LEXAPRO; LUNESTA; SYNTHROID

Lab Data: magnetic resonance, results not available; electroencephalography, results not available LABS: CT, CXR, EKG WNL. EEG abnormal. Urine drug screen (+) benzodiazepines. TSH 19.3(H).

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Chest pain, Dyspnoea, Heart rate increased, Pulmonary embolism, Venous thrombosis

Symptom Text: Information has been received from a general practitioner concerning a 17 year old female who on 03-APR-2007 and 24-MAY-2007 was vaccinated with a first and second dose of GARDASIL (batch#NF12410/lot#1341F), which was well tolerated. On 26-NOV-2007 the patient was vaccinated into the upper arm with a third dose of GARDASIL (batch#NF46740/lot#0223U). Concomitant therapy included hormonal contraceptives (unspecified). On 08-FEB-2008 the patient complained of a sharp pain in chest, increased pulse frequencies and unusual dyspnea after easiest exposures. Based on massive increasement of D-Dimer and increased pulmonary artery pressure showed on echocardiogram, a diagnosis of severe pulmonary embolism (both sides) was established, and she was hospitalized. Diagnosis was confirmed by computerized tomography (spaces of contrast medium in both main pulmonary arteries). The beginning of the pulmonary embolism was found in a thrombosis of the left superficial femoral vein. Therapy with heparin and MARCUMAR was started. The patient also experienced venous thrombosis and coagulation factor VIII level increased and was hospitalized. A factor V Leiden mutation and a APC-resistance as factor II were ruled out. On 08-APR-2008 the following lab tests and diagnostic tests were performed: D-Dimer: 3.88mg/mL; CRP: 3.38 mg/dl; fibrinogen:632 mg/dl; leukocytes:13.0; There was massive increasement of TSH (up to 11micg/dl). An echocardiogram showed increased pulmonary artery pressures; computerized tomography showed spaces, openings of contrast medium in both main pulmonary arteries. Factor VIII activity was slightly increased and Factor VIII associated antigen (Von Willenbrand-antigen) activity was increased. The patient was discharged on 15-FE-2008. On 09-APR-2008 the patient underwent lab tests which included: fibrinogen: 4.8g/l (normal range: 1.8-3.5g/l); Factor VIII: 215% (normal range: 50-175%); D-Dimer: 0.30mg/L (normal range: 0.0.5mg/l); lipoprotein: 79.5 mg/dl (normal range: 0-30 mg/dl); FT3: 5.7 pmol/l (N: 2.7-7.6); FT4: 16.2 p

Other Meds: hormonal contraceptives (unspecified), Unk - Unk

Lab Data: echocardiography, 08Feb08, Increasement of pulmonary artery pressure; computed axial tomography, 08Feb08, spaces, openings of contrast medium in both Pulmonary Arteries; ultrasound, Thyroid gland-without pathological findings; WBC count, 08

MedDRA PT Abdominal pain, Diplopia, Fatigue, Hypoaesthesia, Leukoencephalomyelitis, Sensation of heaviness, Tremor, VIth nerve paralysis

Symptom Text: This report was identified from line listings obtained on request by the Company from the agency under the an Act. A 14 year old female with a previous illness of dizziness, "sight" and numbness was vaccinated with the second dose (also reported as 0 previous doses) of GARDASIL (lot # 659653/1448U), IM into the left arm, on 05-MAY-2008. Concomitant therapy included HAVRIX (unspecified) (lot # AHAVB222AA). On 16-MAY-2008, the patient complained of double vision, numbness in hands & feet, tremors, abdominal pain, heaviness in arms and fatigue. She was seen by the doctor who diagnosed sixth nerve palsy. The patient was admitted to the hospital. An MRI was performed on 23-MAY-2008. A lumbar function was also performed. The patient was diagnosed with Acute Disseminated Encephalomyelitis (ADEM). The listing indicated that one or more of the events required hospitalization, were considered to be disabling, and were considered to be immediately life-threatening. The original reporting source was not provided. The VAERS ID# is 316760. A standard lot check investigation was performed. All in-process quality checks for the lot in question were satisfactory. In addition, an expanded lot check investigation was performed. The testing performed on the batch prior to release met all release specifications. The lot met the requirements of the center and was released. No further information is available.

MedDRA PT Asthma, Dyspnoea, Hypoaesthesia, Loss of consciousness, Panic attack, Paraesthesia, Syncope, Tonic clonic movements

Symptom Text: Information has been received from a nurse practitioner (N.P.) concerning a 14 year old female with no pertinent medical history or drug reactions/allergies who on 16-MAR-2008 was vaccinated with a first dose of GARDASIL (lot# 659437/1266U) 0.5 mL IM. There was no concomitant medication. The N.P. mentioned that after receiving her first dose of GARDASIL on 16-MAR-2008 the patient has been experiencing episodic syncope with shortness of breath, numbness and tingling of the arms and then she passes out. The patient's teachers have reported that she has limb movement similar to a seizure. The episodes last about 5 to 10 minutes. The N.P. mentioned that the patient has had 10 or more of these episodes since 12-APR-2008. All the episodes have been witnessed at school, the episodes that occur at home have not been witnessed. On 19-Apr-2008 a spirometry test was performed and demonstrated a mild obstruction consistent with mild asthma. The patient was then placed on an albuterol inhaler. Additional laboratory and diagnostic tests were performed the same day. A chest X-ray, liver enzyme test, a kidney function and thyroid function test were normal. The patient's blood lymphocyte count was slightly decreased and blood monocyte percent was slightly elevated. The patient was seen in the emergency room the last week of April 2008 and was diagnosed with panic attacks. The patient was sent to a cardiologist who stated that there was no cardiac underlying reason for the episodes and he believes that the patient was having panic attacks. The patient was going to be sent to see a neurologist. At the time of reporting the patient was recovering from syncope, shortness of breath, numbness of the arm, panic attack, tingling of the arm and tonic-clonic movements and the outcome of asthma was unknown. No additional information was available. Additional information has been requested.

Other Meds: None

Lab Data: spirometry, 04/19/08, demonstrated mild obstruction consistent with mild asthma; chest X-ray, 04/19/08, normal; renal function study, 04/19/08, normal; hepatic function tests, 04/19/08, normal; thyroid function test, 04/19/08, normal; lymph

MedDRA PT Lymphadenopathy, Neck mass

Symptom Text: Information has been received from a mother concerning her daughter who in approximately 2007 was vaccinated with her first dose of GARDASIL (lot# not reported). Concomitant therapy included hormonal contraceptives (unspecified). The patient received the second dose of GARDASIL (lot# not reported) between September 2007 and February 2008. During the week of 14-APR-2008 the patient experienced a lump on the side of her neck. The doctor said it was an enlarged lymph node, cause unknown. She was treated with 2 antibiotics. She also saw a dentist for 2 impacted wisdom teeth but the dentist did not think it was connected with the lymph node. However the 2 impacted teeth were removed on 25-APR-2008 because they may have caused the lymph nodes to become infected. The patient's lump on the side of her neck persisted. Additional information has been requested.

MedDRA PT Asthenia, Fatigue, Menstrual disorder, Menstruation irregular, Pain, Vaccine positive rechallenge

Symptom Text: Information has been received from a physician concerning a 16 year old female who on 29-AUG-2007 was vaccinated intramuscularly with her first dose of GARDASIL (Lot # 658488/0930U) (site not reported). The patient has experienced pain and irregular menstrual cycles since administration. On 30-OCT-2007, the patient was vaccinated intramuscularly with her second dose of GARDASIL (Lot # 657006/0188U) (site not reported). On 03-MAR-2008, the patient was vaccinated intramuscularly with her third dose of GARDASIL (Lot # 6659657/1487U) (site not reported). On an unspecified date(s) the patient had a CBC, TSH and glucose test performed, no results reported. On 29-APR-2008, the patient had an office visit where she informed the physician that she was still experiencing weakness, fatigue and menstrual problems. The patient was treated with PONSTEL (not further specified). Additional information has been requested.

MedDRA PT Dysuria, Erythema, Pruritus, Vaginal infection

Symptom Text: Information has been received from a registered nurse concerning a 12 year old female with anxiety disorder and reflux oesophagitis and no drug reactions/allergies who on 03-JAN-2007 was vaccinated with a first dose of GARDASIL 0.5 mL IM. Concomitant therapy included LEXAPRO and PREVACID. On 01-MAR-2007 the patient was vaccinated with a second dose of GARDASIL in her pediatrician's office. The patient has not received a third dose. On 15-MAR-2007 the patient developed persistent recurrent vaginitis, severe dysuria with itching and redness in the genital area. Medical attention was sought. On an unspecified date urinalysis and vaginal cultures were negative. The patient was treated with multiple courses of oral DIFLUCAN, MYCOLOG cream, MONISTAT cream, an estrogen vaginal cream and one of course of VALTREX. The symptoms recurred when treatment was discontinued. At the time of reporting it was unknown if the patient had recovered. No further information was provided. Additional information has been requested.

Other Meds: LEXAPRO; PREVACID

MedDRA PT Delivery, Drug exposure during pregnancy

Symptom Text: Information has been received through the pregnancy registry for GARDASIL from a medical assistant concerning a 26 year old female with erythromycin hypersensitivity who on 27-FEB-2007 was vaccinated with a dose of GARDASIL (Lot# 656372/0243U), 0.5 ml. Concomitant therapy included NUVARING. The patient received GARDASIL while being pregnant (LMP 05-FEB-2007). Follow-up phone call information has been received from a nurse who reported that the patient delivered an 8 pound male, at 39 weeks EGA, with Apgars of 8 and 9. Thick mecomium was noted after artificial rupture of membranes during labor. The baby was healthy, normal and there were no complications. No additional information is expected.

MedDRA PT Drug exposure during pregnancy, Gestational diabetes, Live birth, Postpartum haemorrhage, Urinary tract infection

Symptom Text: Initial and follow-up information has been received from a nurse practitioner concerning a 26 year old female with a history of 2 pregnancies, 2 elective terminations and 0 live births and a history of scoliosis who on 02-FEB-2007 was vaccinated with GARDASIL (Lot number 653776/0014U). Subsequently, the patient discovered she was pregnant. On 06-MAR-2007, the patient underwent an ultrasound because she was unsure of her last menstrual period which revealed an intrauterine pregnancy, 9 weeks, 2 days. Her last menstrual period was determined to be 28-DEC-2006, with an expected delivery date of 07-OCT-2007. On 20-MAR-2007 the patient developed a urinary tract infection and was treated with KEFLEX qid x 7 days. On an unspecified date it was reported that the patient had a 3 hour glucose tolerance test performed, which showed elevated value. The patient's gestational diabetes mellitus did not require insulin therapy. On 02-OCT-2007 the patient delivered a normal, healthy baby girl with no congenital anomalies weighing 6 lbs 4 oz (length not reported). Apgar scores were 7 and 9. The patient experienced a post partum hemorrhage (not further specified). Additional information is not expected.

Other Meds: Unknown

Lab Data: ultrasound, 03/06/07, intrauterine pregnancy, 9 wk 2 day; beta-human chorionic; glucose tolerance test, 3 hr; 1 elevated value

MedDRA PT Drug exposure during pregnancy, Live birth, Pregnancy induced hypertension

Symptom Text: Initial and follow-up information has been received from the Merck Pregnancy Registry via physician concerning a 26 year old female with a history of Epstein-Barr virus infection, who on 09-MAR-2007 was vaccinated with a first dose of GARDASIL. On 10-MAY-2007 the patient was vaccinated with the second dose of GARDASIL. Subsequently the patient became pregnant. The patient's last menstrual period was on 22-JUN-2007. The estimated date of delivery is on 28-MAR-2008. Unspecified medical attention was sought. Ultrasounds were performed on 14-AUG-2007, 17-SEP-2007, and 13-NOV-2007 and were all within normal limits. At the time of the report patient's outcome was unknown. Follow-up information indicated that 37 1/7 weeks from her last menstrual period on 09-MAR-2008 the patient gave birth to a female infant. The infant weighed 7 pounds 3 ounces, and her apgar score was 9/9. The infant was normal with no congenital anomalies. The patient had no previous pregnancies and one full term delivery. Complications were possible mild pre-eclampsia and mild shoulder dystocia during labor and delivery. During pregnancy the patient experienced pregnancy induced hypertension (PIH). Diagnostic tests performed during pregnancy were a 24 hour urine every 6 weeks and NST's every week at starting at 32 weeks. Additional information is not expected.

MedDRA PT Drug exposure during pregnancy, Live birth, Placenta praevia, Small for dates baby

Symptom Text: Initial and follow-up information has been received from a certified medical assistant concerning a 22 year old female who had one previous pregnancy and one full term delivery, who on 31-JAN-2007 was vaccinated intramuscularly with a 0.5mL first dose of GARDASIL (Lot# 654540/0800F). On 29-MAR-2008 the patient was vaccinated with a second dose of GARDASIL (Lot# 654885/1424F). In July 2007 the patient was determined to be pregnant. Her third dose of GARDASIL will be delayed until after completion of the pregnancy. No problems were reported. The patient sought unspecified medical attention. On 28-AUG-2007 an ultrasound was performed for dating and the results were placenta previa. On 28-NOV-2007 a repeat ultrasound revealed small gestational age and on 24-JAN-2008 an ultrasound revealed placenta previa resolved. At the time of the report, the patient's outcome was unknown. No product quality complaint was involved. Follow-up information indicated that 40.5 weeks from her last menstrual period on 13-MAR-2008 the patient gave birth to a male infant. The infant weighed 7 pounds and had an Apgar score of 9/9. The infant was normal with no congenital anomalies and no abnormalities. The complication of marginal placenta previa took place during the pregnancy. Other medication taken during the pregnancy starting on 23-JUL-2007 included prenatal vitamins once daily. Additional information is not expected.

Other Meds: vitamins (unspecified)

MedDRA PT Drug exposure during pregnancy, Live birth

Symptom Text: Information has been received from the Pregnancy Registry for GARDASIL from a 23 year old female with a latex allergy and no pertinent medical history who on 22-FEB-2007 was vaccinated with a dose of GARDASIL (lot # unknown) injection. Concomitant therapy included "CHANPIX" [therapy unspecified]. On 22-FEB-2007 the patient received GARDASIL when she was 5 weeks pregnant. The date of the last menstrual period was approximately 01-JAN-2007. Medical attention was sought. On an unspecified date a pregnancy test was performed to confirm the results. The patient is currently 6 months pregnant. The estimated date of delivery is 08-OCT-2007. No further information is provided. Follow-up information was received from the patient. The patient called and advised that she will be in 90-95% range to have a high birth weight baby. (9lbs +). Patient advised that she may require a c-section. Follow-up information was received from the LPN and reported that the baby had a full-term live birth (female) weighing 7 pounds 3 ounces. The LPN had no further information. Follow-up was also received from the patient who reported her baby is now 7 months old and has a right hip "click". The baby was evaluated by a specialist (not specified) who told her the baby was normal. No further information was provided about the baby. Additional information has been requested.

MedDRA PT Drug exposure during pregnancy, Pregnancy induced hypertension, Premature baby, Premature labour, Streptococcal identification test positive

Symptom Text: Initial and follow up information has been received through the Merck pregnancy registry through a health care professional concerning a 21 year old female with nausea and pain, with a history of 1 pregnancy and 0 live births and a history of alcohol abuse, Papanicolaou smear abnormal, who had a colposcopy and a loop electrosurgical excision procedure performed in April 2007. On 13-Mar-2007 the patient was vaccinated with her first dose of GARDASIL (lot number 655617/1447F) and on 14-May-2007 the patient received the second dose of GARDASIL (lot number 653736/0014U). Concomitant therapy included NUVARING until May 2007, VITRUM PRENATAL, PHENERGAN and ADVIL. the patient had on OB panel on 13-Sep-2007 and a Pap on 09-Oct-2007, results reported as "abnormal". Patient is now pregnant (LMP=20-Jul-2007) estimated delivery date of 26-April-2007. As of 10-Sep-2007 the patient is taking prenatal vitamins and PHENERGAN. The patient's obstetric history included 1 previous pregnancy which ended in an elective termination at an unknown number of weeks from LMP. A prenatal ultrasound was done on 04-DEC-2007 which showed to be normal. The estimated delivery date was mentioned as 25-APR-2008 (previously reported as 26-APR-2007). The patient sought medical attention with an office visit. No adverse experience related to this event. In follow up information from the doctor's office it was reported that mother had pregnancy induced hypertension and preterm labor (no onset dates reported). It was also reported that she was positive for group B streptococcus agalactiae (+GBs) (date of onset not reported). On 25-MAR-2008 she delivered a normal male baby 35 weeks 3 days from her LMP. The baby weighed 7 lb 1 oz and his length was 19.5". His Apgar score was 7/8 and head circumference was 12.6". No complication or abnormalities were reported. Additional information is not expected.

Other Meds: VITRUM PRENATAL, NUVARING, ADVIL 200mg, PHENERGAN (PROMETHAZINE) 25mg

MedDRA PT Drug exposure during pregnancy, Pre-eclampsia, Prolonged labour

Symptom Text: Information has been received from a licensed practical nurse for the Merck pregnancy registry for GARDASIL concerning an 18 year old female who on 08-JUN-2007 was vaccinated intramuscularly with the third dose of GARDASIL (lot# not reported). Per the nurse, the patient received the third dose of GARDASIL while pregnant (LMP=17-Apr-2007). The pregnancy was confirmed by a urine pregnancy test. The reporter did not know when the patient received the first or second dose of GARDASIL. The patient sought unspecified medical attention in the physician's office. The reporter requested that all correspondence take place via mail as opposed to fax and that the mailing envelope be marked "CONFIDENTIAL". Additional information received from pregnancy questionnaire and telephone memo (27-MAY-2008): On 15-FEB-2008 the patient gave birth to a normal, female baby (7.5 pounds, 20 inches long). The patient developed pre-eclampsia at full-term and had a long "30-hour" labor. Both the mother and baby are doing well. Additional information is not expected.

Other Meds: Unknown

Lab Data: ultrasound; urine beta-human, positive

MedDRA PT Delivery, Drug exposure during pregnancy

Symptom Text: Information and follow up has been received from a physician for the Pregnancy Registry for GARDASIL concerning a 14 year old Caucasian female who on approximately 04-OCT-2007 was vaccinated with her first dose of GARDASIL (lot# not reported). Subsequently the patient was about 16 weeks pregnant (estimated LMP was 05-JUN-2007) with a due date of 13-MAR-2008. On 07-DEC-2007 the patient had a level 2 ultrasound for mild cerebral dilated ventricles in the fetus. The patient is taking prenatal vitamins (unspecified) daily. The patient was seen in the office and her outcome was not reported. Additional information has been requested. The patient delivered a healthy female baby on 10-MAR-2008 by vaginal delivery. There were no complications during the delivery and no known abnormalities in the baby. The nurse practitioner indicated that the lateral ventricle dilation found on ultrasound had gotten smaller prior to delivery. The babies birth weight was 7lbs. 5oz.

Other Meds:

Lab Data: Ultrasound, 12/07/07, lateral ventricle dilation.

MedDRA PT Delivery, Drug exposure during pregnancy, Infectious mononucleosis

Symptom Text: Information and follow-up information has been received from a physician's office worker and a nurse practitioner for the Pregnancy Registry for GARDASIL, concerning an 18 year old female who on 29-MAY-2007, 30-Jul-2007 and 02-Jan-2008 was vaccinated with her 0.5 ml first (lot# 657622/0388U), second (lot# 657622/0388U) and third (lot#659055/1522U) doses, respectively, of GARDASIL. Nurse reported that it was the patient's daughter or her friend, who told her about patient's pregnancy. Nurse noted that the patient was approximately 7 months pregnant (LMP approximately 15-Aug-2007). Unspecified medical attention was sought by contacting nurse. In September 2007, it was reported that the patient had mononucleosis, and was treated with AMOXIL, 500 mg BID. It was reported that on 30-Apr-2008 (40 weeks from LMP), the patient delivered a normal male baby. The baby weighed 7 lbs 6 oz and was 20.5 inches long. The patient had no complications during pregnancy and labor. No additional information is available.

MedDRA PT Drug exposure during pregnancy, Ear pain, Impetigo, Inappropriate schedule of drug administration, Pain in jaw

Symptom Text: Information has been received through the Merck pregnancy registry concerning a 16 year old female, with no medical history or allergies reported, who on 30-JUL-2007 and 30-NOV-2007 was vaccinated with the first and second doses of GARDASIL, respectively (Lot # first dose 655617/1447F; second dose 657617/0384U). Concomitant medication included BACTRIM DS and ibuprofen. It was reported that the patient is now pregnant. On 22-AUG-2007 the patient complained of jaw pain. On 16-JAN-2008 the patient complained of ear pain. On 25-JAN-2008 to 4-FEB-2008 the patient had impetigo. On 01-APR-2008 an ultrasound was performed in the third trimester due to no prior obstetrical care. Results were not reported. No problems were reported. On 01-MAY-2008 the patient delivered a 7 pound 6 ounce male infant, length 21 inches, a head circumference of 38 centimeters and Apgar scores 9/9. There were no congenital anomalies or other complications or abnormalities noted. There were no complications reported during the pregnancy or during labor/delivery. No product quality complaint was involved. No further information is available.

Other Meds: ibuprofen, ibuprofen, BACTRIM DS TABLETS

Lab Data: ultrasound, 04/01/08, normal; 3rd trimester assessment, no prior OB care

MedDRA PT Smear cervix abnormal

Symptom Text: Information has been received from a registered nurse concerning approximately eleven college-aged females who on unspecified dates, were vaccinated with the first, second and third doses of GARDASIL. Subsequently the patient's were experiencing abnormal pap smears since receiving GARDASIL. Prior to receiving the GARDASIL, the patient's had normal pap smears. The patient's sought unspecified medical attention. Follow up information from the registered nurse indicated that she has no medical records for these patients and that the girls live in three separate states. At the time of the report, the patient's outcomes were unknown. No product quality complaint was involved. No further information is available.

MedDRA PT Cold sweat, Dizziness, Panic attack, Paraesthesia

Symptom Text: Information has been received from a nurse concerning an 18 year old female with a history of a panic attack not related to GARDASIL who on 11-FEB-2008 was vaccinated intramuscularly with her first dose of GARDASIL (lot # not reported). On 07-MAY-2008 the patient was vaccinated intramuscularly with her second dose of GARDASIL (lot# reported as 657706/1439U). Following the vaccination on 07-MAY-2008, the patient experienced a panic attack, tingling in fingers, dizziness, felt faint and clammy. The patient's blood pressure prior to injection was 100/80 and her temperature was 98.8F. The patient was assisted to supine position and rested in office. The patient felt better after resting and was instructed to see her primary care physician. On 08-MAY-2008 the patient recovered from the panic attack, tingling in fingers, dizziness, feeling faint and clammy. Additional information has been requested.

Other Meds: Unknown

MedDRA PT Drug exposure during pregnancy, Headache

Symptom Text: Information has been received from a nurse, for the Merck pregnancy registry, concerning a 15 year old female with no previous medical history or no known drug allergies who on 21-MAY-2007 was vaccinated intramuscularly in the left deltoid with a 0.5 ml first dose of GARDASIL (Lot # 654535/0960F). On 21-MAY-2007, the patient developed a headache and took over the counter ibuprofen. On 16-JAN-2008, the patient was vaccinated intramuscularly in the right deltoid with a 0.5 ml second dose of GARDASIL (Lot# 658558/1061U). On 26-MAR-2008, the patient was vaccinated intramuscularly in the right deltoid with a 0.5 ml third dose of GARDASIL (Lot# 659657/1487U). On 13-MAR-2008, the patient had a pre natal check up and lab work, blood test, and a pregnancy test. It was reported that the patient is now pregnant with a LMP of 15-Dec-2007. Unspecified medical attention was sought in the office. The patient's outcome was unknown. Additional information has been requested.

MedDRA PT Excoriation, Furuncle, Skin discolouration

Symptom Text: Information has been received from a physician concerning 3 females who were vaccinated on unspecified dates with a dose of GARDASIL (lot#'s not reported). In approximately March-April 2008 the patient's experienced boils. Each patient had the boil in a different location. One patient's boil was under the arm: another patient's was in the groin area and the third patient's was on the outside of the calf. The one on the calf was reddish gray with an abrasion below it. One patient received the second dose of GARDASIL and has refused to get the 1st dose. A phone call was placed on 13-MAY-2008 to obtain more information, but the call has not been returned. Additional information has been requested.

MedDRA PT Injected limb mobility decreased, Injection site pain, Scar

Symptom Text: Information has been received from a physician concerning a 17 year old female who on 25-MAY-2007 was vaccinated with the first dose of GARDASIL (lot# 656051/0244U). On 27-JUL-2007 the patient was vaccinated with the second dose of GARDASIL (lot# 658100/0525U). On 27-NOV-2007 the patient was vaccinated with the third dose of GARDASIL (lot# 655327/1287U). On 08-May-2008 the office manager reported that the patient experienced pain and decreased movement in the injection site arm on the same day of vaccination with the third dose of GARDASIL, 27-NOV-2007. The patient was seen in the office on 20-DEC-2007 and was referred to a neurologist (outcome unspecified). On 08-May-2008, the office manager reported that the patient was still having pain in the injection site arm, but it was improving. The arm had no redness, no numbness, no tingling or masses and the arm had normal capillary appearances. A scar was noted (not clear if the scar was related to vaccination). There was no other information to report. Additional information has been requested.

MedDRA PT Papilloma viral infection, Sickle cell anaemia, Smear cervix abnormal

Symptom Text: Information has been received from a nurse practitioner concerning a 25 year old female, with a family history of sickle cell anemia (Father), lupus (mother) and stroke due to lupus (mother), who on 02-APR-2007 was vaccinated intramuscularly in the left deltoid with her first dose of GARDASIL (Lot # not reported). On 12-JUN-2007, the patient was vaccinated intramuscularly in the right deltoid with her second dose of GARDASIL (Lot # reported as "0089O"). On 14-DEC-2007, the patient was vaccinated intramuscularly in the left deltoid with her third dose of GARDASIL (Lot # 655324/0089U). The nurse practitioner reported that the three GARDASIL doses were given at another office. Concomitant therapy included hormonal contraceptives (unspecified). The reporter stated "birth control started on 26-MAR-2007 (Patient was on birth control prior to this date but stopped at an unspecified time due to family reasons)". On 23-APR-2008 the patient had a thin prep PAP smear "(a high risk HPV test gets done goes along with thin prep PAP)." On 01-MAY-2008, the results of the PAP smear and HPV test were reported and the HPV test was positive. Previous pap smears performed on 09-JUN-2006 and 26-MAR-2007 were negative for lesions and malignancy. On an unspecified date, the patient was found to be positive for sickle cell anemia and will be going to a specialist. The patient will be going for a colposcopy for the abnormal PAP results. No further information was provided. Additional information has been requested.

Other Meds: hormonal contraceptives

Lab Data: Pap test, 06/09/06 - negative for intraepithelial lesion and malignancy; Pap test, 03/26/07 - negative for interferential lesion and malignancy; hemoglobin S test - positive

MedDRA PT Hypokinesia, Injected limb mobility decreased, Pain in extremity, Presyncope, Vomiting

Symptom Text: Information has been received from a nurse practitioner concerning a 20 year old female who on 07-MAR-2008 was vaccinated IM with the first dose of GARDASIL (659964/1978U). Per the reporter, the patient experienced extreme pain in her arm after receiving the first dose of GARDASIL. The pain was experienced in the same arm that the vaccine was administered and the patient noted that the pain made it difficult for her to move her arm. It was also noted that the patient nearly fainted at the office on the day of administration and that the patient had experienced vomiting in the evening of the date of administration. The patient sought unspecified medical attention in the physician's office. Subsequently, the patient recovered from her extreme pain, decreased mobility, near fainting and vomiting. No further information was provided. Additional information has been requested.

MedDRA PT Injection site discolouration, Vaccine positive rechallenge

Symptom Text: Initial information and follow up has been received from a nurse concerning a 26 year old female who on 22-APR-2008 was vaccinated in the left deltoid with her third dose of GARDASIL (lot# 659964/1978U0. On 22-APR-2008 the patient stated that she developed a white area around the injection site from the last two injections. The nurse did see a vague white area- half circle to the left of what looks like the needle stick. Also looks like white vague outline of a bandaid. The patient sought unspecified medical attention and her outcome was not reported. On 14-SEP-2007 the patient was vaccinated in the left deltoid with her first dose of GARDASIL (lot# 658554/0928U). On 16-NOV-2007 the patient was vaccinated in the left deltoid with her second dose of GARDASIL (lot# 659437/1266U).

MedDRA PT Incorrect route of drug administration, Injection site erythema, Injection site irritation

Symptom Text: Information has been received from a health professional concerning a 19 year old female with an allergy to DEMEROL, morphine and penicillin who on 11-OCT-2007 was vaccinated with her first dose of GARDASIL (lot# 658563/1063U). On 03-JAN-2008 the patient was vaccinated with her second dose of GARDASIL (lot# 659439/1267U). On 07-MAY-2008 the patient was vaccinated with her third dose of GARDASIL (lot# 660389/1968U). The third dose may have been administered subcutaneously. Concomitant therapy included YASMIN. On 07-MAY-2008, within 15 minutes of the dose, the patient experienced burning and redness at the injection site. The patient was being treated with BENADRYL, antibiotics and cool compresses applied to the injection site. The patient was seen in the office and her outcome was unknown. Additional information has been requested.

MedDRA PT Medical device complication, Pharmaceutical product complaint, Syncope

Symptom Text: Information has been received from a healthcare worker concerning a 15 year old female who on 07-NOV-2007 was vaccinated with a first dose of GARDASIL (lot # not reported). On 10-JAN-2008 the patient was vaccinated with a second dose of GARDASIL (lot # not reported). On 12-MAY-2008 the patient was vaccinated with a third dose of GARDASIL (lot # 0152X). It was reported that "when attempting to administer the GARDASIL syringe, the plunger would not depress. According to the medical assistant, the white plastic tray was crushed at the end. The plastic seal was loose and up at the damaged end. The carton was not damaged. The syringe was removed from the package and the needle was placed on the syringe. The needle was in the patient's arm and the plunger would not depress. When the needle was removed from the arm, the safety device activated. The syringe was discarded because the patient fainted and the medical assistant needed to put the syringe in a safe place." It was also reported that "they have been using the syringe for a while and are familiar with its use. The product was ordered directly from Merck. This was a product quality complaint. The patient was vaccinated successfully with another prefilled syringe. There were no problems reported. The SR# is 13050492422. Additional information has been requested.

MedDRA PT Drug exposure during pregnancy, Menstruation irregular, Metrorrhagia

Symptom Text: Information has been received from a Licensed Practical Nurse for the Pregnancy Registry for GARDASIL, concerning her 19 year old daughter with asthma and scoliosis who on 17-OCT-2007 was vaccinated intramuscularly with a first dose of GARDASIL (lot # not reported). The nurse reported that her daughter received her first dose of GARDASIL and afterwards experienced irregular period with spotting. On 23-JAN-2008 the patient was vaccinated intramuscularly with her second dose of GARDASIL (lot # not reported) and the patient reported that her period was "not right". The patient believes her LMP was 21-FEB-2008. Concomitant therapy included YAZ, ascorbic acid, cyanocobalamin, omega-3 marine triglycerides and iron (unspecified). The patient also reported that she took YAZ at night time and she forgot to take it one night but then took it the next morning. The patient's mother believes that the birth control failed because of GARDASIL. The mother also reported that the patient was taking YAZ while she was pregnant. An ultrasound on 13-MAY-2008 showed that the patient was 8 weeks 4 days pregnant. Additional information has been requested.

MedDRA PT Pneumonia primary atypical, Weight increased

Symptom Text: Information has been received from a consumer concerning her 10 year old granddaughter who in "late 2007" was vaccinated with her first dose of GARDASIL (Lot #, site and route not reported). In "early 2008", the patient was vaccinated with her second dose of GARDASIL (Lot #, site and route not reported). Subsequently the patient experienced weight gain after the first dose of GARDASIL. It was reported that the weight gain started "within months of the first dose". The patient "now has walking pneumonia" for which she is taking DELSYM. The patient sought unspecified medical attention. The patient's weight gain and walking pneumonia persisted. No additional information was provided. Additional information has been requested.

MedDRA PT Injection site bruising

Symptom Text: Information has been received from a physician concerning a 13 year old female with no previous medical history or no known drug allergies, who in April 2008, was vaccinated IM in the left arm with a 0.5 ml first dose of GARDASIL (lot# 658094/0524U). There was no concomitant medication. For the first week after the vaccination the patient would develop a "bruised area" at the injection site after someone touches or hits the area. Unknown medical attention was sought via telephone. The bruising resolved one week after the injection. Additional information has been requested.

MedDRA PT Arthralgia, Arthritis, Joint swelling, Musculoskeletal stiffness, Oedema peripheral, Pain in extremity, Rheumatoid arthritis, Steroid therapy, Vaccine positive rechallenge

Symptom Text: Information has been received from a physician concerning a 21 year old female with Asthma who on 03-OCT-2007 was vaccinated IM in deltoid with a first dose of GARDASIL (Lot# 658556/1060U). On 05-Dec-2007 the patient received IM deltoid the second (lot# 659435/1265U) and IM deltoid the third dose on 31-Mar-2008 (lot# 659964/1978U). The patient experienced arthritis like symptoms after receiving each of the three doses. The patient experienced pain and stiffness in both hands, feet and her right knee. The patient first experienced the symptoms after the first dose. The symptoms improved by the time the patient was due for the second dose but never completely resolved. When the patient received the second dose the symptoms returned and the same pattern of improvement and return of symptoms was experienced when the patient received the third. It was noted that the symptoms improved but never completely resolved. The patient was treated with anti-inflammatory medications VENTILAN and NAPROXEN. The patient was seen by a physician. The patient was recovering. Follow up information received indicated that on 10-Oct-2007, the patient experienced bilateral, symmetric joint pain and swelling in hands and feet. The patient was being evaluated by Rheumatology for rheumatoid arthritis. Diagnostic laboratory tests were pending. At the time of reporting the patient had not recovered. Additional information has been requested. 7/4/08 Reviewed GYN office records of 3/31/2008. Requested additional vax records & office records. Records reveal patient experienced usual state of good health w/o complaints on day of final vaccination. 7/11/08 Received vax records & GYN office records. No complaints noted on any vaccination dates. 5/12/2008 pt presented w/joint pain. Stated 1 wk after initial injection, developed stiffness & swelling of right hand w/limited ROM of fingers & stiff throughout the day. Also had bilateral foot pain & swelling, unable to wear high heel shoes. Right knee pain. Stated symptoms worsened after eac

MedDRA PT Injection site rash, No reaction on previous exposure to drug, Rash

Symptom Text: Information has been received from a medical assistant concerning an 18 year old female with allergies and pertinent medical history reported as none, who on 18-MAR-2008 was vaccinated with the first dose of GARDASIL (lot # 659055/1522U), 0.5ml, IM to the left arm and no reaction developed. Concomitant therapy included YAZ. On 13-MAY-2008 the patient was vaccinated with the second dose of GARDASIL (lot # 659182/1957U, 0.5ml, IM to the left arm). Following vaccination, the patient was observed for 15 minutes and no reaction was experienced. Per the patient's mother who is a nurse, a rash developed three hours afterwards. The rash started at the injection site, spread to the right arm, the patient's stomach and face, the patient took BENADRYL. The next morning, 14-MAY-2008, the patient's rash resolved and the patient's mother telephoned the doctor's office to report the event. No product quality complaint was involved. Additional information has been requested.

MedDRA PT Face injury, Loss of consciousness

Symptom Text: Information has been received from a secretary of a physician's office concerning a 19 year old female who on 15-MAY-2008 was vaccinated (route unknown) with a first dose of GARDASIL (Lot # 660393/0067X). On the same day the patient was vaccinated with a dose of tuberculin purified protein derivative (PPD, unspecified). On 15-MAY-2008 the patient passed out 10 to 20 seconds after vaccination and hit her face. The physician attended to the patient and the rescue squad was contacted. She was brought to the emergency room where blood work, x-rays and EKG were performed. All tests results were normal. The patient was not admitted to the hospital and released from the emergency room that same evening. It was also mentioned that this patient is "not apprehensive". Subsequently on 15-MAY-2008 the patient recovered. No product quality complaint was involved. Additional information has been requested.

MedDRA PT Hypoaesthesia facial, Injection site pain

Symptom Text: Information has been received from a health professional from a physician's office a 25 year old female with type 2 diabetes mellitus and a history of migraines who on 18-OCT-2007 and 11-DEC-2007 was vaccinated intramuscularly with a 0.5 mL first and second dose of GARDASIL (Lot #'s 658563/1063U and 659441/1446U), respectively. Concomitant therapy included NUVARING and LEVAQUIN. The caller reported that the patient was in the office today (16-MAY-2008) to receive the third dose of GARDASIL. At that time the patient stated that "the day after receiving the second dose, on 12-DEC-2007, she experienced pain in her arm at injection site and numbness in her face lasting 4 days". The patient was seen by her family doctor for symptoms. The third dose of GARDASIL was not administered. No laboratory diagnostic studies were performed. Subsequently, on approximately 16-DEC-2007 the patient recovered. No product complaint was involved. Additional information has been requested.

MedDRA PT Blood urine present, Incorrect route of drug administration, Pyrexia, Vomiting

Symptom Text: Initial information has been received from a health professional concerning an 18-19 year old female who on 14-JUN-2008 was inadvertently vaccinated by intravenous route with a 2nd dose of GARDASIL. On 15-JUN-2008 the patient presented fever (38.6 centigrade) and vomiting. The patient took motilium to treat vomiting and after attending the physician she was administered primperan to treat the vomits and Ibuprofen to treat fever. The patient breathed and urinated well. Follow up information was received. The patient continued with fever (39.6 centigrade). On 15-JUN-2008 the patient went to the clinic, she was vaccinated and there, they indicated her to continue the treatment with Ibuprofen. A blood test showed a neutrophyls deviation (85%). Leukocytes remained at normal levels (4700). Blood in urine was observed, but was not considered relevant as subject was menstruating. An internal medicine physician examined the patient and said that she had an hyperreactivity to a strange protein. In the afternoon, after contacting patient's mother the health care professional reported that the patient did not feel worse during the night. She was being treated with Ibuprofen 600 mg/8 hour and paracetamol 500/8 hour (rotating medication every four hours). The patient presented mild fever on 15-JUN-2008 in the morning (37.5 centigrade). The health professional considered that these adverse events could also occur with the correct vaccine administration. The patient recovered. No further information is available. The case was closed. Other business partner numbers included E2008-05547.

MedDRA PT Migraine, Paraesthesia, Weight decreased

Symptom Text: Information has been received from a physician concerning a 14 year old female who was vaccinated with the first dose of GARDASIL, lot # not provided, on 30-NOV-2007. This vaccination was well tolerated. It was reported by the physician (who received the information from a patient's mother) that the 14-year-old female patient was vaccinated with a second dose of GARDASIL (lot # not reported) i.m. into the upper arm on 03-JAN-2008. In the beginning of May-2008, the patient developed paresthesia, migraine and weight loss. She was hospitalized for diagnostics; no reports on findings were made available to the reporter. The events were ongoing at the time of reporting. According to the patient's mother, "the symptoms improve while her daughter listens to loud music via an MP3-player." The reporting physician does not see a causal relationship to the vaccination (P2). Other business partner numbers included: E2008-05224. No further information is available.

MedDRA PT Drug exposure during pregnancy, Ovarian cyst

Symptom Text: Information has been received from a registered nurse for the Pregnancy Registry for concerning a 15 year old female with no medical history and no drug reactions/allergies, who on 01-Oct-2007, 03-Oct-2007 and 08-Apr-2008 was vaccinated intramuscularly with first, second and third doses, respectively, of 0.5ml of GARDASIL (lot #'s: 658560/1062U, 658563/1063U, 659439/1267U) and became pregnant. Concomitant therapy on 01-Oct-2007, included MENACTRA. On 08-APR-2008 the patient was diagnosed with ovarian cyst. The patient sought unspecified medical attention with another physician. On unspecified date abdominal CT scan for ovarian cyst was performed (results not reported). On unspecified date the patient took urine pregnancy test that positive (LMP=18-Mar-2008). Outcome unknown. No further information available. Additional information has been requested.

MedDRA PT Fall, Head injury, Syncope, Vaccine positive rechallenge

Symptom Text: Information has been received from a physician concerning a 23 year old female who was "very nervous and anxious upon receiving" the first dose of GARDASIL (lot # not reported). The physician reported that he administered the first dose of GARDASIL to the patient who fainted after receiving the vaccine. The patient was given some juice and sat in a chair for 15 minutes after the first episode and then fainted again. She fell to the floor and hit her head. She did not have to go to the hospital, but the doctor reported that he felt there might be some underlying cardiac issue. The patient was referred to a cardiologist. The physician did not feel this was directly caused by GARDASIL because the patient shared that she had this same experience when receiving other vaccines. Patient outcome was not reported. Additional information has been requested.

MedDRA PT Injection site erythema, Injection site pruritus, Injection site reaction, Injection site swelling, Wrong drug administered

Symptom Text: Information has been received from a nurse midwife for the Pregnancy Registry for GARDASIL concerning a 26 year old female with an allergy to morphine, who on 12-MAY-2008 was vaccinated intradermally with GARDASIL (lot# not reported) while pregnant. There was no concomitant medication. It was reported that the patient received GARDASIL when the patient was 7 weeks 3 days pregnant (LMP = 21-Mar-2008) and the estimated date of delivery was 27-Dec-2008. The patient was to get a tuberculosis skin test and in error received GARDASIL intradermally. No product confusion was discovered, but the nurse midwife was not sure how the error was made. On 12-May-2008 after vaccination, the patient developed a local reaction at the injection site, described as itchy, raised and red 2 cm in diameter. Unspecified medical attention was sought during an office visit. At the time of this report, the patient's local reaction at the injection site, persisted. No other information available. Additional information has been requested.

MedDRA PT Injection site pain, Sensation of heaviness

Symptom Text: Initial and follow up information has been received from a nurse and an office worker concerning "almost all" patients (number of patients unspecified) who were vaccinated with GARDASIL (lot# not reported). The patients have been complaining of "heaviness" in the entire arm and "extreme pain" at the injection site after vaccination. It was reported that the pain occurs with all three doses. Patient outcomes were not reported. Patients reportedly sought unspecified medical attention by contacting the office. Subsequently, the patient recovered from "heaviness" in the entire arm and "extreme pain" at the injection site (not further specified). Attempts are being made to obtain additional information to distinguish the individual patients mentioned in this report. Additional information will be provided if available. Additional information has been requested.

MedDRA PT Adverse event

Symptom Text: Information has been received from a Hair Dresser concerning an approximately 14 or 15 year old female customer who was "recently" vaccinated with GARDASIL. The Hair dresser reported that she tried to dye the patient's hair blond, she noticed the color bubbled and got hot and started turning blond very quickly and she had to wash it off immediately. At the time of the report the patient's outcome was unknown. Additional information is not expected.

MedDRA PT Dizziness, Incorrect route of drug administration, Injection site erythema, Injection site pain, Injection site swelling, Paraesthesia

Symptom Text: Information has been received from a licensed practical nurse concerning a 21 year old female with penicillin allergy who on 29-MAY-2008 was vaccinated with a first dose of 0.5 ml GARDASIL via a subcutaneous route. There were no concomitant medications. On 29-MAY-2008, after receiving her first dose she felt lightheaded, the injection site became red and swollen, pain radiated down to her pinky and she felt "tingles" on the left side of her face. She sought unspecified medical attention from the nurse. At the time of the report the patient was recovering. Additional information has been requested.

MedDRA PT Hot flush, Pain in extremity, Palpitations, Paraesthesia, Pharyngolaryngeal pain, Rhinorrhoea

Symptom Text: Information has been received from a physician concerning an 11 year old female with asthma who on 25-MAR-2008 was vaccinated via intramuscular route in her right arm with the first 0.5 mL dose of GARDASIL (lot# 659964/1978U). Concomitant medication included an unspecified asthma medication. On 25-MAR-2008, a few hours after the dose, the patient experienced pain and tingling of the right arm and right leg as well as "hot flashes". On 26-MAR-2008, the next day, the pain and tingling and hot flashes resolved. The physician reported that on 12-MAY-2008 the patient was seen in the office and had complaints of sore throat, nasal discharge and heart palpitations. The physician ordered a complete blood count, metabolic panel, thyroid stimulating hormone, echocardiogram, electrocardiogram, and Holter monitor. The blood work and electrocardiogram were normal but results of the echocardiogram and Holter monitor were pending. On 14-MAY-2008 the patient was seen in the physician's office due to a transient episode of "heart beating fast" and dizziness while she was at school earlier that day. Vital signs were normal at the time of the examination. The physician reported that on 27-MAY-2008, the patient was seen in the office for her second dose of GARDASIL. Her exam was normal. The physician noted that the second dose of GARDASIL was deferred until final test results became available. Additional information has been requested. This is a consolidation of two reports concerning the same patient.

MedDRA PT Injection site pain, Injection site swelling, Malaise, Nausea, Pyrexia, Vaccine positive rechallenge, Vomiting

Symptom Text: Information has been received from a 22 year old female with sulfonamide allergy to an unspecified pertussis vaccine and a history of kidney stone and other kidney problems who in January 2008, was vaccinated with the first dose of GARDASIL (lot#, dose and route not reported). Concomitant therapy included YAZ and ZOLOFT. In January 2008, after first dose of GARDASIL the patient reported that the injection site was very swollen and painful for approximately 4 weeks. She noted that after the second dose of GARDASIL (lot #, date, dose and route not reported) the injection site became swollen and painful. The patient also noted that 5-6 hours after vaccination she developed a fever, began vomiting, and proceeded to feel nauseous and sick for approximately 3 weeks. At the time of the report, the patient reported that she no longer felt sick; however the injection site was still swollen and painful. Unspecified medical attention was sought. No further information was available. Additional information is not expected.

MedDRA PT Rash, Vaccine positive rechallenge

Symptom Text: Information has been received from a registered nurse concerning a female (age not reported) who on an unspecified date was vaccinated with the first dose of GARDASIL (lot not reported). After receiving the first dose the patient experienced a rash on her abdomen and her arm. The patient took some BENADRYL and got prednisone (manufacturer unknown). The patient came back to the physician's office because she wanted to get the second shot of GARDASIL (lot not reported). About a week after the shot the patient broke out in to even more extensive rash and had to get prednisone again. The nurse reported she will not administer the third dose of GARDASIL. The patient's status was not reported. Additional information has been requested.

MedDRA PT Injection site pain

Symptom Text: Information has been received from a nurse concerning a 21 year old female with asthma who on 14-JAN-2008 was vaccinated IM in the upper left arm with the first 0.5 mL dose of GARDASIL (lot 660391/0063X). On 14-APR-2008 the patient was vaccinated IM in the upper left arm with the second 0.5 mL dose of GARDASIL (lot 660391/0063X). Concomitant therapy included APRI and albuterol. After the second dose the patient went mountain bike riding. On 21-APR-2008 the patient complained of pain in the upper left arm and shoulder. No numbness, no tingling, no fever, vital signs were stable. No treatment except for over the counter ibuprofen. Doctor's office suggested to patient follow up with orthopedic doctor. The patient has not recovered. Additional information has been requested.

MedDRA PT Chest discomfort, Chills, Dizziness, Dyspnoea, Fatigue, Headache, Heart rate increased, Musculoskeletal stiffness

Symptom Text: Information has been received from a nurse practitioner concerning a 13 year old female with no known drug reaction/allergies and a history of slow heart rate and an adjustment problems since moving to another country, who on 11-MAR-2008 was vaccinated intramuscularly with a first dose of GARDASIL (Lot # 659657/1487U). On the same day the patient was vaccinated with VAQTA and MENACTRA. After receiving the first dose of GARDASIL, on 11-MAR-2008, the patient experienced intermittent episodes of dizziness. Two days later, on 13-MAR-2008, the patient experienced dizziness, shortness of breath and increased heart rate which lasted a couple minutes. The next day, on 14-MAR-2008, the patient experienced fatigue, headache and tightness at the back of the neck. On 18-MAR-2008 the patient experienced shortness of breath, chills, dizziness. Later that same day she had 2 short episodes of dizziness and tightness in chest. Subsequently, "about two weeks ago", on approximately 21-APR-2008, the patient recovered. The patient was seen in the doctor's office for unspecified medical attention. No product quality complaint was involved. Additional information has been requested.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Initial and follow up information has been received from a registered nurse for the Pregnancy Registry for GARDASIL concerning an 18 year old female who on 06-AUG-2007 was vaccinated intramuscularly in the deltoid with the first dose of GARDASIL (lot # 657622/0388U). It was reported that at the time of vaccination the patient was not pregnant. It was reported that the patient's last menstrual period was on 01-AUG-2007 and not on 01-AUG-2006 as it was previously reported. Four weeks after vaccination the patient was involved in a motor vehicle accident. After the motor vehicle accident the patient found out that she was pregnant. The pregnancy was confirmed (method unknown). At the time of the report it was unknown how far along the patient was in her pregnancy. On 12-JUN-2008 a telephone call was made to the doctor's office to obtain pregnancy outcome information and a message was left. On 13-JUN-2008 the nurse called back and reported that the patient "had a miscarriage early on in her pregnancy." She had no further information. Upon internal review patient having a miscarriage in her early pregnancy was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Caesarean section, Drug exposure during pregnancy

Symptom Text: Initial and follow up information has been received through the Merck pregnancy registry from a health professional concerning a female consumer with a history of being hearing impaired, abnormal pap smears, positive for high-risk HPV and an elective termination of previous pregnancy (7 weeks from LMP) who on 30-APR-2007 was vaccinated with the first dose of GARDASIL. The patient received the second dose of GARDASIL on 31-May-2007 and the third dose of GARDASIL on 20-Sep-2007. Subsequently, it was learned that the patient was probably pregnant at the time she received the third dose. The pregnancy was confirmed by a pregnancy test (LMP=27-Aug-2007). The patient sought unspecified medical attention. The patient did not have any adverse side effects. The outcome was unknown. The patient has transferred to another OB/GYN. On 17-JUN-2008 a follow up telephone call was made to the doctor's office for pregnancy outcome of the patient. The nurse reported that the patient had a scheduled primary Cesarean Section for anticipated size greater a than dates at 38+6 weeks estimated gestational age. She mentioned that patient had a healthy and normal female baby, weighing 8 lbs, 15 Oz. Both mother and baby were doing "fine". Upon internal review patient having Cesarean Section for anticipated size greater than 38+6 weeks was determined to be an other important medical event. Additional information is not expected.

Other Meds: Unknown

Lab Data: beta-human chorionic - positive

MedDRA PT Drug exposure during pregnancy, Urinary tract infection

Symptom Text: Information has been received from a 25 year old female health professional with no drug reactions/ allergies and a history of 2 pregnancies (1 live birth and one elective abortion) who on 20-JUL-2007 was vaccinated with her first dose of GARDASIL, 0.5mL injection. There was no concomitant medication. On 28-SEP-2007 the patient received her second dose of GARDASIL, 0.5ml injection. On 08-OCT-2007 the patient found out that she was 8 to 9 weeks pregnant after getting the first and second doses of GARDASIL. On 27-NOV-2007 an ultrasound was performed with a normal result, "uncertain EDD", estimated to be 31-MAy-2008. Estimated conception date was 24-Aug-2007. The patient sought medical attention. Follow-up information reported that the patient had 2 previous pregnancies. One of those ended in a full term delivery, the other in a miscarriage 8 weeks from LMP. Follow-up information was received. The father of the baby was a cousin with congenital heart problems. On an unspecified date the patient had a urinary tract infection and was given MACROBID. On 27-NOV-2007 and 17-DEC-2007 the patient had a maternal serum alpha-fetoprotein test performed and the results were negative. The reason for the test was the baby's half-brother has downs syndrome. On 28-MAY-2008 a 9 pound 5 ounce baby boy was born. The length was 20 inches and 39 and 4/7 weeks from LMP. The baby's head circumference was 14 inches. The baby was large for the dates and in respiratory distress secondary to pulmonary edema and right pneumothorax. Upon internal review respiratory distress, pulmonary oedema and pneumothorax was considered to be an other medical event. Additional information has been requested.

Other Meds: MACROBID 100 mg

Lab Data: ultrasound, 11/27/07, normal, uncertain EDD; serum alpha-fetoprotein, 11/27/07, negative; serum alpha-fetoprotein, 12/17/07, negative

MedDRA PT Congenital anomaly, Drug exposure during pregnancy, Live birth, Sinusitis

Symptom Text: Information has been received from the Merck Pregnancy Registry from a physician concerning a 15 year old white female with penicillin allergy and no reported medical history who on 21-AUG-2007 was vaccinated with her first dose of GARDASIL (Lot #6578621/0387U) and was pregnant (noted as her first pregnancy). ECD is 12-MAY-2007 and patient's LMP was 06-AUG-2007. Concomitant therapy included azithromycin (manufacturer unspecified). Lab tests included a prenatal screen (no results reported). On 04-SEP-2007 the patient experienced sinusitis. From October 2007 to May 2008 the patient took prenatal vitamins daily. On 18-OCT-2007 an ultrasound was performed to assess fetal development and was normal. Follow up information reported that on 30-APR-2008 the patient vaginally delivered a full term, live born, normal and healthy female who weighed 7 pounds 6 ounces, 19 3/4 in length apgar score 9/9 and a head circumference of 13 3/4. It was reported that the infant had a small congenital anomaly. According to the nurse, the physician's notes also indicated "bilateral hands with rudimentary 6th digit." The nurse stated that it was also noted that there is a positive family history of similar digits. There were no other anomalies and no complications for mother or baby. Additional information has been requested.

Other Meds: azithromycin 250 mg

MedDRA PT Cellulitis, Chills, Feeling hot, Inappropriate schedule of drug administration, Incorrect route of drug administration, Oedema peripheral, Pain in extremity, Pyrexia, Tenderness

Symptom Text: Information has been received from a health professional via company representative concerning a 38 year old female with old tuberculosis (diagnosed in April 2008) who on 30-MAY-2008 at 14:00 was vaccinated with a dose of GARDASIL (Lot no. 658486/0937U, expiry date: 02-APR-2010), subcutaneous injection in her left arm (intentional use of unlabelled indication of GARDASIL and inappropriate use of GARDASIL vaccination). Concomitant therapy included MYAMBUTOL, isoniazide, pyridoxine and rifampin for her tuberculosis. In the afternoon on 30-MAY-2008 the patient experienced fever, chills. On 31-MAY-2008 the patient experienced swelling in the right arm, pain in the right arm, heating sensation in the right arm and tenderness in the right arm (size 7*10 cm). The patient took PONTAL. At 21:00 on 01-JUN-2008 the patient was hospitalized via emergency room because of fever (over 40 celsius degree). The laboratory test results were noted as follows: WBC 11,630/mm^3, platelet 197,000/mm^3, hemoglobin 13 g/dl, C-reactive protein 13.7. The patient was diagnosed with cellulitis and then was treated with UBACILLIN 750 mg, injection, q.i.d from 01-JUN-2008 to 07-JUN-2008. Thereafter the patient recovered from her fever on 04-JUN-2008. The laboratory test results were as follows: WBC 4,570/mm^3 and C-reactive protein 2.73. Subsequently, the patient recovered from the symptoms of cellulitis {fever, chills, swelling in the right arm, pain in the right arm, heating sensation in the right arm and tenderness in the right arm and was discharged on 07-JUN-2008. The reporter said that there was no issue on the vaccine storage in the hospital. No adverse experience was reported so far in patients other than this patient who were vaccinated with same batch number. Causality with GARDASIL was not reported. The reporter asked the company further investigation of these events. The subsidiary asked the company further investigation of these events. The subsidiary PV Contact asked the QA check to the subsidiary MMD, and received the response th

Seriousness: ER VISIT, EXTENDED HOSPITAL STAY, HOSPITALIZED, SERIOUS

MedDRA PT Amenorrhoea, Conversion disorder, Convulsion, Epilepsy, Somnolence, Syncope, Vaccine positive rechallenge, Weight decreased

Symptom Text: Information has been received from a physician concerning an 18 year old female with a history of Apgar score low and congenital hearing loss who in May 2007, was vaccinated with a first dose of GARDASIL 0.5 mL IM. Concomitant therapy included LOESTRIN. In June 2007, the patient experienced a grand mal seizure. The patient received her second dose of GARDASIL in July 2007. In July 2007 and August 2007 the patient experienced a seizure again and was hospitalized. The patient was seen by a neurologist. The neurologist prescribed the patient KLONOPIN. Subsequently the patient experienced 15 pound weight loss and amenorrhea. The patient was then seen by a psychiatrist who stated that he believed the seizures were due to physiological and prescribed additional medications (therapy unspecified). At the time of reporting the patient was recovering. No additional information was available. The reporter considered the events of grand mal seizure, seizure, weight loss and amenorrhea to be other medical events. Additional information has been requested. 7/9/08-records received-evaluation 1/4/08-fainting spells and seizures-Impression:conversion disorder with mixed presentation with symptoms of motor and sensory deficits as well as psychogenic seizures. Experiencing extreme psychological stress unable to deal with, derives secondary gain from the symptoms and gain attention. 7/10/08-records received for DOS 8/13/07- 8/17/07-Assessment:spells, these do not seem to be seizure with maintined consciousness during the spells. Consider psychosomatic etiology. Onset of syncope 2 years ago, circumstances of syncope burning sensation followed by altered sensorium, recalls the entire envents which last 10-12 minutes). Increasing in frequency, college entrance examination. Developed stuttering speech pattern, crying spells and jerking spell while in waiting room. 8/31/07-Condition improved. 7/10/08-records received for DOS 8/9-8/12/07-DC DX: epilepsy. Prolonged complex seizures. Somnolent due to phenobarital.

Other Meds: LOESTRIN

Lab Data: 7/10/08-records received-MRI-chronic white matter disease likely from birth. EEG normal.

History: Apgar score low; Hearing loss 7/10/08-records received-Onset of syncope 2 years ago,

MedDRA PT Caesarean section, Drug exposure during pregnancy, Labour complication, Live birth

Symptom Text: Information has been received from a consumer for the pregnancy registry for GARDASIL, concerning her 15 year old daughter with a history of ear problems who on 10-SEP-2007 was vaccinated with her first dose of GARDASIL and is pregnant. Her last menstrual period was reported as 22-AUG-2007 and her estimated delivery date was 28-MAY-2008. The patient sought unspecified medical attention. Follow-up information has been obtained from a registered nurse who reported that the patient delivered a full term 9 pound 21 inch long, normal, healthy, female via primary cesarean section on 22-MAY-2008. There were no reported complications or congenital anomalies. Upon internal review it was determined that the labour complication that required a cesarean section was an other important medical event. Additional information has been requested.

MedDRA PT Breast swelling, Bronchospasm, Condition aggravated, Dysphonia, Dyspnoea, Fluid retention, Inappropriate schedule of drug administration, Injection site pain, Injection site swelling, Laryngeal oedema, Laryngospasm, Myocardial ischaemia, Off label use, Pyrexia, Sinusitis, Stridor, Thyroiditis, Tracheal oedema

Symptom Text: Information has been received from a patient, concerning a 45 year old female patient who was a HCP herself (dermatologist), with no allergies and no relevant medical history and at the time of vaccination she had herpes infection. On 25-MAR-2008, the patient was vaccinated with GARDASIL, (primary No 2 in series, batch number, route and site of administration not reported). As the woman was probably older than 26, it was probably off label use. Severe injection site pain and slight injection site swelling developed (the day of vaccination), she could not lie upon the spot. The pain lasted 2 weeks. 1 day after vaccination she developed high fever, she was almost hallucinating. After a few days, when she felt slightly better, her temperature was 39.6 C. Since 1 day after vaccination, she seemed to develop bronchospasm: shortness of breath and hoarseness developed, which increased in the days after that. She visited the GP after 3 days because she suspected upper respiratory tract infection, pneumonia or bronchitis. The GP said that her lungs were clean, but he prescribed Atrovent. She visited a lung specialist, who diagnosed that she did not have Asthma, but he did prescribe symbicort and nasal spray. She received antibiotics as well after telephonic consultation with the GP. A few weeks after vaccination she developed sinusitis, which caused aggravation of the shortness of breath and hoarseness. She received a second time antibiotics, and dexamethazon for 10 days and a second nasal spray. She left on April 24, developed shortness of breath during the night, for which she was taken to the ER on April 25. Her trachea was almost completely closed. Diagnosis: stridor, tracheal oedema. An ECG showed cardiac ischaemia. She received Solumedrol 125 milligram, epinephrine and Benadryl. She was monitor guarded in hospital for 5 days. On 30-APR-2008 she developed again laryngeal oedema and laryngeal spasms. The ENT specialist diagnosed oedema of the vocal cords as well, which explains her hoarseness. Sh

MedDRA PT Acarodermatitis, Arthralgia, Chondropathy, Condition aggravated, Dermatitis atopic, Dermatitis contact, Fatigue, Herpes zoster ophthalmic, Hyperhidrosis, Malaise, Nausea, Peripheral vascular disorder, Pruritus, Rash, Sensation of foreign body, Sleep disorder

Symptom Text: Information has been received from an agency, concerning a 14 year old female patient who was vaccinated with a second dose of GARDASIL (Batch #NF27880, Lot #1518F) intramuscular into left upper arm on 25-SEP-2007. The patient already felt unwell and experienced peripheral circulatory disorder 1 week after first vaccination with GARDASIL on 28-JUN-2007. History of knee bruise after an accident on 28-FEB-2007. On 12-JUL-2007 MRI of the knee showed normal results. On 03-SEP-2007 patellar chondropathy was diagnosed. 7 to 10 days p.v. the patient felt unwell and experienced exanthema, increased sweating and nausea. 6 weeks p.v. the patient developed a "worsening" of the left knee, Morbus Sudeck was suspected. On 08-DEC-2007 the patient developed ophthalmic herpes zoster. The patient was hospitalised on an unspecified date. Serology, several MRI, ECG, EEG and neurological examination were carried out (no results reported). The patient recovered from feeling unwell, exanthema, increased sweating and nausea after "weeks", from herpes zoster ophthalmic after 14 days. At the time of reporting to HA (18-MAR-2008) complaints in the area of the left knee were ongoing. Follow-up on 10-JUN-2008. HA provided us with several hospital reports and reports on findings. The patient had an accident on 28-FEB-2008 and achieved a knee bruise. MRI on 12-JUL-2007 showed normal results. On 03-SEP-2007 chondropathy of the knee was diagnosed. From 27-OCT-2008 till 30-OCT-2008 she was hospitalized because of scabies. At that time atopic eczema was present, too. Exact onset and duration of symptoms was not reported. On 16-NOV-2007 she presented again to a dermatologist. Atopic eczema was ongoing, additionally contact dermatitis was diagnosed. The patient was hospitalised from 10-DEC-2007 till 18-DEC-2007 because of Herpes zoster ophthalmic and allergic/atopic exanthema. The patient reported about nausea, sleep disorder, increased sweating and tiredness since about 8 weeks (exact onset not reported). She complained abou

MedDRA PT Gaze palsy, Musculoskeletal stiffness, Pallor, Unresponsive to stimuli

Symptom Text: After injection of Hep B and varicella in the left arm and then Gardasil in the right arm, patient became very pale and she lay back on the exam table and was nonresponsive. Her eyes rolled back and her legs and arms stiffened. Eyes remained open throughout the episode and she "came to" within 1 minute. She continued to be pale for about 5 minutes but was oriented to person and place immediately upon "coming to". She sat up after about 10 minutes, color slowly came back to her lips.

MedDRA PT Caesarean section, Drug exposure during pregnancy, Foetal movements decreased, Hypertension, Pyrexia

Symptom Text: Initial and follow up information has been received from a registered nurse through the Pregnancy Registry for GARDASIL concerning a 14 year old female with a history of tinea versicolour and allergic rhinitis who on 17-OCT-2007 was vaccinated with her first dose of GARDASIL IM (lot# 657872/0515U) and was pregnant. Concomitant therapy included CLARITIN as needed for nasal symptoms. The patient sought unspecified medical attention in the office on 01-NOV-2007. On 02-NOV-2007 the patient had a positive urine pregnancy test (LMP reported as end of June 2007). The patient will be followed by her pediatrician. On 02-JAN-2008 the patient had an ultrasound which showed a single live intra-uterine pregnancy of 26 weeks. It was suggested she have another ultrasound for fetal anatomy. On 11-JAN-2008 the patient had a follow up ultrasound which showed normal progression of pregnancy. On 08-APR-2008, the patient had a fever of 102.5 and hypertension. It was also reported that the patient received prenatal care late. On 08-APR-2008 (39 weeks from LMP) the patient delivered a female infant weighing 6lbs. 8oz. There was "decreased fetal movement" detected and a caesarean section was performed. The child was sent to the NICU after delivery, the nurse suggested that it might have been precautionary, given the mother's health problems before delivery. The child being sent to the NICU after delivery and and decreased fetal movement were considered to be an other important medical event. Additional information has been requested.

Other Meds: CLARITIN

Lab Data: ultrasound, 01/02/08, single live, intra-uterine pregnancy of 26wks; ultrasound, 01/11/08, follow up - normal progression of pregnancy; urine beta-human, 11/02/07, positive

History: Tinea versicolour

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a general practitioner through the Pregnancy Registry for GARDASIL concerning a 17 year old female who on 05-FEB-2008 was vaccinated with her second dose of GARDASIL (Lot#, site and route not reported). The patient was vaccinated 1 month and a half before her pregnancy. Her last menstrual period was on 10-MAR-2008. At the time of the reporting, there was no adverse effect. Follow up information has been received from a general practitioner who reported that on an unspecified date the patient underwent an induced abortion, performed for personal reasons. Upon internal review, the case was upgraded because induced abortion was considered to be an other important medical event. Other business partner numbers include E2008-04014. No further information is expected.

Seriousness: EXTENDED HOSPITAL STAY, HOSPITALIZED, LIFE THREATENING, PERMANENT DISABILITY, SERIOUS

MedDRA PT Coma

Symptom Text: Information has been received from a physician concerning a 21 year old female who on 21-APR-2008 was vaccinated intramuscularly with 0.5 ml first dose of GARDASIL. "Approximately 3 weeks later", on approximately 12-MAY-2008 the patient lapsed into a coma and was hospitalized. Magnetic resonance imaging and "several diagnostic tests" were performed but no results provided. At the time of report, the patient was still hospitalized in a coma. GARDASIL was discontinued. Lapsed into a coma was considered to be disabling, immediately life-threatening and an important medical event. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Convulsion, Familial risk factor, Heart rate decreased, Hyperhidrosis, Loss of consciousness, Muscle rigidity, No reaction on previous exposure to drug, Pallor, Respiratory rate decreased, Urinary incontinence

Symptom Text: Child was given vaccine at approximately 1400 hrs. About a minute later she started becoming pale. She had a seizure-like episode with muscle rigidity and loss of bladder control. She did not appear to lose consciousness completely and was able to answer questions immediately after the episode. We laid her down and applied cool towels to her face. We gave her cool water to drink. She became diaphoretic. Her breathing and pulse remained slow and regular. She became well enough to sit up in a chair about 15 minutes after the episode, and I accompanied her to the car about 5 minutes later. According to patient, the only thing she has eaten all day was a piece of bread. She had never had a similar reaction to immunization, but her mother reported that many of her family members had either lost consciousness or become faint after immunization. She also reported that patient has had low blood pressure in the past. I called to check on her an hour later. She had eaten and was acting normally.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Asthenia, Hypoaesthesia, Myelitis transverse, Paraesthesia

Symptom Text: Information has been received from a physician concerning a 24 year old female who was vaccinated with a second dose of GARDASIL. In March 2008, the patient experienced generalized numbness and weakness in her body after the vaccination. The patient's condition was described as a transverse myelitis. Laboratory studies performed included "blood work" (result not reported) and magnetic resonance imaging of the brain, neck and spinal cord. Spinal cord lesions were found on the spinal cord magnetic resonance imaging. The patient sought medical attention by the physician. At the time of the report the patient had not recovered. Upon internal review the transverse myelitis was considered to be an important medical event. Additional information has been requested. 7/18/08-records received-6/18-7/14/08 presented with recent onset of arm and leg numbness, electrical shock like sensation with neck flexion. Impression:recent onset of transverse myelitis one week after receiving Gardasil vaccine.

Other Meds: Unknown

Lab Data: magnetic resonance - brain, neck and spine; lesions found on spinal cord MRI; diagnostic laboratory - blood work (result not reported) 7/18/08-records received-CSF IgG index elevated, positive oligoclonal bands. CT and MRI of brain normal.

History: Unknown

MedDRA PT Inappropriate schedule of drug administration, Uterine cervix ulcer

Symptom Text: Information has been received from a physician concerning a 27 year old female housewife, who, on an unspecified date, was vaccinated with a dose of GARDASIL. Subsequently, the patient developed a cervical ulcer. The patient sought unspecified medical attention. At the time of the report, the patient had not recovered. The reporter considered the cervical ulcer to be an other important medical event. Additional information is not expected.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Amniotic fluid volume decreased, Caesarean section, Drug exposure during pregnancy

Symptom Text: Initial and follow-up information has been received through the Merck pregnancy registry from a nurse practitioner concerning a 16 year old female who on 07-SEP-2007 was vaccinated with her first dose of GARDASIL IM. On 17-OCT-2007 a positive urine pregnancy test determined patient was pregnant (LMP = 14-AUG-2007). The patient also had prenatal blood work performed. The patient sought medical attention with an exam in the office. The patient's outcome is unknown. Follow-up indicated that the patient had a scheduled caesarean section at term, secondary to a decreased amniotic fluid index. It was reported that the patient "opted" for a caesarean section. The patient delivered a healthy infant with no anomalies and there were no complications. Upon internal review the decreased amniotic fluid index - resulting in a C-section was considered to be an other important medical event. Additional information has been requested.

Other Meds: Unknown

Seriousness: EXTENDED HOSPITAL STAY, HOSPITALIZED, SERIOUS

MedDRA PT Drug exposure during pregnancy, Hyperbilirubinaemia neonatal

Symptom Text: Initial and follow-up information has been received through the Merck pregnancy registry through a physician concerning a 17 year old female with a reoccurrence of sinusitis headaches who on 24-MAY-2007 was vaccinated intramuscularly with her first dose of GARDASIL (Lot # 654535/0960F). On 24-MAY-2007, the patient was also vaccinated with MENACTRA. On 24-JUL-2007, the patient was vaccinated intramuscularly with her second dose of GARDASIL (Lot # 654535/0960F). On 22-OCT-2007, the patient had a urine pregnancy test which was positive and on an unspecified date the patient had an ultrasound. The date of the patient's last menstrual period was 28-JUL-2007 (also reported as 04-AUG-2007). The patient sought unspecified medical attention in the office. The estimated date of delivery is 03-MAY-2008. Follow-up information was received from the physician via telephone on 20-JUN-2008. The patient delivered a healthy and normal, full-term male, "with no physical anomalies". The baby did develop transient hyper-bilirubinemia after birth and was transferred to another hospital where the baby was successfully treated and discharged after 3 days. The physician reported "he's absolutely fine". Upon internal review transient hyper-bilirubinemia required hospitalization for the baby. Additional information is not expected.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Arrested labour, Caesarean section, Drug exposure during pregnancy, Inappropriate schedule of drug administration

Symptom Text: Initial and follow up has been received from a health professional for the Pregnancy Registry for GARDASIL concerning a female 18 years old patient with epilepsy, carpal tunnel syndrome, drug hypersensitivity to phenobarbital and a smoker, with a history of no prior pregnancies who on 01-OCT-2007 was vaccinated with her third dose of GARDASIL IM and was subsequently determined to be pregnant. The patient received her first dose of GARDASIL IM on 30-JAN-2007 and her second dose of GARDASIL IM on 20-APR-2007. Concomitant therapy included TEGRETOL, vitamin D (unspecified), folic acid (unspecified) and calcium (unspecified). The patient's estimated LMP was 28-JUL-2007 with an estimated conception date of 07-SEP-2007. The patient's estimated due date is 02-JUN-2008. On 17-OCT-2007 and 18-JAN-2008 the patient had ultrasounds which were normal for screening and to establish a due date. The patient also had a serum alpha-fetoprotein test which was normal. The patient sought medical attention by contacting the office. Follow up information received from a physician reported that on 12-JUN-2008, the patient developed arrest of active labor and required a cesarean section. She delivered a healthy, normal, 7 pound 15 ounce boy with APGAR scores of 9 and 9. There were no congenital anomalies. It was reported that the patient smoked throughout her pregnancy. The patients outcome was not reported. Upon internal review it was determined that the arrest of active labour requiring a cesarean section was an other important medical event. No additional information is expected.

Other Meds: calcium (unspecified); TEGRETOL, 600 mg; folic acid, mg; vitamin D (unspecified), 50000 units

Lab Data: ultrasound, 10/17/07 - normal screening and establish due date; ultrasound, 01/18/08 - normal screening and establish due date; serum alpha-fetoprotein, normal - normal screening

MedDRA PT Anorexia, Body temperature increased, Chills, Crying, Delirium, Feeling abnormal, Headache, Increased upper airway secretion, Malaise, Nightmare, Pain, Pharyngeal oedema, Pharyngolaryngeal pain, Poor quality sleep, Rhinorrhoea, Tremor

Symptom Text: I had my first (and only so far) injection on Thursday June 26 at 2:45pm. I was overly emotional on Friday evening starting about 7:00pm, which included lots of crying. On Saturday I woke up after getting plenty of rest but did not feel great. I thought I might still be feeling "down" from being upset from the night before. I had no appetite but made myself eat something anyway. I did not leave the house all day and just rested on the couch. By 3pm I had chills so bad that I decided to go to bed and get under my electric blanket. My teeth were chattering loudly and I was shaking out of control. I could not warm up. My head hurt SO much. A few hours later I had my temperature taken and it was 102.6. It lasted many, many hours without breaking. If it had been 103 or higher I would have gone to the ER. My syptoms included nightmares, tossing and turning in my sleep, being delerious to the point of thinking there were other people (whom I did not know) in the room when there were not, horrible headache, crying, phlemn, runny nose, slightly swollen and very sore throat (still sore on Sunday night at 11:45pm), body ache in shoulders, neck, and mostly back. I used a cold, damp washcloth on my forehead as my head felt like it was burning up while my body still felt icy cold even with the electric blanket on high. I had taken 2 Alieve early in the day and 4 Advil later that night or early morning. By 12:30am the fever was still 101.4. By 9am the fever was down to 97.9. By 12:30pm the fever was down to the normal temperature. On Sunday at 11:45pm I still feel ill and phlemny in my throat but not my nose. Sorry for being so graphic. :-) Please contact me if you have any questions.

MedDRA PT Type 1 diabetes mellitus

Symptom Text: Information has been received from a hospital physician concerning an adult female medical student with no reported history who on unspecified dates was vaccinated with a first and second dose of GARDASIL. On 23-MAY-2008, the patient was vaccinated with a third dose of GARDASIL (lot # not reported). On approximately 30-MAY-2008, 1 week post vaccination, the patient was diagnosed with diabetes type I. The reporting physician felt that the type I diabetes mellitus was an other important medical event. Other business partner numbers included: E2008-05651. Additional information is expected.

MedDRA PT Back pain, Cardiac disorder, Fatigue, Headache, Hyperhidrosis, Listless, Nausea, Sensory disturbance, Syncope

Symptom Text: Information has been received from a patient's mother who reported that her 17 year old female daughter was vaccinated with her first dose of GARDASIL (Lot # not reported) on 18-DEC-2007. The patient had a first reported syncope in a discotheque on 22-MAR-2008 and was admitted to an intensive care unit. Heart problems (unspecified) were diagnosed. The second dose of GARDASIL (Lot # not reported) was given on 03-APR-2008. Since vaccination (date not specified) the patient complained of persisting intense headache, nausea, listlessness, chronic tiredness, undefinable back pain and sweaty hands. The patient had a syncope at the beginning of June 2008. Sensory disturbance was diagnosed by a neurologist on 16-JUN-2008. Radiological examinations and MRI were without abnormal findings. The patient has not yet recovered at the time of reporting. Other business partner numbers included: E2008-05791. No further information is available.

Other Meds: Unknown

Lab Data: Magnetic resonance imaging, ??Jun08, without abnormal findings; Diagnostic radiology, ??Jun08, without abnormal findings.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Demyelination, Eye disorder, Fatigue, Hypoacusis, Multiple sclerosis, Paraesthesia, Sensorimotor disorder

Symptom Text: Information has been received from a general practitioner concerning a 16 year old female who on 18-MAR-2008 was vaccinated with GARDASIL (batch number, route and site, not reported). It was reported by a general practitioner to a company sales representative that a 16 year-old female patient received a dose of GARDASIL, on an unspecified date. 3 weeks post-vaccination the patient consulted neurologist for suspicion of multiple sclerosis. Additional information received on 22-JUN-2008: A 16-year-old female patient with neither relevant medical history nor familiar medical history reported received the first dose of GARDASIL (batch number, route and site, not reported) on 18-MAR-2008. Route of administration and site of injection were not reported. Around the 12 to 19-APR-2008 i.e. approximately 3 weeks after vaccination the patient experienced sensorimonitor disorder, with paraesthesia of lower limbs, hypoacusis, important fatigue and ocular troubles. On 23-Apr-2008 a neurologist requested cerebrospinal MRI performed on 2-MAY-2008 and which revealed an area of hypersignals evocating the presence of an active demyelination at brain level. There was spatial dissemination with some positive lesions at gadolinium fluid proteins at 0.28 g/L, glycorrhachia at 3.24 mm/L. Electrophoresis was on-going. Diagnosis was multiple sclerosis. The patient recovered from the symptoms above mentioned. Multiple sclerosis was considered to be an other important medical event. Other business partner numbers include E2008-05797. No further information is available.

Other Meds: None

Lab Data: cerebrospinal MRI performed on 2-MAY-2008: area of hypersignals=presence of an active demyelination at brain level spatial dissemination with some positive lesions at gadolinium and some negative lesions at gadolinium as well

MedDRA PT Caesarean section, Drug exposure during pregnancy

Symptom Text: Information has been received from a through Merck pregnancy registry and a Certified Medical Assistant (C.M.A.) concerning a 16 year old female patient with a history of bacterial vaginosis who on 15-MAY-2007 was vaccinated with a dose of GARDASIL. On 16-MAY-2007 the patient discovered that she was pregnant. The outcome was not recovered. On 11-JUN-2008, a follow up telephone call was made to get the pregnancy outcome for the patient and a message was left at the patient's doctor's office. On 20-JUN-2008 the health care provider returned the call and reported that the patient was delivered by primary cesarean section at term, and had a normal and healthy female baby. The baby weighed 7 lbs 10 oz, after spontaneous onset of labor. No further information was available. Upon internal review patient having "spontaneous onset of labor" which required cesarean section considered to be an other medical event. Additional information is not available.

Symptom Text: Information has been received from an Health Authority concerning a 17 year old female with a history of migraine, who was vaccinated with the third dose of GARDASIL (lot # not provided), in January 2008. It was reported that the patient was hospitalized from 17-APR-2008 to 18-APR-2008. By hospital report it was reported that the patient developed visual disturbance, diplopia, visual field defect, eye itching, eye burning and blurred vision "6 to 9 weeks ago" (onset date not specified). Examinations by an outpatient ophthalmologist, neurologist and an ear, nose and throat (ENT) specialist were without pathological findings). A Magnetic Resonance Imaging (MRI) in the outpatient department showed sinusitis on 29-FEB-2008. The sinusitis was treated with penicillin for 12 days. The examinations as cerebrospinal fluid puncture, sleep electroencephalography (EEG), visual evoked potential (VEP) which were performed in hospital showed no pathologies. The ophthalmological examination showed abnormal visus (+0.6 left eye and +0.6 right eye). There was no indication of optic neuritis. It was intended to refer the patient to the psychologist. At the time of reporting the symptoms were ongoing. Concomitant therapy included hormonal contraceptives for systemic use. Other business partner numbers included: E2008-05653 and PEI2008007916. No further information is available.

Other Meds: hormonal contraceptives (unspecified)

Lab Data: Magnetic resonance imaging, 29Feb08, sinusitis; Electroencephalography, 17?Apr08, showed no pathologies; Visual evoked potential, 17?Apr08, showed no pathologies; Ophthalmological exam, +0.6, left and right eye. No indication of optic neur

MedDRA PT Loss of consciousness, Petit mal epilepsy, Somnolence, Syncope, Syncope vasovagal

Symptom Text: Information has been received from a nurse practitioner concerning a 14 year old female who on 23-JUN-2008 was vaccinated with the first dose of GARDASIL (LOT# 660553/0070X). The nurse reported that the patient began to collapse off the table after receiving her first dose of GARDASIL. The nurse reported that she managed to catch the patient and move her from the table down to a chair in the room where the patient then experienced a petite mal seizure that lasted for about 5 minutes. The nurse also reported that within 3 to 5 seconds after the patient received the vaccination she passed out. The patient "came to" and was helped to a chair. The patient then had a petit mal seizure that lasted from 3 to 5 seconds. The nurse stated that the patient had a vasovagal reaction with a petit mal seizure. When the patient "woke up", it was reported that she was groggy. The nurse stated that the patient remained in the office for a while until she was stable enough to go home. The nurse spoke to the patient's mother via telephone conversation later that day, and the patient's mother reported that the patient was resting and was eating. The patient was reported to be "ok" with no long-term effects from the petit mal seizure. The nurse did not know if the patient was scheduled to receive the second dose of GARDASIL. Upon internal review, petite mal seizure was considered to be an other important medical event. Additional information has been requested.

MedDRA PT Glomerulonephritis minimal lesion, Nephrotic syndrome, Wrong technique in drug usage process

Symptom Text: Information has been received from a physician concerning a 14 year old with no relevant medical history reported, who on 21-APR-2008 was vaccinated with the third dose of GARDASIL (Lot # 0275U, Batch NF54050) via intramuscular route in her buttock. Approximately 2 months after vaccination the patient experienced a lipoid nephrosis with a nephrotic syndrome. She was prescribed 1 mg/kg/day of corticosteroids not otherwise specified. Renal puncture biopsy was not scheduled up today. The reporter considered this case medically significant and potentially serious. At the time of the reporting the patient had not recovered. Lipoid nephrosis was considered to be an other important medical event. Other business partner numbers included: E2008-05670. Additional information has been requested.

MedDRA PT Dizziness, Fall, Headache, Vomiting

Symptom Text: Information has been received from a paediatrician concerning a 13 year old female, who on 15-NOV-2007 was vaccinated with a first dose of GARDASIL (lot # 1536F and batch # NG01520), no adverse events occurred. On 06-JUN-2008, the patient was vaccinated with a second dose of GARDASIL (lot# 1049U and batch # NG46500) into the deltoid muscle. The patient developed vomiting on 08-JUN-2008, dizziness on 09-JUN-2008, headache and tendency to fall on 10-JUN-2008. The patient was hospitalized due to the adverse events on 12-JUN-2008. EEG showed pathologies, MRI and CT were without pathological findings. The neuron-paediatrician assumed a first episode of multiple sclerosis, but there were not yet any diagnostic results to confirm the suspicion. The patient was discharged from hospital on 15-JUN-2008. The patient has not yet recovered at the day of reporting, but she was improving significantly, in particular the dizziness and headache. Other business partner numbers included: E2008-05688. Additional information has been requested.

MedDRA PT Blood pressure decreased, Gaze palsy, No reaction on previous exposure to drug, Syncope, Unresponsive to stimuli

Symptom Text: I had gotten a call from patient's Mom in the morning of 6/24/08 & she stated that she was sending patient in for her shots & that she was unable to make it as was working in the field. I did review both of the VIS with Mom & she stated patient has had no history of problems with vaccinations. She also stated that the first HPV vaccination went just fine. She stated that she would be on her cell phone if anything was needed. 2pm patient came to clinic. Had no complaints. 2:05pm I gave patient her (2nd) HPV vaccination, 2:07pm then gave the Meningitis vaccination. As I put the band aid on she stated "I think I am going to black out." & then at 2:08pm her head went back, eyes rolled & she fainted-was unresponsive for approximately 10-15 seconds. As I seen this I stated her name, then my secretary's name & as my secretary opened door, patient then sat up in chair & blinked her eyes & stated "what was that?" 2:09pm Blood Pressure 100/58 Pulse 70 Respirations 16. States she can remember everything & saying she felt like she was going to black out & then that was it. Continued to take Blood pressures & was 108/68, 112/64 & 108/68. Mom called & aware & came in.Continued to monitor patient & had her sit for 30 minutes & then she stated was feeling fine & would like to go home. They then left & went to home. Mom was called again as they made it home & she is aware of the fact if anything more or if patient has any complaints of the alert 911 or their physician & to let me know also. She stated she will call if any problems. 4:35 Call to patient & her Mom answered & stated all going just fine. Patient has eaten-she now states that patient told her she didn't have anything for lunch today & possibly that might have been a factor in the situation. Has no questions or concerns at this time. 5:30pm I seen patient out for supper with her sister & niece & she stated she felt just fine. Laughed & stated she had never had that happen before & was an experience that she hopes never happens again.

MedDRA PT Abasia, Asthenia, Conversion disorder, Dermatitis acneiform, Dizziness, Eating disorder, Facial palsy, Fall, Headache, Hyperaesthesia, Hyperhidrosis, Hypoaesthesia, Hyporeflexia, Local swelling, Loss of control of legs, Myalgia, Myositis, Nausea, Pain, Pain of skin, Paraesthesia, Photosensitivity reaction, Red blood cell sedimentation rate increased, Skin burning sensation, Sleep disorder, Swelling face, Syncope, Vertigo, Vomiting

Symptom Text: Aug.24, second Gardasil injection received. Sept.3, pressure in jaw and head began, followed by weakness, severe pain and loss of use of legs; nausea, dizziness, fainting, swelling and drooping of face and neck. Oct.2007, lost ability to walk, burning prickles in scalp, hands, legs. Seen by several specialists including hospital neurological teams- no diagnosis given. Seen by multiple specilists Jan. 2008 - June 2008. Unable to eat solid foods, placed on liquid diet. Finally diagnosed by D.O. as having an adverse reaction to Gardasil. Special diet and pain medication given which seem to be helping in small degrees. We were told it would be a long time recovering. 2nd report 320256. 07/23/2008 MR received for DOS 10/19-24/2007 which include 2 Rheumatology consults, neuro consult, psych consult and inpt admission. Pt presented for Rheum eval 10/19/07 with c/o 6 week hx of pain and sensitivity in her face, jaw neck and thoracic region (burning & tingling) and progressive weakness in her limbs. Unable to walk without assistance. Pt reports dizziness, vertigo, syncope and photosensitivity. Sleep is disturbed. Several falls. Has sweats. Presents in sunglasses for photophobia and in a w/c. This followed a viral and /or sinus infection 6 weeks prior. PE (+) for anceiform rash on the back, scalp, face, jaw, and neck tenderness, DTRs 1+ arms, unobtainable in legs, decreased strength in arms and legs, unable to walk. Concern for neurological illness resulted in emergent admission to hospital for further eval. DOS 10/19-24/2007 with DX: weakness. other dx: fibromyalgia, migraines, asthma and chronic pain syndrome. Neuro consult as above but able to elicit patellar reflexes. Psych eval to r/o conversion d/o. Requested further eval. 2nd Rheum consult for increased sed rate. Additional sx of touch sensitivity and lower extremity numbness. Impression: Elevated Sed rate. Myalgia and myositis NOS, Headache, Difficulty in walking. Pt had some nausea and vomiting while admitted. Treated for pain and pt was ambulati

Seriousness: ER VISIT, HOSPITALIZED, SERIOUS

MedDRA PT Bedridden, Convulsion, Demyelination, Dyspnoea, Gait disturbance, Gastrointestinal disorder, Guillain-Barre syndrome, Hypophagia, Irritability, Joint swelling, Migraine, Neuropathy peripheral, Pain in extremity, Rash, Swelling face, Vaccine positive rechallenge, Weight decreased, Wheelchair user

Symptom Text: Information has been received from a consumer concerning her daughter a 22 year old patient with asthma who on 26-JUN-2007 was vaccinated with 0.5 ml of the first dose of GARDASIL (Lot not reported). Concomitant therapy included TOPAMAX. On approximately 29-JUN-2007 the patient experienced seizures and leg pain that would come and go. She also experienced problems breathing. After receiving her second dose of GARDASIL (Lot not reported) on 24-AUG-2007, all of her symptoms progressed extremely. She was very irritable and could hardly walk. She could crawl but she was mainly bed ridden and needed to use crutches or a wheel chair to get to her physician's office. She was experienced problems breathing and had "super migraines" that never went away and were there 24/7. She also had gastrointestinal problems and can hardly eat or digest well. She had lost a lot of weight. She also had a rash that went across her shoulders. The doctor found there was aluminum toxicity in her urine and hair. She had swelling in her face, jaw and wrists. The patient was diagnosed with GUILLAIN-BARRE syndrome, myelin sheath degeneration and peripheral neuropathy. Patient was hospitalized twice: 19-OCT-2007 to 24-OCT-2007 and on 14-DEC-2008 to 15-DEC-2008. She also visited an ER for a few hours but she was not admitted. Patient only received two doses of GARDASIL and the series was not completed. The consumer reported a multiple labs done to the patient. At the time of reporting 18-MAR-2009 the patient had not recovered from symptoms. Additional information has been requested.

MedDRA PT Back pain, Paralysis

Symptom Text: Information was obtained on request by the Company from the agency via a Case Line Listing concerning a 26 year old female who was vaccinated with GARDASIL. Subsequently, 1 day after vaccination, the patient experienced back pain and paralysis. At the time of reporting on 28-NOV-2007 the patient had recovered from back pain and paralysis. The agency considered that paralysis and back pain were related to therapy with GARDASIL. The original reporting source was not provided. Subsequently the patient's experienced was reported in an article. Upon internal medical review paralysis was considered an other important medical event. Additional information is not expected.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Drug exposure during pregnancy, Foetal disorder

Symptom Text: Information has been received through the Merck pregnancy registry for GARDASIL, from a medical assistant concerning a 16 year old pregnant female who on 28-FEB-2007 was vaccinated with a dose of GARDASIL. Follow-up information has been received from a medical assistant and a cardiologist who reported that the patient delivered, vaginally, a healthy, normal, female, weighing 8 pounds, 3 ounces, at term. The pediatrician heard a "slight heart murmur" and the baby was sent to a cardiologist for an evaluation. On 27-MAY-2008 the patient was evaluated by a cardiologist. It was reported that a heart murmur was noted some time after birth. The patient had no cardiac symptoms and had normal growth and development. There was a history of hypertension in the family but not hyperlipidemia or premature coronary artery disease. On physical examination the baby's length was 66 centimeters and her weight was 7.5 kilograms, both of which were of the 50th percentile for age. Her resting heart rate was 135, respiratory rate was 32, and blood pressure was 94/54 in the right arm, 95/44 in the left arm, 105/60 in the left leg and 88/46 in the right leg. There was no pallor, cyanosis, or clubbing. Her chest was clear. There was no hepatosplenomegaly. Brachial and femoral pulses were adequate. There was no brachia-femoral delay. First and second heart sounds were normal. There were no clicks, thrills, rubs, or bruits noted. There was a grade 3, harsh systolic ejection murmur at the left sternal border. Diastole was clear. Her electrocardiogram demonstrated right ventricular hypertrophy. An echocardiogram was performed and demonstrated a mildly dilated and hypertrophied right ventricle with good systolic function. There was a dysplastic pulmonary valve with moderate pulmonic stenosis. The clinical impression was moderate pulmonic stenosis. The patient will be re-evaluated in one year with an electrocardiogram and echocardiogram and most likely will need to have the valve ballooned when she is about 2 or 3 years of age. In the interim,

MedDRA PT Haemolytic anaemia, Transfusion

Symptom Text: Information was obtained on request by the Company from the agency via a Case Line Listing and Public Case Detail form concerning an 18 year old female who on 01-SEP-2007 was vaccinated with GARDASIL. On 15-SEP-2007, 14 days after vaccination, the patient experienced haemolytic anaemia reported as severe acute haemolytic anaemia, questionable cold amplitude IGG, paroxysmal cold and haemoglobuinurea. The agency also reported no evidence of viral or autoimmune of lymphoproliferaton origin. Subsequently, the patient was hospitalised and transfused with 4 units and received high dose of steroids penicillin over 10 weeks. On 26-OCT-2007, the patient haemoglobin was normal . RBC penicillin antibody testing was negative. Subsequently, on 26-OCT-2007, the patient had recovered from haemolytic anemia. The agency considered that haemolytic anaemia was related to therapy with GARDASIL. The original reporting source was not provided. Subsequently the patient's experienced was reported in an article. Additional information is not expected.

Other Meds: Unknown

Lab Data: diagnostic laboratory test, 15Sep07, haemolytic anaemia; red blood cell scan, ??Oct07, RBC Penicillin antibody testing: negative; urinalysis, ??Oct07, haemoglobinurea; hemoglobin, 26Oct07, normal

History: Unknown

MedDRA PT Choking sensation, Oedema peripheral, Pruritus, Rash generalised, Rash pruritic, Throat irritation

Symptom Text: Information was obtained on request by the Company from the agency via a Case Line Listing and a Public Case Detail form concerning a 21 year old female with sleep disorder who on 19-NOV-2007 was vaccinated with GARDASIL. Other suspect therapy included AMOXIL and STILNOX. On 19-NOV-2007, after vaccination, the patient experienced rash (also reported as a red confluent itchy rash all over her body), oedema peripheral (also reported as swollen hands and feet), choking sensation and throat irritation and was hospitalised. The agency considered that rash, oedema peripheral, choking sensation and throat irritation were possibly related to therapy with GARDASIL, amoxicillin and zolpidem tartrate. The original reporting source was not provided. Subsequently the patient's experienced was reported in an article, 25-JAN-2008. Additional information is not expected.

MedDRA PT Agitation, Ataxia, Confusional state, Encephalitis, Endotracheal intubation, Intensive care, Leukoencephalomyelitis

Symptom Text: Information was obtained on request by the Company from the agency via a Case Line Listing and Public Case Detail Form concerning a 16 year old female who on 14-MAY-2007 and 14-JUN-2007 was vaccinated with the first and second dose of GARDASIL. On 04-SEP-2007, 113 days after the first vaccination and 82 days after the second vaccination, the patient experienced encephalitis, agitation, ataxia and confusional state, also reported as acute disseminated encephalomyelitis. The patient presented to the hospital on 08-SEP-2007 with agitation, confusion and ataxia. The patient was treated in the intensive care unit, intubated and ventilated and was given methylprednisolone. At the time of reporting on 20-NOV-2007, the patient's encephalitis, agitation, ataxia and confusional state persisted. The agency considered that encephalitis, agitation, ataxia and confusional state were possibly related to therapy with GARDASIL. The original reporting source was not provided. Subsequently the patient's experience was reported in an article. Additional information is not expected.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Convulsion, Grand mal convulsion, Lethargy, Loss of consciousness, Postictal state, Syncope, Tremor

Symptom Text: Information has been received from a physician concerning a 14 year old female patient who on 23-JUN-2008 was vaccinated with 0.5ml the first dose of GARDASIL (lot # 659180/17580). In June 2008, the patient experienced seizure like symptoms such as shaking and then fainted after receiving her first dose of GARDASIL as well as a few other injections. Other vaccines that the patient received at the time of visit were unknown. The patient recovered a few minutes after fainting. The patient sought medical attention. The physician reported on 23-JUN-2008 the patient received the first dose of GARDASIL (Lot Number 1758U; expiration date June 2010). Within two to three seconds, the patient's whole body started shaking for five seconds. The patient then passed out for five seconds and was then lethargic. The patient experienced a tonic-clonic seizure. The patient was postictal for twenty minutes. The patient lay down for fifteen minutes and then sat up for another twenty minutes. The patient got up fine and then left the office. No labs or diagnostic tests were performed. No treatment was given. Upon internal review, tonic-clonic seizures were determined to be an other important medical event. This is one of several reports from the same source. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Antinuclear antibody, Arthralgia, Joint swelling, Pallor, Systemic lupus erythematosus, Vasospasm

Symptom Text: Information has been received from a registered nurse concerning a 10 year old female patient with no allergies and family history of lupus who was vaccinated with two doses of GARDASIL. The patient developed lupus after vaccination. The vaccinations were administered at another location and no information was available on administration dates. The onset of the systemic lupus was unclear. The patient was performed unspecified blood and laboratory tests. The patient was first seen at the office on 16-MAY-2008. The patient's lupus persisted. Upon internal review, lupus was determined to be an other important medical event. Additional information has been requested. 7/14/2008 MR received from Rheumatology consult for initial and f/u visits 5/16/2008 and 5/29/2008. DX: Raynauds. Probably Lupus with limited manifestations of disease at this time. Pt presented for eval of a 2 mon hx of cold induced vasospasm in the hands in conjunction with a high ANA. Pt had cold induced pallor to the level of the PIP joint. Occasional arthralgias w/o joint swelling.

Other Meds: Unknown

Lab Data: Unknown. Labs and Diagnsotics: ANA (+) at 1: 640 speckled. Alpha 1 Globulin 0.38. Anti smith antibody (+). ESR in the 40's. UA (+) for moderate leukocytes, 5-9 WBCs, 2+ bacteria, 5-9 epis

MedDRA PT Cardiac arrest, Myelitis transverse

Symptom Text: Information has been received from a medical officer at CBER, concerning a 14 year old female who on an unknown date was vaccinated with the first dose of GARDASIL. Within 24 hours of the vaccination, the patient experienced immediate asystole followed by transverse myelitis. Upon internal review, immediate asystole and transverse myelitis were considered to be other important medical events. No further information is available.

MedDRA PT Drug exposure during pregnancy, Stillbirth

Symptom Text: Initial and follow up information has been received from a physician's assistant for the Pregnancy Registry for GARDASIL concerning a 14 year old female with no known allergies and attention deficit/hyperactivity disorder who on 15-FEB-2007 was vaccinated with GARDASIL (Lot#655165/1425F). Concomitant therapy included CONCERTA. On 15-MAR-2007, a urine pregnancy test revealed the patient was pregnant (LMP & EDD = approximately 28-JAN-2007 & 04-Nov-2007). On 17-MAR-2007, a quantitative HCG showed 6-7 weeks gestation. The patient had no symptoms and sought unspecified medical attention. On 01-JUL-2008 the physician's assistant (PA) was informed by the patient's sister, that the patient delivered a stillborn baby "early." The PA was given very limited information and did not know the date of delivery or estimated gestational age. No further information is available.

Other Meds: CONCERTA

Lab Data: urine beta-human, 03/15/07 - positive; total serum human, 03/17/07, 6-7 week gestation

MedDRA PT Convulsion, Diarrhoea, Drug withdrawal convulsions, Malaise, Vomiting

Symptom Text: Information was obtained on request by the Company from the agency via a Case Line Listing and Public Case Detail Form concerning a 20 year old female who on 19-NOV-2007 was vaccinated with GARDASIL. Other suspect therapy included LEXAPRO. Concomitant therapy included DIANE 35 ED. On 20-NOV-2007, 1 day after vaccination, the patient experienced diarrhoea, drug withdrawal convulsions, malaise and vomiting reported as diarrhoea, vomiting and was unwell and had seizures, and was hospitalised. The patient had run out of escitalopram oxalate and had not taken it for 6 days (also reported as stopped 14-OCT-2007). The agency considered that diarrhoea, drug withdrawal convulsions, malaise and vomiting were possibly related to therapy with GARDASIL or withdrawal from therapy with escitalopram oxalate, or a combination of both or an other illness. The original reporting source was not provided. Subsequently the patient's experience was reported in an article. Additional information is not expected. A copy of the published literature article is attached as further documentation of the patient's experience.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Caesarean section, Drug exposure during pregnancy, Inappropriate schedule of drug administration, Premature labour

Symptom Text: Information has been received from a 33 year old female physician for the Merck Pregnancy Registry for GARDASIL, with hypothyroidism and no known drug allergies, who on 01-OCT-2007 was vaccinated intramuscularly into the deltoid with a first dose of GARDASIL. Concomitant medication included SYNTHROID. The patient reported that her last menstrual period was 18-SEP-2007 and she ovulated and conceived 03-OCT-2007. The patient sought unspecified medical attention with another physician. A pregnancy test was performed. On 17-JAN-2007 amniocentesis performed at 16 weeks reported that cytomegalovirus, enterovirus and Toxoplasma were not detected. She went into preterm labor at 34 weeks on 18-MAY-2008 and delivered her daughter by cesarean section at 17:02, weight 400 grams. She reported that she did not experience any other problems with her pregnancy (except an elevated Downs syndrome risk for which she had the amniocentesis). She does not think that the vaccine had anything to do with her preterm labor. Placenta pathology report indicates a third trimester placenta at 34 weeks gestation with subchorionic fibrin deposition and less than 5% of placental disc. Also noted were microcalcifications, intraparenchymal hemorrhage, no acute chorioamnionitis, and a trivascular umbilical cord. On 19-MAY-2008 the patient recovered. No product quality complaint was involved. Upon internal review preterm labor at 34 weeks delivering by cesarean section was considered to be an other important medical event. Additional information has been requested.

Other Meds: SYNTHROID, 100 microgm

Lab Data: diagnostic laboratory, elevated Down syndrome risk; amniocentesis, 01/17/08, cytomegalo virus, enterovirus and Toxoplasma were not detected; beta-human chorionic; pathology analysis, 05/18/08, see narrative

MedDRA PT Brain neoplasm, Dizziness postural

Symptom Text: Information has been received from a gynecologist concerning a 21-year-old female patient who on 11-MAR-2008 was vaccinated via intramuscular route into the right upper arm with a first dose of GARDASIL. Concomitant suspect therapy included hormonal contraceptives started shortly after vaccination. Subsequently, on an unknown date, the patient complained about dizziness on standing up. Neurological tests and examinations through an ENT (ear nose throat) specialist (not specified) showed normal findings. MRI results were pending. Symptoms were ongoing at the time of reporting. Follow up information was received which reported that the case was upgraded as an other important medical event since diagnosis of brain tumor has been established. On 08-MAY-08 a cranial MRI was carried out. it showed that a brain tumor (no other specified). No further information is available since the patient did not present at the office again. It is possible that she has moved to her parents in another city. Other business partner numbers included E2008-04228.

Other Meds: hormonal contraceptives (unspecified)

Lab Data: magnetic resonance imaging, 08May08, Comment: cranial MRI showed a brain tumor (no otherwise specified); neurological examination, Comment: normal; magnetic resonance imaging, Comment: pending

MedDRA PT Dizziness, Headache, Muscle spasms, Neck pain, Vision blurred

Symptom Text: Information was obtained on request by the Company from the agency via a Public Case Detail Form and a Case Line Listing concerning a 15 year old female who on 03-SEP-2007 was vaccinated with GARDASIL (Lot No. 655742/0138U, Batch No. J0799, Expiry date 07-AUG-2009). On 03-SEP-2007 the patient experienced headache, dizziness, muscle spasms, neck pain and vision blurred and was hospitalised. It was described that 20 minutes post vaccination, the patient experienced severe headache, dizziness, neck pain/spasms, blurred vision and was seen by a general physician, an optometrist and a paediatrician. A neck x-ray and a head CT were performed. The patient was admitted to hospital for investigation. All her results were found to be negative. At the time of reporting to the agency on 26-NOV-2007, the outcome of headache, dizziness, muscle spasms, neck pain and vision blurred was unknown. The agency considered that headache, dizziness, muscle spasms, neck pain and vision blurred were possibly related to therapy with GARDASIL. The original reporting source was not provided. Subsequently the patient's experience was reported in an article. Additional information is not expected.

Other Meds: Unknown

Lab Data: Neck X-ray, 03Sep07, negative; Head computed axial tomography, 03Sep07, negative.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Mass, Myalgia, Pyrexia

Symptom Text: Information has been received from a physician concerning a 16 year old female who on 30-MAY-2008, was vaccinated with the first dose of GARDASIL and a dose of DT-IPV in the shoulder. Batch number and routes were not reported. In the morning of 31-MAY-2008, the patient had fever between 40 and 41 degrees C and muscle soreness. The patient was directed to hospital where she was under observation at emergency room. On the evening of the same day, she left the hospital. According to the emergency department, the reaction was to GARDASIL. The patient fully recovered in two days. On 11-JUN-2008, the physician observed a "mass" on each wrist which seemed to be cyst although that it presented abnormal osseous excrescence reported as rigid, remain fixed and were painful. The events appeared a week after the vaccination. A work up was scheduled. At the time of the report, the patient was not recovered. Fever and muscle soreness have been reported following both DT-IPV and human papillomavirus vaccines. Time to onset, clinical feature and quick recovery are consistent with the role of the vaccines. No conclusion can be drawn regarding the mass on each wrist that appeared one week after vaccination as neither results of investigations nor final diagnosis are available. Another etiology can therefore not be ruled out. Other business partner numbers included: E2008-05572. The fever, muscle soreness and pain were considered to be other medically important conditions.

MedDRA PT Drug exposure during pregnancy, Foetal disorder

Symptom Text: Information has been received through a Merck pregnancy registry from a 27 year old female with penicillin allergy and no pertinent medical history who on 20-AUG-2007 was vaccinated with a single dose of GARDASIL. There was no concomitant medication. She became pregnant in September 2007. A pregnancy test was performed (result not provided). Her LMP was 08-SEP-2007. Expected date of delivery was 14-JUN-2008. The patient did not have any adverse symptoms as a result of receiving GARDASIL. She did not have any additional doses of GARDASIL. On 11-JUN-2008 the patient gave birth to a baby girl. The child had been diagnosed with congenital cataracts in both eyes. Unspecified medical attention was sought. Additional information has been requested.

MedDRA PT Drug exposure during pregnancy, Premature labour

Symptom Text: Information has been received from the Merck pregnancy registry for GARDASIL from a physician concerning a 17 year old female who on 16-JUL-2007 was first vaccinated with 0.5 ml, GARDASIL. Concomitant therapy included albuterol which the patient used infrequently. On 17-SEP-2007, the patient presented to the office to get her second dose of GARDASIL but a urine test showed positive HCG and the client was pregnant (LMP 18-AUG-2007). The second dose of GARDASIL was not administered. Followup phone call information from a pediatrician reported that the patient had not been back to the pediatrician's office since she found out she was pregnant. However, the pediatrician was able to report that via their tracking system, it appeared that the patient was still pregnant and had an upcoming appointment. She also reported the patient had been admitted to the hospital for pre-term labor from 28-MAY-2008 to 31-MAY-2008. No outcome information was reported. Additional information has been requested.

MedDRA PT Abdominal injury, Anaemia, Caesarean section, Delivery, Drug exposure during pregnancy, Fall, Inappropriate schedule of drug administration

Symptom Text: Information has been received from a consumer, a 21 year old female, through the Merck Pregnancy Registry for GARDASIL, who on 05-APR-2007 was vaccinated with a first dose of GARDASIL (Lot # unknown), and on 18-SEP-2007 she was vaccinated with a second dose of GARDASIL (Lot # unknown). On 21-OCT-2007 she found out she was pregnant after the second dose. The consumer had performed two pregnancy tests, one was done on 22-OCT-2007 and then another on 08-NOV-2007. Both tests came back positive (estimated LMP 23-AUG-2007). Unspecified medical attention was sought. The consumer reported that she is 29 weeks pregnant. Follow up information has been received from a certified nurse midwife. The patient's significant past medical history was benign. The patient had one previous pregnancy which was a full term delivery. The patient's LMP was confirmed to be 19-AUG-2007 and her estimated delivery date to be 25-MAY-2008. On 04-JAN-08 the patient was started on prenatal vitamins (unspecified) for pregnancy/nutrition. The nurse midwife indicated that the following labs/diagnostics studies were performed: on an unspecified date for Hepatitis C Antibody (tested reactive); on an unspecified date recombinant immunoblot assay (RIBA) (negative); on 04-JAN-2008 alpha-fetoprotein (AFP) (negative) and on 10-JAN-2008 an ultrasound for anatomay (WNL, confirmed dates). On 10-MAR-2008 the patient had a 24 hour urine test and liver function tests which were within normal levels. On 10-MAR-2008, the patient also had a hematocrit of 30, which was done because of anemia. The reporter noted that on 24-MAR-2008, at 31 weeks gestation, the patient fell and hit her abdomen. Labs and electronic fetal monitoring were within normal at that time. On1 5-APR-2008 the patient was started on ED Cyte F for the anemia. No product quality complaint was involved. On 23-MAY-2008, at 39 5/7 weeks from the LMP, the patient underwent primary caesarean section for multiple variable fetal heart decelerations shown on electronic fetal monitoring, and delivered a full

MedDRA PT Diplopia, Dizziness, Hypoaesthesia, Neck pain, Vision blurred

Symptom Text: Information has been received from a general practitioner concerning a 16 year old female with history of breast surgery in March 2008, who on 28-NOV-2007 was vaccinated with the first dose of GARDASIL (Lot # 0276U; batch NF58550) which was well tolerated. On 24-JAN-2008, the patient was vaccinated with the second dose of GARDASIL (Lot # 0352U; batch NG00320). Since January 2008, the patient experienced recurrent neck pain with dizziness, numbness of the skin and double/blurred vision. In the course she presented to a chiropractor once. After "setting maneuver" symptoms improved for short time. She was hospitalized for diagnostics from 11-APR-2008 to 17-APR-2008. All examinations including ophthalmologic check up, electroencephalography (EEG), cranial magnetic resonance imaging (MRI), sonography, X-ray of cervical spine and routine laboratory test showed normal results. Treatment was carried out with analgesics (not specified), ruby light and massage and lead to slow improvement. A psychogenic cause for the complaints was assumed. At the time of the report she had not yet completely recovered. Other business partner numbers included: E2008-05737. Additional information has been requested.

MedDRA PT Arrested labour, Caesarean section, Drug exposure during pregnancy, Live birth

Symptom Text: Initial and follow up information has been received from the Merck pregnancy registry for GARDASIL via a medical assistant (also reported as a nurse) concerning a 24 year old female who on 03-APR-2007 was vaccinated with the first dose of GARDASIL. On 05-Jun-2007 the patient was vaccinated with the second dose of GARDASIL. Concomitant therapy included prenatal vitamins (unspecified). The patient was 9 weeks and one day pregnant. Unknown medical attention was sought. The patient delivered by primary cesarean section secondary to arrest of active labor at 8cm. She delivered a healthy and normal infant at 40 weeks estimated gestational age, weighing 9 lbs. 7 oz. Upon internal review primary cesarean secondary to arrest of active labor at 8 cm was considered to be an other important medical event. Additional information has been requested.

Other Meds: Vitamins (unspecified)

MedDRA PT Anaemia, Arthralgia, Autoimmune disorder, Dyskinesia, Fasciitis, Inflammation, Musculoskeletal pain, Myositis, Oedema peripheral, Pain in extremity, Temporomandibular joint syndrome, Tenderness

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. A 17 year old female with no medical history, no known drug allergies and no previous illness was vaccinated intramuscularly into the left arm with a first dose of GARDASIL (Lot # 653735/0688F) on 13-JUL-2007. There was no concomitant therapy. The patient experienced autoimmune myositis, fasciitis, anemia, chronic autoimmune disease. Patient developed symptoms in ipsilateral arm about 3 weeks post vaccination, progressed to severe inflammatory autoimmune disease that has lasted for 1 year and is ongoing. On 09-JUL-2008 office notes received from the Rheumatologist from 07-SEP-2007 to 03-APR-2008 with diagnosis: Myositis/Fasciitis left arm. Patient developed left shoulder pain and decreased range of motion ROM in August 2007 which has persisted. Patient then developed forearm pain and swelling, elbow pain and pain upon extending fingers and wrist. Physical examination (+) for temporomandibular joint pain and inability to fully open mandible, tenderness of the anterior humeral head, upper inner aspect of the arm below the humeral head, and the lateral aspect of the left forearm. Pain upon dorsiflexion of left wrist. Swelling noted on left forearm. Started on prednisolone. Much improved by 11-OCT-2007 with prednisolone taper scheduled. Increased pain with decreased prednisolone. Dose increased and methotrexate started. Episode of inflammation left leg (ankle and shin pain) April 2008. The listing indicated that the events required an ER visit and one or more of the events was considered to be disabling and to be immediately life-threatening. This was originally reported by a physician. The VAERS ID # 318399. A standard lot check investigation was performed. All in-process quality checks for the lot in question were satisfactory. In addition, an expanded lot check investigation was performed. The testing performed on the batch prior to release met all release specifications. The lot met

MedDRA PT Depression, Throat tightness

Symptom Text: Information has been received from a consumer concerning her daughter, a 15 year old female with a history of syncope vasovagal and no allergies who on 27-JUN-2008 was vaccinated with the first dose of GARDASIL (lot # not reported) injection in left arm. Concomitant therapy included CLARITIN. On 27-JUN-2008 the patient experienced throat closed up and sudden severe depression on the day she received vaccine. The patient was taken to the emergency room but was not admitted to the hospital. Her throat still did not feel fully recovered and she still occasionally has bouts of sadness. This is one of several reports from the same source. Additional information has been requested.

MedDRA PT Accidental exposure, Medical device complication, Rash erythematous, Rash pruritic, Urticaria

Symptom Text: Information has been received from physician concerning a patient who on approximately 26-MAY-2007 was accidentally exposed to 0.5 ml of GARDASIL (lot# 0151X). The physician reported that a while administering the GARDASIL the prefilled syringe safety device deactivated and syringe leaked onto patient's arm. Conflicting follow-up information was received from a nurse who reported that the patient" was never administered with the prefilled syringe". No adverse event reported. At the time of this report the patient's outcome was unknown. Follow up information was received which reported that the patient was a 25 year old female with no pre-existing allergies, birth defects or medical conditions who on 07-JUL-2008 at 6 pm was vaccinated with a first dose of GARDASIL in her arm. There was no illness at time of vaccination. On 07-JUL-2008 the patient experienced disseminated welts, erythematous and pruritic which started on lower back then spread to arm, leg with traveling to face started 1 hour after the vaccination (7 pm) and was still spreading 24 hours later. The patient was advised BENADRYL at the onset of rash. The patient stated that it was very little relief and was advised to report to local emergency room for management and evaluation. Additional information has been requested.

Seriousness: ER VISIT, EXTENDED HOSPITAL STAY, HOSPITALIZED, SERIOUS

MedDRA PT Abdominal distension, Abdominal pain, Abdominal pain upper, Abdominal tenderness, Cholecystectomy, Constipation, Decreased appetite, Dehydration, Diarrhoea, Dyspepsia, Early satiety, Fatigue, Gallbladder disorder, Gallbladder operation, Gastritis, Gastrointestinal disorder, Gastrointestinal motility disorder, Hypokalaemia, Impaired gastric emptying, Nausea, Stress, Vaccine positive rechallenge, Vomiting, Weight decreased

Symptom Text: Patient experienced severe gastrointestinal symptoms after Gardasil injections. Injections 6/12/07 and 8/14/2007 followed by emergency room visits 8/25/07 and 11/1/07, third injection 12/20/07 followed by emergency room visit and extended hospitalization 2/08. Severe abdominal pain and vomiting occured each time which would not stop without emergency medical and drug intervention. Multiple diagnostic and lab tests indicated possibility of gall bladder involvement. Gall bladder was removed 12/5/07. The final Gardasil injection was after gall bladder surgery and another gastrointestinal episode with emergency treatment and a 5 day hospitalization occured after this. Patient had no history of gall bladder or gastrointestinal symptoms before beginning series of Gardasil injections. No underlying cause has been clearly established for these conditions, symptoms or multiple episodes by either primary physician, surgeon, gynecologists or gastroenterologist. Tests indicated slow gall bladder emptying, slow gastric emptying and slight gastritis concurrent with these multiple episodes, but patient had no symptoms indicating slow stomach or gallbladder functioning prior to beginning Gardasil. All other tests and screens were negative for anything unusual. Patient has had no recurrence of the symptoms since 2/08, but she is on continuing drug treatment for the gastrointestinal issues. We are reporting this to assist in identifying any trends related to similar gastrointestinal symptoms, since these conditions are not typical for a 15/16 year old female and the timing of the three injections and the repeated recurrence of these unusual and previously nonexistent symptoms seems a bit more than coincidental. 7/23/08 MR received for several OVs beginning in 11/2007 through 3/2008. Seen 11/7/2007 with c/o 3 episodes of nausea, vomiting and abdominal pain. One episode required IV fluids for dehydration. Pt reports early satiety, weight loss, decreased appetite, fatigue, stress, indigestion, constipation, abdominal bloatin

MedDRA PT Abortion spontaneous, Anogenital warts, Drug exposure during pregnancy, Haemorrhage

Symptom Text: Information has been received from a gynaecologist concerning a 17 year old female who started a spontaneous pregnancy (estimated conception date: 25-MAY-2008) 6 days before receiving the third dose, on 31-MAY-2008, of GARDASIL (Lot#, batch # and route of administration not reported). She had received the first and second doses in December 2007 and February 2008. The patient was concomitantly treated with ALDARA for vulvar condylomae she probably had since February 2008 and were noticed in May 2008. The patient had stopped contraception. ON 10-MAY-2008, she experienced miscarriage followed by bleeding lasting 5 to 6 days. It was also reported that the patient had unprotected sexual intercourse on 25-MAY-2008. She was seen by her gynaecologist on 25-JUN-2008 due to her positive pregnancy test on 17-JUN-2008. She was then approximately one month pregnant (WAES # 0806USA08890). No adverse reaction was reported. Upon internal review, miscarriage was determined to be an other important medical event. Further information is expected. Other business partner numbers included: E2008-05982. Additional information has been requested.

MedDRA PT Myalgia, Pancytopenia, Pyrexia, Retroperitoneal lymphadenopathy, Splenomegaly

Symptom Text: Information was obtained on request by the Company from the agency via a Public Case Detail Form and Case Line Listing concerning a female who was vaccinated with GARDASIL. Subsequently, 3 weeks after vaccination the patient experienced pancytopenia, splenomegaly, retroperitoneal lymphadenopathy and pyrexia and was hospitalised. It was described that the patient experienced pancytopenia with fever, splenomegaly, retroperitoneal lymphadenopathy and myalgia. At the time of reporting to the agency on 19-DEC-2007, the patient had recovered from pancytopenia, splenomegaly, retroperitoneal lymphadenopathy and pyrexia. The agency considered that pancytopenia, splenomegaly, retroperitoneal lymphadenopathy and pyrexia were probably related to therapy with GARDASIL. The original reporting source was not provided. Subsequently the patient's experience was reported in an article. Additional information is not expected. A copy of the published literature article is attached for further documentation of the patient's experience.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Initial and follow up information has been received from a 23 year old female consumer through the Merck Pregnancy registry and an other health professional who on approximately 23-JUN-2007 was vaccinated with 0.5 ml of a first dose GARDASIL. There was no concomitant medication. On 23-AUG-2007 the patient was vaccinated with second dose of GARDASIL. On 06-SEP-2007 the patient reported that she was pregnant. The patient's last menstrual period was 02-AUG-2007. The estimated delivery date was 08-MAY-2007. Unspecified medical attention was sought. A urine test was performed (results not reported). On 26-JUN-2008, it was reported that the patient had a pregnancy loss at 20 weeks estimated gestational age (EGA) and was then seen for a postpartum visit in January after her 20 week loss. At the time of this report, the patient's outcome was unknown. Upon internal review, spontaneous abortion was considered to be an other important medical event. Additional information has been requested.

MedDRA PT Caesarean section, Drug exposure during pregnancy, Foetal macrosomia, Hypertension, Premature rupture of membranes

Symptom Text: Initial and follow up information has been received, via the Merck pregnancy registry, from a registered nurse, concerning a 26 year old female patient with chronic hypertension, who on 24-JAN-2007 was vaccinated with the first dose of GARDASIL (Lot # not provided), and on 04-APR-2007 was vaccinated with the second dose of GARDASIL (Lot #656051/0244U). Concomitant therapy included ALDOMET and prenatal vitamins (manufacturer unspecified). The patient later found out she was pregnant, with the date of the LMP on 14-APR-2007, and an estimated date of delivery on 19-JAN-2008. The nurse confirmed that the pregnancy was normal to date. On an unspecified date, the patient delivered at 39 weeks a healthy and normal male. The patient had spontaneous rupture of membranes and ultimately had a cesarean section. The patient's cesarean section was secondary to fetal macrosomia and chronic hypertension. The baby weighed 10lbs 1.6oz. There were no complications for the baby and mother postoperatively. The baby was discharged home along with the patient. Upon internal review, fetal macrosomia and chronic hypertension were considered other important medical events. Additional information is not expected.

Other Meds: ALDOMET (METHYLDOPA); vitamins (unspecified)

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Initial and follow up information has been received from a physician and a Merck Pregnancy Registry concerning an 18 year old female with a history of asthma who on 31-JAN-2007 was vaccinated intramuscularly with a 0.5 mL dose of GARDASIL, (Lot # 655205/1426F). Concomitant therapy included albuterol. The patient's last menstrual period was on 01-JAN-2007. Subsequently the patient had a positive pregnancy test on 07-FEB-2007. The patient sought unspecified medical attention. The patient had a qualitative human chorionic gonadotropin (HCG) test. No problems reported. On 09-MAR-2007, the patient had an elective termination of the pregnancy. She was approximately 9 weeks estimated gestational age (EGA). According to the physician, the patient didn't have an elective abortion because of the vaccine. This was an unplanned pregnancy and the patient wanted to go on to college, this was the primary reason. The fact that she had the vaccine maybe contributed a little bit after that. At the time of this report, the patient's outcome was unknown. Upon internal review, elective abortion was considered an other important medical event. Additional information is not expected.

Other Meds: albuterol

MedDRA PT Dizziness, Gait disturbance, Headache, Hypoaesthesia, Hypoaesthesia facial, Hypoaesthesia oral, Incorrect route of drug administration, Injection site pain, Migraine, Myalgia, Nausea, Pyrexia, Vaccine positive rechallenge, Vision blurred

Symptom Text: After the 1st shot I was dizzy, nasueous, developed a fever. The next day a bad headache followed and the muscle that received the shot (butt) hurt terribly for the next week and a half. The 2nd shot I received I had the same symptoms only this time I ended up being hospitalized for a "migraine". I had numbness in my face, arms and hands, my entire mouth went numb and I had severely blurred vision and couldn't walk straight. I've never had this before in my life and it seems to follow each shot. It definitely escalated with the 2nd shot and I've become wary of having the 3rd done because of this.

MedDRA PT Activities of daily living impaired, Musculoskeletal pain, Musculoskeletal stiffness, Myalgia, Neck pain

Symptom Text: I received my shot in my left arm on the afternoon of the 11th of June. In the days following, I began to have sore muscles in my left triceps and biceps and left neck/shoulder. The arm pain continued for no more then a day, but the morning of the 17th I woke up, got out of bed, and my neck kinked. The stiff neck was so severe that I could barely move it and it was incredibly painful the entire day. I was forced to look down the entire day because lifting my head up was too painful. I treated it with advil and vicodin and heat packs. The pain went on for days (continuing to lessen) until the 23rd when I could no long feel any lingering neck pain. I had never had a stiff neck last that long previously.

MedDRA PT Injected limb mobility decreased, Injection site mass, Injection site pain, Myalgia

Symptom Text: My daughter rec'd the first HPV shot 03/16/08 and complained of soreness at injection site which subsided within a couple of days. She went for 2nd dose on 05/16/08 and her arm has not been the same since. She complains of muscle soreness and has a small bump at injection site to this day July 9, 2008. She sometimes has difficulty lifting her arm up. I brought her to her MD and nurse practitioner told her to exercise the arm and said this is a normal to feel pain afterwards. I feel this is from the HPV vaccine and consider it to be a consequence of that shot. I will NOT allow her to get the 3rd dose. It was recommended by the NP that she should probably get this third and final shot in her leg, because of the problem she had with her arm. I fear that if the same thing happens she will have problems walking if this shot was to be given in her leg, just as she had problems moving and lifting her arm. I feel this is directly related to the HPV vaccine because she never had a problem with her arm/ muscle before.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Alopecia, Alopecia effluvium, Anxiety, Burning sensation, Pain of skin, Stress

Symptom Text: About 1 week after receiving the first shot, I noticed my hair started to fall out. I went to the dermatologist who said I had telogen effluvium (temporary hair loss). They said it occurs when something "shocks" the bodies system. I have also seen an endocrinologist to rule out all illnesses/diseases (all tests came back negative). I have seen so many doctors and everyone tells me something different. I saw another dermatologist who said the hair loss can last from 6 months to 2 years. I am now suffering from anxiety and stress because of this and nothing seems to be working. My scalp is sore all the time and sometimes burns. It is extremely uncomfortable. The dermatologist can't see anything (meaning it is some underlying symptom).

MedDRA PT Abdominal pain upper, Activities of daily living impaired, Arthralgia, Blood test normal, Chest pain, Disturbance in attention, Dyspnoea, Fatigue, Headache, Hyperaesthesia, Lymphadenopathy, Malaise, Mononucleosis heterophile test negative, Pain, Pneumonia, Sinusitis, Streptococcal identification test positive

Symptom Text: On July 25, 2007 patient went into the Pediatrician's office for a School Physical. The nurse practitioner recommended the Gardasil vaccine. After discussing with her the possible side effects and the fact that patient, has many allergies and I was concerned about possible reactions to the vaccine. The nurse assured us that the vaccine that should not give her a problem. I agreed to the vaccine. The second shot was given to patient on or about October 22, 2007. Within a week of getting, the second vaccine patient started complaining of generally not feeling well. Patient began feeling very tired and generally "achy" all over. She started missing school. Through the entire month of November, patient missed school occasionally due to fatigue and overall achiness. This progressed and became worse. By the end of December, patient had started missing entire weeks of school. She had headaches, joint pain, ached all over, fatigue, difficulty breathing on occasion. Because patient was so ill that when it was time to receive the 3rd shot of Gardasil, we chose to wait even though the doctors reassured us that it would be alright. The symptoms appeared to be consistent with Mono, so in early January we took her to the doctor. He ran Mono tests, Strep tests and blood tests. The strep test was positive, the mono test was negative and the blood tests showed no problems. The doctor prescribed on Antibiotics for the strep. Through the entire Month of January, she was ill, and went through several rounds of antibiotics. Her glands were swollen, her body was in pain, her stomach and chest hurt, legs and joints hurt (at times you could not even touch her, she would cry in pain). There were days that she just could not get out of bed, severe fatigue. By February, patient had developed pneumonia and was so ill that the doctor contemplated putting her in the hospital. The only reason he did not hospitalize her was that due to her allergies to antibiotics he indicated that he really did not have anything

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Abdominal pain upper, Arthralgia, Disturbance in attention, Dizziness, Drug hypersensitivity, Eating disorder, Fatigue, Headache, Pain, Paraesthesia, Sinusitis, Weight decreased

Symptom Text: Patient was 11 on July 25, 2007 when she went into the Pediatrician's office for a School Physical. Patient received the first vaccine during the visit and received the second shot on or about October 22, 2007. Patient began struggling with fatigue and general achiness about 2 weeks after the vaccine. This progressed and became worse. She had issues with fatigue and overall body pain, joint pain, headaches and stomachaches. Patient was able to work through it part of the time but still missed a lot of school. At the end of February, Patient had severe headaches, dizziness, stomach pain, and fatigue. Patient had virtually stopped eating. She had lost 10 pounds in a matter of a month. The diagnosis was "sinus infection." The doctor prescribed an antibiotic. Patient had an adverse reaction to the antibiotic and had to be prescribed a different one. She was on Antibiotics for several weeks without any improvement. In addition to the above noted symptoms reported to the doctors, patient reported difficulty concentrating and severe leg pain and tingling down to her ankles. We have enlisted the help of a Integrated Manual Therapist to get the toxins out of her body. She has been in treatment since mid April and has been improving. She is still having occasional severe headaches, stomach pain and fatigue. Patient has begun eating again but has not gained any weight back (she has lost a total of 20 pounds).

Seriousness: ER VISIT, HOSPITALIZED, SERIOUS

MedDRA PT Concussion, Dizziness, Fall, Gaze palsy, Head injury, Headache, Loss of consciousness, Neck pain, Pain of skin, Somnolence, Subarachnoid haemorrhage, Subdural haematoma, Syncope, Unresponsive to stimuli

Symptom Text: Client had sat in imms room for approximately ten minutes after receiving the vaccinations prior to going to waiting room. Client was waiting for mother to take care of business with clerk for a few more minutes and she went unconscious. Her head hit the floor very hard on the back of her head. Per mother her eyes rolled back and client was non responsive. A rather large hematoma occurred approximately 5 cm by 2 cm and raised approximately .5 cm. Our physician on site assessed client and gave instructions to mother and told mother that Client has a level 1 or 2 concussion. Ice was applied to hematoma and mother was told if confusion or lethargy was to occur she should take client to the hospital. Later that afternoon mother felt client was having trouble staying awake and kept dozing off. Client was taken to ER (09/08/2008) and sent to another facility for observation over night. Hospital discharged client 09/09/2008 with a diagnosis of a small intracranial bleed per clients mother. 7/11/08 Reviewed ER medical records of 7/8/2007. FINAL DX: intracranial hemorrhage of subdural hematoma & subarachnoid hemorrhage Records reveal patient experienced syncope at MD office w/lightheadedness, fall, LOC x 30-45 secs w/head & neck pain when awakened. Exam revealed tenderness at base of skull. Transferred to higher level of care. 8/5/08 Reviewed hospital medical records of 7/8-7/9/2008. FINAL DX: SAH & small SDH s/p fall Records reveal patient continued to experience HA s/p fall. Kept overnight for observation. Did well w/minimal scalp tenderness next AM & D/C to home w/PCP f/u.

Other Meds:

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Back pain, Fatigue, Feeling cold, Groin pain, Hyperhidrosis, Injected limb mobility decreased, Injection site pain, Insomnia, Loss of consciousness, Oedema peripheral, Pain, Pain in extremity, Pallor, Paraesthesia, Presyncope, Pruritus, Pyrexia, Rash erythematous, Tinnitus

Symptom Text: I presented to the doctor with the flu on Monday March 10 2008. The doctor said that it did not matter for the injection. The nurse was called and I was given the first injection. That night all through the night my arm became swollen and sore, I had intense pain in my lower back, groin and shooting pains down my legs. I had tingling in my feet and arms. The next day I nearly fainted when I sat up and every time I moved I had chronic dizziness coupled with ringing in my ears and black outs. Later that evening a red rash started to appear on my arm. I couldn't move my arm without extreme pain. I felt paralysed. A rash appeared on my lower back it looked like a heat rash. I had high fevers and intense pain lots of sweat and then I would feel very cold as if my spine was frozen. The back rash dissappeared but the arm rash increased in size. I went back to the doctor who said the rash would go down - the doctor did not administer anything. The rash did not go down. By the Thursday the rash had increased in size, my upper arm was swollen and itchy, I could not move my arm, I was pale, dizzy, feverish and I had pains in my back and legs. I had insomnia. I consulted a homeopath (as I no longer trusted the doctor) who administered china and apis and other herbs. It wasn't until I started taking these that the rash went down and the fever broke. During the month after the injection I suffered terrible insomnia and dizziness and pain at the injection site. During the two months after the injection I had inexplicable fatigue. Now, (5 months on) I experience a dull throb at the injection site, pain down my arm to my fingers with tingling. I am still experiencing intense fatigue and I believe my immune system is very poor.

MedDRA PT Convulsion, Immediate post-injection reaction, Syncope

Symptom Text: Information has been received from a physician concerning his 21 year old female niece who on 10-MAY-2008 was vaccinated with her first dose of GARDASIL. Patient had no history of allergies and had no concomitant medications at the time of the vaccination. On 11:00 am of 10-MAY-2008, immediately after the vaccination was completely given, the patient experienced seizure and fainting which lasted for approximately 30 seconds. The reporting physician mentioned that the patient did not have breakfast yet when she received the vaccination. Subsequently, the patient recovered from seizure and fainting. The physician mentioned that after the event, the patient was monitored for other similar episodes. At the time of reporting, patient did not have any similar experience yet. The reporter felt that seizures and fainting were related to therapy with GARDASIL. Upon internal medical review, seizure is considered as an other important medical event. Additional information is not expected.

MedDRA PT Blighted ovum, Drug exposure during pregnancy

Symptom Text: Initial and follow-up information has been received for the Pregnancy Registry for GARDASIL from a 25 year old female consumer who on 28-MAR-2008 was vaccinated with her third dose of GARDASIL (lot# not reported). Concomitant therapy included prenatal vitamins (unspecified) once daily. On 06-APR-2008 the patient found out she was 4 weeks pregnant. The patient had a positive home pregnancy test. Subsequently the patient experienced no adverse events and sought unspecified medical attention. The patient's estimated conception date was approximately 19-MAR-2008, her last menstrual period was 06-MAR-2008 and her estimated delivery date was 10-DEC-2008. On 05-MAY-2008 an ultrasound was performed for viability, the results showed no defectable fetal parts or cardiac activity within the sac. On 20-MAY-2008 an ultrasound was performed and showed no fetal pole or yolk sac, which suggested a blighted ovum. The patient did not provide any information on the first and second dose. At the time of the report, the outcome of the patient was unknown. Upon internal review the blighted ovum was considered to be an other important medical event. Additional information has been requested.

Other Meds: vitamins (unspecified)

Lab Data: ultrasound, 05/05/08, reason-viability no defectable fetal parts or cardiac activity within sac; ultrasound, 05/20/08, no fetal pole or yolk sac seen; suggested blighted ovum; beta-human chorionic, positive

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Initial and follow up information has been received from a physician and a nurse practitioner concerning a 17 year old female no past medical history reported, and no previous pregnancies, who on 21-MAY-2008 (also reported as April 2008) was vaccinated with a 0.5 mL dose of GARDASIL and then discovered that she was pregnant. No concomitant medications were reported. No adverse effects reported. The patient sought unspecified medical attention in the office. The patient was referred to an obstetrician for obstetrical care. The patient's last menstrual period was 01-APR-2008 and estimated date delivery is 07-JAN-2009. A urine pregnancy test in the office on 17-MAY-2008 was negative and on 21-MAY-2008 the urine pregnancy test was positive. On 03-JUN-2008 ultrasound results showed that the patient was 8 weeks and 5 days pregnant. On 19-JUN-2008 the patient had a spontaneous abortion at nine weeks. Pathology and chromosomal testing was pending. Spontaneous abortion was considered to be an other important medical event. No further information is available.

MedDRA PT Grand mal convulsion, Inappropriate schedule of drug administration, Loss of consciousness

Symptom Text: Information was obtained on request by the Company from the agency via a Case Line Listing concerning a 27 year old female who was vaccinated with GARDASIL. Subsequently, after vaccination the patient experienced Grand mal convulsion and loss consciousness. At the time of reporting to the agency on 24-DEC-2007, the patient had recovered from Grand mal convulsion and loss of consciousness. The agency considered the Grand mal convulsion and loss of consciousness were related to therapy with GARDASIL. The original reporting source was not provided. Upon internal medical review, Grand mal convulsion was considered an other important medical event. Subsequently the patient's experience was reported in an article. Additional information is not expected. A copy of the published article is attached as further documentation of the patient's experience.

Seriousness: PERMANENT DISABILITY, SERIOUS

MedDRA PT Fatigue, Feeling abnormal, Impaired work ability, Injection site erythema, Injection site pain, Malaise, Somnolence

Symptom Text: Information was obtained on request by the Company from the agency via a Public Case Detail Form and Case Line Listing concerning a 24 year old female who on 14-DEC-2007 was vaccinated with GARDASIL (Lot No. 658214/0734U, Batch No. J2926, Expiry date 13-MAR-2010). On 14-DEC-2007, one hour after vaccination, the patient experienced malaise, fatigue, feeling abnormal, injection site pain and somnolence. It was described that the patient's symptoms of feeling unwell, tired and sleepy were persistent for 6 days at the time of reporting to the agency on 21-DEC-2007. The patient was not able to work. Not specific but soreness and tenderness at site of immunisation. There were nil findings on exam. The patient was apyrexial and normotensive. The patient's PR was 80 (units not specified). Slightly tender aspect around immunisation site with some redness and not hot. The agency considered that malaise, fatigue, feeling abnormal, injection site pain, and somnolence were possibly related to therapy with GARDASIL. Malaise, fatigue, feeling abnormal, injection site pain and somnolence were considered to be disabling. The original reporting source was not provided. Subsequently the patient's experience was reported in an article. Additional information is not expected. A copy of the published article is attached as further documentation of the patient's experience.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Convulsion, Gaze palsy, Postictal state, Staring, Tremor

Symptom Text: Information has been received from a physician concerning a 16 year old female with no pertinent medical history or history of drug allergies or reactions who on 31-JUL-2007 was vaccinated intramuscularly with the first dose of GARDASIL (lot no. 655849/0263U). There was no concomitant medication. On 15-AUG-2007 and 01-SEP-2007, the patient experienced a seizure. On 01-SEP-2007 the patient was taken to the emergency room. The patient was also taken to see a neurologist where she was diagnosed as having generalized seizures. An electroencephalography was performed (results not reported). At the time of this report, the outcome was unknown. Generalized seizures were considered to be other important medical events. Additional information has been requested. 10/16/2008 ER record received for 9/1/07 with DX: Seizure-new onset. Pt was sitting at home when pt began staring up and shaking with eyes rolled back in the head. Witnessed by family. Post-ictal upon arrival. D/C for outpt f/u

MedDRA PT Abdominal pain, Blood glucose decreased, Bronchitis, Condition aggravated, Diarrhoea, Dizziness, Hypoglycaemia, Hypotension, Loss of consciousness, Migraine, Nausea, Pain, Pharyngolaryngeal pain, Pyrexia, Supraventricular tachycardia, Syncope vasovagal, Tonsillitis, Ventricular tachycardia

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. A 16 year old female with mild supraventricular tachycardia and a medical history of dizziness and giddiness, decreased blood sugar, syncope, tonsillitis and nausea, who on 09-JUL-2007, was vaccinated with the first dose of GARDASIL (Lot # 657737/0522U), intramuscularly, into the right arm. On 21-MAY-2007, the patient was complained of passing out from low blood sugar. She also experienced a syncopal episode with nausea. The patient was diagnosed with dizziness and giddiness. On 04-APR-2007, the patient was presented to the emergency dispatch with sore throat and fever. The patient was diagnosed with exudative tonsillitis. A Holter monitor was used to diagnose supraventricular tachycardia. On 16-JUL-2007, the patient experienced sudden unconsciousness and severe abdominal pain on the right side and nausea for 3 days. The patient was also found to have low blood pressure and severe hypoglycemia. The symptoms were treated in ambulance with IV fluids. The patient went into the hospital and had a subsequent doctor visit, and was diagnosed with ventricular tachycardia relating to the event. The patient also experienced diarrhea, lightheadedness, pain when standing, recent bronchitis, migraine headaches, impression syncope vasovagal, hypoglycemia, and abdominal pain intestinal colic. On an unknown date, a urine test and a blood work were performed. The results of the urine test were hemoglobine low 110, glucose urine 1000, nitrite positive. The results of the blood work were glucose 40 and chloride elevated 108. An other test was performed which the result was a normal abdomen. The listing indicated that one or more of the events was considered to be immediately life-threatening. The original reporting source was not provided. The VAERS ID# is 318676. A standard lot check investigation was performed. All in-process quality checks for the lot number in question were satisfactory. In additi

MedDRA PT Caesarean section, Drug exposure during pregnancy, Prolonged labour

Symptom Text: Initial and follow up information has been received from a physicians assistant through the Merck pregnancy registry concerning herself, a 26 year old female with no known allergies and no pertinent medical history who on 07-JUN-2007 was vaccinated with GARDASIL (Lot # 0212U) and discovered she was pregnant on 28-JUL-2007 (LMP 08-JUL-2007). Concomitant therapy included a prenatal vitamin. The patient sought medical attention (office visit). No labs or diagnostic studies were performed. On 02-OCT-2007, the patient reported she was twelve weeks pregnant, felt fine and had no adverse symptoms. On 05-DEC-2007 the patient underwent a routine ultrasound indicated for the pregnancy and the result was negative. The patient reported that on 10-APR-2008 she underwent a cesarean section due to delayed cervical dilation during labor. She delivered a normal male infant weighing: 6lbs 13ozs; length: 19". The patient reported that both mother and baby were doing fine. Upon internal review, the patient's cesarean section due to delayed cervical dilation was considered to be an other important medical event. Additional information is not expected.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Antiphospholipid syndrome, Contraception, Deep vein thrombosis

Symptom Text: Information was obtained on request by the Company from the agency via a Case Line Listing and a Public Case Detail Form concerning a 20 year old female who on 18-OCT-2007 was vaccinated with GARDASIL (Batch # J2138, Lot # 657870/0491U). Concomitant therapy included hormonal contraceptives (unspecified). On 14-NOV-2007, 27 days after vaccination, the patient experienced deep vein thrombosis, also reported as deep vein thrombosis, a large iliofemoral DVT, and antiphospholipid syndrome and was hospitalized. The patient's CT scan showed an acute thrombus expanding the left external and left common iliac veins to the upper end of the common iliac vein. There were no other abnormalities with the pelvis. The patient had high titre anticardiolipin IgG with the titre being more than 64. She also had evidence of anti-beta 2 lycoprotein 1 at a level of 137gU (<20). The patient's antinuclear antibodies were negative and double stranded DNA was low. The patient was treated with CLEXANE and warfarin. At the time of reporting on 04-JAN-2007, the patient's deep vein thrombosis and antiphospholipid syndrome persisted. The agency considered that deep vein thrombosis and antiphospholipid syndrome were possibly related to therapy with GARDASIL. The original reporting source was not provided. Subsequently the patient's experience was reported in an article. Additional information is not expected. This is an amended report. The lot # 657870/0491U has been added to the narrative. A copy of the published article is attached as further documentation of the patient's experience.

Other Meds: hormonal contraceptives (unspecified), Unk - Unk

Seriousness: PERMANENT DISABILITY, SERIOUS

MedDRA PT Gait disturbance, Malaise

Symptom Text: Information has been received in a newspaper article, 06-JUL-2008, received from a mother of a 16 year old female who in 2007 ("last year") was vaccinated with the first dose of GARDASIL. In 2007 the patient felt sick after her first dose of GARDASIL. It was also reported that the patient could hardly walk after the third dose of GARDASIL. The patient's mother took her to three hospitals in a bid to find out what was wrong with her but she could not confirm whether the cause of her daughter's illness was definitely the GARDASIL as it had emerged at the same time. Upon internal medical review, "could hardly walk after the third" was considered to be disabling. Additional information is not expected.

MedDRA PT Abasia, Activities of daily living impaired, Anorexia, Asthenia, Influenza like illness, Malaise, Weight decreased

Symptom Text: Information has been received in a newspaper article, 06-JUL-2008, and also on the news (Sunday - 06-JUL-2008) received concerning a 16 year old female who was vaccinated with GARDASIL. Subsequently the patient felt a bit off after the first two doses of GARDASIL but did not think anything of it. The patient reported that she missed the fourth term of school in 2007 after becoming so ill that she was unable to get out of bed. The patient's mother reported that after her daughter received her third dose of GARDASIL she started getting flu-like symptoms and it went downhill. The patient lost her appetite, dropping 5 kg and 8 kg and got so weak that she couldn't walk unaided. Upon internal medical review, "dropping 5 kg and 8 kg and got so weak that she couldn't walk unaided" was considered to be disabling. Additional information is not expected.

MedDRA PT Hypoaesthesia, Malaise, Muscular weakness, Pelvic pain, Syncope vasovagal

Symptom Text: Information has been received from a health professional concerning a 19 year old female with a history of appendicectomy, hypothyroidism and bone surgery who on 23-MAY-2008, was vaccinated with a dose of GARDASIL (lot # 1146U, batch # NG00400) IM. 11 days later on 03-JUN-2008 she experienced a vagal malaise at school with important pain in pelvis and developed numbness of lower extremities and weakness of lower extremities. Mobile accident unit was called. Electrolytogram and complete blood count was normal. Diagnosis was vagal malaise. She was not hospitalized but came out of hospital in a wheelchair and still had weakness and loss of sensitivity of lower limbs. On 06-JUN-2008 she went to hospital due to persisting symptom to perform complementary work-up. Neurological examination: loss of sensitivity of lower limbs, there was tendon reflex, muscular tonus was resolving. A problem of functional origin was privileged, she was not hospitalized. Medical consultation on 18-JUN-2008: muscular tonus was normal, she was walking normally without any limp, there was tendon reflex, loss of sensitivity of both lower limbs but recovery of bilateral sensitivity with socks. Thyroid work-up was normal. Medullar RMI was scheduled. She had recovered from weakness of lower extremities. She had not recovered from numbness of lower extremities. Other business partner numbers included: E2008-06319. Additional information has been requested.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Diarrhoea, Dizziness, Epilepsy, Loss of consciousness, Night sweats, Syncope vasovagal, Weight decreased

Symptom Text: Information has been received from a gynecologist concerning a 16 year old female with migraine headaches and without family history of epilepsy who on 10-SEP-2007 was vaccinated IM with a first dose of GARDASIL in the upper arm. Concomitant therapy included hormonal contraceptives (unspecified) (manufacturer unknown) for systemic use. On 10-DEC-2007 the patient suddenly developed unconsciousness for several hours in the morning. Additionally, she experienced persisting dizziness and diarrhea for several weeks as well as night sweats and loss of weight. In the time following the events the unconsciousness reoccurred. The patient was hospitalized from 21-JAN-2008 to 23-JAN-2008, 27-JAN-2008 to 28-JAN-2008, 28-FEB-2008 to 04-MAR-2008 and from 01-APR-2008 to 04-APR-2008. On 09-JAN-2008 the patient had and ear, nose and throat examination which showed normal results. The patient had abdominal and thyroid sonography and cranial magnetic resonance imaging which showed normal results. An ophthalmologic examination was normal as well as visual evoked potentials. On 22-JAN-2008, electroencephalogram (EEG) showed intermittent focal disorder right parietal, but no typical epileptic activity was detected. On 28-FEB-2008 the patient had a "prolonged electrocardiograph" which showed normal results. A prolonged-Video-EEG was normal. In a control on 29-FEB-2008 and on 25-MAR-2008 no focal disorder was detected. Differential diagnosis were epilepsy and syncope. The neurological department of the university favoured vasovagal syncopes, but a final diagnosis could not be established. At the time of the report, the outcomes of the syncope vasovagal, epilepsy, unconsciousness, dizziness, diarrhea, night sweats and loss of weight were unknown. Other business partner numbers included: E2008-06028. Additional information is not expected. This case is closed.

Other Meds: hormonal contraceptives (unspecified)

MedDRA PT Abdominal pain upper, Areflexia, Arthralgia, Death of companion, Depression, Diarrhoea, Dizziness, Fatigue, Frequent bowel movements, Hyperaesthesia, Hypoaesthesia, Hyporeflexia, Injection site erythema, Joint swelling, Mood altered, Muscle spasms, Muscular weakness, Neck pain, Neurological symptom, Night sweats, Pain, Purulent discharge, Rash papular, Skin exfoliation, Skin lesion, Tenderness, Tremor

Symptom Text: I recieved the guardisil vaccine three shot series. I was also administered one hepatitis A vaccine shot and the heptatis B series at the same time. Since the administration of the guardisil vaccine. I have had an increase in pain levels throughout the body. I have total body aches that are extremely sensitive to touch and hot water. I have trouble closing my hands and weakness in the left and right arms. I have also had severe calf muscle cramping that came on with sudden onset. I also had episodes of depression and directly after the shots were given I had severe stomach cramping and diarrhea. The bowel movements were extreme and very painful my family had to lift me off the toilet. I had dizziness and redness at the injection site. My genital area began chafing and a layer skin peeled off the scrotum and penis. This happened rapidly after the second shot in the series. I continue to have weakness and arthritic type pain my whole body aches since the vaccine. I've had pain in the neck area with no MRI findings. My moods immediately changed after the guardisil series. The loss of a friend seemed to make it worse. I felt fatigued and my pain started increasing. I was prescribed a medication for the painful diarrhea. I've had numerous neurological problems and uncontrollable leg and hand shaking since administration of the vaccine. I have night sweats with an unknown cause. 8/18/2008 MR received from PCP dated 11/7/2006 to 6/30/2008. Pt received HPV4 #1 on 3/8/07 and #2 on 4/30/07. Seen multiple times for multiple sx (see PMH). Seen 7/5/07 for numbness in feet and L leg weakness and knee pain. On PE absent knee reflexes and ankles 1+. Assessment: bilateral knee pain, probably patellofemoral syndrome. Seen 8/7/07 for new skin lesion- a light brown papule on dorsum of L hand-appears benign. Seen 9/7/07 for increasing back pain, shaking, spasms and numbness of legs attributed to PMH of DDD. 3rd HPV4 given. Seen 10/4/07 for new papule on R flank, swollen, tender and draining pus, possible furuncle. Tx with abx. Se

MedDRA PT Arthralgia, Diarrhoea, Loss of consciousness, Nervous system disorder, Vaccine positive rechallenge, Wrong technique in drug usage process

Symptom Text: Information has been received from a 27 year old male with an allergy to prednisone who about a year ago in 2007 received the complete series of GARDASIL vaccine. Lot # and dates when it was received are not available. Concomitant therapy included hepatitis A virus vaccine (unspecified) and hepatitis B virus vaccine (unspecified) when patient received his first dose of GARDASIL vaccine. Per patient, he passed out every time he received a dose of GARDASIL vaccine and he experienced three times after receiving each dose of GARDASIL. Patient also reported that he had diarrhea, bad neurological problems and arthritic type of pain about a week after receiving the third dose GARDASIL vaccine. Patient noted that he went to the emergency room numerous times last year because of the arthritic pain but he was not admitted to the hospital. It was reported the patient had an MRI done (date and results not provided). No further information provided. The patient's passed out and diarrhea and bad neurological problems and arthritis type of pain persisted. The patient sought medical attention from a neurologist. No further information is available.

MedDRA PT Anxiety, Arthralgia, Depression, Diarrhoea, Dizziness, Fall, Frustration, Gait disturbance, Head injury, Hypoaesthesia, Loss of consciousness, Mental disorder, Muscle spasms, Muscular weakness, Nausea, Tendonitis

Symptom Text: I was administered the guardasil vaccine and the hepatitis A and B vaccine. Since being given the vaccine I got sick the night after haveing the vaccine. I was sick with severe diharea I felt light headed and everything went black my mother came into the bathroom and I had passed out and hit my head on the toilet seat. I first started haveing weakness in my legs. I fell down the steps several times. I informed my docotor but he never reall paid much attention. It seemed he was preocupied. Shortly after that I started haveing numbness in my feet and legs my calf muscled spasm and cramp so bad I limp. This happens on a weekly basis. I started experiencing upper body pain it felt like something arthritic. All day long it felt like a constant severe dull ache. I kept telling my doctor about my pain. He finally sent me to a rhumatologist who did not find anything in my blood to suggest an arthritic condition. after this time there were some deaths and the increased pain and deaths seemed to escalate my feelings. My doctor started saying I was depressed and telling people I was depressed. I didn't feel depressed I felt anxiety from being in severe pain with little relief. I felt frustrated I wasn't being listened too. I hurt really bad and still do. I found out I have tendonitis in my left arm my doctor missed. I belive this was either caused by quinilone antibiotics. My pain has steadily increased since the vaccines. I felt nauseated on a daily basis and my doctor started prescribing me antidepressants without telling me what they were for. He took it to the extreme in trying to get me diagnosed with a mental condition. All the new pain I was feeling was onset after the vaccines. I do have a buldgeing disk in my back that has gone untreated after a failed surgery and the symptoms were ignored until I recently got into a knowledgeable speacialist who started getting things treated. I still have leg pain and arthritic type pain. My docotor seemed to ignore all the new symptoms and tried to blame everything on depressio

MedDRA PT Activities of daily living impaired, Alopecia, Anxiety, Arthralgia, Blepharitis, Bruxism, Cervix disorder, Chills, Confusional state, Depression, Dry eye, Dysaesthesia, Dysuria, Eye pruritus, Fatigue, Feeling abnormal, Fibromyalgia, Flank pain, Hepatomegaly, Impaired work ability, Insomnia, Joint stiffness, Musculoskeletal stiffness, Myalgia, Nausea, Neck pain, Pain, Pain in extremity, Pain in jaw, Pollakiuria, Pruritus, Pyelonephritis, Rash erythematous, Renal disorder, Renal pain, Splenomegaly, Urinary tract infection, Vision blurred

Symptom Text: A few days following my final Gardasil vaccination that received on March, 2, 2007, I had excruciating pain my arm near my elbow. I had to quit my job on March 29 because the pain was too unbearable to continue office tasks like typing. By then, the pain had spread to my neck, and shoulders. On April 3, 2007, I went to see an orthopedist specializing in the arm and hand. He put me on short-term disability and prescribed physical therapy. I went twice a week for approximately 2 months, but the pain kept getting worse. By August, the throbbing, burning pain in my neck was unbearable. On August 24, I saw a neurologist who diagnosed the problem as fibromyalgia. He prescribed Lyrica and Ultram, but neither drug worked, so I discontinued them. In September of 2007, my general doctor ordered blood tests which all returned normal. I had an MRI done of my neck as well, and it returned normal. The MRI did show, however, that abnormal growths had started to form on my thyroid. By October, I felt anxious, depressed, fatigued, and in extreme pain throughout my upper body. By November, my skin became very dry and my hair started falling out. I tried physical therapy one more time, twice a week for three weeks, but again it didn't work. In December of 2007, I was sleeping roughly 11 hours a night. My dentist prescribed me a night guard, because my neck and jaw pain had caused me to begin grinding my teeth. In January of 2008, all of my symptoms continued. By this time my entire body ached. On January 21, I went to an ophthalmologist, because my eyes had become so dry and itchy. He diagnosed the problem as blepharitis, similar to the dry skin I had developed. Because my vision had become blurry, for the first time in my life I was prescribed glasses. On February 15, 2008, I saw a rheumatologist who conducted extensive blood tests and an MRI of the brain. I had become very confused and foggy headed. However these tests came back normal. He prescribed Doxepin, in order to help me gain better sleep. On June 16, 2008 I was rushed t

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Activities of daily living impaired, Arthralgia, Back pain, Bedridden, Dysmenorrhoea, Injection site discomfort, Injection site pain, Menstruation irregular, Neck pain, Pain in extremity

Symptom Text: 7/13/08 Re: 13yr healthy, 5'5" 106lb active, phsically fit, golfs, swims. Gardasil administered Thur, July 3. Extreme pain at injection site and significant pain & discomfort for several days following. Pain was at injection site, elbow up, upper arm, shoulder neck & upper back. My daughter began menstruating May. Her period May was light and June was normal. This month however began July 11, the week leading up to menstruating she suffered incredible cramping. With the onset of her period, she became bedridden and suffered horribly. Call to triage nurse gave all helpful tips but I went through them with my daughter with very little relief. ie. Midol, we had reduced pain with Pamprin but still the level of pain was dibilitating and kept her in bed 2 days, rolling around in pain. Pamprin has 500mg per pill. She took 2 every 4 hours just to keep the level bareable. Even with this level of pain medicine she was not able to resume normal activity. This level of medicine is too much for a 13 yr old! other suggestions laying flat rather than crunched in fetal position that she had been, warm pad, deep breath to work through pain, TV to take mind off agony, massage, comfort foods - tried them with little relief. The women on my side of family have no history of cramps or the severe reaction to normal healthy menstrual cycle as well as the females on my husband's side of family. Menstrual flow is normal, nothing excessive to indicate another reason for such severe pain. I feel the Gardasil vaccination is responsible for this unusual extreme pain. She was too ill to drive to dr office but I will be calling them again Monday morning 7/14/08.

MedDRA PT Dizziness, Ear discomfort, Headache, Hypoacusis, Immediate post-injection reaction, Syncope vasovagal

Symptom Text: Information has been received from a physician concerning a 17 year old female who on 21-MAY-2008 was vaccinated with GARDASIL (lot # not available) for HPV prophylaxis. On 21-MAY-2008, 5 minutes post injection the patient experienced decreased hearing, headaches, unusual sensation in ears and vasovagal but unusual (also described as lightheaded and felt faint) which lasted about 15 minutes. On 21-MAY-2008 the patient recovered from decreased hearing, headaches, unusual sensation in ears and vasovagal but unusual. The physician reported that the patient has never had a reaction to shots, needles, surgery, or pain before. Upon internal review, decreased hearing was considered to be an Other Important Medical Event. Additional information has been requested.

MedDRA PT Dyspnoea, No reaction on previous exposure to drug, Sensation of foreign body

Symptom Text: Information has been received from a health agency concerning a 16 year old female who on 20-DEC-2007 was vaccinated with a third dose of GARDASIL (lot # 0352U, batch # NG00320). In December 2007, the patient experienced dyspnoea of unknown origin and a globus feeling of the throat. She was hospitalized on an unspecified date. Electrocardiogram, electroencephalography, pulmonary function test, arterial blood oxygen saturation test and ears, nose, and throat examination showed all normal results. The adverse events were ongoing at the time of reporting. The patient was vaccinated with a first dose of GARDASIL (lot # 655671/1024U, batch # NE51780) on 28-JUN-2007 and a second dose of GARDASIL (lot # 1473F, batch # NF46730) on 23-AUG-2007. No adverse effects occurred. It was pointed out by the reporter that patient informed herself in the internet about HPV vaccination and possible side effects and only than reported the events to the physician. Other business partner numbers included E2008-06194. No further information is available.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Abdominal pain, Caesarean section, Depression, Drug exposure during pregnancy, Genital haemorrhage, Nausea, Pelvic pain

Symptom Text: Initial and follow-up information has been received from a registered nurse for the Pregnancy Registry for GARDASIL concerning a 16 year old female with asthma who on 24-SEP-2007 was vaccinated IM with a 0.5 ml first dose of GARDASIL (lot #654535/0960F). On approximately 12-NOV-2007, the patient developed depression and was placed on tapering dose of PROZAC. On 05-DEC-2007, the patient was vaccinated IM with a 0.5 ml second dose of GARDASIL (lot #654535/0960F). Subsequently the patient became pregnant. Unspecified medical attention was sought. Last menstrual period was approximately 25-AUG-2007 and estimated date of delivery was 31-MAY-2007. On approximately 10-DEC-2007, the patient developed nausea and was placed on therapy with PHENERGAN. On 03-JAN-2008, the patient had vaginal spotting. Abdominal ultrasound was within normal limits. On 14-JAN-2008, the patient pelvic pain. An gallbladder ultrasound on 14-JAN-2008 (also reported as 15-JAN-2008) was within normal limits. On an unspecified date, the patient developed abdominal pain. The patient had an ultrasound on 31-MAR-2008 (results not reported). On 23-MAY-2008, the patient had a cesarean section due to cephalopelvic disproportion. The patient gave birth to a normal male infant (weight 6 pounds, 11 ounces) that was given for adoption. Upon internal review, cephalo-pelvic disproportion leading to a cesarean section was considered to be an other important medical event. Additional information has been requested.

MedDRA PT Abdominal pain upper, Convulsion, Dermatitis, Drug hypersensitivity, Dyskinesia, Excoriation, Fall, Foaming at mouth, Headache, Loss of consciousness, Muscle spasms, Mydriasis, Staring, Urinary tract infection, Urticaria, Wheezing

Symptom Text: Information has been received from a nurse concerning her previously healthy, menstruating 13 year old daughter with a sibling with seizure disorder who on 19-JUN-2008 was vaccinated with a first dose of GARDASIL. Concomitant suspect vaccination on 19-JUN-2008 included a second dose of VARIVAX. Other suspect therapy included BENADRYL (dose, duration and indication not reported) and BACTRIM given on 23-JUN-2008 and 24-JUN-2008 of the treatment of urinary tract infection (dose not reported). On 20-JUN-2008 the patient experienced severe headache and right arm swelling. On 22-JUN-2008 at 9:30 AM, the patient experienced a seizure for one hour, fell and experienced a "huge abrasion under the chin." The patient began to seizure again at 3:00 PM and was admitted to the intensive care unit. The reporter stated that the seizures started with a headache and then the patient had a blank stare. She had severe right hand spasms and moved her head back and forth. She had involuntary muscle movements with rhythmic movements, mostly of the upper extremity, and jerky, spastic contractions in the lower extremities with plantar flexion of the right foot and a jerky knee. She had dilated pupils and "foaming at the mouth." Sometimes she had wheezing. Sometimes was responsive and sometimes not. Seizure duration was reported as long as 45 minutes and "for hours." On approximately 22-JUN-2008 diagnostic work-up included an electroencephalogram (EEG) which was negative and a magnetic resonance imaging (MRI) and computerized axial tomography (CT) which were normal. "Blood work" and urinalysis were normal. On approximately 23-JUN-2008 the patient had a urinary tract infection that was treated with BACTRIM on 23-JUN-2008 and 24-JUN-2008. The patient was diagnosed with pseudoseizure. On 24-JUN-2008 the patient experienced a 10 minute seizure and was discharged. she was hospitalized for 2.5 days. On approximately 29-JUN-2008, the patient experienced hives and dermatitis which may have been due to an allergy to BACTRIM and was hospitalized. T

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Asthenia, Cold sweat, Disturbance in attention, Dizziness, Feeling abnormal, Feeling hot, Gait disturbance, Muscular weakness, Skin warm, Vertigo

Symptom Text: I was supposed to be abroad for the semester. Mid February, on 2/21, I went to class in the morning and got the feeling of being light-headed, spacey and weak. Before the episode started, my hands felt really hot and clammy. After class, I went back to my senoras house to rest, but it did not get better. CC-CS decided to take me to the clinic to see what was wrong. The doctor there wasn't sure and decided to do a blood test, which turned out normal. Around noon, I called home. About a week before this, I was sitting at dinner and got the similar feeling. I felt really out of it, light-headed feeling in both my head and my knees, spacey. I did not have the clammy feeling in my hands, however. I didn't think anything of it and just went to bed. I felt fine the next morning. The next day after calling my mom (Thursday), my dad flew out because I had not gotten any better. We tried walking, but every time I was out, I got the symptoms and had to sit or go back to the hotel. On Saturday, I had the episodes so bad that I felt like I couldn't stand on my own, so my dad decided to take me to the ER. The doctor there diagnosed me as possibly having vertigo. At the hospital, they checked my heart and took blood and everything was normal. To cure vertigo, the doctor gave me medicine. The medication didn't work however. After nine days with my dad, I was no better, so we decided on 2/28 that it was best for me to come home to pursue further testing and to see doctors. So far I have seen: Neurologist, my primary doctor, ENT, ENT, Endocrinologist. When I get the episodes, the feelings that I experience are: The episodes always start with feelings in my hands (clammy and hot). Feeling of light-headedness in head and similar feeling in my knees. Feeling spacey and out of it. Weak and feeling faint/feeling like I am going to collapse. When the episode is severe, I find that I have to try extra hard to focus to try to let it pass. The episodes can happen anywhere, at any time. Typically, they don't start

Other Meds:

Lab Data: I have undergone extensive testing, which includes: Blood work, EEG, VNG, balance and vestibular studies, EMG, tilt table, spinal tap, wore a Holter monitor for 24 hours, and a MRI of the brain. All of the tests have been negative.

MedDRA PT Anxiety, Arthralgia, Depression, Diarrhoea, Dizziness, Fall, Frustration, Gait disturbance, Head injury, Hypoaesthesia, Loss of consciousness, Mental disorder, Muscle spasms, Muscular weakness, Nausea, Tendonitis

Symptom Text: I was administered the guardasil vaccine and the hepatitis A and B vaccine. Since being given the vaccine I got sick the night after haveing the vaccine. I was sick with severe diharea I felt light headed and everything went black my mother came into the bathroom and I had passed out and hit my head on the toilet seat. I first started haveing weakness in my legs. I fell down the steps several times. I informed my docotor but he never reall paid much attention. It seemed he was preocupied. Shortly after that I started haveing numbness in my feet and legs my calf muscled spasm and cramp so bad I limp. This happens on a weekly basis. I started experiencing upper body pain it felt like something arthritic. All day long it felt like a constant severe dull ache. I kept telling my doctor about my pain. He finally sent me to a rhumatologist who did not find anything in my blood to suggest an arthritic condition. after this time there were some deaths and the increased pain and deaths seemed to escalate my feelings. My doctor started saying I was depressed and telling people I was depressed. I didn't feel depressed I felt anxiety from being in severe pain with little relief. I felt frustrated I wasn't being listened too. I hurt really bad and still do. I found out I have tendonitis in my left arm my doctor missed. I belive this was either caused by quinilone antibiotics. My pain has steadily increased since the vaccines. I felt nauseated on a daily basis and my doctor started prescribing me antidepressants without telling me what they were for. He took it to the extreme in trying to get me diagnosed with a mental condition. All the new pain I was feeling was onset after the vaccines. I do have a buldgeing disk in my back that has gone untreated after a failed surgery and the symptoms were ignored until I recently got into a knowledgeable speacialist who started getting things treated. I still have leg pain and arthritic type pain. My docotor seemed to ignore all the new symptoms and tried to blame everything on depressio

MedDRA PT Drug exposure during pregnancy

Symptom Text: Information has been received from a registered nurse through the Merck Pregnancy Registry concerning an 18 year old female patient with no known medical history or drug reactions/allergies, who on 25-JAN-2007, was vaccinated intramuscularly in the left deltoid with the first 0.5 mL dose of GARDASIL (lot# 654702/0011U). On 27-APR-2007 the patient was vaccinated intramuscularly in the left deltoid with the second 0.5 mL dose of GARDASIL (lot# 657006/0188U). On 07-AUG-2007 the patient was vaccinated intramuscularly in the left deltoid with the third 0.5 mL dose of GARDASIL (lot# 658100/0525U). There was no concomitant medication. The nurse reported that after receiving three doses of GARDASIL the patient is now pregnant. The patient's last menstrual period was on 20-JUL-2007. Her estimated conception date was 04-AUG-2007 which changed her estimate delivery date to 26-APR-2008. An ultrasound done on the 10-DEC-2007 confirmed the change of her EDC. Unspecified medical attention was sought. It was also reported that the patient has not had any previous pregnancies or live births. At the time of this report, the patient's outcome was unknown. Follow up information by an other health professional confirmed that the baby was born and enrolled in a program but she could not provide any additional details at this time. There was no product quality complaint. Follow up information stated that on 28-APR-2008, the patient gave birth to a liveborn infant female weighing 8 pounds 12 ounces. Her APGAR score was reported as 8 - 9. The patient was 41 weeks from her last menstrual period. The infant's head circumference was 13 inches. The infant was reported as normal with no congenital anomalies. There were no complications or abnormalities reported during the pregnancy or labor/delivery. At the time of this report, the patient recovered. Additional information is not expected.

MedDRA PT Drug exposure during pregnancy

Symptom Text: Initial and follow-up information has been received from the Merck pregnancy registry via a registered nurse concerning a 22 year old female smoker with a history of depression with no treatment medications, 2 previous pregnancies, 1 full term delivery at 38 weeks, 1 elective termination, and a cousin with open neural tube defect, who on 24-JUL-2007 was vaccinated IM, into the left deltoid, with a 0.5 ml first dose of GARDASIL (lot # 658822/0927U). It was reported that a pregnancy test was negative at the time of vaccination. Subsequently, the patient became pregnant. The patient's last menstrual period was 14-JUL-2007 and the estimated date of delivery was 19-APR-2008. On 13-AUG-2007 the patient was started on VITAFOL-B, once a day. On 17-SEP-2007 an ultrasound was performed for routine viability source and dating, and the results were intrauterine pregnancy and a positive fetal heart. On 10-OCT-2007 the patient showed to be positive for Coxsackie B titers. On 15-OCT-2007 the patient was vaccinated with a 0.5 mL dose of influenza virus vaccine (unspecified). On 12-NOV-2007 a Maternal Serum Alpha-Fetoprotein Screening was performed for genetic screening, and the results were within normal limits. On 15-NOV-2007 a level II ultrasound was performed for genetic screening and fetal anatomy, and the results were within normal limits. On 18-DEC-2007 a fetal echocardiography was performed and was within normal limits. On 31-JAN-2007 at 28 weeks gestation the patient received a 300 microgram dose of globulin, immune because she was Rh negative. Unspecified medical attention was sought. At the time of the report, the patient's outcome was unknown. On 12-APR-2008 the patient gave birth to a female infant at 39 weeks. The infant weighed 6 pounds 3 ounces, was 18.5 inches long, had an apgar score of 8/9, and a head circumference of 32cm. The infant was normal with no congenital anomalies, complications, or abnormalities. The patient experienced Leukocytosis, Bandemia, and positive Coxsackie B titers during p

MedDRA PT Drug exposure during pregnancy

Symptom Text: Initial and follow up information has been received from a healthcare worker and a certified medical assistant through the Pregnancy Registry for GARDASIL regarding a 19 year old female with a history of seasonal allergies who on 04-JUN-2007 was vaccinated with her first dose of GARDASIL (Lot # 655617/1447F; site and route not reported). On 13-Aug-2007, the patient was vaccinated with her second dose of GARDASIL (Lot #, site and route not reported). On 05-Sep-2007 it was reported that the patient was pregnant. The patient sought unspecified medical attention in the office. The patient had a urine pregnancy test which was positive. "The LMP is unspecified, but the physician believes that the patient is within the first month of pregnancy." On 08-MAY-2008, the patient delivered a normal baby boy (9lbs, 5 oz and 22 1/4 inches) at 40 weeks gestation. The baby's Apgar scores were 8 and 9. The baby was healthy "other than slight jaundice treated with bili light". There were no congenital anomalies or abnormalities. There were no complications with the pregnancy, labor or delivery. Additional information is not expected.

MedDRA PT Drug exposure during pregnancy

Symptom Text: Initial and follow-up information has been received from the Merck Pregnancy Registry via a licensed practical nurse concerning a 20 year old female with a history of social alcohol use in the first and second week until pregnancy confirmed who on 18-JUL-2007 was vaccinated intramuscularly with a first dose of GARDASIL. Concomitant therapy included SKELAXIN five times total for a muscle relaxant and ADVIL 200 mg (frequency not reported). Subsequently the patient was five months pregnant and did not realize it. The patient was a Gravida 1, Para 0. The patient's last menstrual period was in early February 2007 and the date of conception was on 14-FEB-2007. At 25 weeks gestation the patient visited the physician for her 1st obstetric appointment. On 23-JUL-2007 an ultrasound was performed to confirm pregnancy revealing a 25 week gestation. On 30-JUL-2007 another ultrasound was performed that revealed an intra-uterine pregnancy at 25 4/7 weeks gestation and confirmed male fetus. On 06-NOV-2007, at thirty nine and five days from the LMP the patient delivered a normal male infant. Labor and delivery were uncomplicated. The apgar scores were 9 and 9. At the time of the report the patient had recovered. Follow up information was received on 28-MAR-2008 from the physician's office. The mother called the physician's office on 07-JAN-2008 at 1:43 pm and reported that the infant was 2 months old and had a stuffy nose, sneezing and watery eyes. The infant also had a slight temperature of 100 degrees on 06-JAN-2008. On 7-JAN-2008 at 1:55 pm it was noted to observe the infant and do DIMETAPP and ADVIL/MOTRIN. Additional information is not expected.

MedDRA PT Drug exposure during pregnancy

Symptom Text: Information has been received for the Pregnancy Registry for GARDASIL from a nurse practitioner concerning a female (age not reported) who was vaccinated with a first dose of GARDASIL (lot# unknown) injection. Subsequently the patient received her first dose 8 days post conception. Medical attention was sought. No adverse experience was reported. The date of the last menstrual period and the estimated date of delivery is unknown. Follow-up information was received from a nurse practitioner. The female patient was 21 years old with no pertinent medical history and no drug reactions/allergies. There was no concomitant medication. The patient's date of last menstrual period was 14-JUL-2007 and on 16-JAN-2008 the patient was 26 weeks gestation. The patient had a shortened cervix (unknown if this was a condition prior to pregnancy). On 06-AUG-2007 the patient received a first dose of GARDASIL (unknown if this was the first or second dose) from her primary physician. On 20-AUG-2007 the patient had a positive pregnancy test. The nurse mentioned the pregnancy was going well. The estimated date of delivery is 19-APR-2008. The patient delivered a female baby on 21-APR-2008. Additional information is not expected.

MedDRA PT Anaemia, Drug administered at inappropriate site, Drug exposure during pregnancy, Gestational diabetes

Symptom Text: Information has been received through the Merck pregnancy registry from a licensed practical nurse concerning an 18 year old female smoker with a penicillin allergy who on 09-NOV-2006 was vaccinated in the left buttocks with the first dose of GARDASIL (Lot #653735/0688F). Concomitant therapy included NUVARING, LOESTRIN 24 FE and prenatal vitamins (unspecified). On 04-JAN-2007, the patient was vaccinated in the right gluteal with the second dose of GARDASIL (Lot #655765/1425F). It was reported that the patient was pregnant, after receiving the vaccine. Her last menstrual period was reported as 13-MAR-2007 and estimated due date 18-DEC-2007. On an unspecified date in 2007, the patient had the following infections or illnesses during pregnancy gestational diabetes mellitus and anemia. On 07-MAY-2007, an ultrasound was performed results reported were 7 6/7 IUG which confirmed the pregnancy. On 20-JUL-2007, a pregnancy quad screen and ultrasound were performed results were within normal limits. On 29-SEP-2007, 1 hour glucose "HcH" was performed results were not reported. On 18-OCT-2007, an ultrasound was performed results were within normal limits. On 03-DEC-2007, an ultrasound was performed results were within normal limits. On 17-DEC-2007 (39 4/7 weeks gestation), it was reported that the patient delivered a normal healthy baby girl, weight 7lbs 8 oz and Apgar score was 8/9. No congenital anomalies, complications or abnormalities were reported. The seriousness and outcome of the GDMA and anemia were not reported. Additional information is not expected.

MedDRA PT Blood pressure, Drug exposure during pregnancy, Pre-eclampsia

Symptom Text: Information has been received from the step-mother of a 21 year old female and through a Merck Pregnancy Registry. The 21 year old female had no pertinent medical history and no drug reactions or allergies who on approximately 16-APR-2007, "approximately 2 weeks ago" was vaccinated "in the hip area" with the first dose of GARDASIL. The lot number was not available. There was no concomitant medication. It was reported that the patient discovered that she was pregnant approximately a week and a half later on 27-APR-2007. The patient had not visited her physician regarding the pregnancy as of today. It was reported that the patient was approximately 6 weeks pregnant. In follow-up it was reported by a nurse practitioner, who was a nurse midwife concerning a 21 year old, female, patient, with the last menstrual period was 16-MAR-2007, who on 20-APR-2007 received her first dose of GARDASIL, (Lot # 657006/0188U). It was reported that the patient was pregnant with an estimated date of delivery of 21-Dec-2007. It was reported that the patient sought unspecified medical attention. Laboratory evaluation revealed a positive serum pregnancy test and the patient had a fetal ultrasound (results not reported). Follow-up information indicated that on 12-DEC-2007 the patient gave birth to an infant that weighed 7 pounds 12 ounces. The infant was healthy and normal. It was reported that the mother experienced "mild pre-eclampsia and blood pressure issues." Additional information has been requested.

MedDRA PT Drug exposure during pregnancy, Herpes virus infection, Streptococcal identification test positive

Symptom Text: Initial and follow up information has been received from a medical assistant via the pregnancy registry for GARDASIL, concerning a 22 year old female with allergies to amoxicillin, CECLOR and erythromycin, who on 25-JAN-2007 was vaccinated with a single, first dose of GARDASIL at another clinic (lot #654510/0962F). Concomitant therapy included an unspecified prenatal vitamin and ferrous sulfate (unspecified). Subsequently the patient became pregnant (LMP 09-JAN-2007, EDD 16-OCT-2007). On 19-MAR-2007 an ultrasound showed that the pregnancy was 10.8 weeks along, her EDD was 08-OCT-2007, and it showed the "size and dates" (not further specified). As of 25-APR-2007 the patient had not experienced any side effects. Follow up information from the MA, confirmed that on 08-OCT-2007, an 8 pound 9 ounce, 20 inch long, normal female infant (Apgar score 8.7) was born, at 39 weeks after the date of LMP. The pregnancy and delivery had been without complications. Follow-up information was received from a health professional. The baby had a head circumference of 31.5. The patient was Group B streptococcus positive. The patient had herpes in the last 3 weeks of pregnancy and was treated with acyclovir. The patient also had UNISOM for allergies and PRILOSEC for heartburn. Additional information is not expected.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Injection site erythema, Injection site pain, Injection site swelling, Injection site warmth

Symptom Text: Information has been received from a physician concerning a 35 year old female patient with no medical history reported, who on approximately 01-APR-2008, was vaccinated intramuscularly with the second 0.5 ml dose of GARDASIL. On 19-MAY-2008, "approximately two weeks ago," the patient developed redness, swelling, pain and heat at the injection site after receiving her second dose. Unspecified medical attention was sought. At the time of this report, the patient's outcome was unknown. No product quality complaint was involved. Additional information has been requested.

MedDRA PT Smear cervix abnormal

Symptom Text: Information has been received from a physician concerning a 19 year old female with a sulfonamide allergy who on 16-FEB-2007 was vaccinated IM with a first 0.5 ml dose of GARDASIL (Lot# 656049/0187U) in the right deltoid. On 20-APR-2007 she was vaccinated IM with a second 0.5 ml dose of GARDASIL (Lot #657621/0387U) in the left deltoid. On 20-AUG-2007 she was vaccinated IM with a third 0.5 ml dose of GARDASIL (Lot #658556/1060U) in the left deltoid. Concomitant therapy included ORTHO TRI-CYCLEN. The patient had a negative papanicolaou test on 20-APR-2008 and a positive test on 12-MAY-2008. The patient sought medical attention in the office. At the time of the report the patient's outcome was unknown. Additional information has been requested.

MedDRA PT Fatigue

Symptom Text: Information has been received from a physician concerning a 17 year old female with obesity, asthma, depression and allergy to amoxicillin who on 22-APR-2008 was vaccinated IM with a first 0.5 ml dose of GARDASIL. There was no concomitant medication. On 02-MAY-2008 the patient experienced fatigue. The patient sought medical attention in the emergency room for evaluation but was not admitted. Laboratory studies performed included erythrocyte sedimentation rate, mononucleosis serological test, complete blood count and all results were negative. At the time of the report, the patient was recovering. The physician stated she does not believe that the fatigue and the vaccination with GARDASIL are associated. Additional information has been requested.

MedDRA PT Oedema peripheral, Pruritus, Pyrexia, Skin papilloma

Symptom Text: Information has been received from a certified nurse midwife concerning a 20 year old female with sulfonamide allergy and no pertinent medical history who on 08-MAY-2008 was vaccinated IM with a first 0.5 ml dose of GARDASIL (Lot# 660387/1967U) in the left deltoid. Concomitant therapy included hormonal contraceptives (unspecified). On 11-MAY-2008, "3 days later" the patient developed about 16 warts in total all over the back of her hands. The patient's hands started to swell, she was very itchy and had a low grade fever. The patient sought medical attention in the emergency room but was not admitted to the hospital. The patient was seen by the dermatologist and had a biopsy (awaiting results). At the time of the report, the patient's outcome was not recovered. Additional information has been requested.

MedDRA PT Drug exposure during pregnancy, Pregnancy induced hypertension

Symptom Text: Initial and follow up information has been received for the Merck Pregnancy Registry from a registered nurse concerning a 17 year old female with no pertinent medical history or drug reactions/allergies who on 04-OCT-2007 was vaccinated with GARDASIL (lot# 657006/0188U) 0.5 mL IM while pregnant. There was no concomitant medication. The patient was approximately 13 weeks pregnant when she received her first dose, but she did not know that she was pregnant at the time. The patient's date of last menstrual period was 11-JUL-2007. Gestation was 27 and 1/2 weeks. Medical attention was sought. The patient's estimated date of delivery was 16-APR-2008. The mother experienced pregnancy induced hypertension and was treated with NORVASC. It was reported that the patient delivered at 38 weeks gestation, a 7lb. 11 oz. healthy baby girl. On 28-MAY-2008 she was vaccinated with GARDASIL. At the time of the report the outcome of the pregnancy induced hypertension was unknown. Additional information is not expected.

MedDRA PT Lip swelling

Symptom Text: Information has been received from a medical assistant concerning a 17 year old female with no known drug allergies and no pertinent medical history who on 03-APR-2008 was vaccinated with the first dose of GARDASIL vaccine (yeast), 0.5 ml, IM. There were no concomitant medications. Subsequently, in the night of 09-APR-2008 the patient developed swollen lips. She sought medical attention in the office and the swelling resolved without any treatment the following night. No other details were provided. Additional information has been requested.

MedDRA PT Dizziness, Dysmenorrhoea, Metrorrhagia

Symptom Text: Information has been received from a registered nurse concerning a 22 year old female with sulfonamide allergy and a penicillin allergy who on 18-APR-2008 was vaccinated intramuscularly with the first dose of GARDASIL (lot # 660389/1968U). Concomitant therapy included LEVAQUIN, PREVACID (patient given prescription on 18-APR-2008) and SEASONIQUE. On 18-APR-2008, the patient experienced lightheadedness, dizziness, menstrual-like cramping and spotting. The patient also started LEVAQUIN on that day. On 19-APR-2008, the patient recovered from lightheadedness, dizziness, menstrual-like cramping and spotting. The patient did not seek medical attention. No product quality complaint was involved. Additional information has been requested.

MedDRA PT Cough, Dyspnoea, Wheezing

Symptom Text: Information has been received from a physician concerning a 17 year old female with no known allergies who in the first week of March 2008, was vaccinated intramuscularly with the first dose of GARDASIL vaccine (yeast). Two hours after dose given the patient developed cough, shortness of breath and wheezing. The patient went to emergency room and was given steroids and antibiotic. The patient felt better the next morning (within 24 hours). Subsequently, the patient recovered from cough, shortness of breath and wheezing. It was reported that the patient will most likely not be getting second dose of GARDASIL vaccine (yeast) (also reported as discontinued). It was unknown if the symptoms were related to GARDASIL vaccine (yeast) or not. No product quality complaint was involved. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Lip swelling, No reaction on previous exposure to drug, Oedema mouth, Oedema peripheral, Pruritus, Swelling face, Urticaria

Symptom Text: Information has been received from a physician and the mother of a 15 year old female with attention deficit/hyperactivity disorder, allergies to penicillin, erythromycin, amoxicillin, azithromycin, PHENERGAN with CODEINE, SILVADENE, and PROMETHAZINE with CODEINE), who on 19-FEB-2008 was vaccinated intramuscularly with her first dose of GARDASIL (Lot # 659962/1740U; site not reported). On 18-APR-2008, the patient was vaccinated intramuscularly with her second dose of GARDASIL (Lot # 660387/1967U; site not reported). Concomitant therapy included ADDERALL TABLETS and ORTHO EVRA. It was reported that the therapy with ORTHO EVRA started "concomitantly with the vaccine" (reported as on 18-APR-2008, 20-APR-2008 and 21-APR-2008). On approximately 25-APR-2008 (also reported as 27-APR-2008 and "within one week of the vaccine") the patient developed hives all over her body. The next morning, 26-APR-2008, the patient had swelling in her hands and feet and the patient was treated with ALLEGRA and prednisone (unspecified). On 27-APR-2008, the patient developed swelling on her face, mouth and lips. On 27-APR-2008, the patient went to the emergency room for outpatient treatment and received a "steroid shot" (not further specified), BENADRYL and ZANTAC. "The itching persisted for a little while and then all symptoms resolved" (date unspecified). On approximately 27-APR-2008, the patient discontinued therapy with ORTHO EVRA. It was reported that the patient had no adverse effects or problems with the first dose of GARDASIL. The physician suspected that the reactions were related to GARDASIL OR ORTHO EVRA. Additional information has been requested.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Information has been received from a licensed practical nurse, for the Pregnancy Registry for GARDASIL concerning a 25 year old female with a history of dysplasia and loop electrosurgical excision procedure (LEEP performed in 2003) and no drug reactions and allergies who on 01-MAR-2007 was vaccinated with GARDASIL (lot number 656049/0187U) 0.5 ml IM. Concomitant therapy included NUVARING and LEXAPRO. The nurse reported that on 13-JUN-2007 the patient was vaccinated with another dose of GARDASIL (Lot number 657737/0522U) 0.5 mL IM. Medical attention was sought. On 13-JUN-2007 a beta-human chorionic gonadotropin test (unspecified) was performed and the results were positive for pregnancy. No symptoms have been reported. No further information is available. The date of the last menstrual period is 17-MAY-2007. The estimated date of delivery is 21-Feb-2008. Follow-up information was received via telephone from a licensed practical nurse. The patient had an early spontaneous miscarriage at 6+ weeks EGA. Additionally it was reported that the patient had been using the NUVARING when the patient conceived. Upon internal review spontaneous abortion was considered to be an other medical event. Additional information is not expected.

Other Meds: LEXAPRO; NUVARING

Lab Data: beta-human chorionic, 06/13/07 - positive

History: Dysplasia; Loop electrosurgical excision procedure

MedDRA PT Arthralgia, Vascular purpura

Symptom Text: Information has been received from the health authority (reference # MA20081028) concerning a 15 year old female with a history of purpura and rheumatoid in her childhood, who on 13-MAR-2008 was vaccinated with a first dose of GARDASIL (batch# not reported). On 13-MAY-2008 the patient was vaccinated with a second dose of GARDASIL (batch# not reported). On 15-MAY-2008 purpuric lesions appeared. On 20-MAY-2008, the patient complained of articular pain in the knees and ankles. On 25-MAY-2008, during a medical exam the lesions were observed on legs and ankles. No fever was experienced, neither alteration of her general health status nor adenopathy and thrombocytopenia were observed. On 04-JUN-2008, the lesions persisted. A check-up with dermatologist was scheduled. At the time of the report, the patient did not recover. The reporter considered purpura vascular and polyarthralgia to be other important medical events. Other business partner numbers included: E2008-06353 and MA20081028. No further information is available.

MedDRA PT Dysgraphia, Headache, Hypoaesthesia, Injected limb mobility decreased, Muscle spasms, Nausea, Paraesthesia, Paresis, Sensorimotor disorder, Skin warm

Symptom Text: Information has been received from health authorities concerning a 16 year old female patient with a history of appendicectomy who on 16-MAY-2008 was vaccinated with a second dose of GARDASIL (batch number not reported) in the right arm, via intramuscular route. Shortly after vaccination, occurred nausea and headache which resolved spontaneously within a few hours. Two days after occurred paresis and hypoesthesia of the right upper limb where the vaccination was performed. Following the twenty four hours sensitomotor deficiency increased with impossibility to mobilise the right arm, important hypoesthesia for warmth, pain and touch. Only a deep pressure was observed. Ten days later, deficiency started to resolve with still the inability to write. There was also paresthesia type of electric shock and muscular spasms. Electromyography was normal as MRI. On 10-JUN-2008, the patient was recovering from motor and sensitive but there was a presence of hypoesthesia especially at forearm. On 23-JUN-2008 the patient used her arm normally and did not complain anymore. The reporter considered hypoesthesia, paresthesia, muscular spasm, paresis, nausea, headache, mobility decreased and sensorimotor disorder to be disabling. Additional information was not available. Other business partners included are: E2008-06346.

MedDRA PT Drug exposure during pregnancy

Symptom Text: Information has been received from a nurse for the Pregnancy Registry for GARDASIL vaccine (yeast) concerning a 22 year old female with sulfonamide allergy who on 04-DEC-2007 was vaccinated IM with the first 0.5 ml dose of GARDASIL vaccine (yeast) (Lot # not reported). On an unspecified date the patient was vaccinated with a second dose (Lot # not reported). On 05-JUN-2008, the patient was vaccinated with the third dose of GARDASIL vaccine (yeast) (Lot # not reported) then the office discovered that she was pregnant (LXP: 08-MAY-2008). The office performed a pregnancy test prior to the administration of the vaccine that demonstrated a "weak positive". Then after the vaccination a second pregnancy test was performed that displayed a positive result. No adverse effects reported. Concomitant therapy included hormonal contraceptives (unspecified). Unknown medication attention was sought in the office. The outcome was not reported. Additional information has been requested.

Other Meds: hormonal contraceptives

MedDRA PT Dizziness, Feeling abnormal, Lethargy, Nausea

Symptom Text: Information has been received from a physician assistant concerning a 23 year old female with penicillin allergy and allergic reaction to CECLOR who on 05-JUN-2008 was vaccinated with the first dose of GARDASIL vaccine (LOT# 660387/2967U) 0.5 mL, intramuscularly in left deltoid. There was no concomitant medication. The physician assistant reported that on 05-JUN-2008, the patient experienced dizziness, lethargy, nausea and detached feeling following vaccination. The patient received the GARDASIL vaccine, walked 10 minutes through heat and then about 1 hour after vaccination experienced the dizziness, lethargy, nausea and detached feeling that lasted for 30 minutes. The patient returned to the physician assistant's office and was still experiencing some nausea 3 hours after vaccination. At the time of the report the patient was still recovering. Additional information has been requested.

MedDRA PT Hypoaesthesia, No reaction on previous exposure to drug, Paraesthesia

Symptom Text: Information has been received from a nurse practitioner concerning a 24 year old female with no illness at the time of vaccination, no drug allergies/reactions or pertinent medical history who on 02-OCT-2007 was vaccinated with a first dose GARDASIL vaccine in the left deltoid at 5 PM. On 10-DEC-2007, the patient had a second dose of GARDASIL vaccine (lot # 659441/1446U) in the left deltoid at 5 PM. On 10-APR-2008, the patient had a third dose of GARDASIL vaccine (lot# 659180/1758U) in the left deltoid at 9 AM. There was no concomitant medication. Subsequently, the patient reported tingling and numbness in fingers of both hands for 3 days after each administration of the vaccine. The symptoms resolved spontaneously. The patient was evaluated by her primary care physician after the second dose. Additional information is not expected.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Dizziness, Fatigue, Headache, Syncope

Symptom Text: Information has been received from a physician concerning an 18 year old female with mild hypertension and a history of mildly elevated aspartate aminotransferase and increased cholesterol who on approximately 21-MAY-2008 was vaccinated intramuscularly with GARDASIL vaccine (lot # and dose not reported). Secondary suspect therapy included lisinopril (manufacturer unknown). Two weeks ago approximately 21-MAY-2008 when she received the vaccine, the patient experienced quick fainting episode. She was well for one week. The physician reported that for the past week, the patient has had a persistent frontal headache, dizziness and fatigue that seems worsening. The physician noted that the patient was not previously being treated for the hypertension and that the patient's primary care physician thought that the headache might be due to her hypertension. The patient underwent a head CT and CT angiogram, and labs including thyroid test and CBC for which the results were reported as all being normal. On 03-JUN-2008, the reporting physician started the patient on lisinopril (manufacturer unknown). The patient's headache and dizziness did not change after she was started on lisinopril (manufacturer unknown). Additional information has been requested.

Other Meds: Unknown

Lab Data: head computed axial - Normal; angiography - Normal; complete blood cell - Normal; thyroid function test - Normal

History: Aspartate aminotransferase increased; Cholesterol levels raised

MedDRA PT Abdominal pain, Axillary pain, Hyperhidrosis, Injection site pain, Nausea, Pain, Pyrexia, Vomiting

Symptom Text: Information has been received from a physician concerning a 14 year old female who on approximately 02-JUN-2008 was vaccinated in her right deltoid with GARDASIL vaccine (yeast) (lot #, and dose not reported). Concomitant therapy included meningococcal AVYW conj vaccine (dip toxoid) (MENACTRA). The physician reported that the patient experienced excessive pain that radiated to her armpit. That night the patient was sweating, had nausea, and was vomiting. The physician noted that the patient also had a fever of 102 and shooting pain that went across her abdomen. The physician also stated that when the patient came back in the office for a check up she still had a lot of pain at the injection site. Medical attention was sought by the patient. No further information was provided. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Activities of daily living impaired, Areflexia, Dysstasia, Ear infection, Fall, Gait disturbance, Muscle spasms, Muscle strain, Muscular weakness

Symptom Text: Approximately one week after receiving the third dose of the HPV vaccine on April 11, 2008, patient developed cramping in both calves which became increasingly severe, resulting in difficulty walking, inability to stand on the balls of her feet, and loss of reflexes in both ankles and knees as determined by a physical therapist. Patient was seen by a neurologist several days later who found no neurological abnormalities in his exam of her and diagnosed her with "muscle strain of the backs of her legs." Patient is continuing to experience problems with her legs, some days being better than others. Every morning she wakes up with cramping of the calves, and some days she is able to "walk it off," and other days her legs hurt all the time. She is a musical theatre graduate and makes her living singing and dancing. She has been unable to dance since her calves have been affected. Approximately two weeks after the second dose of the HPB vaccine the end of December, 2007, patient experienced ankle weakness which resulted in falling frequently, and she was seen by an orthopaedic surgeon in April 2008 when her ankles did not improve. The orthopaedic surgeon recommended physical therapy for "floppy ankles." It was after the third dose of the vaccine as described in the paragraph above when she experienced problems with her calves, and which led her to see the physical therapist not only for the floppy ankles, but also for the painful calves. Because patient is not recovering, she has an appointment to see an internist who is also board certified in rheumatology. Now that we are aware of her complications following the HPV vaccine, we will, of course, report this to the internist. 8/6/08-office notes received-patient concerned that inadequate dose was administered. Second dose administered 4/11/08 followed by 3rd dose 4/29/08 lot#1967 12/15/08-records received-consultant visit 10/23/08-C/O muscle aches dating back to march 2008 after an ear infection and vaccine. Aching in claves occur after exercise and interm

Other Meds: LEXAPRO 10mg/day

Lab Data: 4/25/08, cursory exam by physical therapist, no reflexes of ankles, knees, weakness of legs, cramping of calves; 4/28/08, neurological exam by neurologist, normal except for leg cramps 12/15/08-records received-EMG demonstrated significant

MedDRA PT Lip swelling, Oedema peripheral, Rash papular, Swelling face

Symptom Text: Information has been received from a consumer concerning her 19 year old daughter who is "allergic to sulfa" and on 02-JAN-2008 was vaccinated with a first dose of GARDASIL vaccine (yeast) (lot # not reported). On 05-MAR-2008 her daughter was vaccinated intramuscularly with a 0.5 mL second dose of GARDASIL vaccine (yeast) (lot # not reported). There was no concomitant medication. The consumer reported that "her daughter experienced swelling after getting the first shot. First her lips swelled up, then her face and then her arms. The swelling usually lasts about 10 hours". The consumer also reported that after the second vaccination, administered on 05-MAR-2008, her daughter developed "sporadic white bumps" on her arms. It was also reported that "after the first time she experienced swelling, she experienced swelling on 21-FEB-2008, 22-FEB-2008, 20-MAR-2008, 26-MAR-2008, 01-APR-2008, 08-APR-2008, 10-APR-2008, 26-APR-2008, 27-APR-2008, 26-MAY-2008, 27-MAY-2008 and 30-MAY-2008. She did not have records of every date she experienced swelling. She is presently not experiencing any swelling. She will not be completing the series. The daughter sought unspecified medical attention. The consumer reported that her daughter's swelling improved after stopping therapy.

MedDRA PT No adverse event, Wrong drug administered

Symptom Text: Information has been received from a physician concerning a 13 year old female consumer who on 10-MAR-2008 was inadvertently vaccinated SQ with 0.65mL of zoster vaccine live (Oka/Merck) instead of varicella virus vaccine live (Oka/Merck) (MSD). Concomitant vaccinations included MENACTRA and GARDASIL (MSD). Subsequently, the nursing error was discovered the next day on 11-MAR-2008. Medical attention was sought in the office. At the time of the report the patient's status was unknown. There was no product quality complaint involved. Follow up information from the medical assistant indicated she inadvertently picked up the wrong bottle as both the zoster vaccine live (Oka/Merck) and the varicella virus vaccine live (Oka/Merck) (MSD) were in the same location in the freezer. The medical assistant indicated that both are labeled clearly, it was human error. Follow-up information has been received from the medical assistant concerning this 13 year old white female with rhinitis allergy who on 10-MAR-2008 was inadvertently vaccinated SQ with 0.65mL of zoster vaccine live (Oka/Merck) instead of varicella virus vaccine live (Oka/Merck) (MSD). The medical assistant indicated that the patient has not experienced an adverse event thus far. Additional information is not expected.

MedDRA PT Dizziness, Headache, Injection site pain, Nausea, Oedema peripheral, Pyrexia, Somnolence

Symptom Text: On 14-JUN-2008 a female of 12 year old assisted to a vaccination day and was placed on therapy with GARDASIL, 0.5 ml, first dose. On 14-JUN-2008 the patient experienced injection site pain, fever, nausea, headache, dizziness and somnolence. Subsequently, the patient recovered from fever, nausea, headache and dizziness. At the moment of the report, the patient presented injection site pain to the touch from the elbow to the shoulder and somnolence. She assisted to the emergency room and was prescribed with acetaminophen every 6 hours (dose unknown). Patient's mother reported that the patient since the day of vaccination has been somnolent and her arm is swelled. The reporter felt that injection site pain, fever, nausea, headache and dizziness were related to therapy with GARDASIL. Additional information has been requested.
