Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Grip strength decreased, Hypoaesthesia, Pain in extremity, Paraesthesia

Symptom Text: Information has been received from a physician's assistant concerning a 17 year old female with hypersensitivity and anxiety, who on 11-JAN-2008, was vaccinated with the first dose of GARDASIL, and vaccinated IM with the third 0.5 ml dose of GARDASIL (lot # 0947X) on 25-SEP-2008. Concomitant therapy included sertraline HCL (ZOLOFT), hormonal contraceptive (unspecified) and albuterol. On 05-OCT-2008, the patient experienced muscle soreness, numbness and tingling of left arm. The left arm was painful with movement. An exam in the office on 13-OCT-2008 revealed decreased strength of the left hand grip. The patient was prescribed a tapering course of prednisone and rest. The patient was not recovered by the time of this report. The patient visited office for medical attention. Additional information has been requested.

MedDRA PT Abdominal pain, Biliary dyskinesia, Cholecystectomy, Headache

Symptom Text: Information has been received from a nurse practitioner concerning a 15 year old female with chronic sinusitis who on 27-JUL-2007 received the first dose of GARDASIL vaccine (yeast) (lot # 658222/0927U), 0.5ml. On 08-Nov-2007, the patient received the second dose of GARDASIL vaccine (yeast) (lot # 659437/12660), and on 17-Mar-2008 received the third dose of GARDASIL (yeast) (lot # 659182/1757U). Concomitant therapy included injected birth control. After the second dose the patient began to have headaches and abdominal pain. The patient had her gall bladder removed at that time because of biliary diskinesia. The patient's headaches and abdominal pain persisted. The patient sought medical attention. Additional information has been requested.

MedDRA PT Drug exposure during pregnancy, Headache, Nausea

Symptom Text: Information has been received from a nurse for the pregnancy registry for HPV concerning a 22 female with gastroesophageal reflux and a history of headache, who on 11-AUG-2008, was vaccinated with the first dose of GARDASIL (660620/0571X), I.M. Concomitant therapy included ranitidine. On 11-Aug-2008 and 09-Sep-2008, the beta-human chorionic gonadotropin tests were negative. On 14-OCT-2008, the patient came to the office complaining of headache and nausea since receiving her first dose of GARDASIL. A pregnancy test during her visit revealed that she is pregnant. The patient's LMP was 13-SEP-2008 and EDD 20-JUN-2009.

Other Meds:

MedDRA PT Drug exposure during pregnancy, Haemorrhage

Symptom Text: Initial and follow-up information has been received from two registered nurses for the pregnancy registry for GARDASIL and the initial pregnancy questionnaire, concerning a 22 year old female with penicillin allergy who on 21-JUL-2008 was vaccinated with the first dose of GARDASIL, Lot # 660553/0070X. On 18-SEP-2008, the patient was vaccinated with the second dose of GARDASIL, Lot # 660616/0570X. Concomitant therapy included EFEXOR, prenatal vitamins and MACROBID. The patient was pregnant. The patient's LMP was on 20-AUG-2008 and EED on 27-MAY-2009. In follow-up information was reported that the estimated conception date was 26-AUG-2008. Unspecified routine OB labs were normal. On 13-OCT-2008 ultrasound was performed because the patient was bleeding and it showed results within normal limits. It was reported that the patient had no previous pregnancies. Additional information has been requested.

Other Meds: MACROBID; EFEXOR

Lab Data: Ultrasound, 10/13/08, within normal limits; Beta-human chorionic, positive

MedDRA PT Asthenia, Back pain, Blood test, Diarrhoea, Dyspnoea, Gait disturbance, Hypersensitivity, Hypoaesthesia, Injection site erythema, Injection site pain, Pain, Paraesthesia, Rash pruritic, Swelling, Tremor, Vaccine positive rechallenge

Symptom Text: Initial and follow-up information has been received from a mother concerning her 18 year old daughter with no medical history reported, wasp stings allergy and pecans allergy who "about 6 months ago" in approximately April 2008, was vaccinated with a dose of GARDASIL, 0.5 ml. Concomitant therapy included ethinyl estradiol/norgesstimate (ORTHO TRI-CYCLEN). After receiving each of her three GARDASIL shots, the patient experienced pain and redness at the injection site. Also, after the third shot the patient experienced pain throughout her entire body, swelling and numbness that started on her left sided and has also moved to her right side. The patient has difficulty walking. The physician prescribed diphenhydramine hydrochloride (BENADRYL) and ibuprofen (ADVIL). On an unspecified date, a blood work was performed (results not provided). In follow-up information the mother reported that her daughter was experiencing difficulty breathing, pains in her lower back, constant diarrhea, swollen stomach and recently she started to have numbness and tingling on her hands and bottom of the feet and toes. On 16-OCT-2008, patient was given mixed steroids shot for any allergic reaction due to GARDASIL and then she experienced elevated blood pressure. On 18-OCT-2008, patient experienced pain from her heart down to her hand and she was shaky and weak as well. Later, physician did an eletrocardiogram (EKG), but the results were normal. He gave her pain shot. On 20-OCT-2008, she was prescribed ibuprofen (manufacturer unknown) 600 mg, but that did not help her. On 23-OCT-2008, she was given an "ultra monitor" for heart (result not reported) and will be doing another echocardiogram soon. Caller also mentioned that patient will be seeing a rheumatologist on 04-NOV-2008 and neurologist on 31-OCT-2008. On 27-OCT-2008, the patient developed an itchy rash between her left fingers and was using antibiotic ointment to treat it. At the timer of the report, physician prescribed her cyclobenzaprine hydrochloride (FLEXERIL) for muscle relaxati

MedDRA PT Drug exposure during pregnancy, Haemorrhage, Inappropriate schedule of drug administration

Symptom Text: Information has been received from a certified nurse midwife assistant for the pregnancy registry for GARDASIL, concerning a 27 year old female with a history of papanicolaou smear abnormal (1998), caesarean section (1999), normal deliveries (2002 and 2006) and no known allergies who on 02-MAY-2007 was vaccinated with the first dose of GARDASIL (Lot # 657005/0314U) into the left deltoid. Concomitant therapy included NORDETTE and prenatal vitamins daily. The patient had her last menstrual period on 10-JUL-2008. In August 2008, the patient experienced light bleeding. On 10-SEP-2008, the patient was vaccinated with the second dose of GARDASIL (Lot # 660393/0067X) into the right deltoid and was pregnant. On an unspecified date, a routine blood work was performed (results not provided). The patient sought an initial pregnancy exam as medical attention. The patient had 3 previous pregnancies and 3 full term deliveries (40, 39 and 40 weeks). No birth defects in previous pregnancies and no infant complications were reported. On 10-OCT-2008, an ultrasound was performed but was too early for evaluation dating. A second ultrasound was scheduled for 27-OCT-2008. The estimated date of delivery was 16-APR-2009. Additional information has been requested.

Other Meds: NORDETTE; Vitamins (unspecified)

MedDRA PT Condition aggravated, Crying, Depression, Headache, Impaired work ability, Migraine, Nausea, Pain, Personality change, Quality of life decreased, Vomiting

Symptom Text: Information has been received from a consumer concerning his 26 year old girlfriend with an occasional migraine, who was vaccinated with the complete series of GARDASIL. Concomitant therapy included hormonal contraceptives. Beginning either after the first or second vaccination, she began to experience headaches, depression, nausea, physical pain, crying, migraines, vomiting, and had became "a shell person". The patient was hospitalized overnight for a spinal tap. At one time she was going to the emergency room 3 times a week. She has had a battery of medical tests that included a MRI, an EKG and a spinal tap which all came back normal. The reporter stated that the GARDASIL had ruined her life, her career and his relationship with her. The patient has been treated with many unspecified medications. The patient present status is not recovered. The patient sought medical attention. Ruined her life, her career and relationship were considered to be disabling. Additional information has been requested.

MedDRA PT Oedema peripheral, Pain, Pyrexia

Symptom Text: Information was received from a pharmacist concerning a 21-year-old female patient with no relevant medical history who received the second dose of GARDASIL (lot# 0513U, batch# NG33990) via intramuscular route on 27-SEP-2008. On the same day the patient experienced oedema in the arm, fever and intense pain. She was hospitalized on an unspecified date. She had fully recovered without any sequelae (unspecified timeline). To be mentioned that the case had initially received by a mail letter from a sales representative, upon contacting the reporter, a pharmacist, by telephone, it was understood that the reporter had not seen the adverse event, nor had any proof of the hospitalization. The reporter also mentioned that the report, in her opinion was not trustworthy as the patient's father could not provide any further details beyond what was reported. She only reported the case after the patient's father request. The attending physician's name was also unknown. Other business partner numbers include: E2008-11105. No further information is available. The case is closed.

MedDRA PT Hot flush, Nausea, Palpitations, Tachycardia, Thyroiditis

Symptom Text: Anemia, Adverse drug reaction; Tachycardia; Nausea; Palpation's; Hot flash, Penicillin allergy Information has been received from a nurse practioner concerning a 25 year old female with a history of anemia (blood transfusion November, 2007) and drug reactions or allergies to penicillin and venlafaxine hydrochloride (EFFEXCR) (not specified) who on 09-APR-2008 was vaccinated with the first dose of GARDASIL intramuscularly in the arm. On 10-June-2008, the patient was vaccinated with the second dose of GARDASIL (lot#659655/14860). On 10- Oct-2008, the patient was vaccinated with the third dose of GARDASIL (lot#661044/0548X). On 10-Oct-2008, the patient developed palpitations, Tachycardia, nausea, and hot flashes within 30 minutes after the third dose of GARDASIL. On 10-Oct-2008 the patient was taken to the emergency room via ambulance and administered diphenhydramine hydrochloride. The patient again experienced hot flashes, nausea, and Tachycardia and went to the emergency room in the hospital where the patient works (date of treatment at the second emergency room is unknown). The patient underwent an electrocardiogram, chest X-ray, and unspecified lab work. The patient continues with symptoms of hot flashes, nausea and Tachycardia that" comes and goes." The patient is out of work and has a follow up appointment with an unspecified primary care provider. The patient reported a similar reaction to venlafaxine hydrochloride in the past (specified symptoms unspecified). No other symptoms or Treatment reported. No other information available. Follow up AE information: The nurse practitioner called back to report that the patient has been diagnosed with thyroiditis. No further information was provided. Additional information has been requested.

MedDRA PT Eye swelling, Periorbital oedema

Symptom Text: Information has been received from a physician concerning a 16 year old female who in August 2008, was vaccinated with the first dose of GARDASIL. On 13-OCT-2008 was vaccinated with the second dose of GARDASIL. The patient got a swollen eye (eye unspecified) after receiving GARDASIL. On 15-OCT-2008 the patient was seen in the office today for a swollen eye diagnosed as periorbital edema. In August 2008 the patient had a similar reaction following the first dose of GARDASIL, but the reaction after the first dose was described as "worse". The physician treated the patient with eye drops (unspecified) and BENADRYL. No time frame development information was available other than the mother brought the patient in "right away". The patient's present status was not recovered. Additional information has been requested.

MedDRA PT Injection site mass, Injection site pain

Symptom Text: Information has been received from a registered nurse (R.N.) concerning a 15 year old female who on 22-sep-2008 was vaccinated intramuscularly in the left arm with the first dose of GARDISAL. Subsequently the patient developed a pea sized "knot" or lump under the skin at the injection site. The time frame development of the lump was not specified at the time of the report. The lump was lender or sore to the touch. The patient was seen by a nurse and used warm compresses on the lump. At the time of reporting (17-Oct-2008) the patient was not recovered. Additional information has been requested.

MedDRA PT Injected limb mobility decreased, Pain in extremity, Wrong technique in drug usage process

Symptom Text: Information has been received from a nurse concerning her 13 year old female daughter with no pertinent medical history and no known drug reactions or allergies who in February 2008, was vaccinated with the first dose of GARDASIL vaccine, IM. On an unspecified date, the patient received the second dose of GARDASIL vaccine, IM. There were no concomitant medications. The nurse reported that her daughter experienced soreness of the arm after receiving the first and second dose of GARDASIL vaccine. The daughter recovered about 1-2 days after each vaccination. On 16-OCT-2008, the patient received the third dose of GARDASIL vaccine, IM at the tendon or joint on the arm. She was not able to lift her arm despite using ice and MOTRIM from 16-OCT-2008 for a few days. She is recovering and can move the arm now. But she is still experiencing soreness. the patient sought medical attention and consulted with the nurse's husband who is a physician. There were no lab or diagnostic studies performed. This is one of several reports from the same source. Additional information has been requested.

MedDRA PT Rash generalised, Rash papular

Symptom Text: 21 Oct 2008 4:46 PM, Pts mom called and states that pts daughter was in on Thursday for the GARDASIL inj and noticed on Saturday a pimple like rash all over her back/stomach/legs/arms...mom would like to know if it is due to the INJ. It was her 2nd dose. Pts mom also states no pain/not itching no fever or other side effects. Mom would like a call back on cell phone. PT's mom also made an appt for derm on 11-6-08. 21 Oct 2008 8:15 PM, Dr inform mom that it is less likely related with the injection site not first time but always possible. Asked her if she would like me to evaluate her before derm appointment...ok to have her come in this week to be seen.

MedDRA PT Alopecia, Dermatitis allergic, Fatigue, Heart rate irregular, Hypertension, Menstruation delayed

Symptom Text: I took my HPV shots abroad. The first shot I took was on December 27th 2007. It didn't feel anything special after this first one. I took my first shot before March 1st 2008. Days after my second shot, I start growing out breakouts (which looks like skin allergy) on my face. It has been bothering me until now. I have also experienced increase of hair loss compared to before taking the shot. After taking the 3rd HPV shot, my skin allergic problem has worsen. It also affected my monthly menstruation cycle. It basically shifted my cycle from normally 30 days to now 34 days. After having taken all 3 shots, i feel like i get tired alot easier than before. I went for an annual body check, I was now told that I have high blood pressure. My cardio result showed that I have irregular heart beat according to the nurse.

Other Meds:

Lab Data: I have not done any lab test but I had consulted one doctor regarding my irregular period. He said it was due to irregular hormonal change. However, I had not experienced that before taking the HPV shot.

Seriousness: DIED, SERIOUS

MedDRA PT Cold sweat, Death, Dizziness, Headache, Malaise, Nausea, Urinary incontinence

Symptom Text: Patient, a previously healthy 19 year-old female college freshman died suddenly yesterday, approximately 10 days after receiving Gardasil & menningococcal vaccines. Vaccines were administered by a medical provider in her hometown while she was home for the Thanksgiving holiday, sometime around 11-28-08. She had a medical appointment pending for 12-8-08 (the day of her death) with the Student Health Service; medical clerk had entered "possible seizure" as the reason for making the appointment. Patient had no history of epilepsy. She complained of a headache and not feeling well in the 24 hours prior to her death. She went to bed at 10:30 PM on 12-7-08, in her dorm room with a roomate. She appeared to still be sleeping the next morning when her roomate left for class. Her body was discovered still in bed around 5 PM that day (12-8-08) with rigor mortis. No history of substance abuse, alcohol intake, or depression or other mental health issues. She was a happy, achieving student. This report is filed by a friend of patient's parents, who is a physician (board certified internal medicine & geriatrics). Report also filed online today with the FDA. Patient's mother can be reached at home for additional details. Memorial service & funeral 12-12-08 and 12-13-08. Only known past medical history requiring physician attention was facial acne. 12/10/2008 Recived records from health center via CDC. Seen 11/3/08 with c/o sore throat, cough, muscle aches and nasal d/c. PE (+) for pharyngeal erythema, purulent nasal drainage, nasal turbinate changes, and lymphadenopathy. Assessment: Probable viral URI with ? sinusitis. Tx: Biaxin. Received from CDC via email: The patient had no previous health problems. She was a freshman and was seen at the college health clinic only once on 11/3/08 for sinusitis. She was on Yaz birth control pills and a topical acne medication. After the death, police questioned her roommate who said that the pt did go out on the evening of 12/6/08 and had a few alcoholic drinks, but not an excessive a

Other Meds: None known. ?? oral contraceptive or an antibiotic for acne.

Lab Data: Autopsy performed 12-9-08 was unrevealing per family verbal report to me; no signs of intracranial bleed, meningitis, cardiomyopathy, trauma. Toxicology report still pending at this time. Post-mortem tox screen (-).

History: Acne. PMH: PCN allergy. Acne. On OCs (Yaz). 12/10/2008 Recived records from health center via CDC. Seen 11/3/08 with c/o sore throat, cough, muscle aches and nasal d/c. PE (+) for pharyngeal erythema, purulent nasal drainage, nasal turbinate changes, and lymphadenopathy. Assessment: Probable viral URI with ? sinusitis. Tx: Biaxin.

Seriousness: DIED, SERIOUS

MedDRA PT Autopsy, Death, Headache, Malaise

Symptom Text: Previously healthy 19-year old female college freshman found dead in her dorm bed approximately 10 days after receiving GARDASIL and meningitis immunizations over Thanksgiving break while visiting family in her hometown. She had very recently made a doctor appointment for the afternoon of Mon. 12/08/2008- pending at the time of her death. She did not show up for the appointment, was found in her bed in the dorm room dead with rigor mortis. The reason noted by intake clerk at student health for making a medical appointment was "possible seizure", patient had no prior medical history of epilepsy or any other disorder, was physically fit and on the crew team. She was last seen alive the evening of 12/7/08. She had talked on the phone to her out-of-state boyfriend and chatted with her dorm roommate. She had complained of a headache and not feeling well that day. She went to bed at 10:30 PM. In the AM, her roommate arose and thought patient was still asleep. The roommate left for the day of classes. Patient did not return friends text messages that day, leading to the finding of her body in bed in the dorm room about 5 PM 12/08/08. Preliminary autopsy done 12/09/08 shows no obvious cause of death per family's verbal report to me. Toxicology results are pending, due back in 6 weeks. Patient had no history of substance abuse and is not thought to be a suicide risk. She had been thriving in college and happy. No suspicions of foul play. Patient was a non-smoker. Funeral is planned for Sat 12/13/08. Tragic end for a brilliant and beautiful young woman. Please investigate possible role of GARDASIL and/or menigococcal vaccine in this death. This report submitted by patient's family friend MD, Internal Medicine and Geriatrics. Thank you for your prompt attention to public safety.

Other Meds: Patient also reportedly received a meningococcal vaccine at the time of GARDASIL vaccine.

Seriousness: DIED, SERIOUS

MedDRA PT Death, Dizziness, Headache, Malaise, Nausea

Symptom Text: Initial and follow-up information has been received for a direct report from the government(VAERS#334611) concerning a previously healthy 19 year old female happy achieving college freshman with no history of substance abuse, alcohol intake, or depression, or other mental health issues, who was vaccinated on approximately 28-NOV-2008 with a dose of GARDASIL, lot number not reported. Concomitant therapy included: meningococcal vaccine (unspecified). It was reported that on 08-DEC-2008, the student died suddenly, approximately 10 days after receiving GARDASIL and meningococcal vaccine (unspecified). The vaccines were administered by a medical provider in her hometown, while she was home for the Thanksgiving holiday. The student emailed campus health services on Sunday night (07-DEC-2008) complaining of dizziness, headache, and nausea. Student Health Services at her University indicated that it might be a seizure, and arranged an appointment for her to be seen in the health services clinic that Monday (08-DEC-2008) (the day of her death). The medical clerk had entered "possible seizure" as the reason for making the appointment. There was no referral to an Emergency Room (ER). She had no history of epilepsy. She complained of a headache and not feeling well in the 24 hours prior to her death. She went to be at 10:30 PM on 07-DEC-2008, in her dorm room with a roommate. She appeared to still be sleeping the next morning when her roommate left for class. Her body was discovered still in bed around 5:00 PM that day (08-DEC-2008) with rigor mortis. Follow-up information reported that the county medical examiner reported that "examinations performed Dec. 9 were inconclusive, but said there were no signs of foul play and no signs of meningitis or other life threatening infectious diseases. Further tests would be performed and it may take up to six weeks for a final determination." This was originally reported by a physician. Additional information has been requested.

MedDRA PT Bronchitis, Choking, Cough, Dyspnoea, Haemoptysis, Hypoxia, Livedo reticularis, Nodule, Oxygen saturation decreased, Peripheral coldness, Pulmonary vasculitis, Skin discolouration, Sleep disorder, Subclavian artery stenosis

Symptom Text: Information has been received from a physician concerning an 18 year old female who was vaccinated with the third dose of GARDASIL vaccine(dose, route and lot# not reported). The patient might have developed vasculitis after receiving the first dose of GARDASIL vaccine. After the third dose of GARDASIL vaccine, a pulmonologist diagnosed that the patient with vasculitis of the lungs. The patient sought medical attention for her adverse experience and then the patient recovered from the vasculitis of the lungs. The pulmonologist attributed the vasculitis to GARDASIL vaccine. Additional information has been requested. 1/27/2009 MR received from vascular, pulmonary and sleep clinics. Pt seen 3/3/2008 in Vascular clinic for abnormal chest CT which showed an subclavian vein stenosis with collaterals seen to supply R arm. CT done to r/o PE due to SOB. No dx noted. Seen in pulmonary clinic 3/31/2008 for eval of hypoxia. In Jan 2008 pt developed cough with blood tinged sputum. DX with Bronchitis with low O2 sats, now improved, however cough remains with occasional choking episodes. Also recently dx with Livido Reticularis due to lacy mottling and coolness of the distal extremities. Reports subQ nodules after HPV shots. PE (+) for lacy reticular rash in arms and legs. Deep coughing spells noted by parent. No interstitial lung disease and unlikely pulmonary HTN. Referred to sleep clinic. Seen in sleep clinic for choking/coughing episodes at night. On altered school schedule due to sleep disturbances. Purple discoloration of legs noted on PE. 1/23/09 07-JAN-2009, Dr provided to CDC most of the requested information and the following additional details: Concomitant medication: prn Zyrtec; no known drug allergies; concurrent condition? / AE?: livedo reticular rash, all over body, on & off from May 2007, around time of vaccines; OTC cortisone cream ineffective; referred to rheumatologist for rash on 29-JAN-2008 - according to consult note, patient had the same rash on her feet "years before"; on 27-FEB-2008, a CT

MedDRA PT Smear cervix abnormal

Symptom Text: Information has been received from a consumer concerning her 21 year old daughter with no pertinent medical history or known allergies who in approximately April 2007, was vaccinated with the third dose of GARDASIL 0.5 ml, IM. Concomitant therapy included PAXIL and hormonal contraceptives (unspecified). It was reported that after the patient received GARDASIL, had a Papanicolaou test positive for HPV. The patient did not know which strain of the virus it is from. There were no Papanicolaou test done during the series, so she did not know if she would have tested positive before or after it was reintroduced. It was reported that a Papanicolaou test done before the vaccination series was "normal". The reporter did not know where the series begun. At the time of the report, the patient had not recovered. Additional information has been requested.

MedDRA PT Erythema, Feeling abnormal, Hypoaesthesia, Swelling

Symptom Text: Information has been received from a physician assistant concerning a 23 year old female, who on 21-OCT-2008, was vaccinated, IM, with the first dose of GARDASIL, 0.5 ml (Lot # 0152X). Concomitant therapy included drospirenone (+) ethinyl estradiol (YASMIN). On 21-OCT-2008, a few hours after receiving her first dose of GARDASIL, the patient experienced localized area of redness, swelling, numbness and a raw feeling on her chin. The patient's localized are of redness and swelling and numbness and a raw feeling on her chin persisted. It was reported that the patient sought medical attention: contacted the office by phone and an appointment in the office had been scheduled. Additional information was received from a physician assistant stating that the patient received GARDASIL in the morning and later that afternoon/evening, patient experienced swelling tin the jaw and chin. This was patient's first dose of GARDASIL. AE reported back around 22-OCT-2008. The patient had no significant medical history and no concomitant medication. Additional information has been requested.

MedDRA PT Back pain, Dyskinesia, Loss of consciousness

Symptom Text: Information has been received from the mother of a 13 year old female with a history of mood disorder who on unspecified dates received the first and second doses of GARDASIL. On 16-SEP-2008 was vaccinated with a third dose of GARDASIL. There was no concomitant medication. After she received the 3rd dose on 16-SEP-2008, later that day she felt pain in her back and grabbed her spinal column. The patient lowered herself down to the floor to lie flat on the ground. She became unconscious and rhythmically moved one of her arms back and forth toward her head. This movement then stopped and she re-gained consciousness and opened her eyes. The entire episode lasted only about 1 to 2 minutes. She seemed fine and normal shortly thereafter. As a precaution she was taken to the Emergency Department of a local hospital where she had a number of tests. All of the test results were normal. She did not have to be admitted as an in-patient to the hospital. She has seemed normal ever since this incident occurred. She subsequently went to a cardiologist and a neurologist who specializes in pediatric epilepsy. The patient's mother said that the neurologist would like to do further testing of her daughter. Additional information has been requested.

MedDRA PT Drug administered at inappropriate site, Injection site mass, Injection site pain, Injection site reaction

Symptom Text: Information has been received from a physician concerning a female who was vaccinated with the second dose of GARDASIL, 0.5 ml. After receiving the vaccine the patient experienced an injection site reaction, a bump the size of a quarter at the injection site which was tender to the touch. It was also noted that the patient received the vaccine in the buttock. As of 22-OCT-2008 the patient's adverse events persisted. The patient called the physician. Additional information has been requested.

MedDRA PT Nausea

Symptom Text: Information has been received from a consumer concerning her daughter who in May 2007, July 2007 and December 2007 was vaccinated with her first, second and third doses of GARDASIL respectively. The consumer reported that starting in August 2008, her daughter had been very nauseous and still was very nauseous and in September 2008,her daughter was put on anti-nauseating medication. The consumer reported that her daughter had been working with a GI,, neurologist and primary care physician, but her daughter stated that the anti nauseating medication (name manufacturer is unspecified) only worked in the morning. At the time of this report, 24-OCT-2008, no outcome reported. Additional information has been requested.

MedDRA PT Abdominal pain upper, Inappropriate schedule of drug administration

Symptom Text: Information has been received from a female consumer, concerning her 13 year old daughter with no medical history or allergies who on 12-FEB-2007 was vaccinated with the first dose of GARDASIL, the second dose on 30-APR-2007 and the third dose on 07-AUG-2007. There was no concomitant medication. The consumer reported that, in August 2007, "not too long after receiving the third dose of GARDASIL", the patient started to have severe stomach pain on her upper left side. The reporter stated that her daughter's pain level on a scale of 1 to 10 was a 7. The consumer reported that the patient had blood work, ultra sounds and CAT scans done and they all came back normal. The reporter stated that the next time the patient saw the physician they may have to "put a scope in her to check out her stomach area". The patient was not recovered at the time of this report. The patient sought medical attention with a physician. No further information is available.

MedDRA PT Astigmatism, Erythema, Glaucoma, Inappropriate schedule of drug administration, Iridocyclitis, Iritis, Lymphadenopathy, Myopia, Oedema peripheral, Papillitis, Photopsia, Sarcoidosis, Vasculitis, Vision blurred, Visual impairment

Symptom Text: Information has been received from a 27 year old physician concerning herself who on 11-JAN-2007 was vaccinated with the first dose of GARDASIL (Lot# 654884/0902F, batch # NE24240). On 10-MAR-2007, the patient was vaccinated IM with the second dose of GARDASIL into the deltoid muscle (Lot# 654884/0902F, Batch # NE24240). In MAR-2007, the patient developed erythema, ankle edema and visual disturbance. On 10-JUN-2007, the patient was hospitalized for the first time due to the visual disturbance. Uveitis anterior and increased eye pressure (both eyes) was diagnosed. The patient was hospitalized from 13-JUN-2007 to 15-JUN-2007. Upon hospitalization, the patient presented with visual disturbance with blurred flickering vision. Diagnosis of uveitis anterior, papillitis, iris granuloma and vasculitis was confirmed. After biliary Lymphadenopathy the patient was hospitalized until diagnosis of sarcoidosis was confirmed. Chest x-ray on 11-Jun-2007. In comparison to previous examination on 07-SEP-2007 significant round shadows of lung hilum (bilateral) as an expression of biliary lymphadenopathy were found. X-ray also confirmed picture of sarcoidosis stage I. Echocardiography on 13-JUN-2007 and abdomen sonography on 15-JUN-2007 showed normal results. Opthalmological finding on 12-JUN-2007: diagnosis of papillitis, uveitis anterior, myopia, astigmatism, secondary glaucoma, vasculitis and iris granuloma. Under local antiinflammatory and pressure-lowering therapy the tension normalized and the patient was recovering. The patient additionally developed flat erythema of both lower legs and ankles, but rather untypical for erythema- nodosum. Systemic steroid therapy was initiated. The patient was treated with prednisolone 100 mg for 3 days, from 17-JUN-2007 treatment with prednisolone 50 mg. Additionally the patient was treated with NEXIUM 20, CALCIMAGON D3. The patient was discharged for further outpatient treatment. The final outcome was not reported. GARDASIL (Lot# 654884/0902F, Batch # NE 24240 administered on 11-Jan-2007 was

MedDRA PT Dizziness, Gait disturbance, Nausea, Orthostatic hypotension, Sensation of heaviness, Vision blurred

Symptom Text: Information has been received from a Registered Nurse concerning a 15 year old female patient with no known drug reactions or allergies and medical history who on 10-APR-2007 was vaccinated with first dose of GARDASIL (Lot number not provided) 0.5ml, intramuscularly. There was no concomitant medication. On 18-NOV-2008 she received her second dose of GARDASIL (Lot # 661703/0651X) 0.5ml, intramuscularly. On 19-NOV-2008 the patient developed dizziness, nausea, blurred vision, and a feeling of her legs being "heavy and wobbly". It was reported that the patient had difficulty walking due to wobbly legs. The patient was seen in the office that day and was found to have orthostatic hypotension. Urinalysis was performed to rule out dehydration. The patient was advised to increase liquid intake and to rest. An office visit on 20-NOV-2008 revealed the hypotension improved. The patient contacted the office by phone on 21-NOV-2008 and stated the symptom of "wobbly legs" was resolving. Subsequently, she has completely recovered. The patient's difficulty walking due to "wobbly legs" and orthostatic hypotension were considered disabling by the reporter. Additional information has been requested.

MedDRA PT Abdominal pain, Appendicectomy, Appendicitis, Demyelination, Nausea, Neurological examination abnormal, Vomiting

Symptom Text: Information has been received from a physician concerning an 18 year old female patient with medical history of arm hypoesthesia one year and a half ago and with digestive disorder episodes, received the second dose of GARDASIL (batch number not reported) on 11-OCT-2008. On an unspecified date the patient experienced digestive symptoms: abdominal pain, vomiting and nausea. Diagnosis was appendicitis therefore the patient had an appendicectomy. 2 to 3 days later the patient had vomiting and then all came back to normal. After 15 days, she had abdominal pain and vomiting again. There was hospitalization and digestive exploration. As to gastroenterologist there was nothing at digestive level but he suspected a neurological impairment. An MRI was performed which showed demyelinating lesions. Evoqued suspected diagnosis by the radiologist was multiple sclerosis or acute disseminated encephalomyelitis. At time of reporting the patient had not recovered. The patient received the first dose of GARDASIL on 20-JUL-2008. Additional information has been requested. Other business partner numbers include E2008-11235.

MedDRA PT Bedridden, Brain oedema, Convulsion, Familial risk factor, Meningism, Migraine

Symptom Text: Information was received from a news broadcast Online (October 29, 2008) reporting that after the first shot of GARDASIL, the patient, an 18 year old female, developed an unknown illness causing migraine-like headaches, coupled with symptoms similar to warning signs of meningitis. Ten days later, while being tested for meningitis in the hospital, she suffered several seizure-like episodes that her neurologist said it was caused by swelling in her brain, which the worst the neurologist said he had ever seen. The neurologist was asked if the patient's reaction could have been caused by GARDASIL and he stated "I can't prove it beyond a shadow of a doubt, but there (was) as much evidence as possible in the medical field to link it." The patient was now bed-ridden and recovering at home. Upon internal review, seizure-like episodes was considered to be an other important medical event. The patient's younger sister also had a similar experience (refer to WAES #0810USA05376). No further information is available.

Symptom Text: Information has been received from an employee concerning a 16 year old female, who on 25-SEP-2008 was vaccinated with GARDASIL (1st dose). The patient never had any psychiatric event, athlete (she plays sand volleyball), does not use to get out at night, studding the 2nd year of high school. Anybody in the family has a history of psychiatric disease or had taken anytime drugs for this condition. Her family begins to notice that the patient was very thirsty (she drunk 31 or more daily), very high anxiety and euphoria approximately 15 days before the outbreak (09-OCT-2008). She used to write happiness notes to her mother, talk about everything with her eyes widened-she gave the impression that "there is no one so happy than me". Her family begins to be surprised, but didn't think that I was something important or severe. On 23-OCT-2008, the patient left school and come back to her home because she had a malaise. On 23 and 24-OCT-2008, she had a very severe insomnia (she slept very little time and woke up thereafter with a peculiar anxiety). Insomnia was higher at the day-break between days 24 and 25-OCT-2008. In the morning of day 25-OCT-2008, from the morning until afternoon the patient was loosing her control, very agitated and anxious- she beat in her relatives, asked for a beer, asked for a knife, she throw out to a window (that had a rail), she told that she was going to materialize with the sofa (hallucinations), much anxiety. The reporter compared the patient's behavior with the character of the movie "exorcist". Starting in the morning, during the afternoon the picture was more intense, the pictures appeared and the patient was uncontrollable. At night, the psychiatrist was called who prescribed EUTONIS, performed a sub-valuation, stating that "it was a very small crisis, with no importance". The patient took a tablet that had no effect, and the physician ordered to take a second one, which she took, but without any effect. The patient nodded (sometimes for 5-10 minutes), when she arouses she didn't disti

MedDRA PT Crying, Pyrexia, Renal pain, Sleep disorder, Swelling face, Vomiting

Symptom Text: Information was obtained on request by the Company from the agency via a Public Case Detail Form and a Case Line Listing concerning a 15 year old female who on14-MAY-2007 was vaccinated with GARDASIL (Lot No. 655742/0138U, Batch No. J0799, Expiry date 07-AUG-2009). on 15-MAY-2007 the patient experienced vomiting, crying, pyrexia, renal pain, sleep disorder and swelling face and was hospitalised. It was described that within 24 hours of vaccination, the patient was vomiting, developed a fever, swelling on side of face, cried persistently for 3 hours, had sleep changes and developed kidney pains. The patient was treated with PANADOL, morphine and antibiotics (unspecified). At the time of reporting to the agency on 25-AUG-2008, the outcome of vomiting, crying, pyrexia, renal pain, sleep disorder and swelling face was unknown. The agency considered that vomiting, crying, pyrexia, renal pain, sleep disorder and swelling face were possibly related to therapy with GARDASIL. The original reporting source was not provided. Additional information is not expected.

MedDRA PT Lethargy, Mouth ulceration, Pyrexia

Symptom Text: Information was obtained on request by the Company from the agency via a Public Case Detail Form and a Case Line Listing concerning a 24 year old female who was vaccinated with GARDASIL. On 30-AUG-2008 the patient experienced lethargy, pyrexia (fevers) and mouth ulceration. The patient was treated with topical analgesia to mouth ulcers and oral analgesia. At the time of reporting to the agency on 04-SEP-2008 the patient's lethargy, pyrexia (fevers) and mouth ulceration persisted. The agency considered that lethargy, pyrexia (fevers) and mouth ulceration were possibly related to therapy with GARDASIL. The original reporting source was not provided. The adverse events of lethargy, mouth ulceration and pyrexia were considered to be disabling by the reporting agency. Additional information is not expected.

MedDRA PT Asthma, Injection site erythema, Injection site pain, Injection site swelling, Injection site warmth, No reaction on previous exposure to drug

Symptom Text: Information has been received from a healthcare worker concerning a 17 year old female with asthma who on 27 Aug 2008 was vaccinated with the first dose of GARDASIL intramuscularly. On 23-Oct-2008, the patient was vaccinated with the second dose of GARDASIL intramuscularly concomitant therapy included unspecified oral contraceptives. It was reported that one day after receiving her second dose, on 24-Oct-2008, the patient experienced an asthma attack. Prior to this, it had been 4 years since this patient had experienced an asthma attack. She was treated with an unspecified asthma inhaler. The patient also developed redness, swelling pain and warmth at the injection site after both of her immunization with GARDASIL. All these symptoms were greater after the second dose than the first dose. The onset date of these symptoms was unspecified. At the time of the report, the patient was recovering. The patient sought medical attention, by phone call.

MedDRA PT Cardiac disorder, Mitral valve prolapse, Palpitations

Symptom Text: Heart problems related to GARDASIL vaccine. My daughter has experienced severe heart palpation's. She has been diagnosed with Mitro Valve Prolapse and struggles with heart palpitations on an ongoing basis. She never had any of these problems prior to her getting the first shot of the vaccine. She is visiting a cardiologist to see what other problems there maybe with her heart. I feels all these symptoms started after her first dose of GARDASIL vaccine. I never made the connections and she has received all three of the series of shots. Until my daughter brought it up in a conversations about a friend of hers at school experienced a similar reaction to her heart after she received the GARDASIL did I finally realize there might be a connection to this drug.

Other Meds:

Lab Data: Xray-heart no inflamed, Feb2008; EKG-low resting heart rate, Feb 2008; EKG- Mitro Valve Proplapse, April 2008.

History: No allergies to anything. Never experienced heart pain or discomfort prior to this series of shots.

MedDRA PT Anger, Condition aggravated, Depression, Dizziness, Headache

Symptom Text: Information has been received from a 21 year old female who received two dose of GARDASIL. She was supposed to get the third dose on 06-OCT-2008, she did not have insurance to pay for it so she did not get it. She started experiencing depression, dizziness and headache "around 19-OCT-2008". The patient mentioned that she had been sad previously after she gave birth to her child (14 months old); however, she was fine for a while and now the depression was back and it was much stronger. She felt angry and sad and wanted to be alone. The patient had the baby before starting the GARDASIL. At the time of reporting the patient was not recovered. No further information is available.

MedDRA PT Injection site erythema, Pigmentation disorder, Pruritus

Symptom Text: Information has been received from a nurse, concerning a 12-year-old female patient with no known drug allergies, who on 22-AUG-2008, received the first dose of 0.5 ml, GARDASIL (lot# 659437/1266U, injection site unknown) via intramuscular route. On 23-AUG-2008, after the administration, the patient developed several red areas off to the side of the site of injection. According to the mother of the patient, " the areas initially looked like the skin had been burned, almost blister-like. The areas are extremely pruritic". On 30-OCT-2008, the patient was examined by her physician. It was noted that she now had a half-dollar size circle (34 mm by 30 mm) that was without pigmentation (very white). She also had two small red dots an a red area 5 cm by 4 cm to the left of thee white area. The red areas of skin were flattened. The patient stated that the areas never released fluid or became scabbed. At the time of reporting, the patient was not recovered from the events. Additional information has been requested.

MedDRA PT Immediate post-injection reaction, Nausea

Symptom Text: Information has been received from a physician concerning a 20 year old female who on 15-OCT-2008 was vaccinated with the second dose of GARDASIL vaccine, IM "single dose vial". The patient experienced nausea almost immediately after receiving her second dose of GARDASIL vaccine sometime around 15-OCT-2008. Physician reported that the patient's nausea "got progressively" for a couple of weeks after which it started to diminish. The patient sought medical attention. The pregnancy test was negative. Additional information has been requested.

MedDRA PT Incorrect route of drug administration, Nausea, Pharyngitis, Vaccine positive rechallenge, Vomiting

Symptom Text: Information has been received from a general practitioner concerning a 15 year old female with drug allergy and asthma who on an unspecified date was vaccinated with the first dose of GARDASIL. The patient experienced intermittent nausea and vomiting after receiving the second dose of GARDASIL (batch number not reported) on 03-MAR-2008. On 23-AUG-2008, the patient received the third dose of GARDASIL (batch no. NF3730; Lot no. 0233U) and experienced severe nausea and vomiting. She received corrective treatment with MOTILIUM and VOGALENE which were both ineffective. At the time of reporting, the patient was better, however she had not recovered. Additional information was received from the physician. The lot number of GARDASIL was provided. The patient recovered on 17-SEP-2008. Follow-up information received from a phone call to the physician on 03-OCT-2008: Echography was normal. Hepatic work-up and urinary analysis were normal. Mononucleosis serology was negative. The patient had pharyngitis. At time of reporting the patient had nausea again. Investigations were scheduled. Follow-up information received through the pharmacovigilance form: Case of misuse. Case upgraded by the company due to the patient's hospitalization. The patient received the third dose of GARDASIL via inappropriate route i.e. subcutaneous route instead of intramuscular route in her left arm. Onset date of nausea and vomiting of moderate intensity was on 28-AUG-2008, with relapse on 20-SEP-2008, 30-SEP-2008 and 18-NOV-2008. At time of reporting the patient had recovered (unspecified timeline). Adverse events were reported as non serious by the reporter. The patient was hospitalized on an unspecified date. Hospital report not available. Start therapy date for VOGALENE was on 28-AUG-2008 and she had it via rectal route, start therapy date for NAUSICAIM was on 20-SEP-2008 and she had it via oral route. There was a misuse with the first dose of GARDASIL (Lot number 655635/1019F, Batch number NE56080) received via subcutaneous route in her left arm

MedDRA PT Asthma, Injection site erythema, Pruritus generalised, Rash generalised

Symptom Text: Information has been received from a Licensed practical nurse (LPN) concerning a 26 year old female patient, with concurrent condition of asthma and sulfonamide allergy who on 20-OCT-2008 was vaccinated with the first dose of GARDASIL intramuscularly into the right deltoid (lot# 0947X). Concomitant therapy included rescue inhaler. On approximately 27-OCT-2008, the patient experienced systemic rash, redness at the injection site, systemic itching and asthma attacks. She was prescribed BENADRYL, used her rescue inhaler, and had a steroid injection. After two weeks, the patient recovered (2008). The LPN considered the systemic rash, redness at the injection site, systemic itching and asthma attacks to be Other Important Medical Events. Additional information has been requested.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Abdominal pain, Groin pain, Muscle spasms, Nausea, Pain in extremity, Pyrexia

Symptom Text: Information was obtained on request by the Company from the agency via a Public Case Detail Form and a Case Line Listing concerning a 12 year old female who on 04-SEP-2008 was vaccinated with GARDASIL. On 04-SEP-2008 following vaccination with GARDASIL, the patient experienced abdominal pain, nausea, groin pain, muscle spasms, pain in extremity and pyrexia and was hospitalized. It was described that the patient was nauseated post vaccine (no vomiting) and attended sick bay at school. The patient developed mild fever and at 8:30 PM of the same day, the patient developed pain in both groins radiating to her kneecaps. The patient also developed abdominal pain and muscle spasms in lower back. The patient was taken to hospital and given IV therapy and PANADOL. Urine and blood testing were done which showed nothing abnormal. At the time of reporting to the agency on 19-SEP-2008 the patient's abdominal pain, nausea, groin pain, muscle spasms, pain in extremity and pyrexia persisted. The agency considered that abdominal pain, nausea, groin pain, muscle spasms, pain in extremity and pyrexia were possibly related to therapy with GARDASIL. The original reporting source was not provided. Additional information is not expected.

MedDRA PT Migraine, Optic neuritis, Visual acuity reduced

Symptom Text: Information was obtained on request by the Company from the agency, via a Case Line Listing and Public Case Details Form, concerning a 26 year old female who on 15-JUN-2008 was vaccinated with GARDASIL, intramuscularly. Concomitant therapy included NORDETTE. In approximately July 2008, "within three weeks of vaccination", the patient developed left optic neuritis and migraine headache and was hospitalised. Results of Magnetic Resonance Imaging (MRI) of the patient's brain and orbits were as follows: "Foci of increased intensities are seen within the periventricular deep white matter bilaterally. Demyelination cannot be excluded at this stage. The orbital contents define normally. Both optic nerves appear unremarkable." The patient was treated with prednisolone. On 21-AUG-2008 the patient had recovered, with sequelae (mild decreased vision), from optic neuritis and migraine. The agency considered that optic neuritis and migraine were possibly related to therapy with GARDASIL. The original reporting source was not provided. Additional information is not expected.

Other Meds: ethinyl estradiol (+) levonorgestrel

MedDRA PT Drug exposure during pregnancy, Foetal disorder

Symptom Text: Information has been received from a 22 year old female patient, for the pregnancy registry for GARDASIL, with no pertinent medical history and no known drug allergies/drug reactions, who on 26-OCT-2007 was vaccinated with the first dose of GARDASIL (Lot # not provided). It was noted that the patient did not receive her second or third doses. Concomitant therapy included ORTHO TRI-CYCLEN. The patient became pregnant in February 2008 and gave birth on 13-NOV-2008. Her son was born with duodenal atresia and only one kidney. It was noted that the umbilical cord formed correctly but was not nourished "correctly" and therefore it looked "mutilated". There was also a tear in the umbilical cord near the belly button. The patient sought medical attention with the physician. Additional information has been requested.

Other Meds: ORTHO TRI-CYCLEN

MedDRA PT Drug exposure during pregnancy, Foetal disorder

Symptom Text: Initial information has been received from a health care professional through the patient's mother. The present case concerns a baby who was born with some abnormalities whose mother was administered one dose of GARDASIL (batch # not reported) during early pregnancy mother linked case WAES# 0805USA00774. The patient's mother was vaccinated with the second dose of GARDASIL on 30-JAN-2008 and the last menstrual period was 11-JAN-2008. It is reported that the baby, a male, was born after 40 weeks and 4 days of gestation. The baby was born by a cesarean delivery. Weight at birth was 3.4 kg., height at birth was 52 cm, Apgar 1 min = 9; apgar 5 min = 10. On the 22-OCT-2008 the patient had his first pediatrician revision during which a heart murmur was detected. The pediatrician forwarded the patient to the hospital cardiology ward in order to perform further test. According to the hospital report the patient, a 12 hour-old-male, was sent from the clinic where he was born due to a heart murmur that was clinically asymptomatic. Upon examination the child with normal coloring of mucosa and skin, pulse was symmetric. Transcutaneous oxigention 100% with inspired oxygen fraction of room air. Normal respiratory system. From cardiac auscultation they found first and second sounds to be normal with systolic murmur of grade II-III/VI in the meso, pulmonary and aortic focus. Echocardiogram showed a normal sinus rhythm for the patient's age. An in-depth echocardiogram study was performed. Relevant findings were: situs solitus with concordance A-V and V-A. Normal pulmonary and systemic venous return. Left and right auricles are normal not dilated. Interauricular septum presents a small, 2mm, oval foramen with minimum left to right shunt. Septum interventricular with a 6mm subaortic interventricular communication, there appears to be overriding aorta, being more evident in longitudinal cut, reminding of Fallot's tetrad. Left ventricle is neither dilated nor hypertrophic presenting a correct function. Right ventr

MedDRA PT Caesarean section, Drug exposure during pregnancy, Foetal disorder, Inappropriate schedule of drug administration

Symptom Text: Initial information has been received from a health care professional through a 28 year old female with a history of 1 pregnancy and 1 live birth who on 30-NOV-2008 was vaccinated with a first dose of GARDASIL. The patient was vaccinated during pregnancy LMP date was 11-JAN-2008 and on 30-JAN-2008 the patient was vaccinated with a second dose of GARDASIL (batch number not reported). No adverse events were reported. The expected delivery date is 10-OCT-2008. The patient had a previous pregnancy. It was reported that the patient gave birth by cesarean to a healthy child. Follow up information was received on 23-JUL-2008. The evolution of the pregnancy was normal. Test results and morphologic echography results are also normal. Follow up information was received that the patient gave birth to a baby with some anomalies by cesarean on the 21-OCT-2008 after a 40 week gestational period. It is reported that the baby has been born with Fallot's tetrad, a congenital heart anomaly. It was reported that the baby, a male, was born on the 21-OCT-2008 after 40 weeks and 4 days of gestation. The baby was born by a cesarean delivery. Weight at birth was 3.4 kg, height at birth was 52 cm, Apgar 1min-9, Apgar 5 min-10. MedDRA PT Acute lymphocytic leukaemia, Chemotherapy, Fatigue, Pallor

Symptom Text: Information has been received from a general practitioner as part of business agreement, concerning a 14-year-old female patient with back pain since the beginning of SEP-2008 received the first dose of GARDASIL (lot number not reported) on 27-NOV-2008. Post vaccination on an unspecified date the patient presented with intense fatigue and pallor. A complete blood count revealed 5 g/l of hemoglobin, diagnosis of acute lymphoid leukemia was established by the beginning of NOV 2008. The patient was hospitalized (unspecified dates). She was under cancer chemotherapy during 5 weeks. At time of reporting, the patient had not recovered. Other business partner number included E2008-11277. No further information is available.

Other Meds: Unknown

Lab Data: complete blood cell count, 01?Nov08, hemoglobin 5 g/l

MedDRA PT Drug exposure during pregnancy, Foetal disorder

Symptom Text: Initial and follow-up information has been received from a certified nurse midwife, for the Pregnancy Registry for GARDASIL, concerning a 22 year old female with inherited bilateral sensoneural hearing loss and a history of vaginal bacterial infections, alcohol abuse and urinary tract infections, and no known drug allergies, who on 23-APR-2008 was vaccinated intramuscularly in the right arm with a 0.5 ml first dose of GARDASIL (Lot# 659964/1978U) while pregnant. There was no adverse event post vaccination. Other medications included prenatal vitamins (unspecified). Prior to the vaccination, the patient was administered a urine and blood test to test for pregnancy. The urine test result was unclear. The blood test result came back with a positive result the next day (LMP = 17-Mar-2008). Results are pending for an ultrasound and CF screen performed on an unspecified date. Unspecified medical attention was sought in the office. The patient's outcome is unknown. Follow-up information was received. Other medications included prenatal vitamins, started on 05-MAY-2008, 1 tablet daily for pregnancy. Complication during pregnancy included fetal vascular thrombosis. On 25-NOV-2008, more than 35 weeks from LMP, the patient experienced fetal death/still birth. The products of conception were examined. The fetus was normal. Upon internal review, fetal death/still birth was determined to be an other important medical event. No further information is available.

Other Meds: Unknown

MedDRA PT Dizziness, Headache, Lethargy, Malaise

Symptom Text: Information was obtained on request by the Company from the agency via a Public Case Detail Form and a Case Line Listing concerning a 14 year old female who on 04-MAR-2008 was vaccinated with GARDASIL (Lot No 657872/0583U, Batch No J2896, Expiry Date 12-FEB-2010). On 10-MAR-2008 the patient experienced headache, dizziness, lethargy and malaise and was hospitalised. It was described that the patient developed bad headache, dizziness and lethargy for 3 days. On 17-MAR-2008 the same symptoms returned but more severe than the initial reaction. The patient was unwell until 19-MAR-2008. On 23-MAR-2008, the same symptoms re-occurred and the patient is still experiencing the same symptoms. The patient was treated with NUROFEN, PANADEINE and ENDONE. At the time of reporting to the agency on 25-AUG-2008, the patient's headache and dizziness and lethargy and malaise persisted. The agency considered that headache, dizziness, lethargy and malaise were possibly related to therapy with GARDASIL. The original reporting source was not provided. Additional information is not expected.

MedDRA PT Dry skin, Injection site reaction, Pigmentation disorder

Symptom Text: Information has been received from a consumer concerning his 16 year old daughter with allergic to AMOXILILLIN who was vaccinated with 3 doses of GARDASIL (route and site not reported). The patient had no reaction to the first 2 doses. Right after the 3rd dose of GARDASIL the patient experienced a reaction at the injection site, that later spread to most of her body. The patient lost tremendous amount of pigmentation in her skin, and the skin is dry and itchy and a lot of times cracks from the dryness. The pediatrician referred her to a dermatologist where she had biopsy done. The office said it was not an allergic reaction. The loss of pigmentation and dryness was mostly all over her face, both arms and legs. The patient's experiences persisted. This is one of several reports received from the same source. Additional information has been requested.

MedDRA PT Drug exposure during pregnancy, Premature labour

Symptom Text: Information was obtained on request by the Company from the agency via a Case Line Listing and Public Case Detail form concerning a 24 year old female patient who on 20-NOV-2007 and 15-JAN-2008 was vaccinated with her first and second dose of GARDASIL. The patient's last menstrual period (LMP) was on 14-JAN-2008. On 30-JUL-2008 the patient went into premature labour and was hospitalized. The baby was born at 28 weeks gestation. The agency stated that there were no other causes found for premature labour. The agency considered that premature labour was possibly related to therapy with GARDASIL. The original reporting source was not provided. Additional information is not expected.

MedDRA PT Anxiety, Immediate post-injection reaction

Symptom Text: Information was obtained on request by the Company from the agency via a Public Case Detail Form and a Case Line Listing concerning a 25 year old female, who has never had a history of anxiety problems before who was vaccinated with 3 doses of GARDASIL. Subsequently after vaccination with the first dose of GARDASIL, the patient developed anxiety. It was described as severe anxiety symptoms immediately after the first dose of GARDASIL, which continued until approximately 4 months after the last (third) dose. The patient was treated with psychological therapy. At the time of reporting to the agency on 29-SEP-2008, the patient had recovered from the anxiety. The agency considered that anxiety was possibly related to therapy with GARDASIL. The original reporting source was not provided. The adverse event of anxiety was considered to be disabling by the reporting agency. Additional information is not expected.

MedDRA PT Abdominal pain, Abdominal tenderness, Dilatation intrahepatic duct acquired, Hepatitis, Lip dry, Mental status changes, Pallor, Pyrexia, Somnolence, Vomiting

Symptom Text: Information was received from a physician concerning a 10 year old female patient with no medical history mentioned who on 28-NOV-2008 received on arm (not specified if left or right arm) the first dosage (shot) of GARDASIL, 0.5 ml, prefilled syringes, intramuscular, out of 3 for immunization against HPV types 6, 11, 16, 18. No concomitant medications were reported. In about two days after vaccination, the patient presented fever (38 C, axillar), sleepiness, biliary vomiting, abdominal pain (periumbilical/periophalic and epigastric). The patient was referred to the hospital where the acute hepatitis diagnosis was suspected. On clinical examination were reported: altered general status, somnolence, dry lips, pale teguments, subcutaneous cellular tissue weak represented, balanced cardio-vascular and respiratory, slight sensitive abdomen on palpitation on periumbilical area. On laboratory test were found elevated serum levels of AST (GOT), ALT (GPT), Gamma-GT, alkaline phosphatase. Total and direct bilirubinemia were found in normal values. On abdominal ultrasonography examination were found signs of hepatitis with enlargement of an all intra-and extra-hepatic ducts. Also, there were found right polycystic kidney and left kidney with modified structure on ultrasonography. During one day of hospitalization in the pediatric department treatment with an antibiotic (not mentioned which one and dosages) and perfusion with glucose and natrium chloride solutions (not mentioned the volume and concentrations) were administered. The patient was referred to the infectious disease department with a diagnosis of acute hepatitis and the outcome was reported as not recovered. In the opinion of the reporting physician, the reported adverse events could be in relation with administration of GARDASIL. Additional information is expected.

MedDRA PT Granulocytosis, Leukocytosis, Lymphadenopathy

Symptom Text: Information has been received from a health authority concerning a 17 year old female patient who was vaccinated with GARDASIL (BATCH # NF14740 LOT # 1340F) on 09-NOV-2007. In December 2007, the patient developed swelling of the lymph nodes (cervical, nuchal, supraclavicular, mediastinal, axillary). Lymphadenopathy of unclear cause was diagnosed. Histological clarification was not performed at the time of reporting. Laboratory findings please see lab comments. Despite ongoing events the patient was vaccinated with a second dose of GARDASIL (BATCH # NF32810 LOT # 1537F) on 21-JAN-2008. Marked leukocytosis was seen by significant granulocytosis. Granulocytosis could indicate a bacterial infection or a systemic inflammatory event. A marked cellular immunodeficiency was not present. The patient was hospitalized from 09-APR-2008 to 16-APR-2008. Virological examination showed no indication for HIV, Hepatitis A, B or C infection, no indication for CMV or EBV infection, HHV-6 IgG positive, Parvo B19 negative, antibodies to VZV and rubella positive. Toxoplasma infection negative. On 16-APR-2008 the suspicion of Hodgkin's disease was diagnosed. The patient and the patient's parents refused further treatment or follow-up examination recommended by the reporter. Therefore the outcome was unknown. Case is Closed. Other business partner numbers include E200811173 and PEI2008018367. No further information is available.

MedDRA PT Wheelchair user

Symptom Text: Case received from an employee (no pharmacist) of pharmacy on 2-DEC-2008. This case is not medically confirmed, it is a hearsay case, with poorly information. The female employee of a pharmacy (no pharmacist) told that it was reported to her from male (no health care professional) that an about 17 year old female was sitting in wheel chair after being vaccinated with GARDASIL (lot, route and site not reported) on an unknown date. After vaccination she was sitting in a wheel chair. The male also reported that causality to vaccination was proofed. Neither the reason why the female was sitting in a wheel chair was reported nor if she still needs a wheel chair or not. As the female employee does not know the male reporter very well, and also in fear that with reporting this case she could get some trouble, it will not be possible to get further information. The outcome was not reported. Other business partner numbers include E200811252. No further information is available.

MedDRA PT Hypoaesthesia, Nervous system disorder

Symptom Text: Initial case was reported from a physician on 04-Dec-2008: A 14 year-old female patient was vaccinated with the third dose of GARDASIL (lot number, site and route not reported) on 13-May-2008. In September/October 2008 the female developed a feeling of numbness in the upper arms and neurologic disorders (not specified per reporter). The female patient was taken into hospital in Department Neurology, for about one week, where a suspicion of multiple sclerosis was diagnosed. Up to time of report the physician did not know what kind of examinations in the hospital were performed, but he will try to get more information. The physician commented that he didn't see a relation between vaccination and the symptoms. The female patient has not yet recovered. Other business partner numbers include E2008-11359. This is one of several reports from the same source. This case is link to case E2008-13371 (same vaccine, same reporter, same date of reporter).

MedDRA PT Condition aggravated, Dermatitis atopic, Pruritus

Symptom Text: Information has been received from a Health authority concerning a 17 year old female patient with a history of atopic eczema and various allergies (penicillin, house dust mite) who on an unknown date, was vaccinated with the first dose of GARDASIL lot number, route and injection site not reported. Concomitant therapy included MINISISTON. In March 2008, the evening post vaccination, the patient developed pruritus of the entire body surface. Within the following days the patient experienced an acute exacerbation of a known atopic eczema. Before the vaccination, the patient had rarely experienced any skin disorders and never before had the entire surface been affected. The patient was hospitalized and received systemic steroid therapy which led to temporary improvement. When the therapy was stopped, exacerbation reoccurred. At the time of reporting, the patient was still in the hospital and had not yet recovered. Other business partner numbers include E2008-11328. No further information is available.

MedDRA PT Arthritis

Symptom Text: Information has been received from a physician concerning a patient who was vaccinated with GARDASIL (Lot # not provided). Subsequently the patient experienced severe arthritis (within 8 hours) in the same arm as the injection. The reporter felt that severe arthritis (within 8 hours) in the same arm as the injection was related to therapy with GARDASIL. Upon internal review severe arthritis (within 8 hours) in the same arm as the injection was considered other important medical event. No further information is available.

MedDRA PT Activities of daily living impaired, Menorrhagia, Thrombosis

Symptom Text: This case was initially reported to an agency by the health authority and it concerns a 12 year old female patient. The patient had 28 day menstrual cycles with five days bleeding. The patient received GARDASIL. Batch number not reported, on 16-OCT-2008. On 28-OCT-2008, 12 days post vaccination, the patient experienced heavy bleeding with clots which was described as very abnormal and the patient was unable to attend school. At the time of the reporting the patient had not yet recovered. The reporter considered the event to be disabling and medically significant. Other business partner numbers include E200811402. No further information is available.

MedDRA PT Conversion disorder, Paralysis

Symptom Text: Information was obtained on request by the Company from the agency via a Case Line Listing concerning an 18 year old female who was vaccinated with GARDASIL. Subsequently after vaccination, the patient experienced paralysis and conversion disorder. At the time of reporting to the agency on 29-SEP-2008, the patient had recovered from paralysis and conversion disorder. The agency considered that paralysis and conversion disorder were related to therapy with GARDASIL. The original reporting source was not provided. Upon internal medical review paralysis was considered an other important medical event. Additional information is not expected.

Seriousness: DIED, SERIOUS

MedDRA PT Autopsy, Death, Headache, No reaction on previous exposure to drug, Pain, Ruptured cerebral aneurysm

Symptom Text: Information has been received from a general practitioner concerning an 18 year old female with pollen allergy, allergic asthma and who was overweight, with a family history of the mother having multiple sclerosis, who on 12-MAR-2008 was vaccinated with the first dose of GARDASIL, lot # not reported, which was well tolerated. It was reported that the second dose of GARDASIL, lot # not reported, was given intramuscularly (IM) to the right deltoid on 21-APR-2008. Concomitant therapy included SERETIDE, albuterol, NASACORT and KESTINE. There was no contraceptive use. On 16-JUL-2008 the patient experienced sudden brutal cephalgia and then she suffered from a pain evocating an aneurysm during rupture. The patient suddenly died in spite of resuscitation technique performed by the agency which evoked a ruptured aneurysm. An autopsy was on-going and the results would be provided. As to the reporter there may not be any link between adverse effect and vaccination. The reported cause of death by the ageny was ruptured cerebral aneurysm, but it had not been confirmed yet by the results of the autopsy which were still pending. Additional information has been requested. Other business partner numbers include E2008-11575.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Biopsy liver abnormal, Hepatic necrosis, Jaundice

Symptom Text: Information was received from a health professional concerning a 18 year old female who was vaccinated intramuscularly with a second dose of GARDASIL (lot# 1285U, batch# NH35150) into the deltoid muscle on 23-Oct-2008. On 18-Nov-2008, the patient developed a progressive increase of transaminases AST and ALT up to 1100 and high total bilirubin value. The patient was hospitalized. On 02-DEC-2008 laboratory testings revealed the following values (units and normal values not reported): Bilirubin total 17, bilirubin direct/indirect 10, LDH normal, AST and ALT decreasing. Serological infectiological examination was without any pathological findings. There was no history of alcohol or drug abuse. On 28-NOV-2008 the result of the liver biopsy showed a distinctive liver necrosis (toxic). The patient was treated with Legalon. At the time of reporting the patient had jaundice but was clinically in a good general condition. The first dose of GARDASIL was given on unknown date, toleration not reported. Other business partner numbers included: E2008-11225. No further information is available.

Other Meds: Unknown

Lab Data: total serum bilirubin, 02Dec08, 17; laboratory test, 02Dec08, bilirubin direct/indirect 10; serum LDH, normal; serum alanine aminotransferase, up to 1000; serum aspartate aminotransferase, up to 1000

MedDRA PT Chest pain, Convulsion, Dilatation atrial, Dilatation ventricular, Dyspnoea, Hypoxia, Mitral valve incompetence, Obesity, Pulmonary hypertension, Syncope, Tachycardia, Tricuspid valve incompetence

Symptom Text: Information has been received from a physician assistant concerning an 18 year old female who on 12-OCT-2007 was vaccinated with the first dose of GARDASIL, the second dose of GARDASIL on 08-FEB-2008, and the third dose of GARDASIL on 02-JUL-2008 (lot numbers and routes were not specified). Concomitant therapy included YASMIN. It was reported that on 02-JUL-2008 after the administration of her third dose the patient experienced shortness of breath and tachycardia upon exertion. The patient has experienced two seizures, the first one was two weeks ago and the second one 3 days ago. An echocardiogram performed on 26-NOV-2008 showed right dilated atrium and ventricle with mitral valve and tricuspid regurgitation. The patient's heart rate increased from 80 to 150 after a short walk in the physician's office on 05-DEC-2008. Patient was admitted into the hospital on 05-DEC-2008. Shortness of breath, tachycardia, seizures, resulted in hospitalization and were considered to be disabling and immediately life-threatening. Additional information has been requested. 12/23/08 Reviewed hospital medical records of 12/5-12/12/2008. FINAL DX: severe pulmonary hypertension, etiology unknown; seizure vs pseudoseizure secondary to hypoxia & tachycardia; mild obesity. Records reveal patient experienced SOB, chest pain x approx 6 wks, syncope & seizures x 2. Cardiac consult done.Tx w/meds & improved.

Other Meds: YASMIN

MedDRA PT Asthenia, Hypertension, Hypertrophic cardiomyopathy, Intensive care, Loss of consciousness, Pulmonary embolism, Tachycardia, Thrombosis

Symptom Text: Case initially received on 04-DEC-2008. Information has been received from a patient's grandmother concerning her 17 year old granddaughter with no pertinent medical history, who was vaccinated with a first dose of GARDASIL (Lot #, route, injection site not reported) in the end of Sep-2008. 14 days post vaccination, the patient developed adynamia ("could not climb any stairs") and experienced loss of consciousness twice. She presented to a physician, but examination revealed no findings. Then the patient developed thacycardia (pulse rate 160) and hypertension of 150/100. On 29-OCT-2008, the patient lost consciousness again and was admitted to hospital. Due to suspected myocarditis or pulmonary embolism and the life-threatening condition the patient was transferred to a university hospital for further examination. The patient was diagnosed with bilateral pulmonary embolism, thrombosis of right leg and hypertrophic cardiomyopathy ("triplication of myocardium"). The patient was in the intensive care unit for a long time (no further specified). Duration and outcome were not reported. Other business partner numbers include E2008-11327. No further information is available.

MedDRA PT Biopsy lymph gland, Chemotherapy, Lymphadenopathy, Non-Hodgkins lymphoma, Primary mediastinal large B-cell lymphoma

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. A 23 year old female patient was vaccinated with the second dose of GARDASIL (Lot # 0947X), intramuscularly in the left arm on 15-JUL-2008. On 15-SEP-2008, the patient was vaccinated with the third dose of GARDASIL. There was no concomitant therapy. The patient was diagnosed with Non-Hodgkins on 20-NOV-2008. She had lymphadenopathy in the neck and anterior mediastinum. She is currently undergoing chemotherapy. A lymph node biopsy was performed with primary mediastinal large b-cell lymphoma. A Pet scan, and Ct scans also done localizing the disease to neck and chest. Chemotherapy, lymphadenopathy and Non-Hodgkins lymphoma were considered to be life-threatening by the reporter. The original reporting source was not provided. The vaers ID# is: 335340. A standard lot check investigation was performed. All in-process quality checks for the lot number in question were satisfactory. In addition, an expanded lot check investigation was performed. The testing performed on the batch prior to release met all release specifications. The lot met the requirements of the Center and was released. No further information is available.

Other Meds:

Lab Data: lymphatic structure, primary mediastinal large b-cell lymphoma; positron emission, localising the disease to neck and chest; computed axial, localising the disease to neck and chest

MedDRA PT Convulsion

Symptom Text: Information was obtained on request by the Company from the agency via a Case Line Listing concerning a 13 year old female who was vaccinated with GARDASIL. Subsequently after vaccination, the patient experienced convulsion. At the time of reporting to the agency on 30-SEP-2008, the outcome of convulsion was unknown. The agency considered that convulsion was related to therapy with GARDASIL. The original reporting source was not provided. Upon internal medical review convulsion was considered an other important medical event. Additional information is not expected.

MedDRA PT Abscess drainage, Injection site abscess, Injection site pain, Injection site swelling, No reaction on previous exposure to drug, Scar

Symptom Text: Information was obtained on request by the Company from the agency, via a case Line Listing and Public Case Details form, concerning a 22 year old female who in July 2008 was vaccinated with her second dose of GARDASIL as prophylactic vaccination. The patient had nil adverse events with her first injection of GARDASIL. On 20-JUL-2008, following vaccination with her second dose of GARDASIL, the patient experienced swelling and pain and was hospitalised. It was described that the patient "developed pain and swelling at injection site. She was in hospital for six days. 90 mls of pus was drained, and the patient now has an unsightly scar". Subsequently, on 08-AUG-2008 the patient recovered from swelling and pain. The agency considered that swelling and pain were probably related to therapy with GARDASIL. The original reporting source was not provided. Additional information is not expected.

MedDRA PT Drug exposure during pregnancy, Foetal disorder

Symptom Text: Initial and follow-up information has been received for the pregnancy registry for GARDASIL from a nurse, a physician and a 29 year old female with a history of anemia, asthma and seasonal allergies, who on 10-SEP-2008 was vaccinated with the first dose of GARDASIL (lot # 0573X) 0.5 mL, IM into her deltoid, when she was six and a half months pregnant. Concomitant medication included REPLIVA and FLONASE. The nurse and the physician reported that the patient has an estimated delivery date of 01-DEC-2008. The patient's condition was not determined to be life threatening, or resulting in significant disability/incapacity, not related to a congenital anomaly, not related to an overdose, not related to cancer, and there was no need for intervention to prevent serious criteria. The patient sought unspecified medical attention. On an unspecified date, there was a pregnancy test performed resulting positive. On 14-JUL-2008, a routine ultrasound test was performed resulting in a normal survey. Follow-up information was received from a physician who reported that the patient delivered a normal baby on 26-NOV-2008. The baby was male and weighed 9 pounds 5.9 ounces, and the APGAR score was 9/9. The infant was born with a congenital small ear tag in his left ear. There were no other complications or abnormalities. The physician reported that during the pregnancy the patient had a normal level II ultrasound/fetal survey at 20 weeks. The patient had no complications during the pregnancy and labor/delivery. There were no infections or illnesses during pregnancy. The patient's medications used during this pregnancy included REPLIVA 1 tablet daily since 11-SEP-2008 for anaemia, and FLONASE daily since preconception. Additional information has been requested.

Other Meds: REPLIVA 21/7, tab; FLONASE

Lab Data: Ultrasound, 07/14/08, normal survey; Beta-human chorionic, positive; Apgar score, 9/9

MedDRA PT Arthralgia, Chills, Feeling hot, Pain, Rash, Rash generalised, Serum sickness

Symptom Text: Information has been received from a physician as part of a business agreement (manufacturer control # GARD 2008 12 12 001) concerning a 25 year old female who on 12-NOV-2008 was vaccinated with GARDASIL. Concomitant therapy included MICROGYNON. On 16-NOV-2008, 84 hours after vaccination with GARDASIL, the patient developed serum sickness. It was described that the patient developed a rash on the lower trunk which spread over several hours. The patient the developed chills and felt worse when she was hot. Two days later, on approximately 18-NOV-2008 the rash became generalised and the patient was admitted to the hospital with a possible diagnosis of scarlet fever. The patient was aching all over and her temperature was 38-39 degree C. A biopsy was done which revealed serum sickness. Subsequently, the patient recovered from the serum sickness. Additional information is not expected.

MedDRA PT Drug exposure during pregnancy, Endometriosis, Foetal disorder, Ovarian cyst, Surgery

Symptom Text: Information has been received from a 25 year old female patient with polytrim eye drops allergy and a history of a tumor taken out of her chest and blood transfusion at age 4, and nose surgery because of a sinus problem in 2005, who received all 3 doses of GARDASIL. In 2007 (last year) was vaccinated with the first dose of GARDASIL (Lot # not reported). On approximately 15-MAY-2008 (mid May 2008), was vaccinated with the third dose of GARDASIL (Lot # not reported). Concomitant therapy included ADVAIR and "birth control". Around July 2008, the patient got pregnant. The patient is feeling fine, however the ultrasound discovered that the baby has a club foot. The patient also mentioned that before receiving the third dose she had a surgery because endometriosis, and had an ovarian cyst drained. The patient sought unspecified medical attention. Normal laboratory tests and first trimester screen were performed (results not provided). Last menstrual period was approximately on 25-JUL-2008 and estimated delivery date is on 01-May-2009. Upon internal review club foot was determined to a congenital anomaly. Additional information has been requested.

Other Meds: ADVAIR; hormonal contraceptives

MedDRA PT Pancreatitis, Parenteral nutrition, Pelvic pain

Symptom Text: Information has been received from a physician concerning a 15 year old female patient who on 15-DEC-2007 was vaccinated with the first dose of GARDASIL (lot# 655503/0012U). On 21-MAR-2008 she received her second dose of GARDASIL (lot# xxxxx) and on 09-JUN-2008 she received her third dose of GARDASIL (lot# 659962/1740U). On September 2008 the patient started to develop pelvic pain and was diagnosed of pancreatitis. Patient was hospitalized and received total parenteral nutrition and lipids and had an IV port. Pancreatitis was considered to be an other important medical event by the physician. Pancreatitis was considered to be disabling. At the time of this report the patient had not yet recovered. No further information is available.

MedDRA PT Cellulitis, Chills, Fatigue, Hypophagia, Injected limb mobility decreased, Injection site erythema, Injection site pain, Injection site warmth, Lethargy, Pyrexia

Symptom Text: Patient received vaccine and initially had soreness at the injection site for about 2 weeks. On 11/29 she noticed redness and warmth in addition to pain in the area. This initally improved without any treatment. Symptoms began to worsen again (redness, pain, warmth in the deltoid area of the arm) and she was seen at an urgent care facility on 12/9 and was given Keflex 250mg TID. Symptoms continued to worsen. She presented to the Emergency Department on 12/13/08 and was given a 1 gram dose of Vancomycin IV and was ultimately discharged home on Keflex 500mg QID and Bactrim DS - 1 tab BID. Patient reports initial improvement after the antibiotic change but then symptoms again worsened and she returned to the ED on 12/16/08 and was admitted to the hospital for IV antibiotics with worsening erythema and pain. She is currently on vancomycin IV and Clindamycin IV was added today because symptoms are not significantly improving. There is no abcess associated with the cellululitis. Patient is still in the hospital- anticipated discharge date unknown. 2/2/09-records received for DOS 12/16-12/19/08 DC DX:Myositis/fascitis.Presented to ER with 6 week history of LUE cellulitis at which time received 3rd gardasil injection in left arm. After injection noticed army sore 1 week later with red ring around injeciton site and treated with oral antibiotics. LUE pain worsing and redness spreading, decreased ROM, fever feeeling lethergic/fatigued. Presented with chills decreased oral intake.

Other Meds: Sprintec

Lab Data: WBC on 12/13 was 12.5 but on 12/16 (day of admission) was 7.0. All other labs are within normal limits. CT of arm on 12/13 was within normal limits but MRI with and without contrast of arm on 12/16 indicated: 1. EVIDENCE OF A FAIRLY DIFFUS

History: Codeine- reaction is rash

Seriousness: ER VISIT, HOSPITALIZED, SERIOUS

MedDRA PT Cellulitis, Hypokinesia, Injection site inflammation

Symptom Text: Information has been received from a registered nurse, an office manager and a medical assistant, concerning a 23 year old female with no known drug reaction/allergies and a history of a staphylococcal skin infection in abdomen (3 years ago), who on 13-NOV-2008 was vaccinated with the third dose of GARDASIL in the left arm. Subsequently, the patient experienced cellulitis in her arm. The office manager (based on patient's account and medical records) reported that the patient's first visit to ER was on 13-NOV-2008. The patient was admitted to the hospital from 16 to 19-DEC-2008. As inpatient, she received treatment with VANCOMYCIN IV and Clindamycin. The patient had a CT scan of the upper left extremity in December 2008, followed by MRIs of the left upper arm on 16-DEC-2008 (abnormal with increased inflammation), February 2009 (showed improvement) and 17-APR-2009 (increased inflammation). There was no additional information in their records regarding dates, sites and lot numbers for GARDASIL doses or any concomitant vaccines. The medical assistant reported that by the moment the patient was admitted to the hospital, her movements were "very restricted". The registered nurse reported that the patient had been a dietary intern at a hospital. The patient's outcome was unknown. Additional information has been requested.

MedDRA PT Facial palsy, Hypoaesthesia oral, Migraine

Symptom Text: Information was obtained on request by the Company from the agency via a Case Line Listing concerning a 12 year old female who was vaccinated with GARDASIL. Other suspect therapy included VARIVAX (manufacturer unknown). Subsequently 1 day after vaccination with GARDASIL and VARIVAX (manufacturer unknown), the patient developed facial palsy, hypoaesthesia oral and migraine. At the time of reporting to the agency on 23-OCT-2008, the patient had recovered from the facial palsy, hypoaesthesia oral and migraine. The agency considered that facial palsy, hypoaesthesia oral and migraine were related to therapy with GARDASIL and VARIVAX (manufacturer unknown). The original reporting source was not provided. Upon internal medical review the adverse event of facial palsy was considered to be an other important medical event. Additional information is not expected.

MedDRA PT Amnesia, Back pain, Blindness unilateral, Blood test, Fall, Fatigue, Headache, Hypoaesthesia, Lumbar puncture, Mood altered, Nuclear magnetic resonance imaging, Nuclear magnetic resonance imaging brain, Optic neuritis, Paraesthesia, Urinary incontinence

Symptom Text: Information has been received from a patient's mother concerning her 17 year old daughter with penicillin allergy and a history of erythematous multiforme (about 10 years ago) who was vaccinated with the first dose of GARDASIL on 04-MAY-2007, she received the second dose of GARDASIL on 06-JUL-2007 and then received the third dose of GARDASIL on 06-NOV-2008. Vaccinations also received on 04-MAY-2007 included a first dose of Hep A (manufacturer unknown) and a second dose of Hep A (manufacturer unknown) on 06-NOV-2007. Concomitant therapy included YASMIN and vitamins (unspecified). It was reported that the patient started complaining of extreme back pain that went from the head down to the spine in May-2008 and then on 22-SEP-2008 the patient started to have vision loss in her one eye, which eye was unspecified. The patient was then admitted to the hospital on 06-OCT-2008 because of the vision problem, she could not control her bladder, very moody, tired, extreme head and back pain. At the hospital she had spinal test done. MRI of her brain and spine, and numerous blood work was done. The patient was diagnosed with optic neuritis and is totally blind in the one eye, and was then sent home from the hospital on 11-OCT-2008. It was reported that the patient still was having problems with the back pain, she also had short term memory loss, she falls a lot, and had tingling and numbing of the hands and feet. It was noted that the patient still had most of the symptoms and they were trying to rule out multiple sclerosis. The patient's mother reported that lot # that she had was 655165/1425F, but she was unsure what dose that lot # was for. At the time of the report the patient had not recovered. Additional information has been requested.

MedDRA PT Condition aggravated, Epilepsy, Grand mal convulsion, Headache, Hypothyroidism, Loss of consciousness, Migraine, Postictal state, Sinusitis, Tongue biting, Vomiting

Symptom Text: Information has been received from a registered nurse concerning a 15 year old female patient with a history of motor vehicle accident in 2003 (CT scan at that time was normal) and minor head injuries due to sports that required stitches who on 03-MAR-2008 was vaccinated with the first dose of GARDASIL (0.5 ml, intramuscularly, lot # 660387/1967U), and on 07-JUL-2008 the second dose of GARDASIL (0.5 ml, intramuscularly, lot # 660553/0070X). On 10-OCT-2008 the patient experienced a petit mal seizure and on 18-OCT-2008 had a second seizure. The nurse stated that each seizure lasted 2 to 3 minutes and it took 30 minutes post seizure for the patient to fully recover. Patient was seen in Emergency Room after the 2nd seizure because she bit her tongue which required treatment. The 3rd GARDASIL dose was delayed pending neurologist's decision. EEG showed bilateral seizure activity. Patient is now taking TOPAMAX. Upon internal review, petit mal seizure, and seizure were determined to be other important medical events. Additional information has been requested. 12/29/08 Received ER medical records for 10/11/2008. FINAL DX: new onset seizures & hypothyroidism. Records reveal patient experienced HA followed by LOC & parent witnessed generalized seizure lasting approx 2-3 min followed by postictal period of approx 15-20 min. Had 1 prior seizure on 10/10/08 & seen by PCP. Referred to neuro. No further seizure activity while in ER & d/c to home. 2/26/09 Received Neuro consut of 10/16/2008. FINAL DX: solitary seizure & migraines Records reveal patient experienced witnessed seizure activity w/tongue biting & postictal period & preceeded by emesis. Tx w/meds & referred for EEG. No further records available. 3/3/09 Received Neuro consult of 10/22/2008. FINAL DX: Epilepsy Records reveal patient had 2 generalized tonic-clonic events c/w epilepsy but unable to determine if partial onset or primary generlized. Was to continue meds & obtain copy of MRI & EEG done at outlying hospital for review. No further r

Symptom Text: Initial and follow-up information has been received from a healthcare professional via local authority (reference # RA-042-2008) concerning a 20-year-old female who on 15-JUN-2008 was vaccinated with the second dose of GARDASIL (lot number and injection site unknown) via intramuscular route. Concomitant therapy included oral contraceptive. The patient had received the first dose of GARDASIL via intramuscular route on 15-APR-2008. In August 2008 ("2 months before reporting"), the patient experienced infectious mononucleosis, fever, asthenia and deglutition disorder ("odinophagy"). Deflazacort was given the week before time of reporting to reduce symptoms without success. On 09-OCT-2008, epstein-Barr virus positive on blood smear. The patient also experienced ear pain and general malaise. She was treated with cefaclor and deflazacort. After therapy, she presented with white cell lineage alterations, namely young lymphocyte count decreased with hyper basophilic nuclei. The transaminase levels were increased. There were no palpable or echography visible adenopathies. The patient's outcome was not reported. Follow-up information received from the local authority (reference # RA-042-2008) reported that adverse events occurred on 08-OCT-2008, i.e. 3 months and a half after vaccination with the second dose and the patient had recovered on 16-OCT-2008 without any therapy. Results of lab tests performed on 08-OCT-2008 and on 14-NOV-2008 were provided: leukocytes numbers have normalized with the lymphocytosis and hyperbasophily disappearance on 14-NOV-2008. In spite of a semiological recovery the anti-EBV IgIM was above the maximum cut-off value. The physician considered the case to be serious event though she stated there was no causal relation between the symptoms and vaccination, only a temporal association. The patient will be submitted to new lab tests in March and re-challenge to vaccine in April. The adverse events were considered to be other important medical event. Other business partner numbers included: E20081012

Other Meds: hormonal contraceptives (unspecified)

Lab Data: Diagnostic laboratory test, 09Oct08, Epstein-Barr virus was positive on blood smear; Diagnostic laboratory test, Transaminase levels were increased; Diagnostic laboratory test, anti-EBV IgIM was above the maximum cut-off value; WBC count, 1

MedDRA PT Condition aggravated, Convulsion

Symptom Text: Information has been received from a physician concerning a 16 year old female patient with a history of seizure disorders who in approximately 15-NOV-2008 "about a month ago", was vaccinated with a second 0.5ml dose of GARDASIL. The physician reported that the patient experienced a seizure after receiving the vaccine. The patient sought unspecific medical attention. The patient recovered within a few minutes. Upon internal review seizure disorders were considered as an other important medical event. Additional information has been requested.

MedDRA PT Convulsion, Vasculitis cerebral

Symptom Text: Information has been received from a physician, concerning a patient who was vaccinated with GARDASIL vaccine 0.5ml, intramuscularly. The physician reported that after receiving the GARDASIL vaccine, about 2 months ago, the patient experienced cerebral vasculitis and seizures. The doctor was unsure if it was the first or second 0.5ml dose. The doctor was not sure if the patient would be seeing a specialist about this AE. The outcome is unknown. The patient sought unspecified medical attention. Upon internal review, seizures were determined to be an other important medical event. Additional information has been requested.

MedDRA PT Activities of daily living impaired, Asthenia, Chest pain, Conversion disorder, Facial paresis, Gait disturbance, Headache, Hypoaesthesia, Mood altered, Oropharyngeal pain, Pain in extremity, Pharyngitis, Viral infection, Weight decreased

Symptom Text: A serious, spontaneous report of conversion disorder reaction, facial muscles have not moved and numbness in toes and fingers was received from a consumer concerning a 12 year old female subsequent to FLUMIST. The patient has a history of psychosocial issues. The patient received GARDASIL the same day as FLUMIST. The patient received FLUMIST intranasal for Flu vaccination on 11-Nov-2008. On 11-Nov-2008 the patient was seen in the pediatricians office for chest pains and during the visit received FLUMIST and GARDASIL. Since 24 hours after administration the patients facial muscles have not moved and she has numbness in her toes and fingers. The patient subsequently was seen by a neurologist, cardiologist and the pediatrician for the events and an MRI was taken. Results are not available. The events are on going and the patient is scheduled to begin physical therapy. The responsible physician assessed the events as not related to vaccine administration and instead considered the event a conversion disorder reaction. The event is considered a serious important medical event. 1/2/09 Received PCP, ER & Neuro medical records of 11/24-12/3/08 FINAL DX: none provided; possible conversion reaction Records reveal patient experienced HA, weakness, difficulty walking, pain in all extremities x approx 3 wks. Missed several days of school. Had been seen in Urgent care 11/24 & 11/27 for sore throat, HA & body aches. W/u WNL. Dx w/viral illness & pharyngitis. Flat affect, weight loss.

Other Meds: Concomitant Drug(s) Not Reported

Lab Data: LABS: CBC, CRP, CK, CMP all WNL.

MedDRA PT Coma, Endotracheal intubation, Guillain-Barre syndrome, Hypoaesthesia, Paraesthesia

Symptom Text: Information has been received from Company representative who was told by a friend of the patient's family. The patient was a 24 year old female patient who was vaccinated in approximately November-2008 with the third dose of GARDASIL. Concomitant therapy included influenza virus vaccine (unspecified). In approximately November-2008, the patient reported tingling in her fingers and toes shortly after the vaccinations. It got worse over night and she went to the Hospital the next day. The hospital did test for persistent numbness and the patient was sent home. The patient's mother found her crawling on the floor a few days later and she was taken by ambulance to the hospital where she was admitted, intubated and in coma. The patient was diagnosed with Guillain-Barre. As of 16-DEC-2008, the patient was still in coma. Guillain-Barre syndrome and coma were considered to be immediately life-threatening and disabling and other important medical event. No further information is available.

MedDRA PT Asthenia, Cellulitis, Chills, Decreased appetite, Ear pain, Erythema multiforme, Malaise, Nausea, Otitis externa, Pseudomonas infection, Rash erythematous, Rash generalised, Rash papular, Rash pruritic, Weight decreased

Symptom Text: On 10-02-2008 the patients mother was in the health department for services and reported that patient became very ill 3 days after getting vaccine here 1/2008. She began with rash and itching on 1 leg that spread in patches all over her body. She did not have a fever. She chilled, had nausea , and was unable to eat. she had no energy. Over the course of her illness (3mo) she lost 20lbs. Shortly after onset of illness, she saw a doctor and was sent to a Dermatologist. According to the patients mother diagnosis was pseudomonas. After 3 months the patient began to have relief from symptoms and is now feeling recovered. Any treatment/ Medications is unknown to me. 12/31/08 Reviewed PCP medical records of 4/08. FINAL DX: erythema multiforme Records reveal patient experienced papular red itchy rash all over x 1 week, decreased appetite, fever & chills x 2 days. Seen in ER on 4/12 & dx w/cellulitis. Tx w/antibiotics. PCP dx w/EM & tx w/steroids. RTC 4/29 w/o improvement, now w/left ear pain & 9# wt loss. Dx w/otitis externa, treated w/ear drops & referred to Derm. No other records available.

MedDRA PT Headache, Incorrect route of drug administration, Pain in jaw

Symptom Text: Case reported by a physician (the patient's father) on 02-OCT-2008: A 16 year old female patient received the third dose of GARDASIL (batch number not reported) on 01-OCT-2008. DOLIPRANE 1 gram was given in the evening after vaccination and the patient slept well. The following day morning i.e on 02-OCT-2008 at 11.30 am, the patient experienced important headache, jaw bone pain rather at the side of injection and temperature up to 37.4 centigrade. There was no adenopathy, induration nor pain at injection site. At the time of the report, the patient had not yet recovered. To be noted that the patient had received first and second doses of GARDASIL which had been well tolerated. Follow-up information received through the pharmacovigilance form on 17-DEC-2008: Case of misuse. Case upgraded to serious due to hospitalization. The patient was born in 1992 and had medical history of colopathy. She received the vaccine via subcutaneous route instead of intramuscular route. Cephalgia of severe intensity and master pain of moderate intensity (previously reported as jaw bone pain) appeared 15 hours after vaccination (previously reported on the following day morning i.e. on 02-DEC-2008 at 11:30). The patient had recovered on the next day. Fever was no longer reported. There was hospitalization (unspecified date). Complete blood count was normal. The case was closed. Other business partner numbers included E2008-09141.

MedDRA PT Feeling of body temperature change, Flushing, Headache, Hypoaesthesia facial, Paraesthesia, Paraesthesia oral, Skin warm

Symptom Text: Initial report was received 18 September 2008 from a health care professional. A 12-year-old female patient had received a left deltoid intramuscular injection of MENACTRA, lot number U2636AA and a first dose right deltoid intramuscular injection of GARDASIL, lot number 0843X (Merck) on 11 September 2008, and on the evening of vaccination, she developed numbness in her face. By the following morning, the numbness had worsened and she complained of a prickly feeling in her cheeks and around her lips, and her face felt hot and cold. According to the mother of the patient, when the mother touched the patient's face, her hand felt cold. The patient's face also appeared pink and puffy. By the afternoon, her lips became tingly. The patient's mother called their health care provider to report the symptoms and stated the patient complained that her head was hurting (onset time and date not reported). The patient had not experienced any fever and no other symptoms occurred. The patient received corrective treatment with BENADRYL. By the following morning (date not reported), all symptoms had resolved. The patient had also received an injection of ADACEL (lot number not reported) within four weeks prior to receipt of MENACTRA and GARDASIL. No further information was provided.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Convulsion, Disorientation, Fatigue, Headache, Immediate post-injection reaction, Sensation of heaviness, Syncope

Symptom Text: Patient was given the GARDASIL shot at county health dept. She had two other shots done in her right arm, before the GARDASIL shot was given on the left side. Patient immediately fainted. When the nurse and I got her back up onto the table, she seized for about 30-60 seconds. It scared the nurse and I both. When she finally "came to" she was extremely disoriented. She said that her legs felt really "heavy" and that her head hurt. It took her about 30 minutes to be able to just stand up. She was then really tired and exhausted all day the rest of that day. This really scared both of us. She really doesn't want to take the next 2 series of the shots because she is scared to death the same thing will happen again. Frankly, so am I. Is this going to be a possibility? Or do we not take the shots now? Please let us know as we are both really concerned.

MedDRA PT Fall, Syncope

Symptom Text: Patient received an injection while in the supine position. Following 12 minutes lying down, patient sat up for about 5 minutes on the exam table. Public Health Nurses then went on to assist her to a chair and allowed her to sit for an additional 5 minutes. The patient then fainted and fell off the chair. The entire time the patient never complained of feeling faint, she had little warning it was going to happen. After the patient fainted, nurses assisted her to a supine position and kept her that way for about a half hour when she felt much better. Patient was only out for about 30 seconds. She came back to and an ice pack was placed behind the patients neck. She was pale throughout the course until she started felling better at which time she began to get her pink color back. She was assisted to the car by wheelchair and transported home per parent.

MedDRA PT Cervical incompetence, Cervix cerclage procedure, Drug exposure during pregnancy

Symptom Text: Information has been received from a gynaecologist concerning a 17 year old female patient with no medical history reported, who on 08-JAN-2008 was vaccinated intramuscularly in the left deltoid with the first dose of GARDASIL (Batch # reported as "NG30020"). It was reported that the patient's last menstrual period was on 02-FEB-2008. Subsequently the patient became pregnant. Her estimated due date is 08-NOV-2008. At the time of reporting the patient was 4+2 gestation week. Upon receipt of new information on 18-DEC-2008, this case was upgraded because of hospitalization. The patient experienced cervical incompetence in 25th week of gestation. She was hospitalized from 10-JUL-2008 to 21-JUL-2008 and a cerclage was performed. Spontaneous birth of a healthy girl (height = 50cm; weight = 2.960 kg) was on 29-OCT-2008. The postnatal examination of mother and child showed no pathologies. Apgar score was 07-09-10. Other business partners numbers: E-2008-01938. No further information is available.

MedDRA PT Breast cancer, Chemotherapy, Lymphadenectomy, Mastectomy, Radiotherapy

Symptom Text: Information has been received from a Nurse practitioner concerning a 25 year old female patient who on 18-APR-2008 was vaccinated with the first dose of GARDASIL. After receiving the first dose of GARDASIL the patient was diagnosed with right breast cancer (2008). In November 2008, the patient had a right segmental mastectomy and lymph node dissection. As per the oncologist the breast cancer is not related to the GARDASIL. The patient was continuing on HERCEPTIN chemotherapy treatments until May 2009. She was also currently receiving radiation therapy. Upon internal review, breast cancer was considered to be an Other Important Medical Event. Additional information has been requested. 1/19/09 Reviewed PCP medical records of 11/14/2008. FINAL DX: right breast cancer, clinical stage T1C N0 M0; ER-positive, HER-2-positive; neoadjuvant chemotherapy; BRCA1 & 2 gene negative; right segmental mastectomy & sentinel lymph node biopsy 11/5/08.

MedDRA PT Adenoidal disorder, Convulsion, Gaze palsy, Hypertonia, Muscle rigidity, Nuchal rigidity, Postictal state, Thinking abnormal, Trismus

Symptom Text: Initial information received on 18-DEC-2008 through the patient's mother regarding an 11 year old female who was administered on DEC-2008 the first dose of GARDASIL (batch number not reported), site and route not reported. Exact date of vaccination has not been reported. According to the hospital discharge report dated 06-DEC-2008, the patient was brought to the emergency room after having an afebrile convulsion during 10 minutes. The patient presented with rigidity in neck and limbs, jaw spasm, eyes rolling into the head, loss of reality and relaxation of sphincters. The patient had a 10 minute postcritical period and afterwards recovered. Patient referred no toxic ingestion, fever, symptoms of infectious disease or any other symptoms. According to the medical history included in the hospital report, the patient had obstetrical brachial palsy. No known drug allerigies. The patient had a family history of pulmonary hypertension, and she's examined in the hospital once a year in the pediatric cardiac ward. Patient's mother had medical history of migraine. A patient's cousin was hospital admitted due to a only one tonic-clonic crisis. Patient's mother's aunt had pulmonary hypertension. Physical exploration: Weight: 52.6 Kg, temperature: 36.5 degrees C, blood pressure: 128/85, cardiac frequency: 91 per minute. Respiratory frequency: 22 rpm. Oxygen saturation: 100%. Upon examination the patient was conscious and oriented, with good general appearance, well nourished and hydrated. The patient presented a mild asymmetry of upper limbs. Right arm hypotrophy. Neurology: PEARL (pupils equal and reacting to light); conserved and symmetric cerebellar penducles. No nystagmus or dysmetria. No meningeal signs. Labial herpes. No petechiae or exanthemas. Abdomen was soft and depressible, no painful upon palpation. No masses or megalies. Normal persitaltism. Heart auscultation presenting clear sounds and rhythm. No cardiac murmurs. Respiratory auscultation: normal vascular murmur. Nasal voice. Pharynx: normal. No lesions in the t

MedDRA PT Blepharitis, Dry eye, Eyelid oedema, Eyelids pruritus, Facial palsy, Hypersensitivity, Inappropriate schedule of drug administration, No reaction on previous exposure to drug, Ophthalmological examination abnormal

Symptom Text: Information has been received from a health authority. This is a case of misuse as the patient was treated outside the terms of the product license as she was 41 years old. This case was initially reported by a health care professional and by the agency on 18-DEC-2008 (IMB 041253). This case concerns a 41 year old female patient. The patient received the first two doses of GARDASIL on 01-APR-2008 and 30-APR-2008 with no adverse effect. The patient was taking concomitant therapy ZYPREXA and PROTHIADEN for unknown indications. The patient received the third dose of GARDASIL (batch# NE 24240, lot # 654884/0902F) on 28-NOV-2008. On 28-NOV-2008, half an hour post vaccination, the patient rang the clinic to say there was a lump on her left eyelid and she was worried it was a wart. The patient was seen in the clinic on 15-DEC-2008 and reported that her eyelid was drooping. On examination both eyelids were inflamed and the patient was referred to an ophthalmologist who treated the patient for dermatitis of the eyelids (treatment unspecified). The health care professional stated that she considered the event to be non-serious. The agency reported that on 28-NOV-2008 the patient experienced hypersensitivity, eyelid oedema, dry eyes and pruritus of the eyelids and considered the events to be medically significant. At the time of reporting, the patient had not yet recovered from any of the events. Other business partner numbers include E200811882.

MedDRA PT Epilepsy, Loss of consciousness, Muscle spasms

Symptom Text: Information has been received from a health care professional concerning a 14 year old female who in May-2008, was vaccinated with the first dose of GARDASIL (Batch number and LOT# not reported), in JUL-2008, was vaccinated IM with the second dose of GARDASIL (Batch number and LOT# not reported). No concomitant drugs were administered. Following the second vaccination i.e in October 2008, the patient experienced clonic spasms and loss of consciousness. On an unspecified date, the patient was hospitalized. MRI scan and encephalography were performed. The finding were indicative of epilepsy. Corrective treatment with KEPPRA dose unknown, was initially given and TEGRETOL dose unknown, was currently given. At the time of the report, the outcome was not reported. According to the reporting physician, events were not related to GARDASIL. To be noted that the patient had no individual or family history of seizure or epilepsy. Additional information has been requested.

MedDRA PT Chest discomfort, Dizziness, Ocular discomfort, Shock, Urticaria

Symptom Text: Information has been received from a physician via a company representative (business partner) concerning a 22 year old female who on 13-DEC-2008 was vaccinated with GARDASIL. At that time, the patient suffered from cold (without fever). Concomitant therapy included amoxicillin/clavulanate potassium, MUCOLASE, NAXEN F and (composition unspecified) from 13-DEC-2008 to 16-DEC-2008 for the treatment of cold. On 13-DEC-2008, 2 hours after the patient was vaccinated with GARDASIL (lot number J3165), the patient experienced shock. The patient experienced blood pressure decreased, chest discomfort, urticaria, ocular congestion and dizziness (symptoms of shock). The patient's blood pressure was 70 mmHg on 13-DEC-2008. The patient was treated for shock in a local clinic (specific contents of treatment was not reported). Subsequently, the patient recovered from shock on 13-DEC-2008. The reporter felt that shock was related to therapy with GARDASIL. The reporter considered the patient's shock as an other important medical event. Additional information has been requested.

MedDRA PT Feeling hot, Hyperhidrosis, Paraesthesia

Symptom Text: Information has been received from a health professional concerning a 17 year old patient who had no relevant medical history and was not taking any concomitant medications. The patient was vaccinated with dose 1 of GARDASIL (lot #1147U, batch #NH17630) on 13-AUG-2008. One hour post vaccination the patient experienced a prickling sensation in the lower back radiating to the lower abdomen and felt hot and sweaty. The feeling then went down both the patient's legs to calf level. The patient only experienced the event on upon movement and the feeling would abate when she stood still. The patient recovered after 3 days. Follow-up information received from the Nurse Practitioner on 17-DEC-2008. The case had been upgraded from non serious to serious. This case concerns a 21 year old female patient (not 17 as previously reported). The patient received the GARDASIL intramuscularly in the arm. The patient was not to receive any further vaccination with GARDASIL. The reporter considered that the events were serious for other medically important condition and were probably related to the vaccine. Other business partner numbers include E2008-09669. No further information is available.

MedDRA PT Anaemia, Drug exposure during pregnancy, Foetal disorder, Gestational diabetes

Symptom Text: Information has been received from a licensed practical nurse (L.P.N) through the Merck pregnancy registry concerning a 22 year old female with cardiac murmur with a history of 2 pregnancies and 2 live births and a history of hypothyroidism who on 27-FEB-2008 was vaccinated with the first dose of GARDASIL (lot # 659653/1448U). Concomitant therapy included FLINTSTONES Multivitamin. The patient was pregnant. The reporter stated that the patient's last menstrual period was 16-FEB-2008. The estimated conception date was 02-MAR-2008. The patient was in for first obstetrics (OB) visit on 10-JUN-2008 and urine pregnancy test was positive and ultrasound due date was 24-NOV-2008. On 02-JUL-2008 ultrasound was performed for size and dating. The result was within normal limits (MNL) and the estimated delivery date was 23-NOV-2008. No product quality complaint was involved. Follow-up information on 19-DEC-2008 was received from a licensed practical nurse (L.P.N) concerning a 23 year old patient who was a smoker, on 27-FEB-2008 at 1535 was vaccinated intramuscularly into left deltoid with the first dose of GARDASIL (lot # 659653/1448U). Ferrous sulfate, FLINTSTONES Multivitamin and omeprazole were used during pregnancy. On 12-NOV-2008, the patient delivered a female baby with congenital anomaly weighing 3103gm (weeks from LMP: 38). Length: 20 inch. Apgar score: 8/9. The baby had a cleft palate. There were no other complications or abnormalities. The complications during pregnancy included gestational diabetes and anemia. Ferrous sulfate was taken for the treatment of anemia. At the time of reporting, the outcomes for cleft palate, gestational diabetes and anemia were unknown. Additional information has been requested.

MedDRA PT Acute disseminated encephalomyelitis, Chronic sinusitis, Disability, Dizziness, Ear pain, Febrile infection, Headache, Hypersensitivity, Hypothyroidism, Lymphadenopathy, Oropharyngeal pain, Pain, Sinusitis, Spondylolisthesis

Symptom Text: Information has been received from Health Authority on 18-NOV-08. Health authority reported that 11 year old female patient was vaccinated with a second dose of GARDASIL (Lot # 1340F and batch NF14740) IM into the left arm on 21-MAY-07. On 28-MAY-07 the patient developed a "pain syndrome" concerning head and abdomen. CT, spinal MRI , examination of the eyes and teeth and "orthopedic examinations" showed normal results. The patient was hospitalized on an unspecified date. The situation was considered to be life-threatening. The reported assumed an acute disseminated encephalomyelitis. Despite ongoing events the patient was vaccinated with third dose of GARDASIL (Lot # 1536F batch NG01520) IM into the left arm on 04-OCT-07. The patient had not recovered at the time of reporting. The first dose of GARDASIL, lot # not reported administered on 23-FEB-07 was well tolerated. Follow up information received from Health Authority on 17-DEC-2008. Case is linked with E2008-10694 (WAES 0811USA03578) (different AEs and hospitalization after first dose). The patient has a history of migraine (without aura, but with vomiting, dizziness and nausea) since she was 7 years old and cramp-like abdominal pain in the course of menstrual bleeding (menarche at the age of 10). The patient was vaccinated with a second dose of GARDASIL (Lot # 1340F and batch NF14740) IM into the left arm on 21-MAY-2007. Five days after the second dose she developed a febrile infection with earache and sore throat. She was treated with antibiotics. Despite ongoing events she was vaccinated with D3 of GARDASIL (Lot # 1536F and batch NG01520) IM into the left arm on 04-OCT-07. Approximately 3 weeks after the third dose she developed intolerable headache and attacks of dizziness which led to disability. Hospital letter (13-MAY to 15-MAY-08): Latent hypothyroid metabolism was diagnosed, but sonography showed normal results. An autoimmune thyroid disorder was ruled out. The patient was treated with thyroid hormones. Schellong test on 13-MAR-2008 and EEG on 14-MAR-

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Back pain, Dysaesthesia, Headache, Hypoaesthesia, Musculoskeletal chest pain, Pain in extremity, Paraesthesia, Post lumbar puncture syndrome, Sensory disturbance

Symptom Text: Information has been received from a gynecologist that a 15 year-old female patient was vaccinated with a third dose of GARDASIL (Lot # 1427U, Batch # NH15200) into the deltoid muscle on 25-AUG-2008. On 26-AUG-2008 the patient experienced pain in the left arm and left leg and musculoskeletal chest pain (upon pressure, left sided). An outpatient examination in a pediatric clinic was inconspicuous. On 27-AUG-2008 the patient developed headache. Outcome was not reported. The first dose of GARDASIL (Lot # 1339F, Batch # NF23310) given on 18-JUN-2007, and the second dose of GARDASIL (Lot # 654884/0902F, Batch # N24240) given on 23-AUG-2007, were well tolerated. Follow-up information was reported by a health authority (reference no. PEI2008016336) with reported that the patient has a history of asthma bronchial, house dust mite allergy and birch pollen allergy. Concomitant medication included SULTANOL and a combination of AARANE. The patient was vaccinated into the left deltoid. Pain started 30 minutes post-vaccination. Additionally, she developed approximately 30 minutes post-vaccination progressive sensory disturbance first of the vaccinated arm, the of the left leg, left half of the face and finally of the left half to the body. At the time of the reporting to HA , the patient was recovering from sensory disturbance. MRI of cervical spine and CSF date showed normal results. Final outcome was reported as not recovered. File is closed. Upon receipt of new information on 18-DEC-2008 this case was upgraded because of hospitalization. The patient was hospitalized due to persisting symptoms from 27-AUG-2008 until 29-AUG-2008. Hemihypaesthesia and dysaesthesia of the left body half and a marked post puncture syndrome was diagnosed. Neurological finding on admission showed sensory disturbance of the left half of the body. On 29-AUG-2008 CSF culture was sterile, virological investigations were not performed. On 28-AUG-2008, CSF oligoclonal bands were not detectable. On 28-AUG-2008, cranial MRI and holospinal MRI showed norma

Other Meds: AARANE; SULTANOL

Lab Data: Magnetic resonance imaging, 28Aug08, cranial MRI and holospinal MRI showed normal results; Magnetic resonance imaging, Cervical spine normal; CSF oligoclonal band profile, 28Aug08, not dectable; Cerebrospinal fluid culture, 29-Aug08, steril

MedDRA PT Anxiety disorder, Ataxia, Cluster headache, Dizziness, Muscular weakness, Neurosis, Oscillopsia, Paraesthesia, Psychosomatic disease, Somatisation disorder

Symptom Text: Information has been received from an internist concerning a 23 year old female who on 07-FEB-2008 was vaccinated IM with her second dose of GARDASIL (lot number 0352U, batch number NG00320, site not reported). The first dose of GARDASIL (lot number 0251U, batch number NF56480) was administered on 04-DEC-2007 and was well tolerated. There was no concomitant medication. In April 2008, the patient developed oscillopsia, weakness in the legs and paraesthesia. In June 2008, the patient additionally experienced ataxia and dizziness. At the time of reporting the symptoms improved significantly but the patient had not completely recovered. Follow-up information was reported by a internist on 18-DEC-2008. This case was upgraded because of hospitalization. The patient was hospitalized from 14-JUN-2008 until 23-JUN-2008. On an unspecified date, the psychosomatic disease with anxiety-neurotic development and vasomotoric headache were diagnosed. The neurological examination on 23-JUN-2008 showed no indication for an early demyelinating disease. Examination by an ENT physician on 16-JUN-2008 showed no otogenous-related dizziness. No organic finding. Somatisation disorder was suspected. The electroencephalography (EEG) showed normal results. Laboratory findings: CSF showed normal results. No oligoclonal bands detectable. No indication to infection of measles virus, rubella virus, varicella-zoster virus, cytomegaly virus and borrelia. The diagnostic results showed no pathologies so that the diagnosis of somatization disorder was established. The final outcome was not reported. No medication was needed. Other business partner control numbers included: E2008-09971. No further information is available. The case was closed.

Other Meds: None

Lab Data: magnetic resonance imaging, 19Jun08, normal result; neurological examination, 23Jun08, no indication for an early demyelinating disease; electroencephalography, normal; cerebrospinal fluid analysis, normal

History: The first dose of GARDASIL (lot number 0251U, batch number NF56480) was administered on 04-DEC-2007 and was well tolerated.

MedDRA PT Caesarean section, Drug exposure during pregnancy, Failed trial of labour, Pre-eclampsia, Threatened labour

Symptom Text: Information has been received from a certified medical assistant (C.M.A.), for the Pregnancy Registry for GARDASIL, concerning a 14 year old female with Ascus positive HR HPV, late care who on 14-AUG-2007 was vaccinated intramuscularly with the first 0.5 ml dose of GARDASIL (Lot #657617/0384U), on 15-OCT-2007 was vaccinated intramuscularly with the second 0.5 ml dose of GARDASIL (Lot #657617/0384U) and on 13-MAR-2008 was vaccinated intramuscularly with the third 0.5 ml dose of GARDASIL (Lot #758222/0927U). Concomitant therapy included prenatal vitamins (PVN). There was no concomitant medication. The patient was pregnant, and her last menstrual period was 18-FEB-2008 and the estimated delivery date will be on 17-NOV-2008 (previously reported as 24-NOV-2008). No adverse event was reported. Medical attention was sought via office visit. Follow up information was received which reported that on 02-NOV-2008, the patient delivered a normal and healthy male baby. The patient had complications, she had mild preclampsia and she was scheduled for induction on 31-OCT-2008. The patient underwent CERVIDIL and PITOCIN, the patient failed to dilate past 4 cm. The patient and partner elected for C/section. There was no infections or illness during pregnancy reported. During the pregnancy was used PROCARDIA, 10 mg, every four hours for threatened pre term labor. Upon internal review failed to dilate was considered an other important medical event because the patient required a C-section. Additional information has been requested.

MedDRA PT Asthenia, Discomfort, Hypersensitivity, Injected limb mobility decreased, Injection site oedema, Pain, Vaccine positive rechallenge

Symptom Text: Information has been received from a pharmacist on 12-DEC-2008 concerning a 26 year old female patient with a history of injection site oedema who was vaccinated with the third dose of GARDASIL (batch # not reported) in her arm on an unspecified date. One to two days later she developed an arm oedema of severe intensity with arm movements constraint. She had recovered in two to three days with PARACETAMOL. The patient had no adverse effect after the first dose of GARDASIL (unspecified date) and she had a slight injection site oedema after the second dose of GARDASIL (unspecified date). The case was closed. Follow up information received on 24-DEC-2008: The case was upgraded to serious due to another seriousness criterion, movement discomfort. It was reported that the patient was 25 years at the time of adverse reactions. The GARDASIL (Batch # NJ02780) was administered in November 2008 via the intramuscular route in the right arm. One or two days post-vaccination the patient experienced oedema, discomfort when moving and local pain during 3 or 4 days, and asthenia during a few days. The reactions were considered as moderate and non serious except for movement discomfort which was moderate and serious. The patient was prescribed corrective treatment for pain with PARACETAMOL 1g three times per day and local disinfection. The patient was diagnosed with allergic reaction to vaccination. The patient recovered. The reporter considered the case as non serious but discomfort was highlighted. The case was closed. The reporter considered injection site movement impairment to be an other important medical event. Other business partner numbers include E2008-11702. No further information is available.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Anxiety, Asthenia, Central nervous system lesion, Coordination abnormal

Symptom Text: Information has been received from Health Authority concerning a 21 year old female patient who was vaccinated with a dose of GARDASIL (lot# not reported) in the beginning of September 2008. Approximately mid of October 2008, the patient developed "subjective weakness" and coordination disorder of the left leg (the leg "stuck" while getting up from the sofa). She presented at the family physician who referred her to an orthopedist, who carried out chiropractic measures at the spine. Symptoms improved but reoccurred 2 days later. The patient was referred to a neurologist. Electrophysiologic examinations showed normal results. Cranial MRI on 13-NOV-2008 showed a 1 cm-sized lesion at the left cerebellar branch. The patient was hospitalized from 17-NOV-2008 until 19-NOV-2008. Laboratory finding see lab comments. CSF on 18-NOV-2008 showed only slight positive oligoclonal bands. C-reactive protein and leukocytes were increased 1.8 mg/l (normal range: 0.1-5.0), 12.96/nl (normal range: 4.00 - 9.40) respectively. Motor-evoked potentials, medianus SEP (two channels), tibial SEP, acustic evoked potentials and visual evoked potentials on 17-NOV-2008 showed normal results. Chest x-ray and EEG on 18-NOV-2008 normal. According to the findings a Multiple Sclerosis was considered to be unlikely by the hospital physicians, however the cause for the single cerebral focus was unclear at the time of reporting. It was pointed out that the symptoms were possibly overlayed by the patient's considerable anxiety. Follow up examinations including MRI and CSF were recommended in case of ongoing of symptoms. Other business partner numbers include: E2008-11900. No further information is available. File closed.

Other Meds: Unknown

Seriousness: ER VISIT, EXTENDED HOSPITAL STAY, HOSPITALIZED, SERIOUS

MedDRA PT Abasia, Amenorrhoea, Back pain, Chills, Dizziness, Ear pain, Headache, Immobile, Loss of consciousness, Malaise, Menstruation irregular, Migraine, Nausea, Pain in extremity, Paraesthesia, Photophobia, Presyncope, Syncope, Tremor

Symptom Text: syncope or seizure still being determined,events started in june of 08, she has experienced over 100 syncope episodes since that time, a month or so after inoculation, co administered with Hep A, episodes began in june, again in august, september, weekly in november, december, has experienced immobility, nausea, irregular and missed periods, migraine like headaches, left ear pain, leg pain and tingling in hands and feet, lower back pain, to date she has been to the ER 7 times and had two hospital stays for issues of passing out from 3 minutes to over 30 minutes as she passes out repeatedly, no medical treatment other than rest up until this point, she is being admitted for further neurological understanding and a three day hospital evaluation. 2/4/09 Neurology consult received dated 12/22/08 for eval of episodic LOC. Pt initially began having lapses of consciousness in 6/2008 on vacation. Seen in ER and found to be dehydrated, possibly r/t alcohol consumption. Repeat attacks however were with good hydration status. 1 week after 1st episode pt was feeling ill and unable to walk/stand w/o having an episode. W/U (-). Pt may have weeks w/o episodes, but then begin with teeth chattering, then a "head rush", dizziness and the feeling of going to pass out. Holter monitor did not register any abnormalities during episodes. Episode in 8/2008, pt was unable to roused x 30 minutes. W/U (-). In 12/08 episode did not involve complete LOC but had bifrontal H/A with photophobia after. Some events involve hand shaking or whole body shaking. Pt to be admitted for further eval.D/C Summary received for DOS 1/5-8/2009 with D/C DX: Unexplained LOC. PE WNL. One mild event noted during admission with teeth chattering and tremulous movements of the upper extremities, L>R. No LOC. No further events during admission.

Seriousness: PERMANENT DISABILITY, SERIOUS

MedDRA PT Anorexia, Arthralgia, Depression, Dizziness, Dry skin, Fatigue, Headache, Irritability, Menstrual disorder, Muscle spasms, Rash, Syncope, Vision blurred, Vomiting

Symptom Text: After my daughter received her 1st shot of 3 (to complete full dose) she started having problems soon after.- light headed, dizziness, fainting, fatigue, loss of appetite, change in menstrual cycle, blurred vision, headaches, joint hip pain, irritability, depression, throwing up and bad cramps. FYI- we opted out of the last two shots. Took patient to regular Dr. appt. We were than told that she should get the HPV shot I was reluctant because I don't have or never had cervical cancer and neither had my mother. They said she would need 3 series of shots all together. After the 1st shot (3/12/08) we started to notice all the symptoms that are describe on page 1. She was a tract runner for her school and very good at that. But after the shot anytime she would run she would throw up and cramp right after. Once she was able to make it half way when she was running 100 yard dash. 1/22/09 Received PCP clinic medical records of 3/12/08 FINAL DX: none provided Records reveal patient experienced rash on abdomen waxing & waning since 12/07. Only dry skin found on exam & tx w/lotion. No other records available.

Symptom Text: Information has been received from a female concerning herself, with no medical history of allergies, who on 15-OCT-2008 was vaccinated with GARDASIL, 0.5ml, intramuscularly. There was no concomitant medication. Caller stated that she was pregnant at the time she received the vaccine. The last menstrual period was approximately on 01-AUG-2008 and the estimated delivery date is 08-MAY-2008. No AE related to the pregnancy reported. Caller stated that she experienced "severe pain" in her abdominal muscle and she no longer had that pain. Caller also stated that she developed a cyst on her right ovary after she got the vaccine. The patient did not indicated if the cyst has improved. The patient sought unspecified medical attention. Additional information has been requested.

Symptom Text: Information has been received from a consumer concerning her 11 year old daughter who on 16-OCT-2008 was vaccinated with her first dose of GARDASIL (route and site not reported). Concomitant therapy included flu vaccine in the same day. On 16-OCT-2008, later that evening the patient experienced vomiting and nausea and was hospitalized for at least 4 days. Patient was vomiting almost every half an hour for those days. When the patient was brought home, she started vomiting again and was hospitalized the second time for 2 days. The patient was recovering. The patient was tested for computed axial tomography (cat scan), magnetic resonance imaging (MRI) and blood test with no result. Follow-up information was received from a registered nurse. The nurse stated that the patient received dose 1 of GARDASIL 0.5 ml IM on 16-OCT-2008. The patient was treated with Phenergan and her symptoms were almost completely resolved. Additional information has been requested. 1/22/09 Received PCP medical records of 10/16-10/25/2008. Records reveal pt in state of usual health on day of vaccination. Later same day, parent had to pick up from school due to SOB, weakness & dizziness. Seen same day by PCP & dx w/allergic rhinitis. Tx w/antihistamines. Developed vomiting. RTC 10/20 for same & sent to hospital. RTC 10/24 s/p hospitalzation. Concerns for PVCs noted in hospital & continued lightheadedness, otherwise feels well. Referred for Holter monitor. Recurrent vomiting 10/25 & was readmitted to hospital. 1/22/09 PCP records included hospital medical records of 10/20-10/23/2008. FINAL DX: vomiting w/dehydration & viral exanthem Records reveal patient experienced bilious vomiting x 5 days, poor appetite, lack of sleep, fatigue. Had been seen in PCP office previous week for viral infection w/SOB & dizziness. In hospital had nausea & diarrhea. On 3rd day in hospital developed facial flushing & rash. 1/30/09 Received additional hospital medical records of 10/25-10/26/2008. FINAL DX: dehydration, bilious vomiting & sin

MedDRA PT Hypoaesthesia, Pain in extremity

Symptom Text: Information has been received from a registered nurse concerning a 13 year old patient with allergies who on 28-AUG-2008 was vaccinated with a first dose of GARDASIL vaccine into her left arm, in the afternoon approximately at 3:00 pm. Concomitant medication included ZYRTEC, vitamins (unspecified), ZANTAC and NASONEX. The only that she had been taking every evening was apparently mometasone furoate. The patient complained of numbness and pain in the arm that the dose was given the whole night. There was no swelling or redness in the area of injection. It was also reported a little redness. Pain eased up somewhat next day (not a persistent), numbness lasted approximately three days. No medical interventions or treatment for the adverse events. No other signs and symptoms reported besides the above mentioned which lasted approximately three days after injection. The patient came for the second dose of GARDASIL vaccine on 30-OCT-2008 but she did not receive it. Additional information has been requested.

Other Meds: ZYRTEC NASONEX ZANTAC vitamins (unspecified)

MedDRA PT Immediate post-injection reaction, Loss of consciousness, Syncope

Symptom Text: Information has been received from a certified nurse midwife concerning a female patient who was vaccinated with the first dose of GARDASIL. The nurse practitioner mentioned that the patient fainted after receiving the vaccine. The patient received her first dose of GARDASIL and waited 15 minutes and was fine. Then when she got up to leave, her knees buckled and she passed out. The practitioner nurse reported that the patient had not eaten that day and was anxious about the shot. The patient recovered without incidence. The patient sought unspecified medical attention. Additional information has been requested.

MedDRA PT Drug exposure during pregnancy, Injection site erythema, Injection site induration, Injection site irritation, Injection site pain, Injection site swelling

Symptom Text: Information has been received from a 20 year old female with anatryptaline allergy and a history of eating disorder, acid reflux and pelvic inflammation (physician found " low recessive cells for cervical"; after treatment and another PAP test the physician suggested getting HVP vaccine) who on 03-SEP-2008 was vaccinated in the upper arm with the first dose of GARDASIL. On 13-SEP-2008 she found out she was pregnant. On an unknown date she received a flue shot and prenatal vitamins. On the day of vaccination the patient experienced "burning pain at the time the shot was given, and after the injection she had a little red dot for a couple of days that eventually turned into a swelled up knot that was very painful to the touch". The consumer recovered "2 and a half weeks after getting the vaccine". The consumer sought unspecified medical attention.

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a Certified Medical Assistant for the Pregnancy Registry for GARDASIL concerning a 19 year old female with penicillin allergy who on 30-JUN-2008 was vaccinated with a 0.5 ml first dose of GARDASIL (LOT # 0250X) and on 29-AUG-2008 received a second dose of GARDASIL (LOT # 0573X). The reporter stated that the patient who had received the GARDASIL vaccine "is pregnant". Her LMP was 19-SEP-2008. Expected date of delivery is 26-JUN-2009. There was no concomitant medication. No adverse effect was reported. The patient was seen in the office for medical attention. Follow up information was received on 30-DEC-2008 from a certified medical assistant who stated that there was a elective termination of the pregnancy. It was unknown if the products of conception were examined or if the fetus was normal. Upon internal review, elective termination was considered to be an other important medical event. Additional information has been requested.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Information has been received from a consumer, for the Pregnancy Registry for GARDASIL vaccine, concerning his 25 year old wife general anesthesia allergy who was vaccinated 3 doses of GARDASIL vaccine (Lot # not reported) prior to becoming pregnant. Concomitant therapy included heart medication. Consumer's wife is the patient in this case. Consumer reported that his wife had completed the GARDASIL vaccine series approximately six months to becoming pregnant with their first child. Consumer reported that they learned at 17 weeks gestation that his wife had lost their baby around 12 weeks of gestation. Laboratory test was performed previous to pregnancy and during pregnancy. Consumer reported that his wife will call back with more specific dates and information. Upon internal review, abortion spontaneous was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Hyperaesthesia, Paraesthesia

Symptom Text: Information has been received from a physician concerning an 18 year old female who was vaccinated with GARDASIL (route and site not reported). On 20-FEB-2008, 22-APR-2008 and 21-OCT-2008, the patient was given the first, second and third dose of GARDASIL separately. There were no adverse effects after the first 2 doses. About 2 days after her last dose of GARDASIL, the patient experienced intermittent episodes of "tingling" in her toes, fingers, and face that last between 30 minutes and 1 hour then resolved. Complete blood panel- complete blood cell count, comprehensive metabolic panel, Sedimentation rate, thyroid stimulating hormone, and Rapid Plasma Reagin done with all results normal. The doctor had characterized this as "a skin disturbance". The patient's tingling in her toes, fingers and face persisted. Follow-up information was received from the physician. She stated that this 18 year old female received her 3rd dose of GARDASIL on 21-OCT-2008 and 2 days later experienced tingling intermittently of fingertips and toes. She stated that the episode last for about 30 minutes and were still occurring intermittently. The patient reported one episode tingling of the face and also reported that the soles of her feet were more sensitive to touch when the tingling was not present and described the sensation as "ticklish". The patient was not reporting any associated pain and did not experience these symptoms following dose 1 or 2. She was concomitantly taking birth control pills since June and was recently treated for Chlamydia. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Disorientation, Dizziness, Inappropriate schedule of drug administration, Migraine, Paraesthesia, Vomiting

Symptom Text: Information has been received from a physician concerning an 18 year old female with PENICILLIN, BACTRIM and DUAC gel allergy and a history of reactive airways who on 03-JAN-2008, 03-APR-2008, 07-AUG-2008, 17-SEP-2008, was vaccinated with the first, second, third and fourth dose of GARDASIL 0.5ml IM separately. On 17-OCT-2008 the patient experienced the sudden onset of disorientation and dizziness. The patient subsequently experienced parasthesia of the lower extremities which then extended to include both arms and her face, as well as one episode of emesis. The patient was seen in the office within 1 hour of the onset of symptoms. A diagnosis of migraine variant was made and the patient was prescribed PHENERGAN and DARVOCET. The symptoms resolved within 2 hours of onset. Additional information has been requested.

MedDRA PT Anorexia, Chills, Dizziness, Feeling hot, Headache, Influenza like illness, Joint swelling, Lymph node pain, Neck pain, Pain, Photophobia, Stomach discomfort, Viral infection

Symptom Text: Information has been received from a consumer concerning her 17 year old daughter with no relevant medical history or allergies who on approximately 23-JUN-2008, was vaccinated with a first dose of GARDASIL (lot number, injection site and route not reported). The patient did not have adverse reaction after receiving the first dose. On 25-AUG-2008 the patient was vaccinated with a second dose of GARDASIL (lot number, injection site and route not reported). There was no concomitant medication. In the first week of October 2008, the patient experienced constant headache, loss of appetite, flu like symptoms and joint swelling. Unspecified medical attention was sought. Laboratory test included MRI cat scan, lime test and rheumatoid test (result unspecified). On 14-NOV-2008 the patient complained that her stomach is bothering her. The patient's events persisted. Additional information has been requested. 1/12/2009 Reviewed PCP medical records of 6/25/08-1/8/2009. FINAL DX: pain amplification syndrome Records reveal patient experienced intermittent throbbing frontal HA, photophobia & dizziness x 1 mo when seen 10/31/08. RTC 11/5 w/continued HA, chills, hot feeling & sore neck. Exam revealed tender supraventricular nodule. Dx w/viral illness. Neuro consult done 11/6/08. Tx w/steroid taper. Developed joint swelling Rheumatology consult done 12/1/08 & dx w/pain amplification syndrome.

MedDRA PT Blood creatine phosphokinase, Injection site atrophy, Injection site pain

Symptom Text: Information has been received from an office manager at a physician's office concerning a 13 year old female who on 31-Aug-2006 and 09-Nov-2006, received the first and second doses of GARDASIL (lot# not provided). On 29-Sep-2008 the patient received the third dose of GARDASIL, IM into the left deltoid (lot# 66104/0548X). Concomitant therapy included YASMIN. A couple of days (also reported as "several days" in follow up) post the third dose of vaccination, the patient experienced "pain and dot above the injection site that eventually widened and spread". It was reported that the patient's injection site reaction was presently two inches in diameter and had a concave look (or divet) whereby the muscle seemed to have deteriorated. In follow-up, it was reported the 2 inch by 2 inch area was concave where the muscle seemed to have deteriorated. The patient reported adverse events on 11-NOV-2008. The patient was seeing an orthopedist. A lab work of CPK was performed (result unknown). At the time of the report, on 12-NOV-2008, the outcome of the patient was unknown. Additional information is not expected.

MedDRA PT Activities of daily living impaired, Asthenia, Disorientation, Dizziness, Hypoaesthesia, Loss of consciousness

Symptom Text: Initial and follow-up information has been received from a medical assistant concerning a 14-year-old female patient with type 2 diabetes, anxiety disorder, Disturbance of skin sensation, insomnia hyperlipidemia and no drug allergies, who on 27-Aug-2008 was vaccinated IM with the first dose of 0.5ml GARDASIL (lot number and injection site not reported). Concomitant therapy included PROZAC, CLARATIN, Mirtazapine, Famotidine (reported as "Samotidine" , manufacturer unknown) and gabapentin for type 2 diabetes, anxiety disorder, disturbance of skin sensation, insomnia, and hyperlipidemia. On 27-Aug-2008 after receiving GARDASIL, the patient experienced numbness all over and passed out; she also experienced immediate dizziness, weakness, and disorientation. Since 28-Aug-2008, the patient has experienced daily episodes of temporary numbness of both feet which lasted an unspecified length of time. The episodes have increased to 2-3 times per day and the numbness, during each episode, now extends from the feet to the mid-chest. The patient was referred for neurologic and orthopedic consultation, providers unspecified and 'all testing was normal" The medical assistant also stated that the patient "has missed a lot of school recently because of the symptoms". In October 2008 the patient did receive the second dose of GARDASIL. At the time of reporting, the patient has not recovered. Additional information has been requested.

MedDRA PT Paraesthesia

Symptom Text: Information has been received from a physician concerning a female patient who was vaccinated with her first dose of GARDASIL (Lot # not reported). After she received the first vaccine her arm was tingling and she had a pins and needles feeling in the arm. The patient sought unspecified medical attention. Subsequently, the patient recovered and she received the second dose of GARDASIL on 10-NOV-2008. At the time of the report, on 11-NOV-2008, the office was unaware if this experience happened again. Additional information has been requested.

MedDRA PT Activities of daily living impaired, Autoimmune disorder, Brachial plexopathy, Immediate post-injection reaction, Injected limb mobility decreased, Muscular weakness, Musculoskeletal pain, Myalgia, Pain, Pain in extremity, Tenderness, Tendonitis

Symptom Text: Information has been received from an office manager concerning a 24 year old female with no medical history who in April 2008, was vaccinated IM with a dose of GARDASIL and on 20-OCT-2008 was vaccinated IM with the third dose of GARDASIL (lot # 661530/0575X) in her left arm. There was no concomitant medication. On approximately 20-OCT-2008, the patient experienced myalgia and pain from the injection site all the way down to her arm. The patient said the third dose was given a little bit "higher" in her arm compared to the first and second dose. The patient had no symptoms with the first and second dose. The patient was an athlete and could not raise her arm laterally and could not dress herself. The physician prescribed an anti-inflammatory and an arm sling for one week but the patient had no improvement. The patient said the first week after the third dose her pain was sharp but the second week the pain was a constant ache. The patient saw a neurologist (unspecified name) on 11-NOV-2008 and she thought that the patient had an autoimmune reaction to GARDASIL. The patient was prescribed a steroid (unspecified), LORTAB and physical therapy. At the time of this report, the patient was not recovered. Follow-up information received from the healthcare worker concerning the path forward included an ultrasound of the patient's shoulder. If the patient's ultrasound was clear, the physician would recommend physical therapy. As of the day of this report, the neurologist's report has not been received by the physician's office. Additional information has been requested. 1/23/09 Reviewed GYN & Neuro medical records. Neuro eval 11/11/2008: FINAL DX: left brachial plexopathy. Records reveal patient experienced LUE pain, tenderness & weakness, left hand weakness, inability to raise left arm since vaccination. Had immediate intense pain which worsened & was from under left clavicle to left shoulder. Tx w/steroids, pain med & PT. Referred for EMG/NCS. GYN records: Reveal patient in good health on day of

MedDRA PT Injection site induration, Injection site pain

Symptom Text: Initial and follow-up information has been received from a nurse practitioner concerning a 23 year old female who on 24-Oct-2008 was vaccinated IM with the first 0.5ml dose of GARDASIL (lot#661764/0650X) in the left deltoid muscle. On 24-Oct-2008 the patient experienced immediate pain at the injection site of the left deltoid muscle after administration of the first dose of GARDASIL. It was noted that the patient initially experienced the pain on the same day that she received the vaccination. The pain "subsided" without treatment in 2 days. The pain at the injection site "returned" on 10-Nov-2008 and was "now" accompanied by firmness" in the area. At the time of this report, the patient's pain and "firmness" at the injection site persisted. The nurse practitioner added that the patient called the practice for medical attention. Additional information has been requested.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Arachnoid cyst, Burning sensation, Paraesthesia, Paraesthesia mucosal, Paraesthesia oral, Sensation of heaviness

Symptom Text: Information has been received from a gynaecologist concerning a 22 year old female with not reported medical history, who on 22-JUL-20087 was vaccinated with the first dose of GARDASIL (lot # 1114U; batch NH10940) SC into the right upper arm. Therapy also included doxycycline for an unspecified indication, starting on 29-JUL-2008 for 10 days. On 13-AUG-2008, the patient experienced paraesthesia of the lips, the tip of tongue and the buccal mucous membrane. Since 14-AUG-2008 she also developed paraesthesia and feeling of heaviness of the left upper and lower arm. The patient was hospitalized from 15-AUG-2008 to 16-AUG-2008. Neurological examination was normal except for the paresthesia in left upper and lower arm and feeling of heaviness of the left arm. CSF showed normal results for cells and protein. Results of oligoclonal bands were not available at the time of reporting. Cranial magnetic resonance imaging (MRI) showed two small lesions at the anterior and posterior horn. At time of reporting, the patient had not recovered. No final diagnosis was established. Follow-up information was received which reported that final diagnosis was suspicious of CIS (clinically isolated syndrome). The patient has a history of riding accident in February 2008 with compression of the cervical spine and several falls. Concomitant to the sensation of heaviness of the left upper arm and forearm, the patient developed "like an inner burning" of the arm. Physical neurological findings VEP, SEP and ECG on 15-AUG-2008 showed normal results. Laboratory findings (see lab section) were normal except for oligoclonal IgG in CSF with one band. Cranial MRI showed two demyelinating foci in the left hemisphere. Suspicion of disseminated encephalomyelitis could not be ruled out, but no active signs were detected ("old lesions"). As an incidental finding an arachnoidal cyst was detected. The hospital physicians pointed out that as differential diagnosis a reaction after GARDASIL vaccination could not completely be rule out. It was discussed that

MedDRA PT Asthenia, Axillary pain, Back pain, Blood urine present, Burning sensation, Chest pain, Erythema, Myalgia, Neck pain, Oral pain, Oropharyngeal pain, Pain, Pain in extremity, Pain in jaw, Photophobia, Pruritus, Pyrexia, Rash pruritic, Swelling, Urticaria, Viral infection, Vision blurred, Visual impairment

Symptom Text: My daughter received her second injection of GARDASIL on December 22, 2008. On December 31, 2008 she had a sudden and severe hives reaction- inner thighs of both legs and feet, blood red, swelled, very painful and itchy. We went to the emergency room where she was treated unsuccessfully with BENADRYL and then was given steroids, which after 12 hours reduced the horrific hives. Then on Friday, January 2, 2009 she started to complain about severe pain in her armpits. By Sunday night the pain spread up her chest, neck, jaw and lips. We have an appointment at our Dr. this afternoon, but felt that since there was NO other reason - sickness, strange meal, etc. I should report this event immediately.4/14/09-records received-presented to ED 12/30/08- C/O rash on legs began morning of visit to ED. Pruritic. Has had similar rash in past. DX: urticaria. Subsequently developed aches in neck and axillae, legs. Assessment: viral syndrome. 1/12/09 C/O body aches and generalized weakness and low back pain and buring of hands. Now severe headache with photophobia and neck stiffness, slight nausea. 4/28/09-office visit 15/09-C/O musculoskeletal symptoms and rash. Previously seen in ED for allergice reaction. Now have aches in neck, axillae, legs. Impression: Viral syndrome. 1/7/09 continues to C/O leg pain and hand and arm pain. Impression: Myalgia. 1/12/09-second opinion for C/O jaw pain, muscle pain and headache. Light sensitive. Spots in eyes. Impression: Parent child concerns. 1/13/09-seen in ED for worst headache of her life. Parent refuses LP. Impression: headache. headache maybe migranoid with photophobia. Myalgia. 1/19/09-C/O blood in urine, fever and sore throat. 3 week history of evolving UTI and strep throat per parent.

Other Meds:

Lab Data: 4/14/09-records received-CT scan brain normal. 4/28/09-records received- Rapid strep negative. Assessment: Acute pharyngitis. WBC 13.0, Antinuclear antibodies direct 95, adenovirus negative. CT head normal.

History: 4/14/09-records received- Allergies:amoxicillin. Obstructive sleep apnea. Tonsillectomy adenoidectomy.

MedDRA PT Physical examination normal, Tremor

Symptom Text: Information has been received from a registered nurse concerning a 14 year old female patient with no pertinent medical history and no known drug allergies who on 16-OCT-2008 was vaccinated with the first 0.5 ml IM dose of GARDASIL (lot # 661530/0575X). On 22-DEC-2008 the patient was vaccinated with the second 0.5 ml IM dose of GARDASIL (lot # 661764/0650X). There was no concomitant medication. On 23-DEC-2008 ("within a day after administration of her second dose") the patient developed tremors which resemble a shudder from chills. No lab diagnostics studies were performed. On 06-JAN-2009 the patient was examined in the office and she was still experiencing tremors, although less frequent, at least once a day. At the time of reporting, the patient was recovering. Additional information has been requested. 3/4/09 MR received from PCP. Received HPV #2 on 12/22/09. Later that day pt noticed tremors of arms, hands, fingers and knees. Seen by PCP on 1/6/09 for persistant tremors, decreasing somewhat in frequency and intensity. No change in awareness, no associated sensory phenomenon, no post-ictal state. PE WNL. No tx at this time. Will watch.

MedDRA PT Injection site erythema, Injection site swelling, Urticaria

Symptom Text: Information has been received from a licensed practical nurse concerning a 19 year old female patient with no known pertinent medical history, and no known drug allergies reaction, who on 30-AUG-2007 on an unrelated office visit, was vaccinated with the first dose of GARDASIL. On 29-NOV-2007, the patient was vaccinated with the second dose of GARDASIL (lot No 659055/1522U), 0.5 ml, intramuscularly. The licensed practical nurse reported that patient did not experienced an adverse reaction after her first GARDASIL. On 29-NOV-2007, after the patient received her second dose of GARDASIL, she experienced redness and swelling at the injection site, as well as hives, after she received her second dose of GARDASIL. The licensed practical nurse reported that the patient had elected not to receive her third GARDASIL. On an unknown date the patient recovered without requiring medical treatment. Additional information has been requested.

MedDRA PT Abdominal pain upper, Drug exposure during pregnancy, Dyspnoea, Pruritus

Symptom Text: Initial information has been received through the pregnancy registry for GARDASIL from a husband concerning his 19 year old wife who on 05-NOV-2008 was vaccinated with the first dose of GARDASIL. On 23-OCT-2008 the patient was vaccinated with hepatitis A (inactive) (manufacturer unknown), hepatitis B vaccine, recomb (manufacturer unknown), MMR II, DTaP (unspecified), poliovirus vaccine and influenza virus vaccine (unspecified). The husband called to report that his wife, the patient, was already learned that she was pregnant two to three weeks ago through a home urine pregnancy test. On 04-NOV-2008, "since two days ago" the patient experienced stomach ache, itching and difficulty breathing. It was reported that no laboratory diagnostic studies were performed. The patient's stomach ache and itching and difficulty breathing persisted. The LMP was reported as the end of Sep-2008. The patient sought medical attention through a nurse. Additional information has been requested.

MedDRA PT Pollakiuria

Symptom Text: Information has been received from a 23 year old female medical assistant with sulfonamide allergy, who on 26-AUG-2008 was vaccinated with the first dose of GARDASIL, HAVRIX, and meningococcal vaccine (unspecified). On 02-SEP-2008 she started to have frequent urination. The medical assistant reported that she did see an urologist who did a "cysto test" in which they stretched her urethra, which relieved some of the pressure, but on 03-NOV-2008 the frequent urination started again. The medical assistant stated that she is not sure is the HPV vaccine has caused this, but she is due to receive the second dose on 11-NOV-2008. At the time of the reporting, the patient had not recovered. Additional information has been requested.

MedDRA PT Muscle rigidity, Pallor, Syncope

Symptom Text: Information has been received from a physician. The physician who reported this did not administer the dose of GARDASIL vaccine to this patient and therefore does not know if this was reported already by the physician who did administer it. It was reported that a female patient was very nervous about receiving their second dose of GARDASIL and told the physician several times that she was going to faint. After receiving the vaccine she became very pale, fainted and became very rigid. The physician noted that it was not a seizure. The patient was sent to the emergency room but it is not known if she was admitted to the hospital. Subsequently, the patient recovered. Additional information has been requested.

MedDRA PT Back pain, Dyspnoea, Ear pain, Erythema, Fatigue, Injection site reaction, Oral dysaesthesia, Pain, Pyrexia, Urticaria

Symptom Text: Information has been received from a registered nurse concerning a 14 year old female with sulfonamide allergy, Penicillin allergy, and asthma who on 29-Oct-2008 was vaccinated at another office with GARDASIL (661766/0652X) intramuscularly in her left arm. Secondary suspected therapy included MENACTRA in her left arm and an unspecified influenza virus in her right arm. All 3 vaccines were received on the same day. The nurse stated that the patient developed a reaction after receiving the 3 vaccines. On 29-Oct-2008 the patient experienced pain bilaterally in her upper and lower back. The patient said her "mouth felt funny" but had no problem swallowing. The patient had ear pain on her right side and ear turned red. The patient also reported mild aches in thighs and knees and a fever of 101f with generalized body aches and fatigue. The patient was seen in the office of the reporter for these symptoms on 30-Oct-2008 and had a transient "hive like" rash on the underside of her left upper arm. The patient also had mild difficulty breathing (her peak flow rate was usually 500 and it dropped to 350). Subsequently, the patient recovered. Additional information has been requested.

MedDRA PT Papilloma viral infection

Symptom Text: Information has been received from a physician concerning an 18 year old female with no relevant medical history or allergies who in approximately 2007, also reported as last year was vaccinated intramuscularly with a first, second and third 0.5 ml dose of GARDASIL (lot number and injection site not reported). There was no concomitant medication. The physician reported that the patient tested positive for GARDASIL. The patient called the physician's office and unspecified medical attention was sought. At time of this report, the patient's event persisted. Additional information has been requested.

MedDRA PT Local swelling, Skin nodule

Symptom Text: Information has been received from a consumer concerning her daughter with no medical with no medical medical history and no known allergies who on approximately 17-Oct-2008 was vaccinated with the third dose of GARDASIL given on the right a cause but believe that it could be the HPV vaccine" The consumer did not want to provide any or demographics or further information until she speaks with her daughter's physician. At the time of the report the patient had not recovered. Follow-up information was received which reported that the patient received the shot on 17-Oct-2008. The "bumps" started on " the weekend of October 24th" and she saw the doctor on 31-October-2008 and again on 07-Nov-2008. The bumps "stopped getting lager" on 05-Nov-2008 and now "they are getting smaller again". When the AE started, "you could not see them but you could feel them because they were under her skin. At their largest , "her neck looked swollen on that side and you could see them. "Presently, they are not visible but they can be felt". She did not have the lot# and the doctor did not do any tests when he saw the patient about this AE. No further information is available.

MedDRA PT Headache, Pain, Vomiting

Symptom Text: Information has been received from a registered nurse concerning a 19 year old female patient who on 21-AUG-2008 was vaccinated intramuscularly with the first 0.5 dose of GARDASIL (Lot # 660555/0279X) and on 27-OCT-2008 was vaccinated intramuscularly with the second 0.5 dose of GARDASIL (Lot # 660555/0279X). Concomitant therapy included birth control pills (unspecified). The nurse reported that after the first and second dose of GARDASIL, the patient experienced headache, vomiting and general body aches. The patient recovered 24 hours after the symptoms started. At the time of the report the nurse was thinking of premedicating her before her third dose of GARDASIL, with ibuprofen and PHENERGAN suppositories. The patient did not seek medical attention. Additional information has been requested.

MedDRA PT Drug exposure during pregnancy, Nausea, Vomiting

Symptom Text: Initial and follow-up information has been received from a registered nurse for the pregnancy registry of GARDASIL, concerning an 18 year old female who on 27-FEB-2008 was vaccinated with the first dose of GARDASIL vaccine (Lot # 658556/1060U) (Expiration date 13-APR-2010), 0.5 mL, I.M. It was noted that on 27-FEB-2008, the patient received MENACTRA. After vaccination the patient discovered that she was pregnant. On an unknown date was performed a prenatal blood work with no abnormal results and an ultrasound with negative results. In follow-up, on 21-NOV-2008, a registered nurse was reporting that the patient experienced nausea and vomiting shortly after receiving the first vaccination on 27-FEB-2008. At the time of the initial report, the time of gestation was 32 weeks. Estimated date of delivery was 23-OCT-2008. In follow-up was also noted that the patient had competed her pregnancy. The date of delivery was not available. The patient sought medical attention at the office. Additional information has been requested.

MedDRA PT Anaemia, Drug exposure during pregnancy, Small for dates baby

Symptom Text: Information has been received from a licensed practical nurse for the pregnancy registry for GARDASIL concerning an 18 year old female with asthma, peanut allergy and 1 previous pregnancies and 1 full term delivery (no birth defects or infant complications noted) who on 05-DEC-2007 was vaccinated with the first dose of GARDASIL IM 0.5 ml. On 05-FEB-2008 the patient was vaccinated with the second dose of GARDASIL IM 0.5 ml. Concomitant therapy included albuterol inhaler as needed. Other medications used during pregnancy included ferrousSO4 and biotin (+) carbonyl iron (+) docusate sodium (+) folic acid (+) minerals (unspecified) (+) vitamins (unspecified) (PRENATE ELITE) and iron supplement for anemia (begin on 12-JUN-2008 until delivery). The patient was pregnant with an estimated date of confinement of 30-SEP-2008. Fetal ultrasounds and positive pregnancy test were performed. On 09-SEP-2008 the ultrasound was performed with the result of "small gestational age". On 23-APR-2008 serum alpha fetoprotein was performed with negative results. The complete blood cell count was performed with the result of anemia. On 22-SEP-2008 the patient delivered a normal male baby weighing 6 pounds 2 ounces at 38 weeks with apgar scores 9/9. There were no congenital anomalies and no other complications or abnormalities. There was no complication during labor/delivery. The patient sought medical attention in the office visit. Additional information is not expected.

Other Meds: Albuterol; Vitamins (unspecified)

Lab Data: Ultrasound, 09/09/08, small gest age; Beta-human chorionic, positive; Serum alpha-fetoprotein, 04/23/08, negative; Complete blood cell, anemia; Apgar score, 09/22?/08, 9/9

MedDRA PT Caesarean section, Drug exposure during pregnancy, Failed induction of labour, Gestational diabetes, Nausea

Symptom Text: Initial and follow up information has been received from a licensed practical nurse (L.P.N.) for the Pregnancy Registry for GARDASIL concerning a 26 year old female with a history of drug hypersensitivity to TYLENOL #3, DEMEROL, and CODEINE, who on 23-JAN-2008 was IM vaccinated with her first dose of GARDASIL (lot number 659439/1267U). On 24-MAR-2008 the patient was IM vaccinated with her second dose of GARDASIL (lot number 659964/1978U). The patient became pregnant after receiving two doses. She has not received her third dose yet. The patient's LMP is 08-Mar-2008. The patient sought unspecified medical treatment with an office visit. The patient has had one previous pregnancy and one previous live birth, with no birth defects and no infant complications reported. Patient outcome was not reported. Follow-up information was received 05-JAN-2009 from the L.P.N. indicating that the patient's estimated conception date was approximately 22-MAR-2008. Ultrasounds were performed on 07-JUL-2008, 19-AUG-2008, 15-SEP-2008, 22-OCT-2008 and 04-NOV-2008, respectively (results not provided). Other medication used during this pregnancy included HUMALOG daily for the treatment of gestational diabetes, LANTUS daily for the treatment of gestational diabetes, "gummi vitamin/folic acid" daily and ZOFRAN), as needed for the treatment of nausea. On 03-DEC-2008, the patient had a C-section due to failure to progress and delivered a normal female baby, weighing 6 pounds, 12 ounces. The baby's length was 18 inches, head circumference was 13 inches and apgar score was 9/9. There were no congenital anomalies or other complications. The patient had no concurrent medical conditions. The outcome of the patient was not reported. Upon internal review, "C-section due to failure to progress" was determined to be an other important medical event. Additional information has been requested.

Symptom Text: Information has been received from a physician concerning a female patient with a history of mouth ulcers who on an unknown date was vaccinated with a dose of GARDASIL, lot # unspecified. The patient came back to the physician's office 4 hours after getting GARDASIL with "vulvar ulcers" diagnosed as "bipolar aphthosis". The physician stated that the patient had gotten the shot when she was experiencing symptoms of West Nile virus; however it was not diagnosed after she had been given GARDASIL. The patient became sexually active "shortly before" she got GARDASIL. At the time of reporting, the outcome of the event was unknown. Follow-up information was received from the physician who reported that the patient had a history of canker sores. The physician also reported that the patient had a viral illness (not specified) prior to receiving the third dose of GARDASIL. The physician stated that the patient had experienced bipolar aphthosis every month for over one year. Follow-up information was received from the physician, who reported that the patient was vaccinated with the third dose of GARDASIL IM, on 18-AUG-2007. The physician reported that within 4 hours of vaccination, the patient had the first outcome of nonherpetic vulvar ulcers. Major work up negative. Presumed to be bipolar aphthosis. At the time of reporting, the patient had not recovered. The patient had numerous cultures and laboratories (unspecified) and a presumptive positive West Nile virus test. The physician considered the event to be disabling. This is one of two reports from the same source. No further information is available. 2/17/09 Received Immunology Clinic records of 7/15-9/26/2008. FINAL DX: Bechet's disease Records reveal patient did not have symptoms when initially evaluated. Valtrex d/c. Had bout of depression w/suicidal ideation. Being seen by counselor & tx w/meds. Developed oral canker sores that waxed & waned & by 9/18 had over 40+ vulvar ulcers w/exudate & bilateral lymph node adenopathy. Depression aggravated by eruption,

MedDRA PT Drug exposure during pregnancy, Premature labour, Urinary tract infection

Symptom Text: Information has been received from a physician for the pregnancy registry for GARDASIL, concerning a 16 year old female with allergic reaction to cephlosporins and a history of 1 pre-term delivery at 36 weeks with complication of apnea of prematurity and no birth defects who on 21-JAN-2008, was vaccinated with the first dose of GARDASIL (lot#657872/0515U). Concomitant medication included ALESSE for birth control. The physician reported that on 24-MAR-2008, the patient was vaccinated with the second dose of GARDASIL (lot # 657872/0515U) at her primary care office. On 09-JUN-2008, the patient had a blood test and urine test for pregnancy, and an ultrasound that confirmed the pregnancy and showed the patient was 23 weeks and 6 days pregnant and the fetus had a normal anatomy. The patient's LMP was 25-DEC-2007 and EDD 30-SEP-2008 and her date of conception was approximately 05 to 10-JAN-2008. The patient sought medical attention at the physician's office. In further follow up, the physician reported that the baby delivered on 31-AUG-2008 was male and weighed 5 pounds, 2 ounces, was 18 1/2 inches, and the APGAR score was 6/9. The infant was normal, with no congenital anomalies and there were no other complications. The patient had complications during the pregnancy and labor/delivery because was a precipitous delivery. She was on bed rest at 31 weeks. On 26-AUG-2008, the patient had an ultrasound which was normal size/fluid. Other medications were used during this pregnancy, was terbutaline 5 mg every 4 hours for pre term labor from 06-AUG-2008 to 07-AUG-2008 and MACROBID, bid, for treatment of a urinary tract infection from 06-AUG-2008 to 13-AUG-2008. No further information is available.

Other Meds: ALESSE, dose

Lab Data: Ultrasound, 06/09/08, confirmed the pregnancy: 23 + 6 weeks, normal anatomy; Ultrasound, 08/26/08, normal size/fluid; Serum beta-human, 06/09/08, confirmed the pregnancy; Apgar score, 6/9; Urine beta-human, 06/09/08, confirmed the pregnancy

History: Early onset of delivery

MedDRA PT Drug exposure during pregnancy, Inappropriate schedule of drug administration, Infection, Medication error

Symptom Text: Information has been received from a registered nurse (R.N.) for the Pregnancy Registry for GARDASIL regarding a 15 year old female who on 14-AUG-2007 was vaccinated intramuscularly with her first dose of GARDASIL (Lot #, and site not reported). Concomitant therapy included a first dose of MENACTRA. On 27-SEP-2007, the patient was vaccinated with a second dose of MENACTRA was received in error. On 16-OCT-2007, the patient was vaccinated intramuscularly with her second dose of GARDASIL (Lot #, and site not reported). On 22-FEB-2008, the patient was vaccinated with her third dose of GARDASIL (Lot # 655165/1425F, site not reported). ON 10-APR-2008, the patient was vaccinated intramuscularly with her fourth dose of GARDASIL (Lot #655165/1425F, site not reported). The patient received the fourth dose of GARDASIL in error. Concomitant therapy included Tylenol. On an unspecified date the patient took a urine pregnancy test which was positive. The patient "thinks she became pregnant in the first week of November 2007" (LMP approximately 10-OCT-2007). On an unspecified date, the patient had an ultrasound (not further specified). The patient had no symptoms. The patient sough unspecified medical attention by seeing the nurse. No further information is available. Follow-up information was received on 03-NOV-2008 from the R.N. and a physician indicating that the patient is with) previous pregnancies. The patient had no significant past medical history or concurrent medical conditions. It was reported that the third dose of GARDASIL (Lot #655165/1425F) was under bad storage and the dose was therefore repeated on 10-APR-2008. Other medication used during this pregnancy included occasional prenatal vitamins for nutrition and Zithromax (initialized on 05-MAY-2008), 250 mg, daily for an unknown infection (it was also reported that the patient had no infections or illness during pregnancy). The outcome of the infection was not reported. An ultrasound performed on 05-MAY-2008 was normal. On 11-AUG-2008, 40 weeks from her LMP, the

MedDRA PT Drug exposure during pregnancy, Gastrooesophageal reflux disease, Perineal laceration, Placental disorder

Symptom Text: Information has been received from a nurse practitioner, for the Pregnancy Registry for GARDASIL, concerning a 20 year old white female with allergies to PROZAC, attention deficit /hyperactivity disorder, bipolar disorder and depression with a history of 1 pregnancy and 1 live birth who on 28-Aug-2007 was vaccinated intramuscularly with the 0.5ml first dose of GARDASIL (lot#658282/0929U). On 27-Feb-2008, the patient was vaccinated with the second dose of GARDASIL (lot#659437/1266U). Concomitant therapy included LAMICTAL and RITALIN. Subsequently, she became pregnant. The estimated delivery date was 02-Aug-2008. The patient sought medical attention at the office. On 17-Apr-2008, an ultrasound was performed for dating and that result showed 24.5 weeks. During the pregnancy, other medications included PREVACID 15mg daily for Gastroesophageal reflux disease. On 02-Aug-2008 the patient delivered a normal, healthy female baby weighing 5 pounds 14 ounces. The apgar scores were 8/9. There were no congential anomalies and no other complications/abnormalities. Additional information has been received from a physician concerning a 20 year old female smoker who had a precipitous spontaneous delivery of a healthy female infant on 02-Aug-2008. On 02-Aug-2008, it was reported that the mother had a calcified placenta and 2nd degree lacerations on her left labial and peri clitoral. On approximately 19-Sep-2008, the patient reported having upper respiratory symptoms. On 02-Aug-2008, the patient's infant had cord around her neck x2. The patient's infant was born without abnormalities. The infant's length was 19 3/4 inches. On 02-Aug-2008, the newborn had a hearing screening test and passed. On 12-Aug-2008, the mother took her infant to a well child visit. She had concerns for some bleeding from the umbilicus. The mother also reported that her infant was spitting up and requested to switch formula to Isomil. Overall, newborn screen and PKU status were normal. On 27-Aug-2008, the mother brought her infant to the physician's office in

MedDRA PT Drug exposure during pregnancy, Pre-eclampsia

Symptom Text: Information has been received from a consumer, who is the mother of the patient, for the pregnancy registry for GARDASIL concerning an 18 year old female who sometime last year (2007) was vaccinated with the first dose of GARDASIL (lot# not reported). Per the reporter, the patient received the second dose of GARDASIL (lot # not reported) either in November or December 2007. About a week ago, the patient found out that she was pregnant (gestation = "patient is 3 months pregnant") and her due date is on 27-OCT-2008 (LMP is approximately 19-JAN-2008). The patient sought unspecified medical attention. About a week ago the patient had a positive urine pregnancy test. No further AE information was provided. Follow-up information was received from a physician concerning the patient with no known allergies and a history of epilepsy, loop electrosurgical excision procedure in Aug 2007 and gastroesophageal reflux disease who at 06:06 on 05-NOV-2008, delivered a normal male infant with no congenital anomalies. It was reported that patient's prenatal testing included ultrasound which was performed on 30-MAY_2008, 05-AUG-2008 and 25-SEP-2008, and her estimated delivery date was 01-DEC-2008. The patient's medication used during pregnancy included prenatal vitamins, prilosec, 20 mg for gastroesophageal reflux disease and Zetran 4 mg for nausea. It was reported that the patient experienced mild pre-eclampsia since 14:23 28-OCT-2008, and severe pre-eclampsia since 13:46 30-OCT-2008. Vacuum assisted delivery was done for problematic fetal heart rate pattern (deep recurrent variables to 100 returning to baseline with overshoots. Minimal progress with pushing from +2 station). Apgar scores included: apgar 1 min: 6; apgar 5 min: 7. The outcome of birth infant included: weight: 2845 gm (6lbs + 4.354 oz) length: 49.50 cm (19.5 inches), head circumference: 34.50 cm (13.6 inches), chest circumference: 32.50 cm (12.8 inches). Additional information has been requested.

Other Meds: Unknown

Lab Data: Urine beta-human, 04/02?/08, positive; Erythrocyte ABO antigen, AB positive; Serum hepatitis B, Negative; Rapid plasma reagin, Non-reactive; Serum HIV-1 and/or 2, non-reactive.

MedDRA PT Drug exposure during pregnancy, Hepatic enzyme increased, Pregnancy induced hypertension, Premature baby, Proteinuria

Symptom Text: Information has been received from a 22 year old female consumer with no pertinent medical history or drug allergies, for the Pregnancy Registry for GARDASIL, concerning the consumer who on 27-MAR-2008 was vaccinated with the first 0.5 ml dose of GARDASIL. Concomitant therapy included "petrocyclin." On 02-APR-2008 the consumer took a pregnancy test, and discovered that she was pregnant. The date of LMP was 03-MAR-2008, the estimated date of delivery was 08-DEC-2008. The patient would discontinue the rest of the series until the pregnancy was over. No further information was provided. The patient sought unspecified medical attention. Follow-up information was received from the patient who reported that she saw certified nurse midwife and she was well, not having any problems and her EDD was 08-DEC-2008. Follow-up information on 24-NOV-2008 from a Certified Nurse Midwife who reported that on 27-MAR-2008, the patient who was a positive Group B streptococcus carrier and with no previous pregnancies was vaccinated with the first dose of GARDASIL. Concomitant therapy included unspecified therapy. On 18-APR-2008, the patient underwent serum alpha-fetoprotein test and result was within normal limit (negative). On 21-JUL-2008, the patient underwent ultrasound for tetracycline exposure and family history of Meckel and result was normal. On 03-NOV-2008, the patient delivered a normal infant (Weeks from LMP: 35). There were no congenital anomalies. The patient experienced pre term dilation, pregnancy induced hypertension, elevated liver enzymes, and positive proteinuria during the pregnancy. Tetracycline was used for dermatologic reason during the pregnancy prior to knowledge. At the time of reporting, the outcomes were unknown. Additional information was requested.

Other Meds: (Therapy unspecified)

MedDRA PT Drug exposure during pregnancy, Infection

Symptom Text: Information has been received through the pregnancy registry and a nurse concerning a 17 year old female who on 09-AUG-2007 and 11-OCT-2007 was vaccinated with a first and second dose of GARDASIL, respectively. Subsequently, she became pregnant. Her last menstrual period (LMP) was reported as July 2007. She received late prenatal care. On 30-MAR-2008, the patient was hospitalized "for delivery" and delivered a healthy baby. Her pregnancy was reported as normal. At the time of this report, the patient had recovered. No product quality complaint was involved. In follow up medical record it was reported that patient developed an infection two days after delivery. The outcome was not reported. Pediatric medical records were received and reviewed. The following experience with the baby were identified. On 08-APR-2008 the baby was brought to the clinic and thick white patch was present on her tongue. She was prescribed nystatin 4 cc on a swab. The mother was instructed to boil blttle nipples. She was instructed to call the clinic if it dose not clear within two weeks. On 11-APR-2008 the baby came to the clinic again. The mother thought she was fussy with bowel movement and felt that she had constipation. Mother reported that the baby was very irritable and screamed with bowel movement. She was advised to use 1-2 teaspoons of dark Karo syrup in every other bottle to see if it helps with the irritability and difficulty stooling. On 01-MAY-2008 baby had a visit to the clinic. On this visit mother reported that baby had watery left eye. It was reported that the baby recovered from constipation (date not reported). Her diaper area was reddened with multiple papules. No excess tearing from the eye noted in this visit. On 01-JUN-2008 the baby reported to have diaper candidiasis. She was called in clotrimazole cream to apply three times per day for ten days to the diaper area. It was discussed with mom other methods of improving diaper rash. Mom was concerned about a bump on baby's right hand. She wanted it to be checked. The

MedDRA PT Constipation, Drug exposure during pregnancy, Premature labour, Vaginitis bacterial

Symptom Text: Initial and follow-up information has been received from a registered nurse and a nurse practitioner, for the Pregnancy Registry for GARDASIL, concerning a 19 year old female with a history of urinary tract infections, kidney infections, a previous pregnancy with an elective abortion, and an "abnormal pap with cryo" in December 2006, who on 14-NOV-2007 was vaccinated with her first dose of GARDASIL. On 21-JAN-2008, the patient was vaccinated with her second dose of GARDASIL. There was no concomitant medication. Subsequently, the patient became pregnant. No adverse symptoms were reported. The registered nurse stated that the patient was 12 weeks pregnant as of 18-Mar-2008. On an unspecified date, the patient took a urine pregnancy test which was positive. The date of last menstrual period was 23-DEC-2007 and the estimated delivery date was 28-SEP-2008. On 19-MAR-2008, the patient had a pelvic ultrasound with the normal result. On 25-MAR-2008 the patient had a maternal serum alpha-fetoprotein test for first trimester screening which was negative. On 26-APR-2008, the patient had an ultrasound for "anatomy" with "Echogenic Fetal Kidneys", results not provided. The dose of GARDASIL were administered at another site while the patient attended college. The patient sought unspecified medical attention in the office. On 10-OCT-2008, the nurse practitioner reported that the patient had her baby at the end of September or beginning of October. She did not have the patient's chart available at the moment so she wasn't sure of the exact date. She also reported that "nothing ever came of that" about the echogenic fetal kidneys that were seen during the 18 week 1 day anatomy scan on 26-APR-2008. The patient had undergone some genetic counseling/testing but everything was normal with the baby. There were no congenital anomalies and the baby was healthy when it was born. Follow-up information has been received from a completed questionnaire from a Certified Registered Nurse Practitioner. Other medication used d

MedDRA PT Cervical dysplasia, Cervicitis, Papilloma viral infection, Smear cervix abnormal, Urinary tract infection

Symptom Text: Information has been received from a Registered Nurse for the Pregnancy Registry for GARDASIL concerning an 18 year old female who on 11-OCT-2007 was vaccinated with the first dose of GARDASIL (lot number not provided) and on 06-FEB-2008 was vaccinated with the second 0.5 ml dose of GARDASIL (lot number not provided) and is now pregnant. There was no concomitant medications. The patient was not experiencing any known symptoms. Medical attention was sought in the practice. Patient outcome was unknown. No product quality complaint was involved. Follow-up information was received from another health professional who reported that on 06-FEB-2008 a PAP test showed atypical squamous cell of undetermined significance s/o HPV. She had the second dose of GARDASIL the same day. On 13-MAR-2008 the patient underwent colposcopy and was diagnosed with cervicitis, focal HPV changes. The patient received MACROBID 100 mg, twice a day for the treatment of urinary tract infection from 07-MAY-2008 to 14-MAY-2008. On 02-JUN-2008 an ultrasound was performed which was within normal limits and showed a fetal anatomy scan at 19 weeks. An MSAFP was declined. Patient declined genetic screening. This was the patient's first pregnancy. On 15-AUG-2008 (at 28 weeks) because she was Rh negative the patient received globulin, RHOGAM intramuscularly. The outcome of cervicitis and urinary tract infection was unknown. On 08-NOV-2008, at 40.5 weeks from LMP, the patient gave birth to a liveborn female infant weighing 5 pounds, 5 ounces, length was 18 inches, head circumference was 12 inches. Apgar score was 8. There were no complications during delivery. The infant was normal. There were no congenital anomalies or other complications or abnormalities. No further information is available.

MedDRA PT Drug exposure during pregnancy

Symptom Text: Information has been received from a Registered Nurse for the pregnancy registry for human papillommavirus vaccine concerning a female with a penicillin allergy who on 12-FEB-2007 was vaccinated with the first dose of GARDASIL (Lot #654741/1208F). The patient received the second dose on 01-MAY-2007 (Lot #655205/1426F) and the third dose on 15-AUG-2007 (Lot #657622/0388U). The patient became pregnant after her last menstrual period of 08-NOV-2007. No adverse effects were reported. Follow up information was received from a licensed practical nurse concerning a Caucasian female with no history of previous pregnancies, who on 12-FEB-2007, 01-MAY-2007 and 15-AUG-2007 was vaccinated with the first, second and third dose of GARDASIL respectively. Concomitant medication included TANDEM DHA. The LPN reported that on 06-MAR-2008 an ultrasound was performed for size and date. On 26-AUG-2008 the female patient gave birth to a normal male (weight 8 pounds 11 ounces and length 20.5 cm). It was reported that there were no complications during pregnancy and none during labor/delivery. The baby presented sleep apnea noted at 3 weeks. Last menstrual period was 08-NOV-2007. Estimated delivery date was 14-AUG-2008. No further information is available.

MedDRA PT Anaemia, Drug exposure during pregnancy, Gestational diabetes, Streptococcal identification test positive, Vaginitis bacterial

Symptom Text: Information has been received from a certified nurse midwife for the pregnancy registry for GARDASIL, concerning an approximately 19 year old female with diabetes, papilloma viral infection, successful smoking cessation at 27 weeks of gestation and thalassaemia minor and a history of depression, who in October 2007, was vaccinated with the first dose of GARDASIL and subsequently was determined to be pregnant. It was reported the patient has no previous pregnancies. On 31-Jan-2008, the patient was placed on therapy with prenatal vitamins (unspecified), PRN for the pregnancy and the treatment of anemia. Other therapies used in pregnancy included as follows: On 31-JAN-2008, the patient was placed on therapy with metronidazole, 500 mg twice a day for the treatment of bacterial vaginosis. On 04-FEB-2008, the patient was placed on ferrous sulfate, 325 mg twice a day for the treatment of anemia. On 04-FEB-2008, an ultrasound was performed and was found within normal limits. On 07-FEB-2008, therapy with metronidazole was discontinued. On 28-APR-2008, the patient was placed on therapy with glyburide, 2.5 mg twice a day for the treatment of gestational diabetes. On 09-MAY-2008, an ultrasound was performed and was found within normal limits. On 27-MAY-2008, an ultrasound was performed and a biophysical profile of 8/10 was found. Diagnostic laboratory tests during pregnancy also included a blood work for iron studies and a group B strep screen found positive. The patient's LMP was on 24-SEP-2007. On 11-JUN-2008, the patient delivered a 39 weeks healthy baby girl with an apgar score of 8 at one minute and 10 at 5 minutes. The estimated date of delivery was 18-JUN-2008. On 14-NOV-2008, the patient had a 5 month old visit and well child examination was found. Baby's growth and developed was considered normal. The baby was recommended for flu vaccine and scheduled for follow-up in two months. No further information is available.

MedDRA PT Anaemia, Drug exposure during pregnancy, Fungal infection, Vaginal haemorrhage

Symptom Text: Initial and follow up information has been received from a nurse and a certified medical midwife for the Pregnancy Registry for GARDASIL, concerning a 23 year old female patient who smokes cigarettes, who in 17-DEC-2007 was vaccinated with the first dose of GARDASIL (Lot No 658563/1063U). In approximately 2008, the patient was vaccinated with the second dose of GARDASIL, 0.5 mL. Concomitant therapy included Depo-Provera on 17-DEC-2007 for contraception. On 17-DEC-2007, the patient took a pregnancy test which came back negative. Patient came back approximately a week later and was pregnant. The last date of menstrual period was on 22-NOV-2008 and the estimated delivery date was on 02-SEP-2008. On 11-JAN-2008, 17-APR-2008, 23-JUL-2008, 08-AUG-2008 some ultrasounds were performed to check the dates, survey and bleeding was found it. On 04-APR-2008 a serum alpha-fetoprotein test performed with negative results. The certified medical midwife reported that on 04-SEP-2008 the patient delivered a normal male baby, with no congenital anomalies, and with no known complication during labor/delivery. The patient had an obstetric history of one previous pregnancy with an spontaneous abortion and history of yeast during pregnancy. There was a complication during the patient's pregnancy with a vaginal bleeding at 36 weeks. Other medication used during pregnancy were prenatal vitamins (PVN), ferrous sulfate for anaemia, and Diflucan for yeast. The baby's weight was 6 pounds with 8 onz, with length of 18 1/2 cm a head circumference of 32 cm and an Apgar score of 9/9. No further information is expected.

MedDRA PT Drug exposure during pregnancy, Staphylococcal infection

Symptom Text: Information has been received from a physician through the Pregnancy Registry for GARDASIL concerning an 18 year old female with a history of deep vein thrombosis at the age of 15 and no drug allergies, who in the middle of September 2007 was vaccinated intramuscularly in the left arm with the first dose of GARDASIL. The patient was vaccinated with a second dose of GARDASIL approximately from the middle to the end of November 2007. There was no concomitant medication. Subsequently, the patient was pregnant. The patient sought medical attention from her primary care physician. A urine pregnancy test was performed and was positive. The patient's last menstrual period was 12-NOV-2007 and her estimated delivery date was 18-AUG-2008. The patient contacted the physician for OB/GYN care. No problems were reported. At the time of the report, the outcome of the patient was unknown. No product quality complaint was involved. Follow-up information was received from a nurse practitioner and patient who reported that the patient delivered a normal healthy baby on 12-AUG-2008. The nurse practitioner reported that during the pregnancy the patient had a routine pregnancy ultrasound on 04-APR-2008, 23-JUN-2008 and 22-JUL-2008 and the results were normal. On 29-MAY-2008, the patient had a glucose screen and was normal. In further follow up, the patient reported that the baby was female and weighed 7 pounds, was 20 inches, the APGAR score was 8/9 and head circumference was 32. The infant was normal, with no congenital anomalies and there were no other complications. The patient had no complications during the pregnancy and labor/delivery. Infection during the pregnancy included a "staff" infection. The medications used during her pregnancy were LOVENOX, 40mg, daily (January to July 2008) and HEPARIN, 20mg, twice daily (July to August 2008) for the treatment of deep vein thrombosis. No further information is available.

MedDRA PT Condition aggravated, Drug exposure during pregnancy, Gestational diabetes

Symptom Text: Information has been received, for the Pregnancy Registry for GARDASIL, from a 24 year old female with a history of gestational diabetes who on 04-JAN-2008 was vaccinated with her first dose of GARDASIL. There was no concomitant medication. The patient reported that after receiving GARDASIL, she found out that she was 5 weeks pregnant. Her LMP was approximately 15-Dec-2007. A pregnancy test was performed. The patient did not seek medical attention. Follow-up information was received on 01-FEB-2008 via phone call from a person of a doctor's office indicating that they did not have any record of the patient ever receiving GARDASIL or any indication that she was pregnant. The patient was last seen in their office in November 2007. Follow-up information was received from a person of a doctor's office indicating that the Hispanic patient had 2 previous pregnancies and 2 pre-term deliveries. No birth defects occurred in previous pregnancies. The patient had pre-eclampsia and gestational diabetes in previous pregnancies. On 26-FEB-2008 an ultrasound was performed and the results were with normal limits. The patient was also placed on prenatal vitamins. Follow-up information was received on 03-NOV-2008 which confirmed that the patient had a past medical history of gestational diabetes. The patient developed insulin dependent diabetes during this pregnancy. She was treated with insulin human NOVOLIN (from 110JUL-2008 till EDC), 24 units, twice a day and insulin aspart NOVOLOG (from 11-JUL-2008 till EDC), 20/16 units, 20, every morning and 16, after supper. Other medication used during this pregnancy included prenatal vitamin (initialized on 20-MAY-2008), 1 mg, daily. On 02-SEP-2008, 37.3 weeks from her LMP, the patient delivered a normal male baby, weighing 7 pounds, 8 ounces. The baby's length was 19.5, head circumference was 13.5 and apgar score was 7/10. There were no congenital anomalies. There were no other complications or abnormalities. The patient had no complication during labor/delivery. Th

MedDRA PT Anaemia, Drug exposure during pregnancy, Foetal disorder, Postpartum depression

Symptom Text: Initial and follow-up information has been received through Pregnancy Registry for a 22 year old female consumer with 2 previous full term deliveries who on 28-AUG-2007 was vaccinated with a first dose of GARDASIL vaccine (lot # 656050/0245U). There was no concomitant medication. On approximately 04-Sep-2007, the patient had a pregnancy test which was positive (LMP approximately 04-JUL-2007). The patient reported having an ultrasound; however, no additional information was provided. The patient sought unspecified medical attention. On 30-OCT-2007, the patient had a positive pregnancy test. The estimated conception date is 27-JUL-2007. The estimated date of delivery is 09-APR-2008. In further follow up, a nurse practitioner reported that the patient delivered a female baby on 23-MAY-2008. The baby weighed 10 pounds 2 ounces, was 20 inches, and the APGAR score was unknown. The infant was macrosomic and had no other abnormalities or complications. During pregnancy, the patient experienced anemia (HgE 10.9). The patient experienced failure to progress because of the large baby during the labor/delivery. On 14-DEC-2007, the patient had an ultrasound which was within normal limits. On an unspecified date, the patient had a positive alpha-fetoprotein test. There were no infections or illnesses during pregnancy. Follow-up information was received from a nursing supervisor who stated that the patient went to their offices on 11-JUN-2008 suffering post-partum depression and was referred to "psych". Additional information has been requested.

MedDRA PT Drug exposure during pregnancy

Symptom Text: Initial and follow up information has been received as part of a Pregnancy registry for GARDASIL. A nurse practitioner and a certified medical assistant reported that a 25 year old female patient with no allergies and two previous pregnancies with full term deliveries and a bilateral tubal ligation (2006), on 11-OCT-2007 was vaccinated with GARDASIL. There was no concomitant medication. Subsequently the patient had a positive home pregnancy test. On 18-OCT-2007 the patient was seen in the office and underwent an ultrasound of the pelvis to confirm pregnancy. The patient's LMP was 01-SEP-2007 (EDD 29-MAY-2007). Follow-up information was received from a nurse who reported that the patient was scheduled at 39 weeks EGA for a repeat Cesarean section and delivered a healthy and normal male, weighing 7 lbs 3 oz. According to the nurse, the patient recovered postoperatively without problems. Additional information is not expected.

MedDRA PT Arthralgia, Inappropriate schedule of drug administration, Pain in extremity, Rheumatoid arthritis

Symptom Text: Diagnosed with rheumatoid arthritis on 01/08/2009 by a rheumatologist at a research center. I am 28 years old, and first noticed pain in feet about 1 month after 2nd round of GARDASIL. I didn't think about any connection at the time, but joint pain, etc had worsened over the year, and my hands, fingers, shoulders, feet really hurt, so I finally went to rheumatologist, everyone saying it sounded like arthritis. There is not a history in my family of arthritis, and I am a healthy person, work as athletic trainer at university. After my feet started hurting, I switched shoes, got insoles, thought wearing flip flops a lot may be causing problem. Nothing has really helped. I had some blood work last summer, checking for some idea of the problem, no problems. I can't help fut feel there is a connection between my early onset of arthritis and this vaccine. I see other people have had similar problems. I just want to find out if there could be a conneciton, and possibly help with my diagnosis, recovery. I don't want to be on arathritis meds the rest of my life! Please contact me with any help in this matter if Merck has some suggestions to help me.

MedDRA PT Chest discomfort, Deep vein thrombosis, Dizziness, Dyspnoea, Dyspnoea exertional, Familial risk factor, Headache, Hypercoagulation, Intensive care, Orthostatic hypotension, Pulmonary embolism, Pyrexia, Tachycardia, Tachypnoea

Symptom Text: Patient received HPV vaccine on 10/23/07 and 12/31/07. On 2/25/08 patient presented with breathing difficulty and was diagnosed with pulmonary embolism. Sibling and mother subsequently diagnosed with Protein S deficiency and patient presumed to have this as well. Patient began OCPs 10/07. Pulmonary embolism likely related to underlying hypercoagualability and use of OCPs, but we are reporting just in case HPV could also have been a factor. 01/26/09 Reviewed hospital medical records of 2/25-3/4/2008. FINAL DX: bilateral pulmonary emboli w/left common iliac DVT. Records reveal patient experienced DOE x 3 weeks & acute SOB w/chest pressure on 2/25. Fever & dizziness 2 weeks prior. Frontal HA 1 week prior. Seen by PCP 2/25 & found to have tachycardia, tachypnea, orthostatic BP. Admitted to PICU. Cardio, vascular surgery, Heme, Pulm consults done. Tx w/anticoagulant meds. D/C to home on continued anticoagulant meds w/thrombotic w/u to continue as outpatient in Hematology clinic. 4/24/09 Received Heme clinic med recs of 3/4/08-1/13/09. FINAL DX: PE assoc w/OCP Records reveal coumadin d/c 7/14/08 & covered w/lovenox to permit protein s testing. Patient self d/c coumadin as of 1/13/09 & no further medical records available.

Other Meds: Orthotricyclen prescribed 10/23/07

Lab Data: LABS: EKG abnormal w/biatrial enlargement w/RV strain. Troponin 2.13(H). Chest CT scan c/w large bilateral PEs. Echocardiogram abnormal w/RV enlargement, tricuospid regurg, pulmonary HTN.

History: PMH: BCP since 10/07. Preemie w/NICU & intubation. ITP at 2-3 yo. Sibling w/intrauterine CVA, cerebral palsy & protein s def; aunt w/DVT; parent & grandparent w/protein s deficiency; parent w/no hx of thrombosis & not on coumadin; grandparent w/recurrent thrombosis.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Activities of daily living impaired, Diarrhoea, Emotional distress, Fear of death, Injection site pain, Injection site swelling, Vomiting

Symptom Text: Mother of patient called immunization clinic at 1:15pm today 01/09/2009 asking for nurse who administered vaccination to her daughter. Mother claims daughter came home from high school today (01/09/2009) sick, having vomiting and diarrhea, with pain to the right upper arm and looked swollen. Mother believes child will die from the HPV ("the girls shot") due to information she gathered from her internet search. Mother stated "What should I do?". I expressed concern and needed more data from mother and crossed-check clients immunization consent form from 01/08/2009. It indicates that I was the administrator of the immunizations and that the HPV #1 dose was given on the Left Upper Deltoid (IM) and the Meningococcal Conjugate (MCV) on the Right Upper Deltoid (IM) with the Varicella #2 dose to Right lower arm Tricep (SQ). I strongly recommended Ice Pack or Ice Cubes inside a zip-lock bag as tolerated by client to Right Arm and/or what mother has previously given child for muscle discomfort, like Tylenol or Mortrin. If S/S continued next 24hours, mom would need to take daughter to ER of choice for follow-up. Mom agreed. 1/12/09 T/C to Mom states pt is no longer ill but mentally scared & will not go to school. Has not seen MD or gone to ER. Only researched on internet & is now afraid she is going to die. Not physically ill. Strongly encouraged Mom to have patient seen by MD or go to ER for reassurance & medical testing. Refuses. Gave Mom CDC NIP info phone # for additional info.

Other Meds: Unknown

Lab Data: Unknown

History: NKA, Last Menstrual Cycle :"12/22/2008" per mom and client statement.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Burning sensation, Erythema, Oedema peripheral, Pruritus, Rash

Symptom Text: 1/7/09@1000-Patient calls this office and speaks to this nurse. States that @ approx. 0630 today she woke up to itchy red bumps all over her (R) arm and (R) arm was swollen, when itched the rash left a greasy residue on her fingers and stated "it felt like my arm was on fire". Patient states @ this time the (L) arm that she got the gardasil injection in was not bothering her at all. Patient stated that she took benedryl (1)p.o. at approx 1100 and itching stopped shortly there after, but rash remained. Patient denies any S.O.B. scratchy throat, or any difficulty breathing. Instructed patient to take benedryl as directed on box and if symptoms worsened to contact Primary physician or Emergency room if needed. I requested at this time for her to come to the clinic for evaluation. 1/7/09@1300 Patient states that rash started on (L) forearm and started to itch and spread up to (L)deltoid. 1/7/09@1620 Patient is here at clinic raised red bumps are seen to (R) & (L) arm that cover the forearm and extend to the deltoid. Patient raised her shirt and no bumps are noted to her back, abdomen, or breast area. Does state that the back of lower (R) leg is itchy but I did not visually see this part and patient states that it is not bothering her like the arms are. Encouraged at this time to follow up with a primary care provider and to continue taking the benedryl as directed on the box. Also encouraged either calamine lotion or over the counter benedryl cream/spray to help with itching. Patient denies anything else new being introduced to her that could cause a reaction at this time. 1/8/09 Was contacted by RN, on this day. Patient states that there is no more itching and the red areas are almost gone.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Asthenia, Fatigue, Feeling cold, Gait disturbance, Headache, Hypersomnia, Hypoaesthesia, Paraesthesia, Sensation of heaviness

Symptom Text: Woke up that Sunday a.m. feeling very tired. Complained of arms feeling heavy and a headache. Later that day complained of numbness and tingling which progressed bilaterally up both her arms throughout that day and into the next several days. Complained of being cold. She slept up to 16 hours/day. Contacted the physician on-call on Monday (Labor Day) who suggested that we wait a week to see what course the symptoms took. Symptoms continued and progressed to complaints of difficulty walking due to heaviness of legs. Numbness and tingling progressed above elbows, but no further. No difficulty breathing. On Wednesday we went to see her primary care physician who felt she had mono, and that it was not related to the HPV vaccine. (patient had NO sore throat) Her doctor ran blood tests, but these returned negative for mono. Patient began to get less tired and less weak beginning on Friday, September 5th, during the day, but then returned to the weakened state on Saturday through Tuesday. And then rapidly recovered to her usual self by Saturday, September 13th. She has had no recurrence of the symptoms since. (NOTE: Her maternal grandfather was diagnosed with Myasthenia Gravis at age 70, and a cousin on her mother's side has Juvenile Rheumatoid Arthritis that first surfaced after a tetanus vaccine when she was 10 years old).

MedDRA PT Drug exposure during pregnancy

Symptom Text: Information has been received from a health professional via CSL as part of a business agreement (manufacturer control # GARD 2008 10 30 002), with follow-up information received from the health professional, concerning an 18 year old female who on 07-MAR-2008 was vaccinated with the second dose of GARDASIL (Lot # 658275/0784U, Batch #J3206, Expiry date 22-MAR-2010). At the time of vaccination with her second dose, the patient was not aware that she was 10 weeks pregnant. On 17-SEP-2008 the patient delivered a normal, healthy female baby weighing 2.83 kilograms. The baby was reported to be healthy and no abnormalities were observed. Follow-up information was received from the reporting health professional, via CSL. The infant was born at 37 weeks gestation with APGAR scores of 9 and 10. The infant was admitted to hospital in the first few weeks of life due to sepsis. This was successfully treated with intravenous antibiotics. The reporter stated that it was uncertain whether the infant's sepsis was related to exposure to GARDASIL. Additional information is not expected.

MedDRA PT Caesarean section, Complication of delivery, Drug exposure during pregnancy

Symptom Text: Information has been received from a general practitioner through the Sanofi Pasteur MSD pregnancy registry concerning a 17 year old female patient started a spontaneous pregnancy (estimated conception date: 15-Feb-2008) 5 days after receiving a dose of GARDASIL (batch number not reported) on 10-FEB-2008. The patient had no medical or obstetric history. Estimated delivery date was 15-NOV-2008. No adverse effect was reported. Follow-up information has been received through the Sanofi Pasteur MSD pregnancy registry initial questionnaire: Vaccination date was reported as 01-FEB-2008 (previously reported as 10-FEB-2008). Estimated date of conception was on 14-FEB-2008. Echographies at 12, 22 and 32 amenorrhea weeks were normal. The patient had no amniocentesis. Follow-up information received through the outcome pregnancy questionnaire on 08-JAN-2009: Case upgraded to serious. There was no complication during pregnancy. Diagnostics performed during pregnancy were normal. There was no infection and no disease during pregnancy. There were complications during the labour and the patient had a caesarean section on 30-OCT-2008. She gave birth to a normal baby girl at 38 amenorrhea weeks. Baby's height was 46 cm, weight was 2.835 kg, cranian perimeter was 33 cm. Other business partner numbers include E2008-02173. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Abdominal pain, Abdominal pain upper, Arthralgia, Asthenia, Back pain, Cough, Dermatitis contact, Dizziness, Headache, Immunisation reaction, Musculoskeletal discomfort, Myalgia, Neck pain, Otitis media, Pain in extremity, Rash, Rash maculo-papular, Sinusitis, Upper respiratory tract infection, Vaccine positive rechallenge, Viral infection

Symptom Text: My daughter recived the first HPV guardasil shot on 9-16-2008. She received meningococcal vaccine at the same time. After the first shot she had a very unusual rash breaking out lasting for about 2 weeks. I did not make the connection until after the 2nd HPV shot on 11-19-2008 when it happened again. In addition this time she had severe neck and back pains severe stomach cramping dizey spells,and feeling weak. It has been 2 months since the 2nd shot. Her doctor has seen her still rash talked to her about her other symptoms that have for the most part cleared up. My daughter will be getting a barage of blood work tomorrow. She is a highly allergic child and had the CDC done a better job of educating parents on their pamplets I would have never never ever let my daughter get this shot. I do not believe children that are chemically sensitive dyes excetra should ever have this shot. To this day the CDC in their pamplet still says there are NO seriouse side effects. 2/24/09 MR received from PCP from 10/8/08 to 2/05/09. WCC 10/8/08 with normal exam. HPV#2 11/19/08. Returned 12/5/08 with c/o neck and back pain and URI sx. PE (+) for discomfort when palpating musculature of posterior neck along T-spine. Impression: URI. BSOM. Neck and Back pain-suspect muscular. Returned 1/9/09 with facial rash and intermittent R hip and leg pain, abdominal cramps on and off. PE (+) for mauculopapular rash face, chest & extremities. Impression: Contact dermatitis. R leg pain now resolved. Vaccination reaction per hx. Returned 2/5/09 with c/o H/A, joint pain, neck soreness and cough. Imp: viral syndrome. sinusitis.

Seriousness: DIED, SERIOUS

MedDRA PT Autopsy, Death

Symptom Text: My daughter had her 3rd GARDASIL vaccine in Sept. She was a very healthy young lady, she went to take a shower and died. Autopsy report states undermined death. There was no sign of trauma to the body to indicate a fall. She had pointed the shower head away from her and she got down on her knees and put her head on the edge of the tub and passed away. This has been a living nightmare for her family. She is not the only one to have had problems and death from this vaccine. Please I beg you to please take it off until it can be further tested. -not tested long enough to begin with- There will be others that will die if the cause is not found. 1/29/09-records received-COD-undetermined.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Arthralgia, Inappropriate schedule of drug administration, Pain in extremity, Rheumatoid arthritis

Symptom Text: Diagnosed with rheumatoid arthritis on 01/08/2009 by a rheumatologist at a research center. I am 28 years old, and first noticed pain in feet about 1 month after 2nd round of GARDASIL. I didn't think about any connection at the time, but joint pain, etc had worsened over the year, and my hands, fingers, shoulders, feet really hurt, so I finally went to rheumatologist, everyone saying it sounded like arthritis. There is not a history in my family of arthritis, and I am a healthy person, work as athletic trainer at university. After my feet started hurting, I switched shoes, got insoles, thought wearing flip flops a lot may be causing problem. Nothing has really helped. I had some blood work last summer, checking for some idea of the problem, no problems. I can't help fut feel there is a connection between my early onset of arthritis and this vaccine. I see other people have had similar problems. I just want to find out if there could be a conneciton, and possibly help with my diagnosis, recovery. I don't want to be on arathritis meds the rest of my life! Please contact me with any help in this matter if Merck has some suggestions to help me.

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a gynaecologist, for the Pregnancy Registry for GARDASIL, concerning a 20 year old female who on 28-MAY-2008 was vaccinated with a first dose of GARDASIL while she was pregnant. The patient started pregnancy on 30-MAR-2008, and received the second dose of GARDASIL on 04-AUG-2008. She discovered her pregnancy on 25-AUG-2008. At time of reporting, she had no adverse reaction. Follow-up information was received by phone from the reporter: Case was upgraded to serious. A voluntary termination of pregnancy was reported. No further information is available. The case is closed. Other business partner numbers included E2008-08038.

MedDRA PT Drug exposure during pregnancy, Tendonitis, Threatened labour

Symptom Text: Information has been received from a physician. The physician reported case of pregnancy through the Sanofi Pasteur MSD GARDASIL Pregnancy Registry on 10-OCT-2008. A female patient received first and second dose of GARDASIL, (batch number not reported) on unspecified dates while she was pregnant: the first dose was administered at 3 amenorrhea weeks and the second dose at 11.5 amenorrhea weeks. At time of reporting there was no adverse effect. Follow-up information received by phone from the reporter on 09-Jan-2009: Case upgraded to serious. The patient was 18 years old at time of events. Her last menstrual period was on 19-Apr-2008 and she started a spontaneous pregnancy. She had received a dose on 30-Jul-2008 at 11 and a half amenorrhea weeks. She discovered her pregnancy at 22 amenorrhea weeks on 07-OCT-2008. On 18-NOV-2008 she was hospitalized for a threatened premature labor and was prescribed LOXEN 50mg. She consulted on 19-DEC-2008 for a shoulder tendinitis. At time of reporting the outcome was not specified. The reporter did not follow her pregnancy but could provide more information if needed. Other business partner numbers include E200809458. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Drug exposure during pregnancy, Intra-uterine death

Symptom Text: Information has been received from a specialist concerning a female who on JAN-2008 was vaccinated with the first dose of GARDASIL (Lot and batch number not reported) while she was at 5 amenorrhea weeks. The patient ignored her pregnancy at time of vaccination. At time of reporting the patient had no adverse effect, echography during pregnancy was normal. The reporter did not see the patient yet she had just received a letter from the gynaecologist who followed her. The patient should give birth soon. This case was not enrolled in the Pregnancy Registry: patient's age was unknown. Other business partner numbers included: E2008-09680. Additional information was received from a specialist who reported that a corrective version was created on 12-Dec-2008 to enroll the patient in the Pregnancy Registry. Follow-up information received through the outcome pregnancy questionnaire on 06-Jan-2009: Case upgraded to serious. The patient was 18 years old. There was no congenital anomaly, no genetic problem in the family, no consanguinity with the partner. The patient had medical risk factor with smoking (10 cigarettes/day). There was no complication during this pregnancy. Diagnostics performed during pregnancy were normal. There was no infection and no disease during pregnancy. Pregnancy seemed to be not followed by the reporter. On 17-Sep-2008 at 17 amenorrhea weeks the patient suffered from an idiopathic early foetal death in utero. Products of conception were analyzed: there was a normal but sanguinolentis foetus. Died baby boy's weight was 0.3 kg, he was normal, without any post-natal complication and no congenital anomaly. The case was closed. No further information was expected.

MedDRA PT Convulsion, Dyskinesia, Dyspnoea, Rash, Tremor

Symptom Text: Information has been received from a nurse practitioner concerning a 17 year old female with no medical history and drug allergies who on 31-DEC-2008 was intramuscularly vaccinated with the third 0.5 ml dose of GARDASIL. She had no problems after receiving the 1st and 2nd doses of GARDASIL. At 22:30 on 02-JAN-2009, 48 hours later, the patient experienced seizure type activity and convulsions, 2 more occurred by 23:30 during which time she was taken to the hospital. It was decided in the emergency room to take the patient to a children's hospital early on 03-JAN-2009. The patient had a total 13 seizures type activities or convulsions but it was unclear the specific time frame. Laboratory tests included an magnetic resonance imaging, ultrasound of the kidney, and "lots of unspecified lab work" (one of the results were normal kidney function). The patient has one more episode after being discharged from the hospital on 04-JAN-2009. The patient was put on XANAX and her mother felt it had helped control the seizure type activity and convulsions. The patient started KEFLEX and AZO for urinary tract infection on 02-JAN-2009. The seizures type activities or convulsions was considered to be disabling. Additional information has been requested. 2/2/09-records received for DOS 1/3-15/09-DC DX: Spells. presented to ED with difficulty breathing, rash and episodic jerking. Rash on back, chest and neck and felt short of breath. Rash would come on with shaking and improve when shaking stopped.

Other Meds: Unknown

Lab Data: Unknown 2/2/09-records received-Renal ultrasound normal. Labs WNL. MRI brain normal.

History: None 2/2/09-records received- PMH: GTC seizure at 8 years of age andmultiple episodes of passing out with exercise and hypoglycemia. Urinary tract infection. Staph knee infection last year.

Prex Illness: 2/2/09-records received- Dysuria, left flank pain times 5 days. After first dose of Keflex felt lightheaded, fall to ground with

Seriousness: ER VISIT, HOSPITALIZED, SERIOUS

MedDRA PT Drug exposure during pregnancy, Premature labour

Symptom Text: Information has been received, for the Pregnancy Registry for GARDASIL, from a nurse practitioner concerning a 16 year old female with no pertinent medical history who on 03-JUN-2008, "while pregnant", was vaccinated with a first dose of GARDASIL. It was reported that the patient was hospitalized for delivery. On 14-SEP-2008 the patient delivered healthy, but premature twins. The babies were about 29 week gestation. It was reported that the babies were healthy, but had "typical premature problems". On 14-SEP-2008 the mother recovered. Follow-up information was received on 08-JAN-2008 via a telephone call from the N.P. in a pediatric practice where the mother was seen. On 03-JAN-2008 the mother received her first dose of GARDASIL (Lot #659180/1758U, expiration date 25-JUN-2010). The nurse was unaware if the patient received any subsequent doses of GARDASIL, there was no record of any further doses given in their office. The nurse did not have any specific information about the patient's obstetrical history, as the next time they saw the patient, she was there with the babies. The babies were born on 14-SEP-2008, both are male. There was no record of the mother's estimated conception date, but the babies were reported to have been delivered at 29 weeks gestation (delivery type was not reported). The nurse did not know if the patient's hospitalization was longer than a "typical" stay for a vaginal or C-section delivery. It was reported that baby "A" weighed 1420 grams and baby "B" weighed 1450 grams. Baby "A" spent one month in the Neonatal Intensive Care Unit and required one week on a ventilator. He had no bleeds, however was diagnosed with necrotizing enterocolitis, which resolved with a formula change. On 15-NOV-2008 baby "A" was re-admitted to the hospital for two days with pneumonia (no further details). Baby "B" was "OK" as far as the nurse knew, no ventilator and no bleeds. Upon internal review, "premature baby with 29 weeks gestation" was determined to be an other important medical event. Additional informa

MedDRA PT Abdominal pain, Activities of daily living impaired, Anorexia, Asthenia, Autonomic nervous system imbalance, Condition aggravated, Fall, Fatigue, Fibromyalgia, Gait disturbance, Gastrointestinal inflammation, Hypoaesthesia, Lethargy, Migraine, Muscle spasms, Myalgia, Pain, Pallor, Paraesthesia, Syncope, Vaccination complication, Vaccine positive rechallenge, Weight bearing difficulty

Symptom Text: Within 3 days of receiving the 2nd round of the HPV vaccination, my daughter began with severe pain in her arms, legs, and hips, difficulty walking which progressed to needing assistance, excruciating pain, numbness/tingling in her lower extremities/feet with weakness in her legs, inability to hold up her body weight, legs would buckle and she would fall when trying to stand, constant muscle cramps and charly horses just with normal movement, her skin was painful to touch, severe aching even with rest, fatigued, pale, lethargic, generalized weakness. 1/21/09 MR received for DOS 1/1-2/2009 with D/C DX: Fibromyalgia. L lens cataract s/p surgical correction. Idiopathic anaphylaxis. H/o syncopal spells. GERD. Migraine H/As. S/P T&A. H/o prematurity. Pt presented to ER with c/o generalized muscle pain, paresthesias and weakness since vax on 12/17/08. Pt has been "bed bound" except for trips to BR with assistance. Also reports generalized weakness, fatigue and anorexia. Currently tapering off steroids prescribed by PCP. PE (+) for antalgic gait and lower extremity pain. 2/20/09 MR received. Pt initially presented 12/26/08 with c/o pain all over since 2nd HPV shot. Had some aches after 1st but pain flared after most recent. Seen by GI for abdominal pain and given dx of inflammation if GI. Assessment: Adverse reaction to Gardasil flaring ANS.

MedDRA PT Blood glucose abnormal, Dehydration, Disorientation, Dizziness, Nausea, Rash, Urinary tract infection, Vomiting

Symptom Text: Information has been received from a registered nurse concerning a 15 year old female patient with no known drug allergies, who on 22-AUG-2007 was vaccinated with the first dose of GARDASIL (lot#657736/0389U) 0.5ml intramuscularly at the health department. In October 2007, the patient started experiencing nausea and vomiting, which required hospitalization twice for dehydration. The patient also experienced episodes of rash, dizziness, disorientation, "problems with blood glucose", and urinary tract infections. Patient sought medical attention by calling the health department. The patient has been evaluated by an unspecified endocrinologist but a diagnosis has not been made at the time of the report. A colonoscopy and other unspecified tests were performed which were negative. Patient received her second and third dose of GARDASIL on unspecified dates. At the time of this report the patient had not yet recovered. This is one of several reports received from the same source. Additional information has been requested.

MedDRA PT Bronchospasm, Ocular hyperaemia, Rash

Symptom Text: Information has been received from a physician concerning a 22 year old female patient with no pertinent medical history and no known drug allergy who on 07-JAN-2009 was vaccinated with the first IM dose of GARDASIL (lot # 659184/0843X). Concomitant therapy included hormonal contraceptives (unspecified). On 07-JAN-2009 the patient experienced redness of the eye, bronchospasms and rash pennciallian. The patient went to ER (it was not known if the patient was admitted). At the time of this report, the physician stated that the patient was fine. Redness of the eye, bronchospasms and rash pennciallian were considered to be immediately life-threatening. Additional information has been requested.

MedDRA PT Activities of daily living impaired, Fibromyalgia, Insomnia, Myalgia, Pain

Symptom Text: Information has been received from a physician concerning a 15 year old female with no previous medical, family, or social history who on 19-NOV-2007 was vaccinated with a first dose of GARDASIL IM. The patient's mother told the physician that a few weeks after the GARDASIL, the patient had body aches and generalized pain. The patient was seen by her pediatrician and a neurologist, and they both thought that it was from GARDASIL. The neurologist had diagnosed the patient with fibromyalgia. CPK was elevated. At the time of reporting, the patient was being treated with cyclobenzapine hydrochloride (MSD), melatonin, imipramine, and chiropractic therapy for the pain and insomnia. The patient has missed many days from school and volleyball because of the fibromyalgia. At the time of reporting, fibromyalgia persisted. The reporter considered fibromyalgia to be disabling. Additional information has been requested. 1/29/09-According to the general practitioner, fibromyalgia persisted while insomnia was being controlled on medication (not recovered).Onset Date: Approximately December 2007 ("a few weeks after Gardasil", per pt's mother) 2/17/09-records received for DOS 7/23/08-neurology notes-C/O muscle aches and pains as well as sleep disturbance. Previously evaluated on 5/12/08, continues with pain on an almost daily basis. However no discomfort in past few days. Impression:history of severe pain in legs and arms and along cervical spine. Sleep disturbance resolved with use of Seroquel. No neurological cause of pain. No rheumatology consult at this time due to insurance issues.

Other Meds: Unknown

Lab Data: plasma creatine kinase, elevated 2/17/09-records received-MRI brain normal, MRI cervical spine minimal bulge at C5 to C6. Pseudotumor Chiari malformation and spinal instability ruled o ut. EMG and nerve conductions tudies normal. CPK sligh

MedDRA PT Convulsion, Dizziness, Feeling hot, Inappropriate schedule of drug administration, Loss of consciousness, No therapeutic response

Symptom Text: Information has been received from a health professional concerning a 19 year old female patient who on 17-DEC-2008 was vaccinated with the first dose of GARDASIL IM into her right arm (lot # 661766/0652X). On 17-DEC-2008 the patient also received MENACTRA and Tdap in her left upper arm. On 17-DEC-2008 ("a few seconds later") the patient experienced convulsed and passed out. The patient stated that she didn't feel funny after the first two shots. When she received GARDASIL she felt a rush of warmth in her arm then she experienced lightheaded and blacked out. At the time of reporting, the patient had recovered. It is unknown if the patient sought medical attention. Upon internal review, convulsed was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Arthralgia, Joint swelling, Oedema peripheral, Pain in extremity, Spondylitis, Tenosynovitis

Symptom Text: Information has been received from a health authority concerning a 19 year old female adult who received on 27-OCT-2008 one intramuscular dose (0.5 mL) of GARDASIL (Lot number and site of administration not reported). On 06-NOV-2008, she noticed pain in her legs, distal of her knees with swelling in the ankle and the back of her feet. The pain was particularly pronounced in the evening and led to immobilization. The symptoms initially improved with therapy of mefenamic acid, but then turned back. The patient was hospitalized on 20-NOV-2008. In the area of the forefoot on both sides tendovaginitis was diagnosed, which improved initially after injection of steroids. In order to be pain free the patient was additionally treated with systemic NSAIDS. The laboratory and serological tests showed the following results: Leukocytes and CRP within the normal range, blood sedimentation rate of 14 mm slightly increased, HLA-B27, rheumatoid factors, anti CCP antibodies, antinuclear antibodies negative and virus serology negative. Complement reaction on Campylobacter jejuni with 1:30 reactive. A reactive tendovaginitis/arthralgia as well as a first episode of a seronegative spondylarthritis diagnosed by the HCP as probable causality. On 24-NOV-2008, the patient complaining discarded from hospital without symptoms. Other business partner numbers included: E2009-00095. Additional information has been requested.

Other Meds: Unknown

Lab Data: WBC count, normal range; Serum ANA, negative; Serum C-reactive protein, normal range; Serum Campylobacter jejuni Ab, complement reaction with 1:30 reactive; Serum cyclic citrulline peptide IgG Ab, negative; Serum rheumatoid factor, negative

MedDRA PT Abasia, Alopecia, Amnesia, Blood pressure decreased, Dyspnoea, Fatigue, Hypoaesthesia, Loss of consciousness, Malaise, Muscle spasms, Muscle twitching, Nausea, Paralysis, Tremor

Symptom Text: Information has been received from an internet report concerning a 16 year old female who in August 2007 received a first dose of GARDASIL and a dose of meningococcal vaccine (unspecified). In October 2007, the patient was vaccinated with a second dose of GARDASIL. The patient did not receive any other shots with her second dose of GARDASIL. It was a month or so after the second dose (in approximately November 2007) that the patient started getting sick. It was reported that the patient "played four sports, danced in her high school's show choir and earned top grades without even trying". The patient, at time of reporting, was exhausted all the time. She was nauseated. She passed out at show choir and blacked out at school. One day her legs went numb. She couldn't walk. It was reported that for a year, the patient had experienced four episodes of temporary paralysis, back spasms so painful "patient would tell her mom 'bye' and stop breathing", hospitalizations, "more 911 calls than the patient could count". Trip after trip to doctors who couldn't seem to find anything wrong. The patient's mother stated that she was convinced the vaccine "turned her perfectly healthy daughter into a chronically ill teenager". It was reported that the patient's hair fell out in clumps. Her nausea was ever present. Her blood pressure dropped dangerously low. She couldn't breathe. Most of the time, the patient couldn't remember what she had read from one day to the next. It was reported that when the patient tried out for basketball at her high school this year, her legs were shaking and she couldn't breathe after two drills. The patient was taking "a handful of pills every day and had to carry a special bag of medical supplies in case she had an 'episode'". It was reported that when the patient had good days, "she knew the twitches in her back and the funny feeling in the back of her head would come back, signaling another episode. Her blood pressure would plummet. She would hear her mother or her boyfriend talking to her, but she w

MedDRA PT Back pain, Chest pain, Headache, Immediate post-injection reaction, Muscular weakness, Nausea, Nodule, Pain in extremity, Pruritus, Rash

Symptom Text: Immediately after receiving shot,severe pain in injection arm.Had to rest for 10mins in office.Beginning the next day, had a painful knot in back, pain in left lung if deep breath is drawn, muscle weakness on left side from shoulder to fingertips all the way down to toes, muscle weakness, nausea, headache,rash on neck and itchiness on chest.These symptoms progressed and got worse and by Friday. Call Dr's office. Was told the symptoms I described had nothing to do with the Gardasil Shot. After I pressed the issue, the doctor returned my call, stated their office could do nothing and suggested I should see my primary care physician. The primary care doctor was booked solid so went to urgent care center. The doctor on duty did not know much about gardasil and suggested we go to the emergency room at another hospital if symptoms got worse. I took my daughter home and watched over her. She did begin to feel better and as of today the symptoms have subsided. This was her 2nd gardasil shot, the first was given 7/2008. She is scheduled to receive the 3rd shot on 2/3/2009. I am very afraid to have the 3rd shot administered because of the difficulty she experienced with the 2nd shot and the lack of support she received from her doctor and the urgent care doctor.

Other Meds: yaz birth control

Lab Data: A blood test was done at the urgent care office for any abnormality and results were okay.

MedDRA PT Dizziness, Inappropriate schedule of drug administration

Symptom Text: Information has been received from a pharmacist concerning a 12 year old female patient who on 28-APR-2008 was vaccinated with the first dose of GARDASIL (Lot # 659962/1740U), intramuscularly. Concomitant therapy included diphtheria toxoid (+) pertussis acellular vaccine (unspecified) (+) tetanus toxoid, VARIVAX and MENACTRA. The pharmacist reported that the patient had been experiencing dizzy spells since receiving her first dose of GARDASIL. The dizzy spells began on 15-05-2008 and she had had 25-30 dizzy spells since that time. The pharmacist reported that GARDASIL series had been completed, the dates of those immunizations was unknown by the pharmacist. At the time of the report, the patient had not recovered. The patient sought medical attention through an office visit. No further information is available.

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a registered nurse concerning a 22 year old female with penicillin and amoxicillin allergy who on 19-JUN-2008 was vaccinated intramuscularly with the first 0.5 ml dose of GARDASIL (Lot # 660555/0279X) while she was pregnant. Concomitant therapy included ADDERALL TABLETS and oral hormonal contraceptives (unspecified). Her last menstrual period was 15-MAY-2008 and the expected delivery date was 19-JUN-2008. On 31-JUL-2008 the patient had a fetal ultrasound that showed a 10 week and 5 days gestational age fetus with positive cardiac activity. A pregnancy Ultra-screening test was performed with abnormal results. It showed an increased risk, 1 in 10, of having a baby with Down's syndrome. On an unspecified date, the patient elected to terminate this pregnancy. After the pregnancy was terminated, on 25-NOV-2008 the patient received the second dose of GARDASIL (Lot 661764/0650X). Upon internal review, the elected termination of pregnancy was determined to be another important medical event. Additional information has been requested.

MedDRA PT Neurological examination, Petit mal epilepsy

Symptom Text: Information has been received from a gynecologist concerning a 17 year old female patient who was vaccinated with a second dose of GARDASIL (lot number not reported) IM into the upper arm on 23-DEC-2008. "After Christmas", exact onset not reported, she developed 6 to 7 episodes of petit mal epilepsy with "obstetrician's hand" {left hand} and absence attacks. The patient fully recovered from the episodes. To be noted that in October 2008, the patient underwent exhaustive neurological examinations (no results reported), the reason was unknown to the reporter. The first dose of GARDASIL, lot number not reported, administered on an unspecified date was well tolerated. Petit mal epilepsy was considered to be an other important medical event by the physician. Other business partner numbers included: E2009-00158. Additional information has been requested.

Seriousness: PERMANENT DISABILITY, SERIOUS

MedDRA PT Condition aggravated, Dissociative disorder, Facial pain, Headache, Sensory disturbance

Symptom Text: Information has been received from a foreign health authority (reference No. PEI2008021013) concerning a 15 year old female patient with history of headache (onset some years ago, at least since March 2007) and family anamnesis of migraine (patient's mother) was vaccinated with a first dose of GARDASIL (batch number NF2330, lot #1518F), route and site not reported on 23-JUL-2007, with a second dose of GARDASIL (batch #NG00010, lot # 1401F) on 27-OCT-2007 and with a third dose of GARDASIL (batch # NF58540, lot # 0253U) on 18-FEB-2008. The frequency of the pre-existing headache increased during the last years and the patient developed chronic headaches and took frequently analgesics. CCT in April-2008 showed normal results. Tension headache and development of headache due to analgesics were suspected. Atypical face pain and dissociative sensory disturbance were diagnosed when the patient presented at the physician practice for follow-up examination on 24-OCT-2008. EEG on 24-OCT-2008 showed no changes. MRI and x-ray cervical spine showed normal results. Examination at an ENT physician was pending at the time of reporting. As the sensory disturbance (hemihypaesthesia) was limited to the median area a psychogenic cause was suspected, but the final cause could not clarified. At a control on 28-NOV-2008 the physical examination revealed normal results. Several therapies including acupuncture and osteopathy have been tried, but without success. HA coded only cephalgia. File closed. Other business partner number include: E2009-00147. No further information is available.

Other Meds: Unknown

Lab Data: electroencephalography, 24Oct08, Showed no changes; Physical examination, 28Nov08, normal results; Magnetic resonance imaging, showed normal results; Spinal X-ray, showed normal results

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Information has been received from a nurse practitioner and a certified nurse midwife, for the pregnancy registry for GARDASIL, concerning a 21 year old female with no medical history, no known drug allergies and with no history of previous pregnancies who on 15-FEB-2008 was vaccinated IM with the first 0.5 ml IM dose of GARDASIL (lot # 659962/1740U). The patient received the second 0.5 ml IM dose on 15-Apr-2008 (lot# 659962/1740U). There was no concomitant medication. On 15-APR-2008 the patient had a positive pregnancy test result. The patient's LMP was 03-Mar-2008 and an estimated delivery date is 08-Dec-2008. No other symptoms were noted. Patient sought medical attention via an office visit. Follow up information has been received from a certified nurse midwife, for GARDASIL, a Pregnancy Registry product, concerning a 21 year old female patient. In May 2008, the patient was seen due to a miscarriage. It is not known if the patient had received any prenatal care prior to the miscarriage. Upon internal review, miscarriage was determined to be an other important medical event. No further information is available.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Abasia, Arthralgia

Symptom Text: Information has been received from a pediatrician that a 15 year old female patient was vaccinated with a third dose of GARDASIL (lot# not reported) approximately 4 weeks ago. "Shortly" p.v. the patient developed increasingly severe diffuse-spreading joint pain. Blood sample (not otherwise specified) showed normal findings. A rheumatological disease could be ruled out. The patient was remitted to a hospital for further clarification on 07-JAN-2009, symptoms were ongoing. Follow up information was received on 09-JAN-2009. The reporting form and laboratory findings were sent by the pediatrician: The patient with history of dysplasia of the elbows and wrists was vaccinated with a third dose of GARDASIL, lot #, site and route not reported, on 04-DEC-2008. On 08-DEC-2008 the patient developed joint pain of the large and small joints (knee, hip, shoulder, elbow, wrists and fingers). Symptoms increased and the patient was unable to walk. According to the reporter, the events occurred independently from the preexisting dysplasia of the elbows and wrists. Clinical findings were negative, no signs of inflammation, neither redness nor swelling. On 31-DEC-2008, Laboratory findings revealed normal values for ANA IgG (negative). RF (rheumatoid factor) -IgM (quantitative): 5.2 IU/ml (normal up to 15), Borrelia b. (Lyme) IgG and IgM antibodies: negative and Antistreptolysin (quantitative): 31U/ml (normal up to 150). Hemoglobin 12.1 g/dl (normal range 12.8-16.8 g/dl), LDH 148 U/L (normal range 160-278 U/L). Other routine laboratory findings showed normal results. Despite treatment with ibuprofen the patient has not recovered at the time of reporting. The first dose and the second dose of GARDASIL given on 12-JUN-2008 and on 12-AUG-2008 were well tolerated. Other business partner numbers include E200900064.

Other Meds: Unknown

Lab Data: diagnostic laboratory test, showed normal findings; hemoglobin, 31Dec08, 12.1 g/dl; serum ANA, 31Dec08, IgG negative; serum B. burgdorferi Western blot IgG Ab, 31Dec08, negative; serum B. burgdorferi Western blot IgM Ab, 31Dec08, negative;

MedDRA PT Abdominal pain, Abdominal pain upper, Asthenia, Chest pain, Chills, Cough, Diarrhoea, Dizziness, Epigastric discomfort, Fatigue, Headache, Lymphadenopathy, Malaise, Migraine, Myalgia, Nausea, Neck pain, Oropharyngeal pain, Pallor, Vomiting

Symptom Text: Information has been received from a physician concerning a 11 year old female with no pertinent medical history who on 12-SEP-2008 was vaccinated intramuscularly with a first 0.5 ml dose of GARDASIL (lot #660618/0572X). There was no concomitant medication. "Three months after administration of her first dose of GARDASIL", on 12-DEC-2008 the patient experienced weakness, sore throat, nausea, vomiting, diarrhea, paleness and abdominal pain. "One month later", the patient's symptoms had not resolved and she was also experiencing chest pain, headaches, dizziness, swollen lymph nodes, chills and myalgia. The patient had office visits. "White blood cell differential count and white blood cell count" were normal. "Four weeks ago", on approximately 12-DEC-2008, the patient was prescribed PRILOSEC. At the time of the report, 09-JAN-2009, the patient had not recovered. Follow-up information received on 12-JAN-2009 from the physician via medical records indicated that on 18-DEC-2008 the patient was taken to the physician's office for follow-up. It was reported that the patient had a sore throat and abdominal pain which persisted one month. The patient vomited for four times on 08-DEC-2008 (previously reported as 12-DEC-2008) and had a diarrhea "last week". There was no blood. The patient was treated with omeprazole, 2-3 times daily for 3 weeks. At the time of the follow-up visit, the patient's abdominal pain worsened and she also had chest pain with deep breath, cough, headaches which happened "every day for one week" and cough. Lab tests performed on 18-DEC-2008 included: giardia antigen was negative, stool culture revealed no salmonella, shigella or campylobacter SP. isolated, white blood cell count and white blood cell differential count were normal, Epstein-Barr viral capsid antigen immunoglobulin M antibody was negative, EBV capsid antigen immunoglobulin G antibody and nuclear antigen immunoglobulin G antibody were positive. It was reported that the patient's mother was suspecting that her daughter's "r

Seriousness: HOSPITALIZED, LIFE THREATENING, SERIOUS

MedDRA PT Coma, Convulsion, Encephalitis

Symptom Text: Information has been received from a physician concerning a 12 year old female who in June 2008, was vaccinated with the first dose of GARDASIL. On 8-JULY-2008, the patient was vaccinated with the second dose of the vaccine. On 13-JUL-2008 the patient experienced seizure and went into a coma. The patient was hospitalized. MRI scan result showed that the patient had right temporal lobe encephalitis. The patient has no medical history of seizures. Subsequently, after two weeks, the patient was discharged. The patient has recovered from seizure, coma and right temporal lobe encephalitis. The reporter felt that seizure, coma and right temporal lobe encephalitis were not related to therapy with GARDASIL. Seizure, coma and right temporal lobe encephalitis were considered to be immediately life-threatening. Additional information is not expected.

MedDRA PT Complex partial seizures, Conversion disorder, Dysgeusia, Electroencephalogram, Grand mal convulsion, Headache, Partial seizures, Status epilepticus, Tremor, Vaccine positive rechallenge

Symptom Text: Information has been received from a physician concerning a 13 year old female who was vaccinated with the first dose of GARDASIL, 0.5ml. Subsequently the patient experienced a shaking in her leg. After getting the second dose of GARDASIL 0.5ml the same experience occurred for almost 12 hours. The patient got checked for seizure activity however they did not diagnose her with that. The patient was hospitalized and the length of hospitalization was unknown. The patient did video EEG. At time of the report the patient was not recovered. Follow-up information has been received from a nurse concerning the patient who received two doses of GARDASIL. The nurse reported that the patient had a grand mal seizure (previously reported as the patient was not diagnosed with seizure activity) and was hospitalized. At time of the report the outcome of the patient was unknown. The patient had follow-up appointment scheduled with the physician on 21-JAN-2009. Additional information has been requested. 1/27/09 Rec vaccine records which did not include Lot #s. HPV #1 given 7/30/08; HPV #2 given 11/18/98. 1/27/09 Reviewed multiple hospital admit medical records: 12/15-12/16/2008 FINAL DX: status epilipticus Records reveal patient experienced seizure of approx 1 hour. Preceeded by HA & LLL shaking which proceeded to seizure. Pt w/history of seizures x 3 mo approx 2x/mo; rencently increased to daily & treated w/oral meds. Continued w/seizures while hospitalized & transferred to higher level of care. PMH: abnormal EEG & seizure disorder x 3 mos prior to current hospitalization. 1/4/-1/5/2009 FINAL DX: partial complex seizures. Tonic-clonic seizure activity began LLE & progressed to RLL & UEs x 10 min. Loaded w/antiseizure med, observed overnight & d/c to home 1/6-1/7/2009 FINAL DX: focal seizure disorder. Neuro consult done & patient transferred to higher level of care. 1/9-1/11/2009 FINAL DX: complex partial seizures Records reveal patient continued to experience seizures, metallic tast & HA. W/U at univers

MedDRA PT Abdominal pain, Activities of daily living impaired, Headache, Pyrexia, Rash maculo-papular

Symptom Text: Information has been received from a physician concerning a 17 year old female with no drug allergies who had recent urinary tract infection and completed a course of ciprofloxacin on 10-JAN-2009. She was intramuscularly vaccinated with the first 0.5 ml dose of GARDASIL on 12-JAN-2009. The patient developed a severe headache a few hours after receiving GARDASIL. The next day she developed a fever of 102F and a maculopapular rash on her face and trunk. On 14-JAN-2009 the patient developed abdominal cramping. She was examined in the office on 15-JAN-2009. A "rapid influenza test and monocyte test" were negative. Unspecified blood work was pending. The patient had been unable to attend school due to the severity of the headache. The patient did not recover at the time of reporting. No further information provided. Headache, fever, maculopapular rash and abdominal cramping was considered to be disabling. Additional information has been requested. 1/29/09-Follow-up from Merck on 1.28.09: PCP's nurse reported that the patient was given a Medrol Dose Pak and the symptoms of headache, rash, abdominal pain and fever resolved within a week

Other Meds: Ciprofloxacin

Lab Data: Diagnostic laboratory, 01/15?/09, rapid influenza test negative; Diagnostic laboratory, 01/15?/09, mononucleosis test negative; Temperature measurement, 01/12/09, 102 F

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Menorrhagia, Vaccine positive rechallenge

Symptom Text: Information has been received from health authorities concerning a 13 year old female with no previous reactions to other drugs, without known clinical history, without history of thrombocytopenia, clotting disorders or irregular menstruation who on 30-OCT-2008 was vaccinated with a first dose of GARDASIL (lot #1201U, batch #NH00900) via intramuscular route. On 08-JAN-2009, the patient was vaccinated with a second dose of GARDASIL via intramuscular route. On 30-OCT-2008, the patient, menstruated, experienced menstruation increased until 30-NOV-2008. The adverse reaction evolved towards cured, without any specific treatment being given. The patient menstruated again in the middle of December 2008. There was a re-challenge with the suspect drug on 08-JAN-2009 with reappearance of the menstruation on 09-JAN-2009. She had menstruated 2 weeks before. At the time of reporting the patient had recovered. Re-challenge was positive. To be mentioned that menstruation anticipated was not coded however the health authorities considered it as a positive re-challenge being as if it were the same adverse effect (menstruation increased). The reporter considered the adverse reactions as an other important medical event and serious. Additional information has been requested.

MedDRA PT Facial palsy, Facial paresis

Symptom Text: Information has been received from a health authority on 15-JAN-2009 (HA reference no. PEI2009000323) concerning a 13 year old female patient who on 22-MAY-2008 was vaccinated intramuscularly with the first dose of GARDASIL (Lot # 0354U, Batch # NF58150) into the left deltoid muscle. On 21-JUL-2008 the patient was hospitalized. Two days prior to the hospitalization the patient was not able to close her left eye. Neurological examination revealed at admission: drooped corner of mouth, forehead was unforrowed and eye lid did not close on the left side. Idiopathic left peripheral facial paresis was diagnosed in hospital. For laboratory findings please see Lab comments. Ophthalmological examination on 22-JUL-2008: normal finding except incomplete eyelid closure. ENT examination: No otitis media, no indication for zoster oticus. The patient was discharged on 22-JUL-2008 and recovered completely within a not specified time. The 2 year old sister had fever and diarrhea 2 weeks ago. The mother had headache and stomach ache for two weeks. The twin sister was hospitalized for serous meningitis on 17-JUL-2008 (WAES # 0901USA02688). The second dose of GARDASIL was given on 18-AUG-2008. No adverse event was reported. This case is closed. This is one of several cases from the same source. No further information is available.

Other Meds: Unknown

Lab Data: neurological examination, 21Jul08, drooped corner of mouth, forehead was unforrowed and eyelid did not close on the left side. Idiopathic left peripheral facial paresis was diagnosed; ophthalmological exam, 22Jul08, normal finding except in

MedDRA PT Anaemia, Anaemia haemolytic autoimmune, Hyperbilirubinaemia, Neutropenia

Symptom Text: Information was obtained on request by the Company from the agency, via a Case Line Listing and Public Case Details form, concerning a 13 year old female who on 22-OCT-2008 was vaccinated with GARDASIL, intramuscularly, as prophylactic vaccination. On 30-NOv-2008 the patient developed autoimmune haemolytic anaemia and was hospitalised. It was described that the patient developed autoimmune haemolytic anaemia with mild anaemia and unconjugated hyperbilirubinaemia and transient neutropenia. A direct antiglobulin test (DAT) was positive, autoantibody with apparent anti Jka specificity. No evidence of viral infection, SLE or immune deficiency was identified. The patient was treated with oral prednisone. At the time of reporting to the agency on 13-NOV-2008, the patient had not recovered from autoimmune haemolytic anaemia. The agency considered that autoimmune haemolytic anaemia was possibly related to therapy with GARDASIL. The original reporting source was not provided by the agency. Additional information is not expected.

Other Meds: Unknown

Lab Data: direct antiglobulin test, results - positive, autoantibody with apparent anti Jka specificity. No evidence of viral infection.

MedDRA PT Cognitive disorder, Convulsion, Emotional disorder, Gliosis, Mental disorder due to a general medical condition, Psychotic disorder, Vasculitis cerebral

Symptom Text: Information has been received from the foreign Health Authorities (Reference no.: PEI2008021098), concerning a 17 year old female patient, who on 18-SEP-2007, was vaccinated with the first dose of GARDASIL (toleration was not reported); on 20-NOV-2007, was vaccinated with the second dose of GARDASIL (toleration not reported) and on 11-MAR-2008, was vaccinated with third dose of GARDASIL, intramuscularly (Lot # and injection site not reported). Starting mid-Jun-2008, the patient developed cerebral vasculitis with acute psychotic symptoms and seizures. Cerebral biopsy, performed on 26-AUG-2008, revealed astrocytic gliosis. Lab finding showed increased number of cells in cerebrospinal fluid (=CSF). Despite of therapies with cortisone, neuroleptics and antiepileptics, the patient only improved slowly from the severe organic brain syndrome with slowdown, cognitive disorders and emotional symptoms. The cause of cerebral vasculitis remained unexplained. The patient had not recovered. Other business partner numbers included (E2009-00275). No further information is available.

MedDRA PT Caesarean section, Drug exposure during pregnancy, Foetal disorder

Symptom Text: Information has been received from a physician concerning a 22 year old female with no relevant medical history and no previous pregnancy who on 27-FEB-2008 was vaccinated with a dose of GARDASIL. On 27-FEB-2008 the patient started her last menstruation period. The patient started a spontaneous pregnancy (estimated conception date on 12-MAR-2008). On 20-MAY-2008, she had a normal ultrasound. No adverse reaction was reported. The date of delivery was estimated on 03-DEC-2008. Follow up information received through pregnancy follow up on 21-JAN-2009: Case upgraded to serious-other medically important event. There was no congenital anomaly, no genetic problem in the family, no consanguinity with the partner. The patient was occasionally smoking. There was no complication during this pregnancy. Diagnostics performed during pregnancy were normal. There was no infection and no disease during pregnancy. On 16-DEC-2008 there was a foetal distress during labour leading to proceed to a cesarean section. She gave birth to a normal baby boy. Baby's weight was 4kg 180 kilograms, height was 56 cm. Apgar score was 10 at 1 mn and 10 at 5 mn. There was no post-natal complication and no congenital anomaly. The patient occasionally used paracetamol during her pregnancy. Other business partner number included: E2008-05386. No further information is available.

Other Meds: None

Lab Data: Ultrasound, 20May08, normal; Apgar score, 16Dec08, 10 at 1 mn and 10 at 5 mn

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Bradypnoea, Hypotonia, Loss of consciousness, Syncope

Symptom Text: Information was obtained on request by the Company from the agency, via a Case Line Listing and Public Case Details form, concerning a 25 year old female who on 01-NOV-2008 was vaccinated with her third dose of GARDASIL. Subsequently, on 01-NOV-2008 the patient experienced loss of consciousness and bradypnoea and was hospitalised. It was described that the patient was vaccinated with her third dose of GARDASIL at 10:52 am without any obvious side effects. At approximately 11:20 am the patient's husband brought her back to the physician's waiting room in a limp, unconscious state. The patient had collapsed 30 minutes after injection. The physician could not feel a pulse, however, a more senior physician could, and the patient's blood pressure was 110/70 and her respiratory rate was low. The patient was taken to the emergency department of hospital, where she was treated with oxygen. She was observed for a few hours and then discharged. On 01-NOV-2008 the patient recovered from loss of consciousness and bradypnoea. The agency considered that loss of consciousness and bradypnoea were probably related to therapy with GARDASIL. Additional information is not expected.

Other Meds: Unknown

Lab Data: Blood pressure measurement, 01Nov08, 110/70, units not specified; Respiratory rate measurement, 01Nov08, low - bradypnoea

MedDRA PT Abdominal pain, Acute disseminated encephalomyelitis, Brain oedema, Chills, Cognitive disorder, Coma, Confusional state, Diarrhoea, Disseminated intravascular coagulation, Encephalitis, Endotracheal intubation, Extubation, Gait disturbance, Glossitis, Headache, Hemiplegia, Intensive care, Lethargy, Loss of consciousness, Miosis, Multi-organ failure, No reaction on previous exposure to drug, Ocular hyperaemia, Oral herpes, Photophobia, Posturing, Pyrexia, Rash, Renal failure acute, Respiratory failure, Septic shock, Sick relative, Strabismus, Toxic shock syndrome, Urosepsis, Vision blurred, Visual impairment, Vomiting

Symptom Text: Information has been received from a physician concerning a 14 year old female who on 17-NOV-2008 was vaccinated with the second 0.5 ml dose of GARDASIL (lot #660553/0070X). Concomitant vaccine included FLUMIST intranasal (cold adapted Ann Arbor master strain). On 22-NOV-2008 the patient developed sepsis shock, high fever, acute renal failure and coma after getting the second dose of GARDASIL and was hospitalized. It was unknown how many days the patient stayed in hospital. Subsequently, the patient recovered on unspecified dates. It was also reported that the patient did not experience any AE after getting the first dose. No additional information was provided. Additional information has been requested. 3/9/09 Received PCP medical records of 11/17/08-12/19/08 as well as partial hospital records. FINAL DX: encephalitis, septic shock Records reveal patient had sore throat & dx w/URI on 11/17/08 when received HPV #2 & flumist vaccines. RTC 12/19 for hospital recheck w/residual hemipalsy. Hospital records of 11/22-12/3/2008: FINAL DX: toxic shock syndrome of unknown etiology, posibly menstrual associated vs post vaccination; acute disseminated encephalomyelitis. Records reveal patient had 2 siblings w/N/V/D 1 week prior to her experienced right frontal HA, chills, fever, bilious emesis, right monocular blurred vision, abdominal pain, diarrhea. Developed increasing confusion, lethargy, photophobia, emesis & became unconscious w/agonal breathing within 24 hours. Intubated by EMS for respiratory failure, temp 103.3, posturing, pinpoint unreactive pupils. Neuro, Neurosurgery, Ophtho, Heme & Renal consults done. Developed DIC likely related to urosepsis & multiorgan failure, acute renal failure, right hypertropia. Admitted to ICU & tx w/multiple IV antibiotics, steroids & pressors for low BP. Extubated 11/24. Remained febrile w/injected eyes, swollen red tongue, rsh & abdominal tenderness. Improved & transferred to inpatient neurorehab center. 3/12/09 Received additional hospital medical records of 1

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Facial paresis, Headache, Meningitis, Pleocytosis, Pyrexia, Vomiting

Symptom Text: Information has been received from a Health Authority (HA reference # PEI2009000322), concerning a 13 year old female, who on 22-MAY-2008, was vaccinated with the first dose of GARDASIL (Batch # NF58150, Lot # 0354U), intramuscularly in the left deltoid and on 18-AUG-2008, was vaccinated with the second dose of GARDASIL (Batch # NH17630, Lot # 1147U), intramuscularly in the left deltoid. On 08-JUL-2008, the patient developed headache and fever which lasted for 1 day. On 11-JUL-2008, she developed again severe frontal headache. On 14-JUL-2008, she vomited for several times a day. The symptoms recurred. The patient's siblings had a common cold at that time. The 2-year-old sister had fever and diarrhea 2 weeks ago. The mother had headache and stomach ache for two weeks. The twin sister was hospitalized for peripheral facial paresis on 21-JUL-2008. The patient was hospitalized on 17-JUL-2008. Clinical examination was normal as well as cranial MRI. CSF showed pleocytosis and elevated protein. Diagnosis of serious meningitis was established. The patient was treated symptomatically with Paracetamol and with penicillin for 3 days until suspicion of borreliosis was ruled out. The patient was discharged on 22-JUL-2008 at a stabilized condition, but not completely recovered. Exact duration of the symptoms and outcome is not reported. The second dose of the GARDASIL was administered into the left deltoid muscle on 18-AUG-2008. In October-2008, the patient developed right peripheral facial paresis. Follow-up examination on 15-NOV-2008 still showed mild facial paresis. Follow-up examination on 15-NOV-2008 still showed mild facial paresis. The patient had not completely recovered at the time of reporting. According to assessment of health authority, there is no causal relationship between the GARDASIL and the serious meningitis and the facial paresis. Therefore, there is no contraindication for administration of the third dose of GARDASIL. No further information is available. File Closed.

MedDRA PT Chromaturia, Henoch-Schonlein purpura, Necrosis, Protein urine present, Scab, Skin discolouration, Wound

Symptom Text: Information has been received from a Health Authority (ref. DK-DKMA-20090077) and a physician concerning a 14 year old female who on 18-DEC-2008 was vaccinated intramuscularly with a first dose of GARDASIL (batch # and site not reported). On 08-JAN-2009, the patient developed Henoch-Shonlein purpura with universal spots. The spots developed to black necrotic wounds which subsequently formed scabs. The patient was hospitalized (date and duration not reported). Initially, protein urine was present and urine was discolored. On an unspecified date, the color of the urine became normal and either protein or blood in urine was no longer present. Dermatological examination and skin biopsy confirmed Henoch-Shonlein purpura. Various blood samples (not further specified) revealed no abnormalities. The patient received no concomitant vaccines or medications. At the time of reporting the patient was recovering. Other business partner numbers included E2009-00372. Additional information has been requested.

MedDRA PT Juvenile arthritis, Pyrexia

Symptom Text: Case initially received from a health authority (reference # PEI2008021125) on 15-JAN-2009. It was reported that a 16-year-old female patient was vaccinated with a third dose of GARDASIL (lot# and injection site not reported) intramuscularly on 28-OCT-2008. On 05-NOV-2008 the patient experienced high fever, which initially could not be explained. Finally, diagnosis of Still's disease was established and treatment with prednisolone was started after 15 days. Then, the fever stopped. On an unspecified date, a blood sample was taken and showed leukocytemia (18.000, unit not reported) and elevated C-reactive protein (28 mg/dL). At the time of reporting to health authority (11-DEC-2008) treatment with prednisolone was ongoing. On the reporting form, the reporter is asking whether there could be a possible relation with GARDASIL. Other business partner numbers include E200900266. No further information is available.

MedDRA PT Hyperreflexia, Muscular weakness, Paraesthesia

Symptom Text: Information was obtained on request by the Company from the agency, via a Case Line Listing and Public Case Details form, concerning a 15 year old female, with a history of recurrent dislocation of her left knee, resulting in left knee surgery, who on 14-SEP-2008 was vaccinated with GARDASIL, intramuscularly. On 15-SEP-2008 the patient experienced muscular weakness, hyperreflexia and paraesthesia and was hospitalized. It was described that the patient experienced feet weakness, bilateral weakness to knees, with weakness ascending and tingling upper extremities. The patient was treated with cortisone injection. At the time of reporting to the agency on 11-NOV-2008, the patient had recovered from muscular weakness, hyperreflexia and paraesthesia. The agency considered that muscular weakness, hyperreflexia and paraesthesia were possibly related to therapy with GARDASIL. The original reporting source was not provided by the agency. Additional information is not expected.

MedDRA PT Dizziness, Fall, Headache, Nausea, Syncope, Visual impairment

Symptom Text: About 7 minutes after patient had the shot, we were standing at the receptionist's area and she fainted and fell down. She remembers getting very dizzy and seeing black dots, but doesn't remember falling. She was awake by the time she was on the floor. We let her lie down, then she was able to walk into a room, and just sat, had water, and we were able to leave about 15 minutes later. Once at home, her head hurt from the fall, she rested, and seemed much better. At night, around 10 pm, she felt slightly nauseous, but then went to sleep for the night.

MedDRA PT Arthralgia, Asthenia, Autoimmune thyroiditis, Back pain, Fatigue, Kidney infection, Menstrual disorder, Pain, Pain in extremity, Sleep disorder, Urinary tract infection

Symptom Text: I had my first injection on 7/10/2008. Since my second injection (9/26/2008), I haven't had a regular menstrual cycle, even while on birth control. I am very tired and weak all the time. I was also diagnosed with autoimmune thyroiditis (10/20/2008). Prior to the injection, I had hypothyroidism. I have had urinary tract infections/kidney infections. I have had pain in my left hip area/leg and back. The pain shoots down my left leg, also injection leg. The pain is so annoying and constant it keeps me up at night. 05/07/09 Received Internal Medicine records 12/10/07-01/14/09 FINAL DX: Hypothyroidism Well patient visits. Adjustment of levothyroxine dosage

Other Meds: Armour Thyroid, Yasmin, Nuvaring

Lab Data: Bloodwork in October and December 2008 and January 2009 by Dr. Records received 05/07/09 - LABS: Thyroglobulin Antibodies = 188 IU/mL, Thyroid Peroxidase = 134 IU/mL

History: Hypothyroidism HPV #2 Lot # 0570X, given 9/26/08

MedDRA PT Amenorrhoea, Drug exposure during pregnancy, Foetal growth retardation, Incorrect route of drug administration, Threatened labour, Vaginal haemorrhage

Symptom Text: Information has been received from a gynecologist, concerning a 20 year old female patient who was considered as non-enrolled as the vaccination was administered more than 1 month before the pregnancy start date (to be clarified). This is a case of misuse, is vaccine administered at inappropriate site. The patient started a spontaneous pregnancy (estimate conception date 15-APR-2008) 5 weeks after receiving on 08-MAR-2008 the first dose of GARDASIL (Lot #, Batch # not reported) in the buttock. Three days after vaccination (on 11-MAR-2008), the patient experienced vaginal bleeding. The outcome was not reported. absence of menstruations was noticed on 26-MAR-2008. The patient had concomitant contraception with DIANE 35. Conception date was estimated through dating ultrasound. Follow-up information on 24-JUN-2008 received by telephone: The reporter specified that the patient was 21 year old and that the vaccine was administered for a limit period of 1 month before the beginning of the pregnancy. The 15-APR-2008 was the pregnancy start date estimated by the ultrasound scan. Follow-up information was received on 31-JUL-2008 which reported that the patient is considered as enrolled in pregnancy registry as the vaccine was administered 5 weeks before conception date. Initials of the patient were modified. Patient's date of birth, height and weight were reported. On 15-APR-2008, the patient started a spontaneous pregnancy (estimated date by the ultrasound). The echography was normal. Estimated date of delivery on 15-JAN-2009. She had no previous pregnancy. Consent form was provided. Follow-up information was received on 20-JAN-2009 which reported that the patient had complications, abnormal diagnostic performed and infection or disease during her pregnancy: echography at 22 amenorrhea weeks revealed threatened premature labour, intrauterine growth retardation, and then there was a suspicion of pulmonary embolism (unspecified date). she gave birth to a normal baby girl on 12-DEC-2008 at 36 amenorrhea weeks. Baby's birth w

MedDRA PT Caesarean section, Drug exposure during pregnancy, Inappropriate schedule of drug administration

Symptom Text: Information has been received through the Merck Pregnancy Registry from a healthcare worker concerning a female (age not reported) who on 02-JUL-2007 was vaccinated with a dose of GARDASIL (lot 657737/0522U). On 15-APR-2008 the patient was vaccinated IM with the second 0.5 mL dose of GARDASIL (lot 657737/0522U). Concomitant therapy included CLARITIN 10 mg PO q am. At the time of the second vaccination the patient was pregnant. The pregnancy was confirmed via a "pregnancy bloodwork." No adverse events were reported. The LMP was reported to be on 08-APR-2008. Follow up information indicated that on 12-JAN-2009 the 18 year old female patient delivered a baby by cesarean section (no details provided). The baby's weight was 8 pounds and 2 ounces with normal neonatal course. It was 39 weeks from last menstrual period. There were no past medical history and concurrent medical conditions. Upon internal review, the patient's delivery via cesarean section was considered an other important medical event. Additional information has been requested.

MedDRA PT Asthma, Autonomic nervous system imbalance, Bronchial hyperreactivity, Depression, Disturbance in attention, Dizziness, Dyspnoea, Fatigue, Headache, Hypotension, Visual impairment

Symptom Text: Information has been received from a gynecologist concerning a 15 year old female patient who was vaccinated with the third dose of GARDASIL (batch # NF585S0; Lot # 0276U) I.M into upper arm on 13-DEC-2008. Since vaccination, the patient experienced alternating headache, dizziness, dyspnea and visual disturbance. Electroencephalography, cranial computed tomography and electrocardiogram were without findings. Epstein-Barr viral capsid antigen immunoglobulin G antibody test was positive on 04-DEC-2008, this result was assessed that there is no acute infection. At the time of reporting the patient had not recovered. Dose 1 of GARDASIL given on 30-MAY-2007 (batch # NE38100; Lot # 654948/0908F) and dose 2 of GARDASIL on 02-JUL-2007 (batch # NE45050; Lot # 655376/0572F) were well tolerated. Follow up information has been received concerning the patient. It was reported that at the beginning of 2008 the patient developed dizziness, dyspnea on effort, tiredness and impaired concentration. In April 2008 suspicion of vasovagal dizziness was diagnosed by a neurologist. Neurological examination and cranial MRI showed normal hyperreagibility by means of inhalative metcholine provocation, dyspnea on effort in the sense of asthma on effort, arterial hypotension, psychovegetative syndrome and suspicion of depressive syndrome were diagnosed. Dyspnea on effort started about 1 year ago especially during sports. Physical, cardiological examinations and pulmonary function showed normal results. The patient had not recovered at the time of reporting. The first dose of GARDASIL (batch # NE45050; Lot # 655376/0572F) was given on 02-APR-2007 and the second dose of GARDASIL (batch # NE38100; Lot # 654948/0908F) was given 30-MAY-2007. Dyspnea on effort was considered a symptom of asthma. Upon medical review this case was upgraded to serious because of long duration of the adverse event. The physician considered asthma, visual disturbance, headache, dizziness, tiredness, concentration impaired, psychovegetative syndrome, depressive syndrome

MedDRA PT Convulsion, Loss of consciousness, Nausea, Syncope, Vomiting

Symptom Text: Information has been received on 21-JAN-2009 from an Health Authority concerning a 13 year old female patient who received the first dose of GARDASIL (Lot #....., batch # NJ21180) via intramuscular route on 22-DEC-2008. 30 Seconds after vaccination, she lost consciousness with convulsion for 15 seconds. The patient did not experience sphincter incontinence. She woke up well, with space and time orientation but with nausea and vomiting. There was no specific treatment of the adverse reaction. The patient was under medical supervision and vital sign monitoring. There was no previous history of adverse reaction to other drugs. However, the patient had a history of loss of consciousness when blood analysis was conducted (one episode two years ago). Furthermore, she was concomitantly taking Paracetamol. There was no other known clinical history. At the time of reporting, the patient had recovered. Other business partner numbers include E2009-00496, L200901-159 and RA-002-2009. The health authority considered convulsion, fainting, and vomiting to be other important medical events. No further information is available. The case is closed.

MedDRA PT Vaginal discharge, Vaginitis bacterial

Symptom Text: I took the GARDASIL shot series. It didn't cause major problems, but when I took the second shot around the above date I noticed a change in my vaginal discharge. The shot caused me to get bacterial vaginosis. I had it for nine months till I figured out there was a problem because a month before hand I took myself off birth control and I thought my body was just going through changes. I talked to my doctor and he told me it wasn't the GARDASIL shot, so I took the third shot in the series. It immediately caused the bacterial vaginosis yet again. It's not that it's serious, but every woman should know that this is a possible side effect and may be they should prepare themselves.

MedDRA PT Drug exposure during pregnancy, Inappropriate schedule of drug administration, Nausea

Symptom Text: Information has been received a consumer through a Merck pregnancy registry concerning herself, a 41 year old female with allergies to Sulfa and iron supplements", who on 29-Apr-2008 was vaccinated IM with the third dose of 0.5 ml GARDASIL while she was pregnant. Her LMP was 27-Jan-2008. Expected date of delivery was 02-Nov-2008. The patient visited physician's office for medical attention. Prenatal testing included ultrasound for her has been normal. The patient had received the first dose of GARDASIL on 01-Oct-2007. Follow-up information has been received from a completed questionnaire. The patient was a Caucasian with no previous pregnancies. She also had Crohn's disease and multiple bowel excisions. Medications during her pregnancy included prenatal vitamins for routine use and REPLIVA 21/7 for anemia. She also had ZOFRAN for nausea on 13-March-2008. Ultrasound on 05-Jun-2008 was normal. On 13-Nov-2008, 41 weeks from her LMP, the patient delivered a live normal male infant weighing 6 pounds 3 ounces. The infant's Apgar score was 8/9 without congenital anomalies, complications or abnormalities. There were no complications, infections or illnesses during the patient's pregnancy and delivery. No further information is available.

Other Meds: Repliva 21/7, Zofran, Vitamins

Lab Data: Ultrasound normal - Prenatal testing including ultrasound has been normal. Diagnostic laboratory 04/11/08 - normal male.

MedDRA PT Drug exposure during pregnancy, Fungal infection, Herpes simplex

Symptom Text: Initial and follow-up information has been received from a nurse practitioner concerning a 26 year old female patient with no pertinent medical history or concurrent conditions and no drug reactions/allergies, who on 29-JAN-2008 was vaccinated with the first dose of GARDASIL (lot # 655327/1287U) 0.5 mL, IM. On 03-MAR-2008, the patient received the second dose of GARDASIL (lot # 655604/0052X) 0.5 mL, IM. There was no concomitant medication. The patient was subsequently determined to be pregnant in April 2008. In April 2008, the patient's urine pregnancy test was positive for pregnancy. The patient sought medical attention with an office visit. The last menstrual period was on 09-FEB-2008. Therapy with GARDASIL was discontinued. The patient's estimate date of conception was 23-FEB-2008 and estimated date of delivery was 15-NOV-2008. No problems reported. Prenatal testing included. On 23-Apr-2008 ultrasound: Routine test - Within normal limits. On 16-Jun-2008 serum alpha-fetoprotein test: Negative. Time 4. Routine test. On 07-Jul-2008 ultrasound: Routine test. Within normal limits. The patient had five previous pregnancies and five (previously report that on 21-NOV-2008, the patient delivered a normal and healthy female baby weighing 8 lb and 14 oz and apgar score 9/10. No complications during the pregnancy and labor/delivery, no congenital anomalies, and no complications or abnormalities. During the pregnancy, prenatal laboratories were performed. There was infections or illness during the pregnancy, a laboratory test was positive for HSV I and II. The patient received prophylactic Valtrex, 500 mg, BID, started on 06-OCT-2008 to delivery day 21-NOV-2008. Other medications used during this pregnancy included Metronidazole 500 mg for 7 days on 20-OCT-2008 for bacterial vaginosis and Diflucan 150 mg one time oral dose that same day for a vaginal yeast infection. Additional information is not available.

MedDRA PT Arrested labour, Drug exposure during pregnancy

Symptom Text: Initial Information and follow up has been received from a pharmacist and nurse for the Pregnancy Registry of GARDASIL concerning a 24 year old female with a history of 0 pregnancies and 0 live births who on 01-NOV-2007 was vaccinated with her first dose of GARDASIL (lot # not reported). On 27-DEC-2007 the patient was vaccinated with her second dose of GARDASIL (lot # not reported). Concomitant therapy included methyldopa, 500 mg BID for hypertension. The patient is now pregnant with an LMP date of 11-MAR-2008 and a delivery due date of 16-DEC-2008. No problems were reported. The patient is also taking 40mg daily of PROTONIX for gastrooesophageal reflux disease (GERD). The patient sought medical attention by contacting her physician on an unspecified date. Follow-up information was received from an RN for the Pregnancy Registry for GARDASIL. On 28-JUL-2008 and 12-SEP-2008, ultrasounds were performed for the evaluation of growth and date, and the results were within the normal limit. On 09-DEC-2008, the patient with chronic hypertension (CHTN) and gastrooesophageal reflux disease (GERD) gave birth to a 7 pounds 0 ounce male infant. The labor was forced for arrested descent. Apgar score was 8/9. The infant was normal without congenital anomalies. There was no infections or illnesses during pregnancy. No further information is available.

MedDRA PT Drug exposure during pregnancy, Foetal disorder, Fungal infection

Symptom Text: Information has been received from a medical assistant and a nurse practitioner, for the pregnancy registry for GARDASIL, concerning a 23 year old female patient with Glioblastoma multiforme in 2007, cholecystectomy in 2001, history of smoking and asthma, and with a history of 4 pregnancies and a 4 full term deliveries, who on 08-NOV-2007 was vaccinated the first 0.5 ml dose of with GARDASIL (Lot #654540/1209U). The patient became pregnant after receiving the vaccination. Her LMP was 18-DEC-2007. Estimated conception date was 15-DEC-2007 and EDD was 26-SEP-2008. Other medications used during pregnancy included MONISTAT on 11-apr-2008 for yeast and prenatal vitamins 7 tablets once a day on 11-APR-2008. Prenatal care panel were performed. On 07-FEB-2008 ultrasound was performed for SGA with the result of pregnancy 5 week 6/7 day; on 25-APR-2008 amniocentesis was performed for SGA with the result of pregnancy 5 week 6/7 day; on 25-APR-2008 amniocentesis was performed for SGA with the result of pregnancy 17 week 2/7 day, and MSAFP was performed for screening with the result of Neg x4. On 24-SEP-2008 the patient had a normal female infant (6 pounds, 10 ounces) with no congenital anomalies. Other complication was choroid plexus cyst. There was not complication during pregnancy and labor/delivery, and not infections or illness during pregnancy for the patient. BS monitoring per 6 AM was performed during pregnancy. Follow up information was received from a nurse practitioner. She reported that the fetal choroid plexus cyst was noted only prenatally on a mid-trimester ultrasound. On 10-JUN-2008, at 25 weeks EGA, the patient had a follow up sonogram with a perinatologist who said the cyst had resolved. No further testing was done or needed. The reporter also noted that the baby was fine with no problems and no anomalies. Additional information is not expected.

Symptom Text: Information has been received from a specialist and from the health authority, concerning a 20 year old female with asthenia, anxiety/overwork syndrome and psychologic fragility since May 2008 and a history of cardiac murmur during childhood, who in OCT-2008 was vaccinated with the first dose of GARDASIL. The patient had no adverse effects after this dose. Concomitant therapy included BUSPAR, LEXOMIL, magnesium (unspecified) (+) pyridoxine hydrochloride and hormonal contraceptives (unspecified). On 27-DEC-2008 the patient was vaccinated with the second dose of GARDASIL, batch number not reported. It was reported that 3 days after the second dose of GARDASIL, i.e. in JAN-2009 the patient presented with hyperthermia at 38 C associated with breathlessness. After a malaise during shopping on 01-JAN-2009 the patient consulted her general practitioner; she had tremor and tachycardia. Blood analysis was performed on 03-JAN-2009 and revealed a slight hyperleukocytosis (12.4 103/mm3). By the evening on 03-JAN-2009 the patient presented with a malaise again but with no dyspnea and after taking BUSPAR. 2 hours later the intervention of EMUR (emergency medical mobile unit) could lead to recuperate a sinusal rhythm. Continuous arrhythmia with atrial fibrillation was diagnosed. The patient was transferred to medical intensive care service: she presented with bilateral mydriasis, hypothermia at 33.7 C, the result of measure of sugar in her blood was increased at 3.18 and she had cyanosis of face, ears, and extremities. Radiological examinations revealed a pneumopathy of the right middle pulmonary lobe and septal hypokinesia with paradoxical septal. There was no cocaine and no benzodiazepines. The patient presented with multiorgan failure under high dose of amines and then she dies in spite of the cardiopulmonary by-pass and extra corporeal oxygenation assistance. An autopsy was performed (unspecified date) and found no cause of death, also reported as information on autopsy was still awaited. Other business partner numbers incl

MedDRA PT Abdominal pain, Convulsion, Loss of consciousness, Pain, Tremor, Vomiting

Symptom Text: Information has been received from a consumer concerning the 15 year old daughter of her friend who "months an months ago" was vaccinated with GARDASIL (route and site not reported). Subsequently the patient experienced vomiting, seizures, shakes, black out, abdominal pain and excruciating pain from head to toe and was hospitalized in and out. Per caller, the last time she spoke to the patient's parents, the patient was at home but they are thinking of bringing the patient to another hospital. Per caller, the patient's vomiting, seizures, shakes, black out, abdominal pain and excruciating pain from head to toe persisted. Attempts to verify the existence of an identifiable patient have been unsuccessful. No further information is available.

MedDRA PT Arrested labour, Caesarean section, Drug exposure during pregnancy, Induced labour, Postmature baby

Symptom Text: Information has been received from a gynecologist for the pregnancy registry for GARDASIL concerning an 18 year old female who was vaccinated with the third dose of GARDASIL (Lot # 1049U Batch # NG46500) into the deltoid muscle on 13-MAY-2008. On 08-APR-2008 the patient already received a booster dose RECOMBIVAX HB (Lot # 654829/0335F Batch # NF24490) into the deltoid muscle. On 12-JUN-2008 pregnancy in 14th gestation week was detected. Date of last menstrual period (LMP) is unknown. Estimated outcome pregnancy (EOP) will be 13-DEC-2008. At the time of reporting no adverse event occurred. The first and second dose of GARDASIL and RECOMBIVAX HB were well tolerated. Follow-up information received on 16-JAN-2009. Upon medical review the company upgraded the case to serious because of caesarian section. It was reported by the gynecologist that the patient had a normal course of pregnancy. Medical induction of labor was performed on the 9th day due to postmaturity. Caesarian section was performed due to interrupted labor and the patient gave birth to a normal baby on 21-DEC-2008. The Apgar score was 9/10/10. The postnatal examination of the mother and child showed no pathologies. Other business partner number included (E2008-05526). No further information is available. Case closed.

MedDRA PT Abdominal pain upper, Arthralgia, Fatigue, Headache, Neck pain

Symptom Text: Information has been received from an office manager at the physician's office, concerning a female patient, who was vaccinated with first, second and third doses of GARDASIL (dose, route, lot # not reported). The office manager reported that the patient completed her GARDASIL vaccination series a couple of months ago and started experiencing hip pain and headaches. At the time of the report, the patient had not recovered. Follow up information was received from the Registered Nurse on 23-DEC-2008 which reported: The patient was vaccinated with three doses of GARDASIL on 19-SEP-2007, 29-NOV-2007 and 03-APR-2008 respectively. The patient experienced hip pain, headaches, and stomach pain and that were all still ongoing. The patient also experienced fatigue but that has resolved. Follow up information has been received from a Registered Nurse on 30-DEC-2008 which reported that the lot number that was administered was: 660387/19670. The patient was administered the vaccine at her pediatrician's office. The patient was also administered varicella virus vaccine live (Oka/Merck) (MSD) and hepatitis B virus vaccine rHBsAg (yeast) (MSD) on the same day the patient received her third dose of GARDASIL. Additional information has been requested. 2/4/09-records received-presented on 11/17/08 with C/O run down, tired. 11/24/08 still very fatigued, dizzzy, occasional. 12/16/08 C/O headache. Possibility treated by another physician prior to presenting on 11/17/08. 2/23/09-records received-office visit 1/20/09-C/O headache, neck in pain for past 3 months. Holter monitor supraventricular ectopic beats noted. 12/30/08 increasing headaces.

Other Meds: Unknown

Lab Data: Unknown 2/4/09-records received- HA. Holter monitor normal EEG normal with mild swelling of background. Chemistry normal. Chest x-ray no evidence of infiltrate or pleural effusion.

MedDRA PT Musculoskeletal chest pain, Nausea, Pain in extremity

Symptom Text: Information has been received from a registered nurse concerning a 26 year old female who on 25-SEP-2008 was vaccinated with a first dose of GARDISIL vaccine. After the first dose of GARDASIL vaccine she felt pain in the muscles around her chest but they resolved in three days. Concomitant therapy included vitamins (unspecified) and OMEGA-3. On 18-dec-2008 the patient received a second dose of GARDASIL vaccine and later that day called the nurses and stated that she experienced slight nausea, pain in her left arm and pain in the muscles around the chest not her heart. The nurse also reported that she advised the patient after she told her the experience with the second dose to seek further medical attention, but the patient said she would not since it happened with the first dose and it resolved. The nurse at this time is unsure if the patient had recovered. The patient sought medical attention through a call to the nurse. Additional information has been requested.

MedDRA PT Amenorrhoea

Symptom Text: Information has been received from a physician concerning a 21 year old female patient with no pertinent medical history and no drug reactions/allergies, who in approximately October 2008, a few months ago (exact date unspecified) was vaccinated with an initial dose of GARDASIL vaccine. There was no concomitant medication. Since receiving the GARDASIL vaccine, coincidently the patient had not had her period the past 2 months. The patient was not pregnant and not in a relationship. The patient had no underlying medical conditions that would explain this as she exercised regularly but not to excess, she was thin but not underweight, and she did not have a medical issue such as PCOS (polycystic ovary syndrome). She had an upcoming appointment with her gynecologist. No other symptoms were present. As of 22-DEC-2008, the patient's outcome was unknown. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Asthenia, Disturbance in attention, Dizziness, Lymphadenopathy, Malaise, Tremor

Symptom Text: Information has been received from a physician concerning a 23 year old female patient with depression, who on an unspecified date, was vaccinated with the first dose of GARDASIL and on approximately 29-NOV-2008 was vaccinated with GARDASIL. Concomitant therapy included TRAZODONE HC1, CLONAZEPAM, METHYLPHENIDATE and YASMIN. The physician reported that the patient reported feeling weak, dizzy, tremulous over her entire body and her subclavian lymph node was enlarged on the same side where the vaccine was received. The physician reported that the patient experienced the same reaction after both doses of the GARDASIL vaccine. The symptoms were more severe after her 2nd dose. Exact dates of vaccinations were not available. It was 4 four weeks post dose 2 and patient still did not "feel herself". The patient reported she still felt weak and is unable to concentrate. At the time of the report, the patient had not recovered. The patient sought medical attention and was seen at the physician's office. Additional information has been requested.

Seriousness: ER VISIT, EXTENDED HOSPITAL STAY, HOSPITALIZED, LIFE THREATENING, SERIOUS

MedDRA PT Abnormal behaviour, Aggression, Agitation, Akinesia, Anxiety, Asthenia, Back pain, Confusional state, Decreased appetite, Dizziness, Educational problem, Encephalitis, Endotracheal intubation, Fatigue, Grand mal convulsion, Headache, Hyperreflexia, Injection site pain, Lethargy, Malaise, Mood swings, Muscle twitching, Nausea, Pain, Personality change, Postictal state, Posturing, Retching, Skin papilloma, Status epilepticus, Tremor, Vomiting, Weight decreased

Symptom Text: February 2008 first shot experienced headaches, dizziness, back pain, soreness at injection site (still feels pain in arm today). April 2008 after second infection in addition to above symptoms, confustion, lethargic, gagging, nausea, vomiting, massive warts on the bottom of feet, mood swings, altered personality, shaking. In May 2008 was brought to the hospital had a MRI and cat-scan both normal. The doctor said she was experiencing headaches. In June 2008 she woke up with a headache and vomiting, collasped into a grand-mal seizure. Tranferred to a hosptal. Went through every test possible and came home for a few days. Went into another grand-mal seizure that lasted about three hours, had to be intabated again and transported to the hospital again where they did another MRI, EEG, Spinal Tap and more and more blood tests. Her protein level in her Spinal Tap was very high (159). We are still dealing with a very ill child. On Christmas day she had a seizure and back to hospital which is two and a half hours away from where we live. She takes 14 pills a day with really no answers to why she is ill. Her immune system is confused, confusing her brain. Her life has changed dramatically as she is unable to do the things a healthy 17 year old should be able to do. 2/17/09 Neuro consult dated 1/2/09 received with dx: probable Hashimoto's Encephalopathy. Report reveals pt had 2 prolonged seizures in summer 2008 with behavioral and mood changes. Dx with Hashimoto's Encephalopathy and tx with steroids x 3 mon which were tapered off. On 12/25/09 pt woke feeling nauseous and gagging, tremoulous, and feeling sick. Felt like face "was pulling off". Unable to yell or move. Found by parents seizing ~ 10 minutes. Diastat administered. Transferred to hospital. Post-ictal then later combative and agitative. Pt reports being tired and achey since 11/08. Neuro exam WNL. 3/19/09 Additional records received from 7/23/08, 8/26/08 and 2/20/09 Neuro consults as well as rheum consult 2/20/20009 as well. Pt hospitalized in June

Other Meds: none at time of vaccinaion

Lab Data: Spinal Tap protein 159 very high. Labs and Diagnostics: CSF protein increased, then repeat CSF WNL. Anti-thyroid peroxidase Ab 107 (H). TSH WNL. T4 WNL. EEG abnormal x 3. Lipase increased. ANA 1:80. Lupus anticoags (-).

Seriousness: ER VISIT, HOSPITALIZED, PERMANENT DISABILITY, SERIOUS

MedDRA PT Activities of daily living impaired, Bruxism, Constipation, Headache, Migraine, Nausea, Pain, Post lumbar puncture syndrome, Pyrexia, Temporomandibular joint syndrome, Vomiting

Symptom Text: I got the first HPV vaccine, and 1 hr later, I developed a fever of 102.0, was vomiting, and had a severe headache. Ever since 9/20/07, I have had a chronic, 24 hr/day headache. I have seen my PCP, neurologist, and many ER visits. It has been concluded that this occurred from the HPV vaccine. After doing extensive research about GARDASIL, and being advised by healthcare professionals, I got the first dose on 9/20/2007. About an hr later, I got a fever of 102.2, was vomiting, and had a severe headache. Eventually, the other symptoms went away, but the headache continued. It was an intense headache that lasted 24hrs/a day. I saw my PCP several times, and was referred to a neurologist. In the meantime, I got the second dose on 11/14/2007. I did not put two and two together. Since there was a long wait to see the neurologist, I ended up in the emergency room twice in 12/07. The first visit, an MRI, CT, and Lumbar Puncture were performed. I ended back in the ER a few days later for observation. All of the tests came back normal, but the pain was unbearable. I was put on IV MORPHINE, which had little affect. I then got an urgent appt with my neurologist in 12/07. Since 9/07, my life has been turned upside down. I have missed work, had to switch jobs, and have struggled to finish nursing school. I was 100 percent healthy before this immunization I have spent thousands of dollars on medications, copays, alternative options, such as chiropractic care, acupuncture, and massage. I simply can't afford it. I have been on more Rx in the last year and a half than most people have in a lifetime. At 21 years old, I should be able to live a normal life. Within the past month, I have been back in the ER three times. The only thing that "took the edge off" was IV DILAUDID. I have tried basic OTC such as ADVIL, TYLENOL, ALEVE, EXCEDRIN, Rx NSAIDS, PREDNISONE, muscle relaxers, anticonvulsants, and tricyclic antidepressants. Caffeine and antihistamine, narcotics, and just about anything else you can of, I have tried. Still, nothing has

Other Meds: At the time, just oral contraceptives 2/17/09-records received-Current medications Necon and Lorazepam.

Lab Data: Several tests, including extensive blood work; Cat Scan; MRI; and Lumbar puncture. 2/17/09-records received-CSF pressure 120-130, protein 31.2 and glucose 61, cutlure negative. CBC showed elevated WBC 10,300. Urinalysis revealed 1+ protein

Seriousness: ER VISIT, HOSPITALIZED, PERMANENT DISABILITY, SERIOUS

MedDRA PT Activities of daily living impaired, Headache, Pain, Pyrexia, Vomiting

Symptom Text: Information has been received from a 20 year old female patient with no pre-existing physician-diagnosed allergies, birth defects or medical conditions who at 10:00 on 20-SEP-2007 was vaccinated with the first dose of GARDASIL in her arm (lot #658558/1061U) after doing extensive research about GARDASIL. Concomitant therapy included hormonal contraceptives (unspecified). There was no illness at the time of vaccination. At 11:00 on 20-SEP-2007 ("about an hour later") the patient experienced a fever of 102.2, vomiting and a severe headache, and was hospitalized for two days. Subsequently, the other symptoms went away but the headache persisted. It was an intense headache that lasted 24 hours a day. The patient saw her PCP several times and was referred to a neurologist. On 14-NOV-2007, the patient received the second dose of GARDASIL in her arm (lot # 658560/1062U). In December 2007 the patient went to the emergency room twice. At the first visit, MRI, CT and lumbar puncture were performed. The patient ended back in the ER a few days later for observation. All of the tests were normal, but the pain was unbearable. The patient was given IV morphine which had little effect. Then in December 2007 the patient got an urgent appointment with the neurologist. She noted that her life had been "turned upside down", and the patient had missed work, had to switch jobs and had struggled to finish nursing school. She also indicated that she was 100% healthy prior to the vaccinations. The patient had been on more therapy in the last one year and a half, and has been in the ER three times again "within the past month". The only thing that "took the edge off" was IV DILAUDID. She had tried basic OTC such as ADVIL, TYLEND, ALEVE, EXCEDERIN, nonsteroidal anti-inflammatory drug (unspecified), PREDNISONE, muscle relaxes, anticonvulsants, tricyclic antidepressants, caffeine, antihistamine, narcotic, and just about anything else. Still nothing had worked. The patient's doctor had concluded she had a serious reaction from GARDASIL. A feve

MedDRA PT Caesarean section, Drug exposure during pregnancy

Symptom Text: Information has been received from a registered nurse for the Pregnancy Registry for GARDASIL concerning a 28 year old female patient with no pertinent medical history, no drug reactions/allergies, who on 03-AUG-2007 was vaccinated intramuscularly with the first 0.5 mL dose of GARDASIL (Lot # 658222/0927U). There was no concomitant medication. On 05-OCT-2007 the patient was vaccinated intramuscularly with the second 0.5 mL dose of GARDASIL (Lot # 658563/1063U). The patient became pregnant after receiving her second dose of GARDASIL. Her LMP was on 19-APR-2008 and estimated date of delivery was 24-JAN-2009. On 19-JAN-2009 the patient delivered by caesarean section. Upon internal review, patient delivered by caesarian section was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received on 14-AUG-2008 from a gynaecologist, concerning a 16 year old female who was vaccinated with GARDASIL (lot #, route and site not reported) on an unspecified date. At the time of reporting, the patient was in the 5th month of pregnancy (22nd week of pregnancy). No adverse effect was reported. Follow-up information received via the pregnancy follow-up reporting form on 20-JAN-2009 and by phone call on 21-JAN-2009. Upon medical review the company upgraded the case to serious because of induced abortion. It was reported by the gynaecologist that the patient consulted him on 14-AUG-2008 in 22nd weeks of gestation. Thereafter she underwent voluntary termination of pregnancy (induced abortion) between 15-AUG-2008 and 20-AUG-2008. The patient was vaccinated with a third dose of GARDASIL, lot # not reported on 20-JAN-2009 which was well tolerated. Case closed. Other business partner numbers include E2008-07749.

MedDRA PT Abortion induced, Drug exposure during pregnancy, Foetal disorder

Symptom Text: Information has been received for the pregnancy registry for GARDASIL from a 20 year old female patient who was vaccinated with the first dose of GARDASIL (lot# not provided) when she was "around one month pregnant". Subsequently the baby had some complications and when patient was three months pregnant she terminated the pregnancy due to the complications. Patient was then referred to another physician (name not provided) who told the patient that the complications she had with the baby were probably related to GARDASIL. Upon internal review, the termination of the pregnancy was considered an other important medical event. No further information is available.

MedDRA PT Abdominal pain lower, Activities of daily living impaired, Anxiety, Decreased appetite, Dehydration, Endometriosis, Muscle spasms, Nausea, Pelvic pain, Tenderness, Vaccine positive rechallenge

Symptom Text: Information has been received from a physician concerning a 10 year old female patient with anterior and posterior endometriosis and SYNAREL allergy and a history of laparoscopic band surgery (2007) who on 08-MAY-2008 was vaccinated with first dose of GARDASIL (Lot # not reported). Concomitant therapy included LUPRON DEPOT on 06-NOV-2008, in December 2008 and January 2009. In June-2008 after administration of vaccine the patient experienced intermittent lower anterior abdominal pain on left and right side. The pain was below umbilicus more midline than lateral. Patient had lower abdominal wall tenderness. She also experienced anxiety, nausea and decrease in appetite. She was hospitalized in June of 2008 for a few days due to dehydration and abdominal pain. She did not experience pain in July and August of 2008. On 03-JUL-2008, the patient was vaccinated with the second dose of GARDASIL (lot # not reported). In September of 2008 abdominal pain returned. She was hospitalized 16-SEP-2008 to 18-SEP-2008 and then again in October of 2008. On 03-NOV-2008, the patient was vaccinated with the third dose of GARDASIL (lot # not reported). On 22-JAN-2009 to 23-JAN-2009 she was hospitalized for dehydration. She was unable to attend college because of her symptoms. She was being treated with PERCOCET and DILAUDID but was not currently taking either medication. In September 2008 laparoscopy was performed (results not reported). Also colonoscopy, computed axial tomography, sonogram and complete blood cell count were performed (results not reported). At the time of the report on 27-JAN-2009 the patient was recovering. The patient sought medical attention office visit. The physician considered intermittent lower anterior abdominal pain on left and right side, anxiety, nausea and decrease in appetite to be disabling. Additional information has been requested. 2/10/09 Received hospital medical records of 9/16-9/18/09. FINAL DX: pelvic pain, endometriosis Records reveal patient experienced lower abdominal pain, cramping since

MedDRA PT Dialysis, Face oedema, Inappropriate schedule of drug administration, Localised oedema, Oedema peripheral, Renal failure, Systemic lupus erythematosus

Symptom Text: Initial case was reported on 27-JAN-2009 by Health Authority (ref. number DK-DKMA-20082812). This case is an overdose case. It was reported that a 16-year-old female patient was vaccinated with GARDASIL (lot#1941U, Batch# NJ01850 site of administration not reported) intramuscularly on 22-OCT-2008. It was reported that the patient previously had received 3 vaccinations with GARDASIL (batch#, route and site of administration not reported). One month later, on 22-NOV-2008, the patient developed neck oedema, oedema face and leg oedema. On 24-NOV-2008, the patient was seen by a physician (GP). Urine strip test revealed blood and protein present in urine. Blood pressure was 160/90 mmHg. Streptococcus A test was negative. The patient was admitted to hospital on 24-NOV-2008. The patient was diagnosed Systemic Lupus Erythematosus. As a consequence of systemic lupus erythematosus, the patient experienced renal insufficiency that required dialysis treatment. At the time of report the patient had not recovered and received immune suppressive treatment (not further specified). The patient had a medical history of episodes with intermitting eye oedema during the past 2-3 years. This was interpreted as unspecified allergy. The patient had received 3 vaccinations with GARDASIL (batch number, route and site of administration not reported) previously. Vaccination dated not reported. No reaction was reported in connection with these vaccinations. Relevant test/laboratory data: On 24-NOV-2008 urine strip test revealed blood and protein present in urine. Blood pressure was 160/90 mmHg, and streptococcus A test was negative. Other business partner numbers include: E2009-00647. No further information is available.

MedDRA PT Dyspnoea, Pain, Pericarditis

Symptom Text: Information has been received from a female patient with attention deficit/hyperactivity disorder; hyperactivity due to treatment with CERAZETTE and deafness unilateral (cytomegalovirus or waardenburg's syndrome) from birth who on 12-DEC-2008 was vaccinated with the first dose of GARDASIL (lot # not reported). Concomitant therapy included alprazolam (manufacturer unknown) and ABILIFY. Few days after vaccination, first symptoms occurred with breathlessness. As the reaction was very painful, corrective treatment with ASPIRIN 3 gram was taken. At cardiology consultation, the patient was diagnosed with a small pericarditis sicca. Electrocardiography and echocardiography were normal. A follow up was not planned. At the time of the report, the outcome was unknown. The case was not medically confirmed. Pericarditis sicca was considered to be another important medical. Other business partner numbers include: E2009-00655. No further information is available.

MedDRA PT Erythema nodosum, Incorrect route of drug administration

Symptom Text: Information has been received form a Foreign Health authorities concerning a 15 year old female patient with a medical history of fracture, joint ligament rupture and rhinitis allergic who received the first and second doses of GARDASIL (batch numbers not reported) via an inappropriate route of vaccination i.e. subcutaneous route instead of intramuscular route respectively on 02-JUL-2008 and 30-AUG-2008. At the end of August 2008, she presented with erythema nodosum which worsened after the second dose of GARDASIL. Several consultations were needed and the patient was hospitalized on an unspecified date. Aetiological, infectious, medicated and inflammatory work-up were negative on 07-JAN-2009. At the time of the report, the patient had not recovered. According to Foreign Health Authorities, there were no other triggering factors identified as GARDASIL and the third dose was not contra-indicated. The Foreign Health Authorities assessed the causal relationship between the reported reaction (s) and vaccination as doubtful according to the Foreign method of assessment. The case is closed. Other business partner numbers include E2009-00653, LM20090060 and LM900021.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Dizziness, Headache, Nausea, Syncope

Symptom Text: Information has been received from a healthcare worker concerning a 17 year old female patient with no known drug reactions/allergies and medical history who on 15-OCT-2008 was vaccinated intramuscularly with the first dose 0.5 ml dose of GARDASIL (Lot #660618/0572X), and on 22-DEC-2008 with the second dose of GARDASIL (Lot #661044/0548X). There was no concomitant medication. On 29-DEC-2008 at home the patient experienced syncope and possible seizure. The patient was evaluated at a local emergency room and a CT scan of the brain and Electrocardiogram were normal. Since then, the patient had experienced persistent dizziness, headaches, and nausea. The patient was examined in the office and was prescribed PREVACID. An Electroencephalogram was normal. The stool was positive for occult blood so the patient was referred to an unspecified gastroenterologist. An abdominal ultrasound and endoscopy had been scheduled. The patient sought medical attention. At the time of reporting the patient was not recovered. Upon internal review seizures were considered to be an other important medical event. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Activities of daily living impaired, Diarrhoea, Diplopia, Disturbance in attention, Dizziness, Fatigue, Headache, Memory impairment, Nausea, Photophobia, Tension headache, Weight decreased

Symptom Text: Severe, chronic headaches that began very soon (within days) after first vaccination of Gardasil. Headaches became progressively worse and currently continue daily- one year later. Referral was made for vision testing, CT Scan and MRI, with no underlying cause of headaches determined. Numerous different prescription drugs were prescribed with no effect until current prescription, taken twice daily, was found to help subdue the headaches- though they have not been eliminated. At their worse, the headaches were debilitating- rendering my daughter unable to function at school with some days missed and numerous visits to the nurses office and then to the doctors office. At home, she would just curl up into a ball many days- unable to function whatsoever. The headaches begin when she wakes in the morning and persist throughout the day- every day. 3/13/09 OV dated 12/24/07 received from PCP for 16 yr WCC. Impression: Acne. Sent to derm. Left SI joint pain and R lower rib tenderness. HPV vax given. 3/16/09 Neurology consults received dated 3/14/2008 to 2/2/2009. Initially seen 3/14/08 for c/o 8-9 wk hx of H/A. Pt reports double vision, dizziness, nausea and lightheadedness with H/A. Recent 6lb weight loss. PE WNL. DX: Chronic Tension H/A. Rx meds. F/u 6/2/08 with no improvement,H/A now daily. Meds increased. F/u 8/1/08 H/A now with photophbia and nausea. 8/8/08 Mom reporting memory difficulties x several weeks. 9/2008 started Cymbalta with some improvement in H/A, however having diarrhea and tiredness. Changed to Zoloft.

Other Meds: Minocycline

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Bronchitis, Fatigue, Generalised oedema, Glomerulonephritis chronic, Hypotension, Proteinuria, Toxoplasmosis

Symptom Text: Information has been received from a physician concerning a 17 year old female with pneumopathy, otospongiosis, allergic asthma, and a history of allergy to graminaceae and acarus (which was former and had resolved) who on 17-MAY-2008 was vaccinated with a third dose of GARDASIL. Concomitant therapy included desensitization treatment. In June 2008, the patient complained of unusual fatigue. During the summer, she developed bronchitis and toxoplasmosis. Late in august 2008, she experienced generalized oedema. There was no hematuria, but there was proteinuria. The patient had no hypertension but hypotension. Renal biopsy revealed chronic glomerulonephritis with mild glomerular lesions. Corrective treatment with high dose of corticosteroids, 55 mg per day was given and a strict diet without salt and sugar was prescribed, and symptoms oedema resolved. A good prognosis was given because of the age, the response to treatment and the early diagnosis. Hypotension, generalised oedema and bronchitis were considered symptoms of chronic glomerulonephritis. The events were considered to be other important medical events. Additional information has been requested. Other business partner numbers included E2009-00825.

MedDRA PT Demyelination, Dysaesthesia, Hypoaesthesia, Motor dysfunction, Multiple sclerosis, Pain, Paraparesis, Vaccine positive rechallenge

Symptom Text: Information has been received from a health agency (case # 94191) concerning a 16 year old female patient who on 10-JUN-2008 was vaccinated intramuscularly with the first dose of GARDASIL (batch # NF35170; lot # 1475F). On 20-JUN-2008 she presented with algia, dysesthesia, motor impairment and hyposthenia of the upper right limb. The family physician advised treatment with OKI after which there was an initial improvement (after 7/10 days), but the symptoms reoccurred in July 2008, as hyposthenia of the right limbs worsening for about 2 weeks and then spontaneously resolving, with the exception of the impairment to the fine motility of the right hand. On 18-AUG-2008 the patient was vaccinated with the second dose of GARDASIL (batch # NF35170; lot # 1475F). On 01-SEP-2008 she went to the hospital because of the impairment to the fine motility of the right hand. She was admitted to the hospital on 01-SEP-2008 and discharged on 06-SEP-2008 with the diagnosis "suspected multiple sclerosis". Investigations performed during admission: brain MRI with contrast, showing demyelinization with active plaque; cervical MRI with contrast showing demyelinating active plaque. Evoked potentials within normal limits. CSF testing within normal limits, CSF isoelectrofocusing: presence of 16 oligoclonal bands IgG, Link's index = 28 (normal range 0.30 - 0.70). After discharge the patient returned to the hospital on 13-OCT-2008 for a worsening paraparesis (mainly affecting the left side) and she was treated with SOLU-MEDROL I.V. for 5 days. In December 2008, the diagnosis of multiple sclerosis was confirmed and she has been in treatment with Interferon beta I a (unspecified) since. At the time of reporting the patient had not recovered. This case is linked with WAES #0902USA00339, reported by the same physician with the same lot number. Other business partner numbers included E200900775 and IT03209. Additional information has been requested.

MedDRA PT Immediate post-injection reaction, Syncope

Symptom Text: Information has been received from a 19 year old female patient who on 27-JAN-2009 was vaccinated with first dose of GARDASIL (Lot # not reported). On 27-JAN-2009 after she received the vaccine she fainted immediately. As she was coming to she could hear the nurse yelling that she was having a seizure and she then fainted a second time. She came to and fainted a few more times, then she went to the emergency room in an ambulance. She was not admitted to the hospital and was released a few hours after she had received the vaccine. On 27-JAN-2009 the patient was recovered. Patient sought medical attention was at emergency room. The patient considered seizure and fainted was determined to be other important medical events. No further information is available.

MedDRA PT Rash

Symptom Text: Spoke with pt on Tuesday 2/3/09 she was administered the HPV vaccine about 4 hours later a rash devloped on her back that grew to cover the majority of her back. She feels that today it is not spreading and she feels it is getting better she dose not tolerate benadryl so that was not advised. No SOB, pain, fever, hives. Advised pt she should not continue with the HPV series as there is really no way of telling how she may react. She was in agreement with this. Pt will call back if any other symptoms devlope or rash dose not continue to improve over the next few days

Other Meds: Flonase, Synthroid, Yasmin

Lab Data: per pt the rash is getting better.

MedDRA PT Abortion induced, Drug exposure during pregnancy, Menstruation delayed

Symptom Text: Case of pregnancy follow-up received from a general practitioner on 08-DEC-2008. A 18-year-old female patient started a spontaneous pregnancy and received an injection of REVAXIS (batch # not reported) and the first dose of GARDASIL (batch # not reported) on 01-DEC-2008 while she was pregnant. Her estimated date of last menstrual period was on 31-DEC-2008. At the time of reporting the patient had no adverse effect. During the consultation with the physician and after the vaccination the patient complaint with delayed menstrual period and to be a little puffy since few days. Beta human chorionic gonadotropin test revealed her pregnancy. She wanted to keep the baby. A correction version was created on 23-DEC-2008 to code "vaccine exposure during pregnancy" in accordance with the specific rules of the GARDASIL pregnancy registry. Follow-up information received through the initial pregnancy questionnaire on 02-FEB-2009: Case upgraded to serious. There was a voluntary termination of pregnancy not other wise specified. No more information was provided. This case is closed. Other business partner numbers include E200811440. No further information is available.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Condition aggravated, Hypoaesthesia, Paraesthesia, Pruritus, Restless legs syndrome, Upper respiratory tract infection, Viral infection

Symptom Text: Information has been received from a Registered Nurse concerning her 22 year old daughter who on 27-OCT-2006 was vaccinated with first dose of GARDASIL (Lot# 653937/0637F) intramuscularly right deltoid. Concomitant therapy included influenza virus vaccine (unspecified). On 02-MAR-2007 "she developed restless leg syndrome". The restless leg syndrome resolved but recurred in May 2007 and it was no know if she had recovered. The patient sought unspecified medical attention. Follow up information has been received from a Registered Nurse concerning a 21 years old female patient with colitis ulcerative and scoliosis. Illness at time of vaccination included a slight cold. The patient was taking NYQUIL which she had used before. Other concomitant medications included hormonal contraceptives (unspecified). On 02-MAR-2007 patient experienced tingling, itching, restless feeling where legs and arms had to keep moving and it was reported that it lasted all night until 03-MAR-2007 (am). She went to the emergency Room and was diagnosed with possible restless leg syndrome. On approximately 09-MAR-2007 the patient was seen by Neurologist and ruled out a stroke. On approximately 07-MAR-2007 she recovered. In approximately May 2007, the patient experienced a reoccurrence of the events. Blood test and neurologic exam were performed at Emergency Room (results were not showed). The registered nurse considered possible restless leg syndrome to be an other important medical event and also disabling as it reoccurred 2 to 3 months later. Additional information is not expected. 3/4/09 Received Neuro medical records of 3/2-3/19/2007. FINAL DX: probable post-viral syndrome Records reveal patient experienced pruritis & tingling of extremities x 2 days when hospitalizeed 3/2-3/4/2007. Had similar symptoms briefly & intermittently x 2 mo. Had URI approx 2 wks prior to hosp admit. When seen as outpatient 3/19/07, resolved intermittent pins/needles of legs 3-4 days s/p hospital d/c. 3/4/09 Received ER medical records of 3/2/2007. FI

MedDRA PT Alopecia, Anxiety, Asthma, Blindness transient, Condition aggravated, Conjunctivitis, Contraception, Cough, Dysphagia, Fatigue, Feeling cold, Headache, Immune system disorder, Localised infection, Pain, Panic attack, Presyncope, Pyrexia, Sinus headache, Swelling face, Tension, Tremor, Upper respiratory tract congestion, Weight decreased

Symptom Text: I have lost at least 25% of my hair. I have never experienced this type of hair loss before the shot, and am not under any major stress. I had my last shot about one year ago, and have noticed a lot of shedding of my hair since then. It is just now to the point that other people are noticing how wide my part is getting. Not to mention the fact that I have had other strange symptoms. Sometime after my second shot, I ended up in the hospital with what the doctors called a "panic attack". I have no previous history of panic attacks and was not under any real stress at the time. Furthermore, I have had extreme headaches, near fainting spells with partial loss of vision for a few hours at a time. To add to that, I have developed immunity deficiencies. Before this vaccine, I was perfectly healthy. Now, I have spent hundreds and hundreds of dollars trying to figure out what is wrong with me. This is physically and emotionally damaging, and I hope no one else has to experience this. 2/11/09 Received ER medical records of 8/23/2007. FINAL DX: panic attack; possible med side effect Records reveal patient experienced shakiness, difficulty swallowing with sudden onset after taking bactrim for facial infection. Felt facial swelling. Tx w/antihistamine, improved & d/c to home. 3/10/2009 Received PCP medical records of 1/29/08-1/14/2009. FINAL DX: Records reveal patient experienced: asthma, sinus HA, chest congestion, cough, fever, body aches, URI, asthma exacerbation, BCP use, tension & difficulty relaxing, weight loss, feeling cold, anxiety, fatigue, conjunctivitis, HA w/temporary left lateral vision loss 11/08, alopecia 12/08. Tx w/meds.

Other Meds: Yasmin, albuteral, singular

Lab Data: Had a normal blood test before shot, and after shot tested for immune deficiencies. LABS: CT head WNL., ANA 1:40.

History: Asthma, allergies (not to food or medications)

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Ataxia, Demyelination, Dysaesthesia, Headache, Paresis, Vertigo, Vision blurred, Vomiting

Symptom Text: Information has been received from Health Authority on 28-JAN-2009. A 14 year old female was intramuscularly vaccinated with the third dose of GARDASIL (lot #1881U, batch n. NJ03030) on 04-DEC-2008. It was also reported that the patient was vaccinated with the first dose of GARDASIL (lot #1475F, batch n. NF35170) on 29-MAY-2008 with no adverse effect. The second dose of GARDASIL (lot #1475F, batch n. NF35170) was administered on 29-JUL-2008. On 05-AUG-2008 the patient presented with blurred vision in the left eye and dysesthesia in the third finger of the right hand for one week. She was evaluated by an ophthalmologist on 08-AUG-2008 and resulted within normal limits. On 04-JAN-2009 she presented with headache, vomiting, subjective vertigo, worsening ataxia, left crural paresis and she was admitted to the hospital. Investigations performed during admission included: 16-JAN-2009, brain MRI with contrast: diffused demyelinization with active plaques. 19-JAN-2009 evoked potentials: PEV normal in morphology and with, latency slightly above the norm in the right eye response. Stimulation in the left eye evoked morphologically normal response, with latency markedly above the norm and width significantly reduced in comparison to the right eye. PEA bilateral latency increased along the central acoustic ways with significant increase in the peak I-III and I-V. 21-JAN-2009 evoked potentials: PES upper limbs stimulation of the median nerve at the wrist evoked latency responses within normal limits at Erb and Cv7. Cortical response appeared asymmetric in latency (Left > right) with N20 on the left at the limits of the norm and discretely disgregated on the right. The morphology of the sub-cortical complex P14-N18 on th right appeared disgregated as well. On 17-JAN-2009 CSF exam: isoelectrofocusing presence of about 12 oligoclonal bands IgG type. Link's index=2.41. Chloride 109 meq/L, LDH 3 IU/L. She was diagnosed with "acute demyelinating disease". At the time of reporting her condition had improved. The final outcome was no

Seriousness: PERMANENT DISABILITY, SERIOUS

MedDRA PT Abdominal pain upper, Alopecia areata, Hypothyroidism, Type 1 diabetes mellitus

Symptom Text: Information has been received from a physician concerning a 9 year old female who on 26-JUL-2007 was vaccinated with the first dose of GARDASIL, lot # not available. There was no concomitant medication. In July 2007 the physician reported that patient had a C & S negative for vaginitis before vaccine started. In approximately August 2007, the patient experienced hypothyroidism. On 14-AUG-2007 the patient was diagnosed with insulin dependent diabetes mellitus (IDDM). In November 2007, the patient experienced alopecia areata. Subsequently the patient experienced tummy ache. On 31-JAN-2008 the physician reported that the patient had her third dose of GARDASIL, lot # not available. IDDM, hypothyroidism and alopecia areata were considered to be permanent or substantial disabilities by the physician. Additional information has been requested.

Other Meds: None

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Drug exposure during pregnancy, Intra-uterine death

Symptom Text: Information has been received from a nurse and a physician for the pregnancy registry for GARDASIL concerning a 15 year old female student with no pertinent medical history and no allergies who on 31-AUG-2007 was vaccinated with the first dose of GARDASIL IM 0.5 ml in the deltoid. On 03-JUN-2008 the patient was vaccinated with the second dose of GARDASIL IM 0.5 ml in the deltoid (lot # 660391/0063X). Concomitant therapy included prenatal vitamins. The patient was 23 weeks gestation. The patient's last menstrual period was 09-APR-2008. The estimated due date is 14-JAN-2009. No adverse symptoms. The patient sought medical attention in the office visit. The urine pregnancy test was performed. Follow-up information has been received from the physician from questionnaire. On 02-OCT-2008 ultrasound was performed for routine with normal results at 19 weeks 6 days. On 25-NOV-2008 serum alpha-fetoprotein test was performed with fetal demise at 24.3 weeks. It was reported that the patient was 24.3 weeks by ultrasound date but was 28 plus weeks by first ultrasound date. On 27-NOV-2008 the patient with 0 previous pregnancy underwent induction for fetal demise at 24.3 weeks. The fetus was normal with no autopsy done. There was no complication during pregnancy. Upon internal review, fetal death was determined to be an other important medical event. Additional information is not expected.

Other Meds: Vitamins (unspecified)

Lab Data: ultrasound, 10/02/08, normal 19.6 weeks; urine beta-human, pregnancy; serum alpha-fetoprotein, 11/25/08; fetal demise at 24.4 weeks

MedDRA PT Vaginal discharge, Vaginitis bacterial

Symptom Text: I took GARDASIL shot series, It didn't cause major problems, but when I took the second shot around the above date I noticed a change in my vaginal discharge. The shot caused me to get bacterial vaginosis. I had it for nine months till I figured out there was a problem because a month before hand I took myself off birth control and I thought my body was just going through changes. I talked to my doctor and he told me it wasn't the GARDASIL shot, so I took the third shot in the series. It immediately caused the bacterial vaginosis yet again. It's not that it's serious, but every woman should know that this is a possible side effect and may be they should prepare themselves.

MedDRA PT Abdominal pain, Abdominal pain upper, Activities of daily living impaired, Aggression, Anorexia, Aphasia, Arthralgia, Asthenia, Asthma, Cough, Diarrhoea, Disturbance in attention, Dizziness, Dyspnoea, Ear pain, Eczema, Enteritis, Gastrointestinal pain, Headache, Hypoacusis, Hypoaesthesia, Impaired driving ability, Listless, Lymphadenopathy, Memory impairment, Metrorrhagia, Mood altered, Oropharyngeal pain, Pain in extremity, Presyncope, Pruritus generalised, Sleep disorder, Weight decreased

Symptom Text: Information has been received from a gynecologist, concerning a 21 year old female patient with history of pollinosis who was vaccinated with a third dose GARDASIL (Lot number 0277U, Batch number NG00020, injection route and site not reported) On 13-MAR-2008. On 28-MAR-2008, the patient developed gastrointestinal cramps with postprandial diarrhea for, the first time. She recurrently complained of abdominal cramps with diarrhoea. After one of these episodes, in September 2008, she went to the emergency room. Clinical examination, lab tests and abdominal sonography were without pathologies. Suspected diagnosis was enteritis. During months she had a weight loss of 5 kg of weight. Within a few months p.v. the patient also experienced generalized itching and an eczema on the right hand. The patient additionally complained of impaired memory, amnesic aphasia, concentration impairment, bad mood, aggression, listlessness, arthralgia, headache, pain and numbness in the whole left arm (from shoulder to fingertips) so that temporarily driving a car was not possible. Also, the patient experienced intermenstrual bleeding, sleeping disorder because of pain in legs, dizziness, feeling of weakness and near fainting, loss of appetite, sore throat with dizziness, feeling of weakness and near fainting, loss of appetite, sore throat with lymphadenopathy followed by ear pain and reduced hearing. In June 2008, the patient consulted a pneumologist because of frequent dyspnoea and unusual cough. Diagnosis of allergic bronchial asthma was diagnosed for the first time (long time history of pollinosis). Treatment with beclometasone and salbutamole inhalatives was started. The outcome was not reported. Upon internal review report considered medically significant. Other business partner numbers included: E2009-00384. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Cervical incompetence, Drug exposure during pregnancy, Premature baby, Premature labour

Symptom Text: Information has been received from a gynaecologist concerning a 24 year old female patient who on 28-FEB-2008 was vaccinated with the third dose of GARDASIL (lot no. 1201U, batch no. NG29050) via the intramuscular route into the upper arm. On 28-FEB-2008 the patient experienced vaccine exposure during pregnancy. No adverse effect after vaccination. The date of last menstrual period was 11-FEB-2008. No detailed information about first and second vaccination. Follow-up information was received on 03-FEB-2009. This case has to be upgraded to serious because of premature birth. It was reported by the gynaecologist that the patient experienced premature birth after a normal course of pregnancy cervical incompetence due to premature labour. Premature birth took place on 21-OCT-2008 (in 36+1 weeks of pregnancy). The patient gave birth to a normal and sound baby on 21-OCT-2008. Weight at birth was 2585 g and height at birth was 49 cm. Apgar score was 6/7/8. The postnatal examination of mother and child showed no pathologies. The first three obligatory primary infant's examination showed normal results. Premature birth was considered to be an other important medical event by the business partner. Other business partner numbers included: E2008-03922. The case is closed. No further information is available.

Seriousness: HOSPITALIZED, LIFE THREATENING, SERIOUS

MedDRA PT Convulsion, Dizziness, Endotracheal intubation, Eye movement disorder, Intensive care, Loss of consciousness, Myoclonus, Pyrexia, Sedation, Tremor, Trismus

Symptom Text: Information has been received from the health authority and a physician who was treating the patient, concerning a 14 year old female who on 18-NOV-2008 was vaccinated with the first dose of GARDASIL, (lot # 1282U, batch # NH45150), which was well tolerated. On 04-FEB-2009 the patient was vaccinated with the second dose of GARDASIL, (lot # 1647U/batch #NH52670), route and site not reported. It was reported that ten minutes after vaccine administration the patient presented with fever (maximum temperature recorded, 38.5 C), dizziness, convulsions and loss of consciousness. In order to treat the adverse event, the patient was given several doses of VALIUM in the health center where she was vaccinated. The patient did not improve with this treatment therefore she was transferred by an ambulance to the hospital where she was admitted to the pediatric intensive care unit. Once in the hospital, the patient was treated with a bolus of DIAZEPAM. The seizures did not remit, thus she was administered another bolus of diazepam. The patient continued presenting myoclonic movements especially in the lower limbs. The patient also presented with trismus and ocular deviation. The patient was given DEPAKINE, phenytoin and midazolam by perfusion to treat the adverse events. The patient was intubated and then induced into a barbiturate coma. On 05-FEB-2009 treatment with sedatives, midazolam, was stopped. DEPAKINE and phenytoin by perfusion treatment continued. Extubation was attempted while the patient remained semi-conscious. During the extubation attempt, the patient had another seizure. Consequently the patient was sedated and inbutated once again. Several tests have been performed on the patient. The nuclear magnetic resonance imaging (MRI) appeared to be normal. Lumbar puncture was also normal. Electroencephalography results were pending. The reporting investigator considered convulsion, dizziness, loss of consciousness, pyrexia and tremor to be life threatening. A lot check has been initiated. Other business partner numbers

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Arthralgia, Myalgia, Myositis, Rhabdomyolysis

Symptom Text: Information has been received initially on 29-JAN-2009 from a school physician concerning a 10 year old female patient who on 03-DEC-2008 was vaccinated into the arm with the first dose of GARDASIL (Batch # NG14300 Lot # 0467U) (route not reported). On 09-DEC-2008 the female patient came for examination due to persistent muscle pain in the area of both thighs, incipient 24 hours post vaccination. It was reported that the injection site was not inflammatory and the female patient reported about persistent pain in both thighs during going and running, and in the area of the left hip. At the area of both quadriceps musculature local pain without external abnormality. It was reported, that as the female patient was sportive and trained (wrestler) a blood test (CPK-Creatinphosphokinase, CRP-C reactive protein) on an unspecified date the family doctor was initiated to exclude an iatrogenic rhabdomyolysis. Results were only reported for CK-NAC. As well, the female patient was examined at the emergency department and the pediatric department to exclude a coxitis fugax. An ultrasound examination of the hip was performed, results without finding. The diagnosis of a reactive myositis of both quadriceps muscles was reported. The lab was inconspicuous, except for a heightened CK NAC (263), ranges not reported. A lab control in January 2009 was performed. The CK NAC value decreased to 98, as well as the other parameters, inconspicuous. The physician observed, that the CK heightening was due to the local injection or activated due to concomitant reaction of musculature. Therefore the physician decided not to vaccinate the female patient with the second dose of GARDASIL, as she could not exclude an iatrogenic activated rhabdomyolysis. A treatment with antiphlogistics was unknown. The female patient recovered after about 2 weeks. Upon internal review suspicion of rhabdomyolysis was considered a medically significant event. Other business partner numbers include E2009-00844. Additional information is not expected. The case is clos

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Convulsion, Pyrexia

Symptom Text: Information has been received from a healthcare professional concerning her 20 year old daughter who was vaccinated with all three doses of GARDASIL. One week after receiving the third dose the patient experienced spiking a 104 degree fever and sometime after that the patient experienced a seizure/seizure like activity. Two weeks after the seizure like activity the patient saw a neurologist. At the time of this report, the outcome was unknown. Upon internal review, seizure/seizure like activity was determined to be an other important medical event. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Caesarean section, Complication of delivery, Condition aggravated, Drug exposure during pregnancy, Failed trial of labour, Foetal disorder, Premature rupture of membranes, Urinary tract infection

Symptom Text: Information has been received from a medical assistant and a pediatrician concerning a 17 year old female patient for the pregnancy registry for GARDASIL with no pertinent medical history and no known drug allergies, who on 31-OCT-2007 was vaccinated with the first dose of GARDASIL (lot# 653978/0955F) 0.5 ml intramuscularly. There was no concomitant medication. It was reported that the patient found out she was pregnant in "December 2008" after receiving the first dose of GARDASIL. Patient sought medical attention from unspecified OB. On 29-AUG-2008 the patient received the second dose of GARDASIL (lot# 660553/0070X) 0.5 ml intramuscularly after delivering a healthy baby on June 2008. Follow-up information received from the medical assistant who reported that the patient has had a history of 1 previous pregnancy and 1 full term delivery. The infant was born 30-JUN-2008, Apgar score of 1, normal, with no congenital anomalies and with no other complications or abnormalities. Follow up information received on 06-FEB-2009 from a pediatrician who reported that the patient has a history of mononucleosis and UTI. Number of previous pregnancies is 0 (previously reported as 1); number of previous live births is 0 (previously reported as 1). The date of the last menstrual period is 08-OCT-2007. On 24-NOV-2007 patient was on treatment with KEFLEX 500 mg twice a day, for 5 days for the treatment of urinary tract infections. Ultrasounds performed on two different occasions with normal results. On 27-JUN-2008 a biophysical profile was performed. Complications during pregnancy included premature rupture of membranes and irregular fetal heart rate, fetal arrhythmia. Failure to progress during labor/delivery therefore a cesarean section was performed. The baby was born 37 weeks from LMP, weighed 6 pounds 11 ounces and was 19 inches tall. Infant was normal with no congenital anomalies. No further information is available.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Anaemia, Caesarean section, Drug exposure during pregnancy, Face presentation, Failed trial of labour

Symptom Text: Information has been received from a registered nurse (R.N.), for GARDASIL, a Pregnancy Registry product, concerning a 15 year old female patient, who on 23-APR-2008 was vaccinated with the first dose of GARDASIL. On the same day, the patient also visited the OB/GYN, and had a positive pregnancy test. Details of the pregnancy and gestation were not reported. Follow-up information was received on 05-FEB-2009 indicating that on 22-APR-2008 (previously reported as 23-APR-2008), the patient with behavioral problem and school problem and a history of varicella disease was vaccinated intramuscularly in the right deltoid with a first dose of GARDASIL (Lot #659439/1267U). It was reported that the patient had 0 previous pregnancies. An ultrasound performed on 25-JUN-2008 revealed possible brachycephaly. Amniocentesis performed on 27-AUG-2008 showed no brachycephaly. Maternal serum alpha-fetoprotein (MSAFP) on 07-JUL-2008 was negative. It was reported that the patient developed anemia during pregnancy. There were no infections or illnesses during pregnancy. On 16-NOV-2008, 38 weeks from LMP, the patient had a cesarean section for occiput posterior descent, and delivered a normal male baby, weighing 6 pounds 10 ounces. The baby's length was 20 inches, head circumference was 13 inches and apgar score was 8/9. There were no congenital anomalies, other complications or abnormalities. Upon internal review, "cesarean section for failure to progress" was determined to be an other important medical event. Additional information is not expected.

Other Meds: Unknown

Lab Data: ultrasound, 06/25/08, possible brachycephaly; amniocentesis, 08/27/08, no brachycephaly, beta-human chorionic, 04/23/08, pregnant; serum alpha-fetoprotein, 07/07/08, negative x4

History: Varicella

MedDRA PT Dizziness, Immediate post-injection reaction, Loss of consciousness, Pallor

Symptom Text: Patient was in office for routine visit. Pt was ordered HPV vaccine, menactra (meningococcal) vaccine, and adacel (tdap) vaccine. Gave all three immunizations and right after giving the HPV vaccine, patient stating she felt like she was going to pass out. Patient leaned forward onto her mom while sitting on exam table and passed out, became very pale. Pt did not fall off table. Myself and another nurse immediately laid pt back on table. Pt awoke after only 1-2 seconds. We elevated pt's legs and had pt lay there while monitoring her for approximately 10 minutes. Pt was awake, alert, and oriented. At that time we gave her a small cup of orange juice and elevated pt's head. Pt laid there for approximately 10 more minutes and then we had the doctor check the pt. Pt was stating she was feeling fine, awake, alert, and oriented/walking around in room. Dr. gave the okay for pt to go home.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Acute disseminated encephalomyelitis, Back pain, Confusional state, Diplopia, Disorientation, Dizziness, Encephalitis, Fatigue, Headache, Hypersomnia, Mental disorder, Post lumbar puncture syndrome, Visual impairment, Vomiting

Symptom Text: Developed symptoms of severe headache, fatigue, dizziness, abnormal vision and excessive sleeping on about 5/2/2007, 5 weeks after receiving HPV #1 and about 1 week after diagnosis of acute Group A strep throat on 4/26/2007. She continued to have prolonged symptoms and MRI of brain was performed on 5/23/07 and was consistent with Acute disseminating encephalomyelitis. She was hospitalized for several days and treated with IV steroids and bed rest. She had a prolonged convalescence but for the most part all symptoms had completely resolved by August 2007 except for continued headaches for which she takes amytriptline rather regularly. She continues to have psychologic issues, but these pre-dated HPV vaccine and I do not think they are the result of HPV. She sees a psychologist regularly. She has not received any further HPV due to concern about possible connection with her A.D.E.M. 2/24/09-records received for DOS 5/30-6/2/07-DC DX:post lumbar puncture headache. Acute disseminated encephalomyelitis (ADEM). One month prior received treatment for infectious cerebellitis and a diagnosis of ADEM 2-3 weeks prior to admission. Prior to lumbar puncture C/O confusion and disorientation. Presented with vomiting and headache. Lower back pain. Blood patch performed. Eye consult 5/23/07-C/O sudden onset horizontal diplopia, dizziness and movement of the environment. 3/23/09-additional information recieved-presented on 5/30/07- with C/O headaches after lumbar puncture. 2-3 weeks ago developed diplopia and a gait imbalance,

Other Meds:

Lab Data: MRI of brain consistent with A.D.E.M. 4/24/09-records received-MRI abnormal signal in brainstem without regional mass effect. Compatible with demyelinating disease. T2 signal abnormality. MRI showed ADEM. Follow-up MRI yesterday showed imp

History: Adjustment reaction with depressed mood 2/24/09-records received-PMH: Chronic tension headaches, neck and shoulder tension. Headaches for many years but now worse. Double vision. Stated always had tracking issues with reading. Strep throat 5/7/07.Allergy to penicillin.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Breath sounds abnormal, Cyanosis, Dizziness, Erythema, Muscle contracture, Muscle rigidity, Mydriasis, Respiratory arrest, Retching, Unresponsive to stimuli

Symptom Text: Pt was sitting on exam table after vaccine and she felt dizzy. She was assisted to lying position on table by mother. A few seconds later nurse arrived in room and pt had rigid posture. Her face was red, then blue, and patient had ragged breathing. Her third and fourth fingers of her right hand were clenched, and her right arm was contracted. Pt's eyes fully dilated. Another nurse elevated pt's legs. A few seconds later Pt stopped breathing for about 5 seconds and nurses performed vigorous sternal rub, causing patient to resume ragged breathing. A few seconds later, Pt heaved, but did not vomit, was then turned to her left side. A few seconds later, pt started kicking for a few seconds, then relaxed, and was immediately responsive. Pt stated her name when asked, and was breathing calmly and normally. No loss of bladder or bowel function. Total non-responsive time was about 45 seconds. Pt was then kept supine for 5-10 minutes, then sitting for 5 minutes, then standing. No further loss of consciousness. Multiple sets of BP and pulse, and O2 sats obtained immediately after episode.

Other Meds: none

Lab Data: immediately after episode: BP 112/48, HR 91, O2 98% 5 min after episode: BP 104/52, HR 90, O2 99%

MedDRA PT Abdominal pain, Inflammatory bowel disease, Nausea

Symptom Text: Case was initially reported by Health Authority (PEI2008014571). Information has been received from a gynecologist concerning a 14 year old female patient who on 10-APR-2008 was vaccinated with the second dose of GARDASIL into the deltoid muscle (Batch #NG20180, lot # 0510U). On 15-APR-2008 the patient developed abdominal pain and nausea especially postprandial. Gastroscopy and colonoscopy showed no pathological findings. The patient was tested for food allergy, the results were no available at the time of reporting. The patient had not recovered at the time of reporting (28-JUL-2008). The first dose of GARDASIL was given on an unknown date and was well tolerated. The reporter assessed the relation to the vaccine as unlikely but the mother insisted on reporting. The file was closed. Follow up information was received on 09-FEB-2009: this case had to be upgraded due to long persistence of symptoms. It was reported that the patient underwent a colonoscopy on an unspecified date and an inflammatory bowel disease was diagnosed. The health authority considered inflammatory bowel disease to be an other important medical event. The file was closed. Other business partner numbers include E2008-10095. No further information is available.

MedDRA PT Acute myeloid leukaemia, Dyspnoea, Nausea, Vomiting

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. A 16 year old female with asthma and attention deficit/hyperactivity disorder and a history of "MR" (not otherwise specified) on 18-DEC-2008 was vaccinated intramuscularly with a third dose of GARDASIL (lot number 661703/0651X) in the left arm. Concomitant therapy included clonidine, albuterol and montelukast. On 17-DEC-2008 the patient experienced nausea and vomiting. The patient's mother took the patient to the emergency room. On 19-DEC-2008 the patient's mother took the patient to emergency for shortness of breath. The patient was diagnosed with acute myeloid leukemia. The listing indicated that one or more of the events required hospitalization, was considered to be immediately life-threatening. No further information is available. The original reporting source was not provided. The VAERS ID # is 339525. A standard lot check investigation was performed. All in-process quality checks for the lot number in question were satisfactory. In addition, an expanded lot check investigation was performed. The testing performed on the batch prior to release met all release specifications. The lot met the requirements of the Center and was released.

MedDRA PT Bradycardia, Dizziness, Hypoglycaemia, Hypotension, Pallor, Similar reaction on previous exposure to drug

Symptom Text: Information has been received from a Health Authority (Ref. No. L200901-487) on 05-FEB-2009 and transmitted under local reference number RA-006-2009. A 13 year old female patient experienced dizziness, pallor, Hypotension at 90/50 mmHg, bradycardia and hypoglycemia around 60 mg/dl with a duration of 40 minutes, ten minutes after she had received the second dose of GARDASIL (batch no. NJ32820; lot no. 0779X) via intramuscular route on 19-JAN-2009. There was no specific treatment for the adverse reaction. To be noted that when she had received the first dose of GARDASIL (batch no. not reported) on an unspecified date, the patient had shown the same symptoms and had fainted. The patient had no known clinical history. History of adverse reactions to previous other drugs was unknown. The patient recovered without specific treatment on unspecified date. The case is closed. The patient's experience was considered serious as an other important medical event. Other business partner numbers included: E2009-01092. Additional information is not expected.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Carcinoma in situ, Cervical dysplasia, Smear cervix abnormal, Uterine dilation and curettage

Symptom Text: Information has been received from a physician concerning a 24 year old patient with a history of papanicolaou smear abnormal who on 20-FEB-2007 was vaccinated with the first dose of GARDASIL (lot no. 656049/0187U), second dose of GARDASIL (lot no. 657621/0387U) was given on 20-APR-2007 and third dose on 20-AUG-2007 (lot no not reported). In August 2008 the patient was diagnosed with carcinoma in situ. A colposcopy was performed and result was high grade squamous epithelial lesions. On an unknown date a uterine dilation and curettage was performed. It was also reported that a cervical cone biopsy was made (results not provided). Upon internal review, the patient's carcinoma in situ was considered an other important medical event. The patient's sister had a similar adverse experience following vaccination (WAES 0902USA00938). Additional information has been requested. 2/25/09 GYN records received from 11/2005 to 12/2008. Seen 2/9/07 for annual exam. Normal PAP. HPV vax series started. Returned 8/7/08 for exam. PAP (+) for mild dysplasia. Colposcopy 9/2/08. Cone bx (+) for carcinoma in situ and severe dysplasia.

Other Meds: Unknown

Lab Data: Colposcopy, high grade squamous epithelial lesions; Cervical smear, ascus pap smear. Labs: PAP (+) for ASCUS, HPV (+). Cervical cone bx (+) for carcinoma in situ with extensive glandular involvement. Repeat (-) for malignancy.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Hypoaesthesia, Paresis, Sensory disturbance, Somatoform disorder

Symptom Text: Information has been received from a general practitioner on 05-FEB-2009 who also sent a hospital discharge report concerning a 14 year old female patient who was vaccinated with a third dose of GARDASIL (lot #0253U, batch #NF58540, injection route not reported) into the left upper arm on 15-OCT-2007. On 15-DEC-2007 the patient developed hypaesthesia and paresis of the right hand. The patient was hospitalized from 17-DEC-2007 until 20-DEC-2007. Hypaesthesia and paresis of the right hand were diagnosed. Cranial and cervical MRI were normal as well as neurography, AEP and routine lab findings (not otherwise specified). VEP showed a slight delay on the right side. CSF was not examined. According to a neurological examination on 18-JAN-2008 the patient had not recovered and persisting sensory disturbance of the right hand was diagnosed. A somatoform origin of the complaints was suspected and a psychiatric examination planned. On the reporting form it was mentioned that the patient developed during the course about 6 weeks later also sensory disorder and paresis of the right and left foot. Hypaesthesia of the right hand and right foot were persisting at the time of reporting. The first and second dose of GARDASIL (both lot# not reported) administration on 01-JUN-2007 and 24-AUG-2007 into the left upper arm were well tolerated. Other business partner numbers include: E2009-01038. No further information is available. File closed.

Other Meds: None

Lab Data: magnetic resonance imaging, ??Dec07, cranial and cervical MRI were normal; Auditory evoked potential, ??Dec07, normal; Visual evoked potential, ??Dec07, slight delay on the right side; Diagnostic laboratory test, ??Dec07, neurography normal

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Abdominal pain, Asthenia, Blindness, Deafness, Diarrhoea, Dysgeusia, Dyspnoea, Feeling cold, Injection site pain, Injection site swelling, Nausea, Pallor, Syncope, Tinnitus, Visual impairment

Symptom Text: I received the Gardasil vaccine and walked out of the room. As I exited I lost vision and hearing and collapsed, still conscious and very nauseated. Difficulty breathing occurred once vision returned. Hearing did not return for 10 minutes and I heard a ringing, metallic sound every time I talked. Vision was yellow and green, and my face had lost all color (pale/green). 15 minutes after the shot I had abdominal cramps and diarrhea. I drank some water and was then freezing cold and very weak. I felt more normal by the end of the day. On the second and third day, I had swelling and tenderness at the injection site.

MedDRA PT Asthenia, Cold sweat

Symptom Text: About 2 minutes after the shot I walked out of the doctors office and into the lobby, and all of a sudden I lost all energy in my body. Literally, I felt as though if I were to take one more step I would collapse. I did not have the energy to put my hand up and ask the clerk for help, and she was only a few feet away. Not knowing what else to do, I laid down on the floor in the lobby and tried to sleep. Probably soon after a medical assistant brought me back into the office and gave me some water. She said I looked "clammy" and I felt a cold sweat. After I drank the water I laid down on one of the beds in the small offices. I have not gone back to get the other two shots. I am a 19 year old female.

MedDRA PT Anxiety, Back pain, Blood potassium decreased, Convulsion, Dyskinesia, Headache, Influenza like illness, Muscle contractions involuntary, Muscle spasms, Nausea, Pain

Symptom Text: Headaches starting January 3rd. Nausea and flu-like symptoms starting around January 15th. Low back pain started early January. February 2, patient had one "violent seizure-like episode" with strong involuntary muscle contractions at school. Ambulance was called, patient went to ER. Diagnosed with low potassium. February 3, patient had several more episodes at school. Ambulance was called again, patient went to ER and had several more episodes in the ER, and admitted to hospital. Possible dystonia? Several more episodes in the hospital with total lab and diagnostic test work-up. Discharged February 8 with diagnosis of anxiety. Was given Kepra which took her from 30 seizures a day to 15 a day. Patient taking 500 mg bid. Back pain remains at an 8 which increases to 10 right before an episode. Patient is aware and alert during seizure-like episodes and states they are extremely painful muscular contractions. Has follow-up testing with pediatrician and ob-gyn, and has been referred to specialist.2/27/09-records received-for DOS 2/3-/2/8/09-presented with back spasms after 1 day history of multiple episodes of flexing back and flexing hands foreward and flexing legs backwards with severe pain.

Other Meds: Oral contraceptives

Lab Data: EEG, EKG, CT Scan, MRI, X-ray of back, extensive blood and urine work-up. Video x24 hours with EEG. 2/27/09-records received EEG negative. Labs WNL. CT of head and MRI WNL.

History: Allergic to Penicillin. Seasonal allergies. 2/27/09-records received- History of panic attacks and anxiety.

MedDRA PT Abdominal neoplasm, Azotaemia, Chemotherapy, Coma, Haemorrhage, Rhabdomyosarcoma, Surgery

Symptom Text: Information has been received from a Foreign Authority (reference number DK-DKMA-20090203) concerning a 15 year old female patient who was vaccinated intramuscularly with the first dose of GARDASIL (lot # 1941U, batch # NJ01850, site of administration not reported) on 23-DEC-2008. It was reported that the patient experienced rhabdomyosarcoma on 25-Dec-2008. She was diagnosed with rhabdomyosarcoma (date of diagnose not reported). The sarcoma presumably had its origin in the patient's uterus (not confirmed). The patient was hospitalized (date not reported) and placed in coma (date not specified) at the hospital intensive unit. The patient's abdomen was opened due to an inoperable, rapidly growing tumor which at the time of acute operation had grown rapidly to the size of a full term pregnancy (date not specified). The patient received chemotherapy (onset date not specified) and experienced complications in form of uraemia and bleeding (not further specified). The course of the disease was reported as unexpectedly fast and aggressive. Initially, before the expansion of the abdomen, the adverse event was interpreted as appendicitis. At the time of report to the Health Authorities the condition of the patient was stable and she was scheduled to be taken out of coma the next day (date not reported). It was reported that the patient was healthy and did not suffer from any known diseases at the time of vaccination. The patient received no concomitant vaccinations or medication. At the time of report the patient had not recovered. Other business partner numbers include: E2009-01070. No further information is available.

Seriousness: ER VISIT, HOSPITALIZED, SERIOUS

MedDRA PT Dyskinesia, Headache, Loss of consciousness, Muscle twitching, Myoclonic epilepsy, Neurological examination abnormal, Photophobia, Tremor

Symptom Text: Information has been received from a Registered Nurse (R.N.) concerning a 17 year old female with no family history of seizures or drug allergies who received all three doses of GARDASIL and then experienced seizures. All 3 doses were administered at a different facility and the patient just started coming to the nurse's office in December 2008 so the dates or lot number of the GARDASIL administered were not available. The patient was vaccinated with the third dose of vaccine in mid-January 2008. The seizures began in April 2008. In December 2008 the seizures became consistent and occurred daily. Starting 09-FEB-2009 the patient experienced blackouts. A neurologist determined the patient was having monoclonic seizures and prescribed KEPPRA and DILANTIN. The KEPPRA would be discontinued and replaced with LAMICTAL. Neurological tests indicated abnormal electroencephalogram. The nurse also mentioned that the patient has been experiencing headaches but had no further information about them. At the time of reporting the patient was getting worse. The patient was hospitalized and was seen by a neurologist. Additional information has been requested. 2/24/09 Received hospital medical records of 12/10-12/11/2008. FINAL DX: myoclonic seizures Records reveal patient experienced HA, photophobia x 2 days then had involuntary jerking/shaking/twitching episode while in class 12/9. Neuro consult done. Tx w/meds. 3/5/09 Received Neuro medical records of 1/15/09 FINAL DX: seizure disorder, generalized, myoclonic Records reveal meds were adjusted.

MedDRA PT Fatigue, Feeling cold, Injection site pain, Musculoskeletal stiffness, Pyrexia

Symptom Text: Information has been received from Health Authority (reference no. 2009-00428) on 05-FEB-2009 concerning a 15 year old female adolescent who on 15-JAN-2009 was vaccinated intramuscularly with a dose of GARDASIL (batch #US30960, site of administration not reported). After 24 hours the patient developed fever (39 degrees Celsius), fatigue, neck stiffness, feeling cold and injection site pain. A meningism was excluded in the physical examinations of the patient. A blood count was unremarkable, the C-reactive protein increased to 27 and a serology for influenza A and B was also negative. After 4 days the patient recovered without damage. Fever, fatigue, feeling cold, injection site pain and neck stiffness were considered to be important medical events. Other business partner numbers included E2009-01067. No further information is available. Case is closed.

MedDRA PT Cardiogenic shock

Symptom Text: Information has been received from a health professional (a nurse) via a company representative (sales) concerning a teenage female who was vaccinated with the first dose of GARDASIL. This is a hearsay report in the absence of an identifiable patient. Attempts are being made to verify the existence of a patient. The reporting nurse (outpatient injection room) heard this case from another nurse in a general ward. The patient was vaccinated with the first dose of GARDASIL (the date of vaccination was not reported). Subsequently the patient experienced cardiogenic shock. The patient received CPR in ER due to cardiogenic shock. The outcome and the causality with GARDASIL was not reported. The patient's cardiogenic shock was considered as an other important medical event. The company representative asked to PV staff whether there have been adverse events of cardiogenic shock after vaccination of GARDASIL. The company representative also suspected that this case might be rumor. Attempts have made to receive additional information by telephone but information has not received at the time of this report. Additional information has been requested.

MedDRA PT Blood pressure decreased, Convulsion, Dizziness, Eating disorder, Gastric disorder, Gastrointestinal disorder, Headache, Loss of consciousness, Tremor, Weight decreased

Symptom Text: Information has been received from a kindergarten teacher concerning her husband's relative's churchmember's daughter's friend at school, a girl who in August 2008 was vaccinated with the third dose of GARDASIL. The patient developed similar symptoms as her friend (WAES #0902USA01121) noted below, most of which started in September 2008. Headache, seizures, quit eating, passed out, lost weight, gastric disorder, blood pressure dropping extremely low, dizziness, tremors, and digestive disorder. It was also noted that this patient's digestive tract issues were worse. At the time of the report, the patient had been out of school about the same amount of time as her friend, approximately 8 or 9 weeks. The reporter considered both girls' symptoms to be due to the vaccine. Attempts are being made to verify the existence of an identifiable patient and reporter. Upon internal review, seizures is considered to be an other important medical event.

MedDRA PT Caesarean section, Drug exposure during pregnancy

Symptom Text: Information has been received through the Merck pregnancy registry from a physician concerning a 17 year old female who on 16-NOV-2007 was vaccinated with the first dose of GARDASIL. Subsequently, the patient learned that she is pregnant. The pregnancy was confirmed by a pregnancy test. Concomitant therapy included injection with the first dose of VARIVAX on 16-NOV-2007. Other concomitant therapy included HAVRIX and MENACTRA. No adverse side effects were reported as a result of this exposure. The patient sought unspecified medical attention. Follow up information was received from the nurse via phone call. It was reported the baby was "fine", healthy and normal. The reporters now see the baby was well. The baby was born by C-section (Caesarean-section) with no complications but the reporter did not know the indication for the C-section. The baby weighed 7 lbs 9 oz and was 18 and a half inches long. Upon internal review, "the baby was born by C-section" was determined to be an other important medical event. No further information was available.

MedDRA PT Activities of daily living impaired, Aphonia, Dysphonia, Inappropriate schedule of drug administration, Stress, Vocal cord atrophy, Vocal cord disorder

Symptom Text: Information has been received from a pharmacist concerning a 29 year old female who on 03-JAN-2009 was vaccinated with a second dose of GARDASIL (batch number not reported). Several months later, the patient experienced dysphonia, characterized by a hoarse voice and aphonia. She had a work interruption during 3 weeks. In January 2009 she consulted two otorhinolaryngologists who did not make a diagnosis, and a phoniatrician who diagnosed compressed vocal cords. The patient was treated with cortisone and anti-inflammatory drugs. It is noteworthy that the patient was under antidepressants treatment, that she was a light smoker and did not take any alcohol. Furthermore, there was a possible context of stress. At the time of reporting, the outcome was not reported. Dysphonia and vocal cord atrophy were considered to be medically significant (other important medical events). Other business partner numbers included E2009-01100. Additional information has been requested.

MedDRA PT Abdominal pain, Balance disorder, Convulsion, Depersonalisation, Dizziness, Fall, Fatigue, Hypoaesthesia, Muscular weakness, Nausea, Restless legs syndrome, Syncope, Urinary incontinence, Vestibular neuronitis

Symptom Text: Information has been received from a Registered Nurse concerning her daughter (a 15 year old female) who in August 2008 was vaccinated with the third dose of GARDASIL (lot number was not available). The patient experienced leg weakness, dizziness, fatigue and syncope after receiving her third dose of vaccine. At the time of reporting the patient was not recovered. Follow-up AE Information was received from the Registered Nurse by phone concerning her daughter with no pertinent medical history and drug allergies who was vaccinated with her third dose of GARDASIL in April 2008 (not August 2008 as previously reported). Date of birth of the patient is 19-JUN-1993. Patient is not pregnant. Lot #s of GARDASIL are unspecified. Her symptoms began in October 2008. In addition to leg weakness, dizziness, fatigue and syncope the patient has also been experiencing seizure-like activity. No other vaccinations was administered with GARDASIL. Patient is on AVIANE birth control. The patient has seen a neurologist and has had an EEG, EMG of lower extremities and MRI of brain, MRI of abdomen and lab work. All tests have all come back negative. Dose 1 was administered on an unspecified date and dose 2 was administered on 09-SEP-2007. The patient's symptoms are getting worse. The syncope and seizure-like activity are occurring more often. No hospitalization, not life-threatening, not a significant disability. No treatment and no medication have been prescribed at this point. Upon internal review, seizure-like activity was determined to be an other important medical event. The patient sought medical attention. Additional information has been requested. 2/24/09 Received PCP medical records of 11/7/08, Records reveal patient experienced abdominal pain, dizziness, numbness & urinary incontinence x 1. Refered to Neuro. 3/4/09 Received Neuro medical records of 11/18/2008-2/12/2009. FINAL DX: right peripheral vestibular dysfunction, vestibular neuronitis & restless leg syndrome Records reveal patient experienced episodes of diseq

MedDRA PT Activities of daily living impaired, Asthenia, Blood pressure decreased, Chelation therapy, Convulsion, Dizziness, Eating disorder, Fluid replacement, Gastric disorder, Headache, Hyperbaric oxygen therapy, Loss of consciousness, Neurological symptom, Oxygen supplementation, Sinus disorder, Tremor, Weight decreased

Symptom Text: Information has been received from a kindergarten teacher concerning her husband's relative'S churchmember's daughter, a 14 year old girl who on an unspecified date was vaccinated with the third dose of GARDASIL. After getting all three doses of GARDASIL, the patient was treated by a holistic doctor for the following experiences attributed to the GARDASIL vaccine: headache, "stomach stays inflamed", blood pressure dropping extremely low causing dizziness and passing out, tremors and seizures. The patient had a sensation that she was going to pass out in bed one night. The next night, on 31-DEC-2008, it happened. Her mattress was moved to the floor for safety reasons. The family decided she cannot be left alone anymore. The patient would not be returning to school. The doctor said she would miss this semester. The school has set her up with online classes so she won't miss any of her credits. It was reported that "she doesn't feel good enough for any of that as yet, but she's moving in the right direction". She was sleeping in a hyperbolic chamber at night to help get oxygen into her body. That was helping. She was also on oxygen during the day for the same reason. She was receiving electrolyte drinks. She was to begin nutritional IV's to supply her body with nutrients. The chemicals in her body have built barriers and she is not receiving the nutrients from food that she needs. She has lost weight. She had quit eating for awhile but now the doctor has her eating every two hours. She had an appointment with a homeopathic neurologist scheduled. The family reported problems with the patient's veins. A nurse tried to put a shunt in and it infiltrated after 2 days. The nurse tried 5 times and couldn't get the IV back in. The doctor wanted a central line put in. The patient had "a little sinus thing going on" and couldn't get in the hyperbaric chamber for most of the last week. She realy began to have some bad days. She started having small seizures (19-JAN-2009). But her "sinus thing' got better so she could stand for

MedDRA PT Activities of daily living impaired, Dysstasia, Gait disturbance, Inappropriate schedule of drug administration, Pain in extremity, Pyrexia, Thrombosis

Symptom Text: Information has been received from an office manager who is the mother of a 23 year old female with a medical history of broken hand and wrist injury which required plate on hand and knee injury (ruptured bursa), who on 22-APR-2008 was vaccinated with the first dose of GARDASIL IM 0.5 mL. On 10-JUL-2008, the patient was vaccinated with the second dose of GARDASIL IM 0.5 mL and on 16-JAN-2009, the patient was vaccinated with the third dose of GARDASIL (Lot number 0947X) 0.5 mL IM in the left deltoid. Concomitant therapy included YAZ. On 19-JAN-2009, the patient developed a fever. The patient had positive markers for mononucleosis but had a series of pending tests. On 23-JAN-2009, the patient experienced left leg pain. The pain continued for the next couple of days and on 25-JAN-2009 she went to the emergency room where she was diagnosed with a blood clot. She was transferred to another hospital because there were no beds and was hospitalized for 3 days. An ultrasound was performed which was positive for blood clot. The patient was treated with heparin for the clots. On 27-JAN-2009, the patient was discharged with LOVENOX and COUMADIN. The patient will be on the blood thinner for a minimum of 3-6 months. Currently, the patient was not able to walk long distances or stand for long periods of time. The patient was not able to play her usual sports because of being on blood thinners. As of 09-FEB-2009, the patient was recovering. The blood clots was considered to be immediately life-threatening and disabling by the office manager. This is an amended report. The GARDASIL dose given closest to the earliest AE onset date was changed from the third dose given on 16-JAN-2009 to the second dose given on 10-JUL-2008. Additional information has been requested.

Other Meds: YAZ

MedDRA PT Autopsy, Cardiac arrest, Cardiomegaly, Cough, Death, Pulmonary embolism, Respiratory tract congestion

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. A 13 year old female with blood clot on 28-APR-2008 was vaccinated with the third dose of GARDASIL (lot # reported as 659964/1978U), vaccination route and site not reported). The patient was a healthy, active teenager. On 26-OCT-2008, the patient developed a pulmonary embolism after having 3 rounds of GARDASIL. The patient complained of cough and congestion which lasted several days. Emergency department records for the date of surgery on 26-OCT-2008 was received on 09-MAR-2009, which reported that the patient presented in full cardiac arrest after suffering a full and prolonged cardiac arrest, asystole. The patient expired. Autopsy report was received on 23-FEB-2009 which revealed that immediate cause of death: massive pulmonary embolism, mild cardiomegaly. The original reporting source was not provided. The VAERS ID # is 339771. A standard lot check investigation was performed. All in-process quality checks for the lot number in question were satisfactory. In addition, an expanded lot check investigation was performed. The testing performed on the batch prior to release met all release specifications. The lot met the requirements of the Center and was released. No further information is available.

MedDRA PT Inappropriate schedule of drug administration, Oropharyngeal pain, Radiotherapy, Tonsillar neoplasm

Symptom Text: Information has been received from a health professional, via CSL as part of a business agreement (manufacturer control No. 2009 02 10 LS1), concerning a 49 year old female who on 28-NOV-2008 was vaccinated with her second dose of GARDASIL (Lot # 0353U, Batch # NH00870, Expiry date 22-FEB-2010). This was inappropriate schedule of drug administration due to the patient's age of 49 years. On 30-NOV-2008, 2-3 days after the second vaccination with GARDASIL, the patient experienced a sore throat and two weeks later, a tonsillar tumour was diagnosed. Subsequently the tonsillar tumour was removed and at the time of reporting on 10-FEB-2009, the patient was undergoing radiation treatment. Upon internal medical review, tonsillar tumour was considered an other important medical event. Additional information has been requested.

MedDRA PT Abdominal pain, Angioedema, Anxiety, Choking, Dehydration, Dermatitis allergic, Dyskinesia, Dyspnoea, Eyelid oedema, Hypersensitivity, Idiopathic urticaria, Nasal congestion, Oedema peripheral, Pain, Rash, Throat tightness, Tremor, Urticaria

Symptom Text: 3rd in the series of Guardasil on 7/24/2008. On 9/10/2008, patient went to emergency room in ambulance due to rash and difficulty breathing, assumed allergic reaction to something. On 9/20/2008, patient had 2nd reaction with severe hives, shaking, jerking spasms and dehydration, assumed allergic reaction. Both times treatment was IV benedryl and prednazone pack. Allergist consultation visit the following day resulting in his prescribing use of over the counter allergy meds; Claritin in the AM, Pepsid mid day, Zyrtec at bedtime, benedryl as needed. 9/25/2008 patient was asleep and woke up choking with extreme breathing difficulties, resulting in another ambulance ride and a 3rd emergency room visit. Treatment was IV benedryl and Prednazone pack. Over the next 5 months several (5-7) cases of mild to moderate hives during which patient took over the counter benedryl and hives went away. On 2/09/2008, patient had severe abdominal pain, began having difficulty breathing and noted hives. This resulted in 3rd ambulance ride to emergency room. For 5 months, patient has taken over the counter allergy meds regularly as described above. Up to this point in her life she has had no known allergies, no anaphylaxis and has been in very good health, active in sports. During this 5 months, she has been to the emergency room 4 times, 3 of those with severe breathing difficulties. Symptoms include hives, abdominal pain, swelling of hands and fingers, difficulty breathing all occurring rapidly. This is considered to be a life threatening situation. It appears that this response could have been caused by Guardasil injection from 7/24/2008. 3/17/09-received office records for date of vaccine. Well visit. krk 4/6/09-records received-ED visit 9/O itching and diffuse swelling, facel feels swollen. PE:eyelids slightly swollen. DX:acute allergic reacion. acute allergic rash. ED visit 9/20/08-C/O allergic reaction, ithcy urticarial rash suddenly with some shortness of breath. Previous episodes of urtic

MedDRA PT Anaphylactic reaction, Convulsion

Symptom Text: Information has been received from a physician concerning a 20 year old female patient with no pertinent medical history and eye redness who on 04-JAN-2008 was vaccinated with the first dose of GARDASIL (Lot # 659437/1266U) intramuscularly. On 20-MAR-2008 the patient was vaccinated with the second dose of GARDASIL (Lot # 660387/1967U) intramuscularly and on 24-JUL-2008 the patient received the third dose of GARDASIL (Lot # 660620/0571X) intramuscularly. It was reported that approximately two months after receiving the third dose of GARDASIL the patient experienced a delayed anaphylactic allergic reaction. The reaction was described as being severe but there were no specific symptoms provided. It was reported that the anaphylactic reaction has been concurrent. The number of recurrent anaphylactic episodes was unspecified. The patient was seen at the emergency room following each episode and received intravenous fluids and epinephrine. The reporting physician considered the delayed anaphylactic allergic reaction to be other important medical event, life threatening and significantly disabling. A standard lot check investigation was performed for the Lot # 660387/1967U. All in-process quality checks for the lot number in question were satisfactory. In addition, an expanded lot check investigation was performed. The testing performed on the batch prior to release met all release specifications. The lot met the requirements of the Center for Biologics Evaluation and Research and was released. A standard lot check investigation was performed for the Lot # 660620/0571X. MedDRA PT Convulsion

Symptom Text: Information has been received from a nurse concerning a 17 year old female patient who on 13-FEB-2009 was vaccinated with the first dose of GARDASIL, within five minutes post vaccination the patient had a seizure. The nurse reported that the patient was taken and admitted to the hospital. The nurse reported that the patient had been released from the hospital but did not know how long time the patient was in the hospital, and the physician wanted to run some tests to make sure that nothing else was going on with the patient. At the time of the report the patient was recovering. Upon internal review seizures was considered to be as an other important medical event. Additional information has been requested.

MedDRA PT Abasia, Arthralgia, Arthritis, Aspiration joint, Genital herpes, Impetigo, Joint effusion, Joint swelling, Musculoskeletal stiffness, Oral herpes, Polyarthritis, Rheumatoid arthritis, Synovitis, Tendon pain, Tendonitis

Symptom Text: Developed Rheumatoid Arthritis-- Pain began within 5 days of last dose of GARDASIL vaccination. Severe joint pain--unable to walk. 2/26/09 Received PCP vaccine records & medical records of 1/2-8/29/2008. FINAL DX: Rheumatoid arthritis Records reveal patient had known right knee, left hip & low back pain. By 2/08 had diffuse joint swelling while at college & seen in student health where CRP & RA factor both (+). Referred to Rheum. Tx w/steroids, plaquenil, methotrexate & humira. Right knee synovial fluid drained 6/08. RTC 7/08 w/right heel pain x 1 mo. Dx w/right Achilles tendonitis. Referred to ortho but did not go. RTC 8/08 w/probably genital herpes & oral cold sores. Tx w/antivirals. Symptoms did not resolve, seen in student health & dx w/impetigo. 3/4/09 Received Rheum medical records of 2/08-12/08. FINAL DX: intensely inflammatory additive symmetrical polyarthritis w/flagrant synovitis while on steroids Records reveal patient experienced joint pain, swelling & stiffness beginning 12/07. Exam revealed multiple sites of synovitis, right knee warmth & effusion. Tx w/additional meds of hydroxychloroquine & methotrexate. Humira added later as s/s persisted.

Other Meds: At time- None

MedDRA PT Dizziness, Injection site pain, Pain in extremity

Symptom Text: Information has been received from a registered nurse concerning a 17 year old female with drug hypersensitivity to MORPHINE who on 14-AUG-2008 was vaccinated IM with the first dose of GARDASIL 0.5ml (LOT # 659962/1740U). Concomitant therapy included MENACTRA. After receiving her first dose of GARDASIL, the patient experienced dizziness and lightheadedness, and slept for a few hours. The patient also experienced pain in her arm at the injection site. Subsequently, the patient recovered from adverse events (date unspecified). It was reported that the patient sought medical attention: phone call. Additional information has been requested.

MedDRA PT Affect lability, Hypoaesthesia, Multiple sclerosis, Muscular weakness, Pyrexia

Symptom Text: Case received from a health care professional on 13-FEB-2009 and transmitted by a distributor under reference number CM9024. A 16 year old female patient with no relevant medical history reported received the second dose of GARDASIL (IM, batch number not reported) on an unspecified date. 4 days later the patient experienced atypical numbness. 20 days after the vaccination the patient visited a neurologist in his private practice while presenting with symptoms of left side hypoaesthesia, lability and mild muscle weakness. In addition the patient had mild fever at 37.3 degree. A brain MRI scan was performed (unspecified date) and revealed multiple cerebral foci with increased gandolinum uptake in T2 sequences. A possible diagnosis of multiple sclerosis was given. The patient was in good health and was not hospitalized nor received any treatment. The patient had a free medical history and no concomitant treatment. The reporting physician did not associate those adverse events to the vaccination with GARDASIL. Further information is expected. Multiple sclerosis like syndrome and fever were considered to be an other important medical event by the health care professional. Other business partner numbers include E2009-01355.

MedDRA PT Bronchospasm, Dyspnoea, No reaction on previous exposure to drug, Oropharyngeal pain, Pyrexia, Rhinorrhoea

Symptom Text: Information has been received from the patient's mother concerning her daughter (a 20 year old female) who on 16-JAN-2009 was vaccinated with the third dose of GARDASIL (lot# 1647U, batch# NH52670, route and site not reported). Secondary suspect therapy included TERBASMIN given on 24-JAN-2009. On 18-JAN-2009, 2 days after vaccine administration, the patient presented with fever and throat pain. During the following days the fever dropped, nose mucus secretion appears. On 23-JAN-2009 the patient visited the doctor due to difficulty breathing. She is referred to the emergency room with a bronchoconstriction. URBASON and VENTOLIN along with SERETIDE and TERBASMIN are administered to treat adverse event. The patient is hospital admitted due to bronchoconstriction on the 24-JAN-2009, she remains hospitalized for 4 days. Prior doses were well tolerated. Other business partner numbers include: E2009-01347. No further information is available.

MedDRA PT Convulsion

Symptom Text: Information has been received from a physician concerning a female who on an unspecified date was intramuscularly vaccinated with the second dose of GARDASIL. Three weeks later the patient developed two seizures. The patient was given anti-seizure medications. At the time of reporting, the patient recovered from seizures. Upon internal review, seizures were considered to be other important medical events. Follow-up information was received from an office manager concerning the 19 years old patient who did not receive GARDASIL in the physician's office and is no longer seen by the physician. The patient's mother mentioned the adverse event to the doctor when she brought the patient's younger sibling for a visit. No further information is available.

MedDRA PT Demyelination, Encephalitis post immunisation, Vision blurred

Symptom Text: Information has been received from a Health Authority (reference number ES-AGEMED-308185236) concerning a 17 year old female with a history of fall with blow to left occipital region of head 15 days before the hospital admission (01-OCT-2008); systemic herpes zoster infection in 1996; herpes zoster in first and second branches of left trigeminal nerve, disseminated without complications who in October 2008, was vaccinated with GARDASIL intramuscularly. It was reported that the patient presented a post vaccination encephalitis and demyelinating disease, from 07-OCT-2008 recovering on 14-JAN-2009. It was reported that the patient was vaccinated with the second dose of GARDASIL 2 months ago, beginning of October 2008, exact date not reported. The patient was hospital admitted on 15-OCT-2008. A week before hospital admission, the patient began to notice problems when reading the computer screen, unable to read properly the ending of words accompanied with a blurry vision sensation. No cephalgia. Since problem with vision persisted during the next few days, the patient visited the ophthalmologist on 13-OCT-2008, who during the examination saw in the campimetry a right homonymy hemianopsy with macular conservation. The patient was sent to the emergency room for further exploration and a neuroimaging test. After performing a computed tomography (CAT) scan, that showed hypodense images of left parietoccipital. The patient is orientated and conscious in time and space. Her language is normal, articulated with no disphasic elements. Conserved memory. No rigidity of the neck nor meningeal signs. Both carotids beat symmetrically, no murmurs, cranial pairs with right homonym hemianopsy, rest of pairs are among normal values, muscular strength is well conserved symmetrical V/V, sensitivity conserved symmetrically. ROT: 2-3/5 symmetric, RCP: bilateral flex. NO tremors, no dismetries, or axial distonia. No signs of vestibular or extrapyramidal pathology. Conserved vesicular with no added noise. Rest of exploration is normal. The

MedDRA PT Injection site erythema, Injection site inflammation, Injection site pain

Symptom Text: Patient was given 4 vaccines on 2/17/09 afternoon (menactra, varivax, gardasil, adacel). Late that evening note redness and soreness to the back of her left arm. Mom treated with cold compress, but soreness and redness did not resolve. Seen her on 2/19/09; teen has circumscribed area of pink inflammation to back of left upper arm. Approximately the size of 1/2 dollar coin. No induration or fluctuance. This site is consistent with where varivax vaccine was given, both per record and per LPN who gave vaccine. Due to teen's hx of eczema and cannot absolutlely r/o secondary infection, was placed on Amoxicillin.

MedDRA PT Balance disorder, Dizziness, Feeling abnormal, Gaze palsy, Hypotonia, Paraesthesia oral

Symptom Text: After giving Varicella vaccine, Tdap, then HPV, child's eyes rolled back, body slumped to right side, b/l arms and legs waved/flapped side to side. No jerking motions. No rigidity of child's body noted. No pallor or cyanosis. Immediately requested mother to notify MD. Layed child down flat on exam table. Within seconds, child opened her eyes and asked what was the matter. I asked her if she remembered what happened. She remembered feeling light-headed. Then felt like she "had a dream". Child A,A,Ox3. Child c/o tingling feeling in arms and lips. BP done (refer to vitals section). Dr Winters responded first then DR Ferran. Had child lay flat until feeling of dizziness passed. Water given. Had child sit with feet dangling. Then had child stand. When initially stood up, child c/o unsteady feeling. Sat child in chair for 15-20min. Child reported that she felt fine, was able to walk steadily, no feeling of dizziness. Dr Ferran okayed that child go home. Left with mother and sibling. Father was driving family home.

Symptom Text: Information has been received from a nurse practitioner and the mother concerning a 16 year old female with no medical history and drug allergies who on 28-JAN-2009 11:45 was vaccinated with the first 0.5 ml dose of GARDASIL (lot # 661703/0651X) IM in the left arm. On the same day the patient was also vaccinated with a dose of HAVRIX into the right arm. There was no other concomitant medication. About an hour later after the patient went to school she blanked out in class. This was after 12:30. The teacher thought the patient was sleeping because her head was down and he called her name. The kids in class shook her and she woke up. She lost consciousness for about 5 minutes. The patient said that she did not hear any of the lessons. The patient was recovered after she was shaken on the same day. The patient sought unspecified medical attention. This is one of several reports received from the same source. Additional information has been requested.

MedDRA PT Abdominal pain upper, Alopecia, Arthralgia, Back pain, Convulsion, Cyanosis, Fatigue, Gingival bleeding, Headache, Immediate post-injection reaction, Respiratory arrest, Visual impairment

Symptom Text: Information was viewed on the Internet concerning a 19 year old patient who in approximately April 2008 (10 months ago), was vaccinated with the first dose of GARDASIL. Second dose was administered (unspecified date). The mother of the patient reported that prior to first shot, the patient was healthy and active. After the vaccination the patient's back started hurting immediately and about three weeks after the first dose of GARDASIL the patient had her first seizure. After the second dose of GARDASIL the seizures, increased, as did severe stomach pain experienced, fatigue, headache, joint pain, vision problems, hair loss and bleeding gums. The mother reported that the patient has been hospitalized four times, there has been multiple ambulance calls daily seizures, several incidents of cluster seizures where she stopped breathing and turned blue. The mother reported that patient seemed to be improving as time goes by. Therapy with GARDASIL was discontinued. Attempts to verify the existence of an identifiable patient have been unsuccessful. No further information is available.

MedDRA PT Chest pain, Cough, Deep vein thrombosis, Hypercoagulation

Symptom Text: Information has been received from a physician concerning a 20 year old female with respiratory allergies who on 21-FEB-2008, 24-APR-2008 and 16-SEP-2008 was vaccinated with the first, second and third dose of GARDASIL respectively (first and second dose lot # unspecified, lot # third dose 660612/0229X). Concomitant therapy included MENACTRA (administered on 21-FEB-2008), ZYRTEC and ALLEGRA. On 04-NOV-2008 the patient went to the physician's office with chest pain and coughing. On 07-NOV-2008 and 14-NOV-2008 the patient came back to the physician's office because the symptoms were still persisting. On 14-NOV-2008 the physician suggested to the patient to go to the hospital. The patient was hospitalized on 15-NOV-2008, a lot of different unspecified tests were done, and the patient was diagnosed with hypercoagulable state and deep venous thrombosis. On an unspecified date the patient was released from the hospital, but the physician did not mention how long the patient was in the hospital for. The physician stated he feels that hypercoaguable state and DVT are life threatening, he was unsure if GARDASIL caused the experience. The patient is still recovering. Additional information has been requested.

MedDRA PT Activities of daily living impaired, Alopecia, Autonomic nervous system imbalance, Dizziness, Immune system disorder, Loss of consciousness, Migraine, Nausea, Orthostatic intolerance, Panic attack, Staphylococcal infection, Vision blurred

Symptom Text: Information has been received from a consumer via the Internet concerning her daughter who in August 2007, was vaccinated with GARDASIL. Subsequently the patient had been sick ever since. The patient had several hospital stays, saw a neurologist on a reg basis, and had been diagnosed with dysautonomia with orthostatic intolerance. The patient experienced blackouts, chronic dizziness and took massive anxiety medicines. She also experienced loose clumps of her hair, blurred vision, migraine headaches, nausea and panic attacks. The patient's immune system had been so compromised that she had gotten MRSA (resistant staff) two times and was hospitalized for that. The patient was also an honor student (straight A's) with a very bright future. Her grades had dramatically dropped. The reporter stated that they had to put her on a plan at school so that her attendance can not be held against her, and her teachers had to reduce her work load because she did not know from one day to the next whether she would be able to get out of bed. At the time of reporting, the outcome was unknown. Attempts are being made to verify the existence of an identifiable patient and reporter. No further information is available.

MedDRA PT Headache, Vertigo

Symptom Text: Information has been received from the health agency (documentation # 29795). A 12 year old female patient (no medical history reported) was vaccinated with the second dose of GARDASIL (batch # NG14300, lot # 0467U, route: intramuscular, site not reported) on 19-DEC-2008. 15 to 20 minutes after vaccination the female patient developed headache and vertigo. Blood pressure RR: 105/72. The duration of reaction was about 6 hours. It was reported that the female patient has recovered. This case was classified by the reporter as medically significant. The case is closed. Other business partner numbers include E200901337.

MedDRA PT Anaphylactic shock, Hyperventilation, Malaise, Urticaria

Symptom Text: Information has been received from a health agency (HA reference # DK-DKMA-20090229). It was reported that a 12 year old female patient was vaccinated with a dose of GARDASIL (IM, batch # NJ38950, lot # 0747X, site of administration not reported) on 28-JAN-2009. Approximately five minutes after the vaccination on 28-JAN-2009, the patient had an anaphylactic shock and experienced hyperventilation, malaise and developed a rash which was presumably urticarial. Her pulse was reported to have been 150 and her blood pressure 140/80 mmHg. The patient was injected with 0.5 milliliter epinephrine (manufacturer unknown, concentration not reported) IM in the right arm. The GP tried to place a drip in the patient but failed. The patient was injected with 2 milliliter TAVEGYL IM (manufacturer unknown, concentration and site of administration not reported) to which she responded well and was thereafter sent acute to the emergency room. At arrival to the emergency room the patient experienced rash again and was administered SOLU-MEDROL IV (manufacturer unknown, concentration and site of administration not reported). The patient was admitted to the hospital's children ward for observation for 24 hours with SOLU-MEDROL injection every 6th hour. The patient recovered (time not further specified) and was released from the hospital with stable blood pressure and feeling well. Other business partner numbers include E200901463.

MedDRA PT Asthenia, Bronchitis, Cardiomyopathy, Dyspnoea exertional, Left atrial dilatation, Mitral valve incompetence, Oedema peripheral, Pulmonary hypertension, Ventricular hypokinesia

Symptom Text: Information was received from the health authorities under the local reference numbers NY20090035 and NY0919105 concerning an 18 year old smoking female patient with medical history of psoriasis who on an unspecified date received a dose of GARDASIL. Secondary suspected therapy included the chemotherapy course with intravenous dose of doxorubicine hydrochloride since May 2008 for right leg synovial sarcoma. On 01-SEP-2008 and 02-SEP-2008 a sixth course of chemotherapy was performed in good conditions, with a good tolerance. Before or after this course (precise date not reported), the patient received a dose of GARDASIL. On 03-SEP-2008, the patient was seen to perform an isotopic ventriculography. The left ventricular ejection fraction was measured at 67% i.e. no modification since the examination date 05-MAY-2008. On 15-DEC-2008, the patient was seen for asthenia, dyspnoea on effort, lower limb oedema since the beginning of November 2008 and episode of bronchitis. On 16-DEC-2008, biological tests revealed pro brain natriuretic peptide (BNP) at 2651 pg/L, urea at 0.21 g/L and creatininaemia at 8.8 mg/L. Cardiac work-up performed on 18-DEC-2008 evidenced a cardiomyopathy severely hypo kinetic with left ventricular impairment, left ventricular ejection fraction at 20%, without left cavitary dilatation, non-significant mitral insufficiency, dilatation of the left atrium, dilatation of the lower vein with loss of respiratory sensitivity, pulmonary hypertension with pulmonary artery pressure (PAP) at 50 mmHg and a slight pericardial side. The patient was hospitalized on 19-DEC-2008 in a specialized unit. On 24-DEC-2008, pro BNP was 984, urea was 0.46 and creatininaemia was 9.6. The evolution was on-going. The health authorities assessed the causal relationship between the reported reactions and vaccination as "doubtful" and they assessed the causal relationship between the reported reactions and chemotherapy as "possible" according to the foreign method of assessment. Other business partner numbers included E2009-01393

MedDRA PT Facial palsy

Symptom Text: Information has been received from a health authority (HA ref. DK-DKMA-20090206), concerning a 14 year old female who on 18-NOV-2008 was vaccinated with the first dose of GARDASIL (lot number, batch number and site of administration not reported), intramuscularly. Approximately 14 days later the patient experienced what might have been paralysis in the left side of the face. The patient was unable to fully close her left eye and had fewer wrinkles around left eye than around her right eye when she squeezed her eye tightly together. The patient's smile was crooked and she could feel a difference in the area around her mouth and eyes that was not normal. The patient was having her teeth in the upper mouth regulated with permanent braces and this was at first thought to be the reason for the adverse event. The patient was therefore seen by a dental specialist on 11-DEC-2008 who thought it to be paralysis in a facial nerve and referred the patient to her GP. The patient was seen by her GP on 12-DEC-2008 who thought the facial paralysis was due to a previous infection (no infection reported in patient history). The GP referred the patient to an ear/nose/throat specialist who did an ear pressure test, hearing test and neuro test (not further specified, date not reported) and concurred that the adverse event was probably due to an infection in the past. Eight days later on 25-DEC-2008 the patient was recovered. The patient's mother thought there might be a connection between GARDASIL vaccination and the facial paralysis. Upon internal review facial paralysis was considered a medically significant event. The case was closed. Other business partner number included: E2009-01274. No further information is available.

MedDRA PT Injection site pain, Similar reaction on previous exposure to drug

Symptom Text: Information has been received from a physician concerning a 17 year old female with drug hypersensitivity and allergic reaction to AMOXICILLIN and CODEINE who on 31-OCT-2008 was vaccinated with a first dose of GARDASIL vaccine. The patient received a second dose of GARDASIL vaccine (Lot #661046/0546X). There was no concomitant medication. 4 days after vaccination with the second dose of GARDASIL vaccine the patient developed persisting injection site pain lasting more than 5 days, the patient was vaccinated in the deltoid with a 1 inch needle. The patient was treated with hot compresses and anti inflammatory medication. After the first dose of GARDASIL vaccine she had pain, but it resolved in a few days. No laboratory studies performed. The patient sought medical attention through an office visit. At the time of this report the patient had not recovered. Follow up information received on 30-JAN-2009 stated that the patient had called back the physician with injection site pain 10 days after the GARDASIL vaccine was administered. No further information is available.

MedDRA PT Furuncle, Injection site pustule, Purulence

Symptom Text: Information has been received from a nurse practitioner concerning a 23 year old female patient with no pertinent medical history and no known drug allergies, who on 21-NOV-2008 was vaccinated with the first dose of GARDASIL vaccine (lot # 661530/0575X) 0.5 ml intramuscularly. There was no concomitant medication. The patient experienced puss-filled boils around the site of injection (2008). The boils "come and go" for the last eight weeks. She had had a total of 8-10 boils so far. The patient had a tattoo on her left arm (around the deltoid area) which she had had for years prior to receiving the vaccine. The patient's puss-filled boils around the site of injection persisted. The patient sought medical attention. Additional information has been requested.

MedDRA PT Abasia, Activities of daily living impaired, Anorexia, Depression, Dyskinesia, Headache, Muscle twitching, Restless legs syndrome, Rheumatic fever, Streptococcal identification test negative

Symptom Text: My daughter started to get restless in the legs and had many headaches. She was twitching and couldn't stop from jerking movements in head and legs. We thought maybe she got a hold of some kind of drug. The doctors said she has rheumatic fever. This is triggered by strep throat. The only problem she tested negative for that. Now she can't even walk. She has no hunger and is very depressed. 10 years old and making drugs that take healthy kids and turn them into this. I didn't like the idea of my child taking this drug and my wife only did because the doctor said he highly recommended it. Well now that this has happened I have found out that they have had 21 deaths in 2 years. Thanks for telling us that in the side effects. I don't see anything mentioned about this. My daughter got only one dose and was set to get her second when this happened. This drug needs to be taking off the market. I don't want to see another family go through what we are going through. She has missed 3 weeks of school and I don't see her recovering anytime soon. 1 death is too many and I know that there are many out there that will be permanently disabled over this drug. PLEASE TAKE THIS DRUG OFF THE MARKET. I will continue to spread the word out to Family & Friends in hope that they won't put their child in the hands of this drug maker. GARDASIL needs to be stopped.

MedDRA PT Myalgia, Pyrexia, Rash

Symptom Text: Information has been received from a registered nurse concerning a 15 year old female patient with no pertinent medical history and no known drug allergies/drug reactions who on 25-JUN-2008 was vaccinated with the first 0.5 ml dose of GARDASIL (Lot # 659962/1740U) intramuscularly. There was no concomitant medication. It was reported that on 26-JUN-2008 the patient experienced a fever and muscle aches and the symptoms resolved on approximately 30-JUN-2008. On 27-AUG-2008 the patient was vaccinated with the second dose of GARDASIL (Lot # 660555/0279X). On 28-AGU-2008 the patient developed a rash on her trunk. It was reported that the rash resolved on 30-AUG-2008. The patient called health department. This is one of several cases from the same source. Additional information has been requested.

MedDRA PT HIV test positive

Symptom Text: Information has been received from a nurse practitioner concerning an 18 year old female patient who on 26-NOV-2008 was vaccinated intramuscularly with a 0.5 ml dose of GARDASIL. It was reported that a HIV test performed on 26-NOV-2008 showed she was IgA positive. A western blot test had an indeterminate result. On 05-DEC-2008 the viral load was 0. On 07-JAN-2009 another HIV EIA ELISA showed she was IgA positive and the Western Blot result was indeterminate. The nurse stated that the results were the same for both dates. Additional information has been requested.

MedDRA PT Lymphadenopathy, Vaccine positive rechallenge

Symptom Text: Information has been received from a physician concerning a 16 year old female patient who on unspecified dates was vaccinated with the first dose and the second dose of GARDASIL vaccine. Concomitant therapy included hepatitis A Vaccine (inactive) (manufacturer unknown) when the patient received the first dose of GARDASIL vaccine. Subsequently, the patient developed 2 nodes on her neck and her "glands" were swollen within 24 hours after receiving the first dose of GARDASIL vaccine. Subsequently, the patient recovered. The physician also noted that the patient experienced the same symptoms after receiving the second dose of GARDASIL vaccine. The patient was seen by the physician. Subsequently, the patient recovered. Additional information has been requested.

Symptom Text: Information has been received from a consumer concerning her 14 year old female daughter with no pertinent medical history, no drug reactions/allergies, who in April 2008 was vaccinated with the first dose of GARDASIL vaccine and on an unspecified date was vaccinated with the second dose of GARDASIL vaccine. There was no concomitant medication. In July 2008, the patient noticed that her hair began to thin out and within 2 months she lost all her hair. The reporter took her daughter to the dermatologist. The consumer specified they took test but did not provided what type of test. The consumer stated that "the patient had had wigs and shampoos, name of shampoo unspecified, to help hair grow back, but non of that was working." The dermatologist as well as the family doctor indicated this was due to GARDASIL vaccine. Therapy with human papilloma virus vaccine was discontinued. At the time of reporting, the patient had not recovered. This is one of two reports received from the same source. Additional information has been requested.

MedDRA PT Contusion, Drug administered at inappropriate site

Symptom Text: Information has been received from a nurse practitioner concerning a 20 year old female with no known drug reaction/allergies and a history of exercise induced asthma who on 02-JUL-2008 was vaccinated with the first dose of GARDASIL vaccine, 0.5ml, intramuscularly. On 05-AUG-2008 was vaccinated with the second dose of GARDASIL vaccine, 0.5ml, intramuscularly and on 12-JAN-2009 was vaccinated with the third dose of GARDASIL vaccine 0.5ml, intramuscularly. The nurse practitioner reported that on 12-JAN-2009, the patient experienced bruising after receiving her third dose of GARDASIL. The nurse also reported that the patient received the third dose as an intramuscular injection that was administered below the deltoid region of the arm. The lot numbers for the vaccines were not available. The patient recovered on an unspecified date. The patient sought medical attention calling to nurse's practice. Additional information has been requested.

MedDRA PT Asthenia, Cough, Dizziness

Symptom Text: Information has been received from a physician concerning a female with eczema who about 1 year ago, was vaccinated with the first dose of GARDASIL, 0.5 mL, intramuscularly (lot number not reported). It was reported that the patient developed a persistent dry cough immediately after receiving the GARDASIL. The cough is worse at night but does not wake the patient. She experienced dizziness and weakness immediately after administration of the vaccine but the symptoms were resolved in 2 days without treatment. The patient did not return to the office to complete the vaccine series. They physician has scheduled the patient for an office evaluation. The physician did not think that the vaccine caused the persistent dry cough, and the patient will be worked up for allergies. Patient not recovered from persistent drug. Additional information has been requested.

MedDRA PT Back pain, Drug exposure during pregnancy, Induced labour, Nausea, Uterine contractions during pregnancy, Vomiting

Symptom Text: Initial and follow-up information has been received through the Merck pregnancy registry through a 23 year old female consumer who was vaccinated with her first dose of GARDASIL (date not specified). On an unspecified date, the patient was vaccinated with her second dose of GARDASIL. On 19-OCT-2007, the patient was vaccinated with her third dose of GARDASIL. There was no concomitant medication. Subsequently, the patient found out she was 5 weeks pregnant (LMP approximately 02-OCT-2007). In follow-up information, the patient reported that on 02-JUL-2008, she had her baby boy. Follow up information has been received from the consumer and a completed questionnaire on 16-FEB-2009. The consumer reported that her son was now 7 months old and was healthy and well. He weighed 7lbs 14 oz, and was 21" long at birth. She stated she was told the baby is physically and developmentally at a 1 year old level, doing very well. The consumer said she had some minor complications during the pregnancy, starting with nausea and vomiting for the first five months, and at 25 weeks had a lot of premature contractions but only dilated to 1 cm. She was advised to increase her rest based on the number of contractions she was having. She never had any further cervical changes, and never had a diagnosis of preterm labor, just preterm contractions. Her labor was induced at 39 weeks (reason not provided) and had a normal vaginal delivery. It was reported on the questionnaire that the patient with no infections or illnesses during pregnancy, no concurrent medical conditions, on an unspecified date experienced low back pain during pregnancy. Other medications used during this pregnancy included REGLAN, ZOFRAN and prenatal vitamins (unspecified). The patient had a negative "CF" profile and 1st trimester ultrasound screening within range. On 02-JUL-2008 at 37 weeks from LMP, the patient delivered with no complications, a normal male liveborn infant with no congenital anomalies or other complications or abnormalities. He weighed 7lbs 14 oz, and was

MedDRA PT Hypoaesthesia

Symptom Text: Information has been received from a physician concerning a 19 year old female who in early September 2008, was vaccinated with the first dose of GARDASIL (lot # not reported). The physician stated that the patient received the first dose of GARDASIL and then she started to have numbness all throughout her body. The physician does not know if the numbness started at the injection site or not, but the numbness started to get progressively worse. The patient had a test done for multiple sclerosis and lyme disease with negative results. The physician indicated that the patient still has the numbness throughout her body. The physician considered the event to be disabling. Additional information has been requested.

MedDRA PT Alopecia, Anaemia

Symptom Text: Information has been received from a consumer concerning her 18 year old daughter with asthma who in the summer of 2008, was vaccinated with the first dose of GARDASIL (lot # was not reported). Concomitant therapy included ADVAIR. The patient's mother stated her daughter had 2 doses of the vaccine and reported that around the first week of September 2008 the patient's hair started to fall out. The consumer stated that her daughter's hair started to fall out in clumps and within months all of her fell out. The patient was seen by a rheumatologist, her primary care physician, and a dermatologist; numerous amounts of blood work were done for all auto immune disorders, vitamin deficiency, Lyme disease and many others. The only thing that the blood work has shown is that she was slightly anemic. They still can not find anything that would cause her hair to fall out. The consumer stated that she did not let her daughter get the third dose and stated that she did research that the vaccine can cause alopecia and she can not figure anything else but the vaccine that could cause this. This is one of several reports received from the same source. Additional information has been requested. 4/3/09 Office note received for DOS 2/26/09 with DX: Alopecia areata, approaching universalis. Pt presented with c/o progressive, extensive hair loss involving scalp, eyebrows, eyelashes and body hair since 9/2008. PE confirms c/o. Tx: steroids.

MedDRA PT Rash, Wrong drug administered

Symptom Text: Information has been received from a medical assistant and a registered nurse concerning a 15 month old patient who vaccinated with a dose of GARDASIL due to nursing error. No adverse effect reported. Follow up information was received on 27-Jan-2009: The healthcare worker reported that the patient was supposed to received Enders-Edmonston + Jeryl-Lynn + Wistar RA 27/3 but the nurse grabbed GARDASIL instead. It was reported that the patient experienced a rash on his trunk and neck. It was reported that the patient was given Benadryl and the symptoms improved. It was reported that the patient has not received Enders-Edmonston + Jeryl-Lynn + Wistar RA 27/3 MSD. Follow-up information received from a registered nurse on 30-Jan-2009 who reported that the rash that the patient developed faded the next day and was gone by 2 days. No further information is available.

MedDRA PT Burning sensation, Incorrect route of drug administration, Pain in extremity

Symptom Text: Information has been received from a medical assistant concerning a female patient who on 14-JAN-2009 was vaccinated subcutaneously with the third dose of GARDASIL vaccine instead of intramuscularly. The reporter stated that the patient reported a "burning feeling" down her arm when the GARDASIL vaccine was given, and she did not have this "burning feeling" after the first two doses but only with this last dose. The patient currently had some soreness in the lower triceps of her arm. The patient sought unspecified medical attention. At the time of reporting, the patient had not recovered. Additional information has been requested.

MedDRA PT Alopecia, Amenorrhoea, Skin discolouration, Weight increased

Symptom Text: Information has been received from a doctor of pharmacy concerning her daughter who in October 2007 was vaccinated with the first dose of GARDASIL. In December 2007 the patient received her second dose of GARDASIL and in July 2008 the patient was vaccinated with the third dose of GARDASIL. It was reported by the pharmacist that since her daughter was given the GARDASIL she has not had a menstrual cycle. Her daughter also had dark spots on her hands, has had an increase in weight gain and hair loss since she started the GARDASIL series. The patient had not recovered at the time of the report. Follow up information was received on 16-JAN-2009: the doctor of pharmacy stated that her daughter was not pregnant. She stated her daughter was an otherwise healthy 14 year old. It was reported that the patient was amenorrheic for almost one year. It was reported that the patient was no taking any other concomitant medication. The pharmacist was concerned regarding the possibility of future fertility problems for her daughter in the near future. The doctor of pharmacy had a full medical evaluation scheduled for her daughter in the near future. This is one of several cases from the same source. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Dizziness, Hypoaesthesia, Muscular weakness, Paraesthesia, Throat tightness, Urticaria, Vision blurred

Symptom Text: Information has been received from a physician and her assistant concerning 23 year old female who on an unknown date was vaccinated with a first dose of GARDASIL vaccine and a second dose of GARDASIL vaccine on 12-JAN-2009, lot number 661766/0652X. It was reported that the patient experienced dizziness and blurry vision after receiving the first dose of GARDASIL vaccine. On 12-JAN-2009 the patient felt like her throat was closing and took BENADRYL. On 14-JAN-2009 the patient called the office and reported her left leg and arm were numb, right hand was tingling and she was still experiencing intermittent blurry vision. The physician prescribed ZYRTEC for the next week to treat what she feels may be an allergic reaction to the vaccine. Her outcome is unknown. Follow-up information received from physician's assistant indicated that the patient was vaccinated with the first dose of GARDASIL vaccine on 28-OCT-2008, lot number 661530/0575X. Concomitant medication include FENCOM for birth control. It was reported that the patient called the office on 15-JAN-2008 to report that she was experiencing hives. Follow up information was received from the physician who noted that the patient has a long-standing "histrionic personality" and an anxiety disorder for which she takes KLONOPIN as needed. She claims to have experienced some throat tightness after dose 1, but did not report this to her physician until after his occurred with dose 2. She has had multiple symptoms of numbness, tingling and weakness of the extremities (of note, the injection was given in the right arm but complaining have been on the left side initially, then bilaterally); however, she has been able to go to work as a hairdresser. Since the development of hives, the patient has not been seen in the office and has not responded to phone messages from the physician's office. No further doses of GARDASIL are planned, given the concern about hypersensitivity. Follow-up information received from her physician indicated that the patient called the office on 1

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT No reaction on previous exposure to drug, Pain in extremity, Urticaria

Symptom Text: Information has been received from a nurse practitioner concerning a 25 year year old female patient with no pertinent medical history, not known drug reactions/allergies who on 01-JUL-2008 was vaccinated intramuscularly with the first GARDASIL vaccine, on 02-SEP-2008 was vaccinated intramuscularly with the second 0.5 mL dose of GARASIL vaccine. The patient did not have any adverse effects after the first or the second dose. On an unspecified date, in approximately 2008 the patient was vaccinated intramuscularly with the third 0.5 mL dose of GARDASIL vaccine. Subsequently the patient developed "achiness" in the injection arm 24 hours after her third dose of GARDASIL vaccine. The nurse practitioner mentioned that patient had not sustained any injury. The patient was sent to see an allergist since she had developed hives on approximately 13-NOV-2008, "2 months ago". The patient's hives were treated with ZYRTEC. While seeing the allergist the patient mentioned the "achiness" to her arm. The allergist recommended that the patient saw her primary care provider since he felt it was "a drug reaction". The patient was seen on 12-JAN-2009 and the nurse practitioner stated she was able to reproduce the discomfort by "pressing down inside elbow and the patient experienced tingling in three of her fingers". The nurse practitioner mentioned "I did not believe that this is caused by GARDASIL vaccine and there was something else going on". At the time of reporting, the patient had not recovered. Additional information has been requested.

MedDRA PT Dizziness, Syncope

Symptom Text: Information has been received from a physician concerning a female who on unspecified date was vaccinated with a first dose of GARDASIL and had syncope. The physician did not specify if the patient fully fainted. After the second dose of GARDASIL on unspecified date, the patient felt dizzy. The physician reported that the patient then received the third dose of GARDASIL on unspecified date but they had her lay down to receive the vaccine and no experience was reported. The patient sought medical attention to the physician. Additional information has been requested.

MedDRA PT Dizziness, Fall, Grand mal convulsion, Headache, Heart rate increased, Hyperventilation, Hypoaesthesia, Leukocytosis, Loss of consciousness, Ocular hyperaemia, Pallor

Symptom Text: Information has been received from local health authority (reference # ES-AGEMED-589239339) regarding a 17-year-old female patient with no known relevant medical history, who on 28-JAN-2009 was vaccinated with a dose of GARDASIL (lot number and injection site unknown) via intramuscular route. On the same day, seconds after vaccination, the patient felt dizziness and fell to the floor unconsciously, after a few seconds she began with tonic-clonic convulsions for 5 to 10 seconds. The patient stopped seizing for 30 seconds and then began with convulsive movements again for another 5 to 10 seconds. Approximately one minute afterwards, the patient slowly recovered consciously, but lost consciousness again in 2 or 3 more occasions. The patient complained for having a numbness sensation in hands. The patient was pale and her systolic arterial pressure was 80 mmHg (diastolic was not noticed). Laboratory tests on 28-JAN-2009 also showed: glucose 107 mg/dL, electroencephalogram normal, arterial oxygen saturation 97%, leukocytosis with left deviation. Her pulse was quick and initially imperceptible and filiform later on. The patient was hyperventilating (40 breaths per minute) and eyes were red. Pulmonary auscultation was normal. The patient did not present with allergic reaction signals (bronchospasm, laryngeal oedema, erythema). The episode lasted for about 10 minutes, after which the patient recovered. 100 cc's of physiological serum and 40 mg of intravenous URBASON were administered to the patient in order to treat adverse event. After the episode, laboratory tests showed: mean arterial pressure 115/70, heart rate 90 bpm, respiration rate 18 rpm. On the next day the patient presented with cephalgia in the occipital region that ceased with paracetamol. It is reported that the patient had recovered from these events, exact date not reported. The events were considered serious by health authority as other important medical events. Other business partner numbers included: E200901371.

Other Meds: Unknown

Lab Data: Blood pressure measurement, 28Jan09, 80 mmHg, systolic blood pressure registered; Electroencephalography, 28Jan09, normal; Diagnostic laboratory test, 28Jan09, leukocytosis with left deviation; Diagnostic laboratory test, 28Jan09, 115/70, m

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Information has been received from a health professional (clinic nurse) concerning a 26 year old female with a history of induced abortion 6 years ago who on 06-JAN-2009 was vaccinated with second dose of GARDASIL (with the first dose received on 25-OCT-2008). There was no concomitant medication. After vaccination with the second dose, the patient was found to be pregnant and subsequently, the patient experienced accidental miscarriage on approximately 26th January 2009 when she traveled outside foreign country. The doctor felt that this was an individual case and was not related to administration of GARDASIL. Accidental miscarriage is considered to be an other important medical event. Since the patient was not followed up by the doctor, no further information is available.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Abdominal pain, Asthma, Blood pressure abnormal, Chest pain, Costochondritis, Diarrhoea, Dizziness, Dyspnoea, Headache, Heart rate increased, Loss of consciousness, Nausea, Pain, Syncope

Symptom Text: About 1 wk after 1st GARDASIL, my daughter began having headaches, nausea and began passing out. Began having trouble breathing. Pediatrician referred her to cardiologist. Tilt table test were done. BP problems were noted. She has been on medications since. 3/3/09-records received presented with C/O fainting spells 2-3 times per day no LOC. Assessment:chronic fainting spells, chronic dizziness. 7/16/08 C/O abdominal pain watery diarrhea. Positive ill contact. 8/22/08-C/O SOB. History of episodic SOB at school day of visit. C/O body aches. Bronchial asthma. 10/17/08 chest pain with tenderness center or chest. Assessment costochondritis. 1/22/09-persistent headache. 3/9/09-consultant records received for DOS 5/14/08-seen for C/O dizziness and fainting for one month. All occur with position changes. C/O fatigue. Heart rate mildy accelerated prior to fainting and feels dizzy and wobbly. Impression:mostly likely secondary to neurocardigenic syndrome. Office visit 6/4/08-Continues to faint on daily basis and having difficulty breathing when running. Impression strong vasodilatory component. Neurocardiogenic syncope. Recommend volume loading and salt in diet. Office visit 8/27/08-continues to have dyspnea mostly during PE at school, feels like she cannot breathe, loses breath,loses balance and nearly faints. C/O shortness of breath rather than syncope.

Other Meds: None at time of vaccine

Lab Data: 3/9/09-records received-Electrocardiogram normal. 2D echo with color flow and Doppler normal with trace tricuspid insufficiency with low estimated RV pressure. Holter examination normal. Title table exam multiple episodes of fainting.Pulmon

History: None 3/9/09-records received-PMH:bronchitis and whooping cough.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Abdominal pain, Activities of daily living impaired, Anxiety, Asthenia, Blindness, Bone pain, Chest pain, Dizziness, Fall, Flank pain, Headache, Hyperaesthesia, Hyperventilation, Hypoaesthesia, Incoherent, Musculoskeletal pain, Myalgia, Pain, Pain in extremity, Panic attack, Paraesthesia, Syncope

Symptom Text: Information received from patient's mother by phone. Per mother Pt. began having body pain at 2:00AM on 10-21-08, unresolved by TYLENOL. No fever. At 6:00 AM on 10-21-08 Pt. arrived at mother's house, fell on floor complaining of severe pain in flesh, bones and muscles. Also complained of headache, dizziness, "unable to move". Mother reports patient was sensitive to touch, was assisted to bed. Mother reports patient had pain, weakness X 6 days, was unable to attend school and stayed in bed and slept for 6 days taking TYLENOL every 6 hours while awake. (M) reports patient was able to ambulate to bathroom and kitchen to eat. Mother reports symptoms improved on 10-26-08 but did not completely resolve. Mother reports approximately 11-2-08 patient had worsening pin for 1-2 days in (L) shoulder, left sided chest pain, pain in abdomen and legs. Pain improved but continues to "come and go". Mother reports that on 1-22-09 patient was sitting in class and suddenly lost eyesight and reported dizziness and being unable to move. Was reported by witnesses to be mumbling and incoherent and was taken to hospital by ambulance. Mother reports patient had left sided pain, numbness and a "prickly sensation" all over but mostly in upper body. Patient had numerous tests including CAT Scan, EKG, blood tests and IV fluids/medication (potassium, ATIVAN). Mother reports all test came back "negative". Patient had appointment with MD on 1-23-09 and had more testing for "artery inflammation" and Lupus among others. Mother reports a.u tests "negative". Patient to have follow up with Neurologist. 3/3/09 Received vaccine records & ER medical records of 1/22/2009. FINAL DX: hyperventilation syndrome; panic attack; numbness. Records reveal patient experienced anxiety, syncope, hyperventilation while in class. Tx w/IVF. Improved & d/c to home.

Other Meds: None

Lab Data: All "negative" per Mother. 1-22-09 EKG; CAT Scan; multiple blood tests; Urine tests. 1-23-09 Testing for Lupus; "artery inflammation", among others per mother's report LABS: WBC 12.9(H), H/H 15.1/43.5(H). potassium 3.3(L), anion gap 15

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Blindness, Dysarthria, Headache, Hypersomnia, Pain, Pain in extremity, Paraesthesia

Symptom Text: Initial report received on 25 February 2009 from the patient's parent. A 24-year-old female patient had received two vaccines on 20 October 2008. She had received a first dose of ADACEL and a dose of GARDASIL (manufacturer Merck). The lot numbers, routes and sites of administration for both vaccines were unknown. At the time of vaccinations, the patient had no concurrent illnesses, or use of other medications, but had medical history of severe allergy to Brazil nuts and allergy to other nuts. Within 24 hours after vaccination (02:00am on 21 October 2008), the patient had pain in her arm (unknown which arm), body aches, tingling all over, and headache. Per the reporter, the patient slept for six days. On 21 January 2009 (93 days post-vaccination), the patient "lost vision" and had garbled speech. She was taken to the emergency room where several diagnostic tests were completed. The diagnostic tests included CAT scan, EKG, drug toxicity test, and other blood test. The results of the tests were not provided. As of 25 February 2009, the patient continues to have intermittent body aches and tingling. At the time of this report, the recovery status of the patient was unknown. Documents held by sender: None.

Other Meds:

Lab Data: CAT scan; EKG; Drug toxicity test and other blood tests - results not provided.

History: At the time of vaccination on 20 October 2008, the patient had no concurrent illnesses; but did have a history of severe allergy to Brazil nuts and allergy to other nuts. The patient was not taking any concomitant medications at that time; and had not experienced any adverse events with prior vaccinations. The patient had not received any other vaccinations within four weeks of 20

Seriousness: ER VISIT, PERMANENT DISABILITY, SERIOUS

MedDRA PT Arthralgia, Blindness, Bone pain, Dizziness, Headache, Hypersomnia, Hypoaesthesia, Incoherent, Myalgia, Pain, Vision blurred

Symptom Text: Information has been received from a consumer concerning her daughter, a 24 year old female with allergy to nuts who in the afternoon October 2008 (also reported as in December 2008) was vaccinated with the first dose of GARDASIL, IM, 0.5ml. Concomitant therapy included tetanus toxoid. At 02:00 the patient complained of body pain that got worse and worse. The very next morning the patient came to the house at 6:00AM and collapsed on her floor, complaining of severe pain in her joints, flesh and bones. The patient stated "this is the worse pain ever." The patient could not stand to be touched or moved without having severe pain. The patient also had muscle pain and bone pain. The patient was a nursing student and did not go to class that day. The patient slept for 7 days before recovering. During that time, if the patient was awake, she complained of lots of pain, including a headache. The patient was given TYLENOL for the headache. The patient also experienced dizziness and lightheadedness. Since that time, there had been progressive problems in her condition. A few days ago (on approximately 20-FEB-2009) while the patient was in her nursing class she lost her vision, her vision then became blurry, developed left side pain and numbness and a pain attack. The patient was speaking incoherently. (The following day the patient she was in her head saying "help me out of the class, something is wrong" but the other students told her that they were not able to understand her.) The patient was taken to the hospital (emergency room), she was not admitted. She had undergone multiple diagnostic tests. All results had come back negative. The patient continued to complain of pain that came on and then faded, and then came on again and then faded. Sometimes the whole body was in pain, including thoracic area, chest, arm, leg, sometimes it was just left-sided pain. The patient was told not to receive any additional doses of GARDASIL by her physician. The patient's events were considered to be disabling. A

MedDRA PT Injection site mass, Injection site pain, No reaction on previous exposure to drug

Symptom Text: Information has been received from a registered nurse concerning a 22 year old female who on unspecified dates was vaccinated with the first and the second dose of GARDASIL vaccine. Patient did not experience any problems. On 24-NOV-2008, the patient was vaccinated with the third dose of GARDASIL vaccine (lot number 661764/0650X)0.5 ml IM and experienced a lump in the injection site area shortly after on the same day. The lump was painful to touch. The patient sought medical attention, called office. The location of the lump was unspecified. The lump resolved on its own couple of weeks after received the third dose. Additional information has been requested.

MedDRA PT Basilar migraine, Condition aggravated, Dizziness, Dysarthria, Headache, Hypoaesthesia, Loss of consciousness, Pallor, Paraesthesia, Vision blurred, Visual impairment

Symptom Text: Information has been received from a doctor of pharmacist concerning a 17 year old female patient with no pertinent medical history and no known drug allergies/drug reactions, who completed her GARDASIL vaccine series "sometime" last year. Concomitant therapy included hormonal contraceptives (unspecified) and vitamins (unspecified). It was reported that about a month after completion of the series the patient began to develop "stabbing left hemisphere head pain and numbness to the left arm and leg. It was reported that the patient has continued to have biweekly "attacks" since the beginning of symptoms. At the time of reporting the patient had a blood work, head computed axial tomography and an magnetic resonance imaging of head done. All results were negative. At the time of the report the patient had not recovered. The patient sought medical attention with the neurologist. Additional information has been requested. 3/16/09 Received Neuro medical records of 1/8-2/18/2009. FINAL DX: probable basilar migraine Records reveal patient experienced four spells of unconsciousness, pallor, slurred speech over several weeks preceded by blurred vision & seeing spots. Has had frequent dizziness, right parietal pain, contralateral arm & leg tingling. Referred for MRI & tx w/meds. RTC 2/18 w/good response to meds.

Other Meds: hormonal contraceptives, vitamins (unspecified)

Lab Data: diagnostic laboratory - negative; head computed axial - negative; magnetic resonance - negative LABS: Echocardiogram, EKG, EEG done 11yo all WNL.

History: None PMH: Overweight, appendectomy & cholecystectomy, 12yo. LOC w/possible seizure, 11yo. Family hx: migraines

MedDRA PT Herpes zoster, Pain, Pruritus, Vaccine positive rechallenge

Symptom Text: Information has been received from a physician concerning a 14 year old female who on 20-MAY-2008 was vaccinated with the first dose of GARDASIL vaccine (lot no. 659180/1758U) 0.5 ml, IM. On 29-JUL-2008 was vaccinated with the second dose of GARDASIL vaccine (lot no. 660387/1967U) 0.5 ml, IM and on 24-NOV-2008 with the third dose of GARDASIL vaccine (lot no. 655604/0052X) 0.5 ml, IM. The physician reported that the patient developed Zoster 7 to 10 days after administration of her first and second dose of GARDASIL vaccine. The physician reported that the first outbreak of Zoster was below her breast bone at the end of her sternum. It was 3 inches wide. The patient had severe pain and some itchiness. The physician did not know the location of her second outbreak because the physician did not examine the patient but rather treated her over the phone. The patient was treated with VALTREX and ADVIL both times. The second outbreak required to be treated with a second course of VALTREX. Cultured cessions from the first outbreak confirmed Varicella Zoster virus. Additional information has been requested.

MedDRA PT Amnesia, Back pain, Depression, Mood swings, Myalgia, Pyrexia, Vaccine positive rechallenge

Symptom Text: Information has been received from a consumer concerning her 12 year old daughter with no known medical history and allergies, who on 10-JUN-2008 was vaccinated with a first dose of GARDASIL. On 10-JUN-2008 the patient experienced fever of 102 for three to four days. She also started getting depressed, and she begun having mood swings, memory loss, achy back and muscle pain. After she received the second dose of GARDASIL, she came down with a fever of 103 and the symptoms continued and had not improved. There were no laboratory diagnostics performed. The patient did not seek medical attention. At the time of this report the patient had not recovered. Follow up information received on 19-JAN-2009 stated that a phone call was received from the reporter, she mentioned that a physician did not administered the GARDASIL vaccine, a nurse did. Additional information has been requested. 3/2/09 Per reporter/parent pt has not sought tx for fear of being prescribed psychiatric meds. Case closed.

MedDRA PT Colposcopy, Drug exposure during pregnancy

Symptom Text: Information has been received from a licensed practical nurse for the Pregnancy Registry for GARDASIL, concerning a 26 year old female patient with a history of papilloma viral infection, who on 10-APR-2008 was vaccinated with the first dose of GARDASIL (Lot number 659964/1978U) 0.5 mL IM. On 11-JUN-2008, the patient was vaccinated with the second dose of GARDASIL (660393/0067X) 0.5 mL IM and on 08-OCT-2008 was vaccinated with the third dose of GARDASIL (Lot number 660557/0072X) 0.5 mL IM. There was no concomitant medication. The nurse reported that the patient who received all three doses of GARDASIL was pregnant. A urine pregnancy test done on 08-OCT-2008 at the office was negative. The last menstrual period was on 14-OCT-2008 and the estimated delivery date will be on 21-JUL-2009. Follow up information was received from the LPN who reported that the patient with asthma (status post), had a 3 previous pregnancies (2 full term deliveries (39 weeks both) and 1 elective termination at 4 weeks). The patient did not had any birth defects or infant complications in any previous pregnancy. On 29-DEC-2008, the patient was placed on prenatal vitamins. On 13-0CT-2008 a PAP was performed, positive result for ASCUS and HRHPV. On 12-DEC-2008, a colposcopy was performed (results not provided). Additional information has been requested.

MedDRA PT Drug exposure during pregnancy

Symptom Text: Information has been received from a registered nurse concerning a 16 year old female with no medical history and allergies and 0 previous pregnancies, who on 30-OCT-2008 was vaccinated with a 0.5 mL first dose of GARDASIL vaccine (lot #661530/0575X), intramuscularly. Concomitant therapy included ALESSE. On 30-OCT-2008 the patient discovered that she was pregnant, the nurse mentioned that the LMP was 18-NOV-2008, but the patient had an abnormal cycle and the LMP may had been a month earlier. Laboratory diagnostics studies performed include a urine pregnancy test on 18-DEC-2008 at the office, a pre-natal blood work drawn on 23-DEC-2008 (results pending) and a prenatal ultrasound scheduled for next week. Clonazepam (dates taken 20-OCT-2008 for 2 days), PREDNISONE (dates taken 22-NOV-2008 for 3 days) and chlorpromazine (dates taken 20-OCT-2008 for 2 days) were taken by the patient. No adverse effects reported. The patient sought medical attention through an office visit. follow up information received on 27-JAN-2009 from an initial pregnancy questionnaire stated that the patient had recurrent hiccups. Concomitant therapy included MENACTRA. CHLORPROMAZINE (25-NOV-2008 to 28-NOV-2008, 25 mg 3/day). PREDNISONE (22-NOV-2008 to 25-NOV-2008, 20 mg x 2 daily) and CLONAZEPAM (20-NOV-2008 to 22-NOV-2008, 0.25 mg 0.5 mg 2 x day) were taken by the patient for hiccup syndrome. On 07-JAN-2009 the patient had an ultrasound performed for dating, the fetal heart rate was 135; 1 weeks 0 days. The estimated delivery date was 26-AUG-2009 (previously reported 25-AUG-2009). Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Drug exposure during pregnancy, Nasopharyngitis, Respiratory tract congestion, Urinary tract infection

Symptom Text: Information has been received through the Merck pregnancy registry from a female consumer, nurse practitioner and physician concerning female with history of caesarian delivery and abnormal past papanicolaou test and none known drug reactions / allergies, who on 22-Feb-2008 (also reported as 22-June-2008 was vaccinated intramuscularly, into left deltoid, with her 0.5ml first dose of GARDASIL (lot # 655327/128U) and found out she was pregnant (LMP) 26-Jan-2008, (also reported as 28-June-2008) . On 29-Feb-2008, the patient took pregnancy test that tested positive. The urine test for pregnancy was confirmed during the physician's office visit on 03-Mar-2008. Unspecified medical attention was sought during an office visit. No adverse symptoms. No further information was provided. Follow up information was received via pregnancy questionnaire from a physician. The patient had a history of early tobacco and discontinued with pregnancy. She had one previous pregnancy which was full term delivery and the infant complication was macrosomia. There was no other significant past medical history and concurrent medical conditions. During this pregnancy she took MACROBID 100mg bid and Phenazopyridine hydrochloride 200mg tid to treat urinary tract infection and pseudo ephedrine HCL 300mg prn tid to treat cold / congestion. Concomitant medication included multivitamins. Diagnostic test during the pregnancy included : cystic fibrosis on 16-APR-2008 was negative, serum alpha-fetoprotein test on 16-May-2008 was negative, ultrasound on 12-Jun-2008 CWO normal anatomy, and glucose tolerance test on 16-Sep-2008 was 1/4 elevated. On 23-Oct-2008, she delivery a normal health male baby weighting 3129 grams, length 48cm, and Apgar score was 9/9 at 39 weeks from her LMP. Additional information is not expected.

Other Meds: Vitamins

Lab Data: Diagnostic Laboratory 04/16/08 - cystic fibrosis negative; Ultrasound 06/12/08 - CWO normal anatomy; Beta-human chorionic 02/29/08 - positive; Beta-human chronic 03/03/08 positive; Glucose tolerance test 09/16/08 - 1/4 elevated ; Serum alph

History: Cesarean section; Papanicolaou smear abnormal; Ex-tobaco user

MedDRA PT Anxiety, Drug exposure during pregnancy, Haemorrhage, Muscle spasms

Symptom Text: Information has been received from Pregnancy Registry for GARDASIL vaccine from a Registered Nurse (R.N.) concerning a female patient who was vaccinated with a third dose of GARDASIL vaccine (lot # unknown). The nurse reported that the patient received her third injection when she was pregnant but did not know it. It was unknown if medical attention was sought by the patient. The data of last menstrual period and estimated date of delivery is unknown. The outcome was unknown. Follow up information has been received from a registered nurse, for GARDASIL, a Pregnancy Registry product, concerning a 17 year old Caucasian female patient with no previous pregnancy history and no pertinent medical history who on 09-OCT-2007 was vaccinated with the first dose of GARDASIL (lot # not provided). Subsequently the patient was pregnant (LMP was 13-NOV-2007 and EDD was 20-AUG-2008). On 10-DEC-2007 she received the second dose of GARDASIL (lot # not provided) when she did not realize she was pregnant (previously reported the third dose). Concomitant therapy included allergy injection every other week for treatment of allergies. Other medications used during pregnancy included prenatal vitamin qd taken for December 2007 to August 2008. In October 2007, the patient experienced anxiety and ZOLOFT 50 mg qd was started. On 14-JAN-2008 ultrasound was performed for bleeding and cramping with the result of within normal limits. On 24-MAR-2008 routine ultrasound was performed again with the result of within normal limits. On 06-AUG-2008 (from LMP 37 weeks 6 days) the patient delivered a normal, healthy male baby weighting 8 pounds 10 ounces with no congenital anomalies. The Apgar score was 8/9. There was not complication during pregnancy and labor/delivery, and not infections or illness during pregnancy for the patient. Additional information is not expected.

Other Meds: allergenic extract

Lab Data: ultrasound 01/14/08 - within normal limits; ultrasound 03/24/08 - within normal limits; Apgar score 8/9 -

MedDRA PT Drug exposure during pregnancy, Labour induction, Prolonged pregnancy

Symptom Text: Information has been received through the Merck pregnancy registry from a physician concerning a 25 year old female with a history of tonsillectomy who on 29-NOV-2007 was vaccinated with the third dose of GARDASIL. No information was provided concerning the first or second dose of GARDASIL. On 29-NOV-2007 the patient also had blood work taken "which had showed she was pregnant" (LMP=05-SEP-2007). The patient sought unspecified medical attention and reported that she was about "three weeks pregnant". No further information was provided. Follow-up information has been received from a physician concerning the patient who was induced on 12-AUG-2008 because she was 41 weeks gestation, and had a vaginal delivery of a normal baby with "good Apgars", "everything went well". The reporter indicated that the patient did well and was discharged home with the baby on the next day No further information is available.

MedDRA PT Anaemia, Anogenital warts, Caesarean section, Cervical dysplasia, Drug exposure during pregnancy, Failed trial of labour

Symptom Text: Information has been received from a Certified Nurse Midwife, for the Pregnancy Registry for GARDASIL, concerning a 19 year old female who in August 2008, was intramuscularly vaccinated with a dose of GARDASIL. It was reported that the patient was pregnant at the time of vaccination. The patient's LMP was 07-APR-2008 and the EDD was 12-JAN-2009. It was reported that this was the patient's first pregnancy. Pregnancy test was positive and ultrasound was performed on 10/14/2008. Follow up information was received from a certified nurse midwife who indicated the patient had positive atypical squamous cell of undetermined significance (ASCUS) HPV both in genital warts and in PAP test. The patient also had anemia during pregnancy. At 17 weeks gestation the patient performed ultrasound. On 29-JAN-2009, 41 weeks+ from her LMP, the patient delivered a health male baby weighing 9 pounds and 7 ounces. Apgar score was 7/9. The patient experienced low transverse cesarean section (LTCS) due to failure to progress (FTP). Upon internal review, low transverse cesarean section due to failure to progress was determined to be an other important medical event. No further information is available.

Other Meds: Unknown

Lab Data: ultrasound, 10/14/08, 27 weeks gestation RCA; cervical smear, ASCUS HPV +; beta-human chorionic, 10/14/08, pregnancy test positive;

MedDRA PT Convulsion, Injection site pain, Loss of consciousness, Tremor

Symptom Text: Information has been received from a physician concerning a 23 year old female who was vaccinated with a first dose of GARDASIL 0.5ml IM. Subsequently the patient experienced "seizure like reaction", the patient was shaking and passed out shortly after receiving the dose of GARDASIL 0.5ml IM. After receiving her vaccination the patient became responsive again within 1-2 minutes and noted that the injection was very painful. The patient was in the office when the event occurred. It was noted that the patient had since returned to receive the second dose of GARDASIL 0.5ml IM with no problems. Upon internal review seizures like reaction was determined to be an other medical event. Additional information has been requested.

MedDRA PT Activities of daily living impaired, Arthralgia, Back pain, Headache

Symptom Text: Information has been received from a physician concerning a 15 year old female with no medical history and drug allergies who, on an unspecified date, was vaccinated intramuscularly with her first 0.5 ml dose of GARDASIL. There was no concomitant medication. The patient had experienced hip pain, lower back pain and headache after receiving the first dose of GARDASIL. It was noted that she had experienced pain in both of her hips but the left side had more pain than the right. The pain in her hips had made it difficult for the patient to participate in her soccer games. The patient sought medical attention and was seen by physician. The lot numbers and dates of administration were unknown. At the time of reporting (20-FEB-2009) the patient was recovering. The reporter considered the adverse experiences to be disabling. Additional information has been requested.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Abdominal discomfort, Convulsion, Dizziness, Inappropriate schedule of drug administration, Loss of consciousness, Nausea, Nuchal rigidity

Symptom Text: This is a case of misuse (third dose of vaccine administered one month after the second dose). Initial information has been received from a Health Authority (reference number # ES-AGEMED-113070438) on 18-FEB-2009. On 19-FEB-2009 additional information was received from the Health Authority correcting the first information sent. Last information was received concerning a 16 year old female who was vaccinated with the second dose of GARDASIL (batch number not reported) by intramuscular route (site not reported) on 23-DEC-2008 (vaccine administered out of the official vaccination campaign). On 27-DEC-2008 the patient presented with dizziness and nausea. The patient was then administered DOGMATIL, TORECAN and PRIMPERAN to treat these events. The patient got worse at night, and decided to go to a hospital's emergency room where she presented a loss of consciousness and nuchal rigidity (hospital discharge report hadn't been received yet). The patient didn't present with fever. Convulsions hadn't been confirmed. Meningitis or Meniere's vertigo were suspected, thus patient was kept under observation. The patient was hospital discharged next day. Auditive-vestibular and ocular pathologies had been discarded. Electrocardiogram results, blood test and a scanner were pending. The patient was at home, but she continued presenting with unspecified discomfort (dizziness, gastric discomfort). The patient's primary care physician had prescribed her SERC to use in case of a new episode of dizziness. The physician considered that adverse events could be due to an allergic reaction to the medication administered the day the adverse events started. A few days before second dose vaccine administration, the patient experienced some episodes of dizziness. The patient didn't have any problems after receiving the first dose of GARDASIL (batch number, date, route and site not reported). The patient received the third dose of GARDASIL in January 2009 (exact date not reported, batch number and site not reported) by intramus

MedDRA PT Blood culture, Diarrhoea, Influenza like illness, Pyrexia, Stool analysis, Vertigo, Vomiting

Symptom Text: Information has been received from foreign Health Authority (reference # ES-AGEMED-813067338) regarding a 17 year old female who was administered on 16-JAN-2009 the second dose of GARDASIL (batch # NH52670, lot # 1647U) by intramuscular route. It is reported that on 20-JAN-2009 the patient presented with vertigo. She attended a hospital's emergency room where she was treated with TORECAN and she improves. On 29-JAN-2009 the patient presented with diarrhea and vomiting, again she visited the emergency room where she was hospital admitted. The patient was treated with serum therapy, antibiotics, metoclopramide and paracetamol. On 01-FEB-2009 the patient was discharged, although febricula persisted. On 10-FEB-2009, she is admitted again with the same clinical picture, a stool test and hemoculture are performed (results pending). The patient was discharged on 13-FEB-2009, kept under observation. The reporter informed that upon information obtained on 16-FEB-2009, according to the doctor the patient presented an intercurrent viral clinical picture with symptoms compatible with a pseudo-flu syndrome. The medical evaluation regarding this case has been that the events are not related with vaccine administration according to reporter's criteria. Further information is expected. Other business partner numbers include E200901560.

MedDRA PT Convulsion

Symptom Text: Information has been received from a nurse in a physician's office concerning a female who was vaccinated with a dose of GARDASIL (lot # not reported). Subsequently the patient experienced a seizure after the vaccination. The patient was air lifted to an unspecified hospital and was admitted as an inpatient for unspecified amount of time. At the time of the report (23-FEB-2009), the patient was recovering. It was reported that the patient was not given the vaccine at this physician's office. The nurse learned of this adverse event through the grandmother of the patient. Additional information has been requested.

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act concerning a 17 year old female who on 13-MAR-2007 was vaccinated with a third dose of GARDASIL intramuscularly into the left arm. After the first dose of GARDASIL (administered on 13-SEP-2006) the patient experienced dizziness, light-headed, nauseous, headache, leg cramps and shooting leg pain. After the second dose of GARDASIL (administered on 13-NOV-2006) the patient experienced same symptoms after first dose plus hair loss, abdominal bloating, menstrual cycle stopped, weakness, poor circulation. After the third dose of GARDASIL the patient experienced all symptoms listed above plus excessive hair loss, pale/purple skin, always cold, loud ringing in ears, extreme digestive, stomach pain, gastrointestinal discomfort, chronic constipation, joint pain, facial swelling, chronic fatigue, irritability, easily agitated, extreme weakness and all-over muscle fatigue (with difficulty in walking, talking, moving, etc.) The patient was diagnosed with thrombocytopenia, pancytopenia, amenorrhea, hypothyroidism, anemia, low blood pressure, antoimmune disorder, partial organ failure, digestive disorder, Epstein Barre, orthopnoea, hormonal imbalance, urinary tract infection. The patient had to seek alternative medicine doctors to receive nutritional supplementation because other doctors could do nothing for her. Recently she has been referred to a clinic (Scheduled appointment for 30-Mar-2009). This was originally reported by a consumer. A standard lot check investigation was performed. All in-process quality checks for the lot number 0263U in question were satisfactory. In addition, an expanded lot check investigation was performed. The testing performed on the batch prior to release met all release specifications. The lot met the requirements of the Center and was released.

Symptom Text: Information has been received from a physician via an email from a consumer concerning the consumer's 16 year old daughter who on 20-MAY-2008 was vaccinated with the third dose of GARDASIL (lot no. and route not reported). The consumer reported that in the summer of 2008, the patient started to complain of constant fatigue, had fainting spells and random bouts of aches and pains. On 11-SEP-2008, she was sent home from school with complaints of headache, spine pain, confusion and symptoms of bladder infection. She was given antibiotics by the gynecologist and was sent home. The consumer reported that the next day (12-SEP-2008) the patient woke up screaming for help as she couldn't feel her arms and legs, was gasping for air, vomiting, had severe back pain and fever. The mother reported that at the emergency room (ER) the patient was given antibiotics and sent home as she was told she "may have passed a kidney stone". It was reported that over the next two weeks her health was deteriorating and after her fourth visit to the ER she was finally hospitalized for the next ten days. Over the course of her stay the patient was seen by teams of doctors from Neurology, Rheumatology, Infectious disease, Endocrinology, Adolescent medicine, Urology, and Cardiology. The consumer reported that the patient endured two spinal taps, many MRI, CAT scan, sonograms, ultrasound and blood workups until "her body could no longer emit any blood". The patient was on morphine drip for severe headaches, liquids for rehydration, PERCOCET for allover pain and two and nausea medication for severe vomiting and acid reflux. The patient was checked for Lyme disease, meningitis, lupus, fibromyalgia chronic fatigue Hoshimoto's disease kidney disease and multiple sclerosis and everything showed up negative. The patient became so sleep deprived because her heart rate was in the 30 range that a monitor constantly kept her awake. The patient started hallucinate and was developing blood clot in her legs from lack of use. The mother stated that since the

Symptom Text: Information has been received from a nurse practitioner concerning 16 year old female who was intramuscularly vaccinated with 1st, 2nd and 3rd 0.5 ml doses of GARDASIL (1st lot #658560/1062U, 2nd lot#659439/1267U, 2nd lot#659439/1267U, 3rd lot#660553/0070X) on 24-SEP-2007, 19-NOV-2007 and 20-MAY-2008, respectively. Concomitant therapy included YAZ, MACROBID and "septim (ceptim)". On 11-SEP-2008 the patient experienced urinary tract infection. On 12-SEP-2008 she experienced fever, vomiting and severe back pain. She went to the ER. On 14-SEP-2008 she had headaches, couldn't move her head and was shaky. She was weak and couldn't walk up stairs. A CAT scan was negative. On 25-SEP-2009 she went to a medical center for leg weakness, severe headache, costal vertebral tenderness and photophobia. An MRI done was negative. The patient was treated with morphine drip for her headaches. She was suggested by someone that it could be fibromyalgia. Other lab diagnostics studies included: STD check, vaginal culture, "kidney test", "urinary tract infection (UTI) test" and "e-coli test". All tests done were negative except for the one for her UTI. It was unknown if the patient was ever admitted to a hospital for adverse events. The patient was recovering at the time of reporting. Follow up information was received from a physician who reported that the 16 year old female student with penicillin allergy and post concussion syndrome was intramuscularly vaccinated with 3 doses of GARDASIL (1st dose into right deltoid, 2nd and 3rd doses into the left deltoid). There was no illness at time of vaccination. On 11-SEP-2008, the patient presented in the physician's office with urinary tract infection (UTI), low back pain, blood and leukocytes in urine. She was prescribed MACROBID 100 mg, po, Bid 7. On 12-SEP-2008 she went to emergency room (ER) due to worse syndromes and suggested to perform CT scan. Pyelonephritis was treated with axid ceftin. Nausea, vomiting and fever were treated with pyridine. She also complained of joint pain, could n

MedDRA PT Balance disorder, Condition aggravated, Juvenile arthritis, Vaccine positive rechallenge

Symptom Text: Information has been received from a physician via CSL as part of a business agreement (manufacturer control # 2009 02 25 KC1) concerning a 12 year old female with systemic juvenile arthritis who on 03-APR-2008 was vaccinated with the first dose of GARDASIL. On 29-APR-2008 the patient experienced flare of rheumatoid arthritis. Subsequently the patient recovered from the flare of rheumatoid arthritis. On 19-JUN-2008 she was vaccinated with the second dose of GARDASIL. On 25-JUN-2008 the patient experienced a second flare of rheumatoid arthritis which resulted in a 2 day hospital admission. Subsequently, the patient recovered from the second flare of rheumatoid arthritis. It was reported that the patient had been unstable throughout the course of vaccination but her arthritis has now been stabilised. the patient will be enrolled in a study of antibody response to GARDASIL. Additional information is not expected.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Asthenia, Headache, No reaction on previous exposure to drug, Performance status decreased

Symptom Text: Information has been received from a pediatrician concerning a 17 year old female patient with no pertinent medical history reported who on an unspecified date was vaccinated with the second dose of GARDASIL (Lot # not reported). It was reported that on an unspecified date the patient developed headache. It was reported that as symptoms became chronic the patient underwent multiple examinations and was even hospitalized for diagnostics on an unspecified date. No cause for the complaint was found, migraine was ruled out. It was reported that treatment with different analgesics (not specified) was not successful. It was reported that finally treatment was started with butterbur (herbal preparation) which lead to slight improvement. A causal relation with the vaccine was seen by the parents who surfed the web for information about GARDASIL. It was reported that the third dose will not be administered. A psychosomatic cause was evoked by the reporter. It was reported that the patient's parents refused according to psychological diagnostics/intervention. The patient had not recovered at time of reporting. Follow up information was received: it was reported that the patient was 16 years old (previously reported as 17 years old) at the time to onset. The first dose of GARDASIL was given into the left upper arm on 07-NOV-2007 and was well tolerated. The second dose of GARDASIL (Lot # and injection route not reported) was administered on 03-JAN-2008 into the left upper arm. It was reported that the next day, on 04-JAN-2008 (previous onset date not reported), she developed headache (becoming chronic in the further course) as well as loss of performance and strength. Neurological investigations were performed (results not reported). It was reported that despite therapy attempts with analgesics, acupuncture and herbal preparation (Petadolex), the patient has not recovered at the time of reporting. Other business partner numbers include E2009-01456. No further information is available.

MedDRA PT Asthenia, Convulsion, Feeling hot, Gaze palsy, Immediate post-injection reaction, Loss of consciousness, Syncope

Symptom Text: Information has been received from a health care professional concerning a 25 year old female who on 16-JAN-2009 was vaccinated with the first dose of GARDASIL (lot# 1647U, batch# NH52670) route and site not reported. It is reported that the patient presented with convulsions, immediately after vaccine administration, these convulsions started from the abdomen and went up. The patient experienced a loss of consciousness and eye deviation. These events lasted for a few seconds or a few minutes. The patient was placed with her legs up, her arterial pressure was measured and a glycemic test was performed. Arterial pressure was a little low. The patient sat. She felt general weakness during chat afternoon and a warm/hot sensation right after she was vaccinated. The patient recovered. No further information has been requested. Additional information obtained on 18-FEB-2009: When the reporter was asked for a more detail description of the adverse event, she clarified that it was not a real convulsion but a convulsive syncope that lasted seconds (less than 1 minute) and resolved spontaneously. The event was defined as non serious by the reporter. Upon internal review, "convulsive syncope" was determined to be an other important medical event. Other business partner numbers include: E2009-01408. No further information is available. The case is closed.

MedDRA PT Convulsion, Fall, Skull fracture, Subarachnoid haemorrhage, Syncope

Symptom Text: This case was reported by a regulatory authority (2009-00650) and described the occurrence of syncope in a 13-year-old female subject who was vaccinated with ENGERIX B (GlaxoSmithKline), GARDASIL (non-GSK). On 15 November 2008, the subject received unspecified dose of ENGERIX B (intramuscular, unknown injection site, lot number not provided), unspecified dose of GARDASIL (intramuscular, unknown injection site). On 15 November 2008, 5 minutes after vaccination with ENGERIX B and GARDASIL, the subject experienced syncope with a convulsion; then she fell on the floor and experienced skull fracture with a slight subarachnoid hemorrhage. The subject was hospitalized for 1 week. During the hospitalization no diagnostic or therapy documented regarding epileptic events, so that the convulsion has to be seen in the context of the syncope. At the time of reporting the events were resolved. The regulatory authority reported that the events were possibly related to vaccination with ENGERIX B and GARDASIL. Due to close temporal connection between the two vaccine administrations and the occurrence of the adverse events, it was not possible to identify one of the two vaccines rather their injection as cause. A non-medicamentous cause seemed to be however improbable. This was all the information available from the Regulatory Authority. If they receive additional information, they will report it as soon as they get it. Therefore this case has been closed.

MedDRA PT Convulsion, Fall, Head injury, Immediate post-injection reaction, Malaise, Skull fracture, Subarachnoid haemorrhage, Syncope

Symptom Text: Case received from foreign Health Authority on 26-FEB-2009 under reference 2009-00650. It was reported that a 13 years old female adolescent received on the 15-NOV-2008 one intramuscular dose of GARDASIL 0.5 mL (lot# 654792/0873F is valid for ROTATEQ, but not valid for GARDASIL, site of administration not reported) and one milliliter intramuscular of ENGERIX B 20, (batch # and site of administration not reported). Directly after the administration, the patient felt unwell, but she did not inform the medical personnel. After getting up (5 minutes after the vaccination) the patient experienced a syncope with a convulsive seizure. She crashed on the back of her head and further experienced a skull fracture with a mild subarachnoidal hemorrhage. The patient was hospitalized for one week in the hospital where she recovered without sequelae. Other business partner numbers include: E2009-01736.

MedDRA PT Abdominal pain, Activities of daily living impaired, Blood amylase increased, Gastrointestinal disorder, Infectious mononucleosis, Nausea, Oropharyngeal pain, Similar reaction on previous exposure to drug, Splenomegaly, Weight decreased

Symptom Text: Information has been received from a nurse practitioner concerning a 14 year old female with a history of high fever after receiving unspecified pertussis vaccine as an infant who in July 2008, was vaccinated with the first dose of GARDASIL. There was no concomitant medication. In approximately July 2008, "2 days after administration of her first dose", the patient experienced gastrointestinal problems. Her symptoms lasted for 1 week. In September 2008, the patient was vaccinated with the second dose of GARDASIL. In approximately September 2008, "one week after administration of her second dose", the patient developed severe abdominal pain, nausea and severe sore throat. Her symptoms did not improve. On 30-OCT-2008 the patient was diagnosed with mononucleosis and enlarged spleen. Her gastrointestinal problems continued despite a CAT scan confirming spleen was no longer enlarged. The patient experienced severe pain in left upper quadrant of abdominal area. She had lost a lot of weight and had elevated amylase levels. She had been examined by a GI specialist but no diagnosis was reached. She was currently being treated with ZANTAC, ACTIGALL, DONNATAL and pancreatic enzymes. At the time of this report, the patient had not recovered. The reporter considered the events to be disabling due to the patient was "missing school and unable to participate in sports". Additional information has been requested.

MedDRA PT Abasia, Aphasia, Arthropathy, Cerebrovascular accident, Hypoaesthesia, Malaise, Vaccine positive rechallenge

Symptom Text: Information has been received via CSL as part of a business agreement. It was reported in a newspaper article that a female high school student, aged approximately 18 years and a talented touch football player, was vaccinated in 2008 with GARDASIL (manufacturer unknown) (exact dates and number of doses not reported). Subsequently, not long after vaccination with GARDASIL (manufacturer unknown), the patient "started getting sicker and sicker after each (vaccination)" until she suffered a "stroke without the bleed" and was in hospital for three months. The patient stated that she had to "learn to walk and talk again". It was reported that the patient's mother believed that her daughter's stroke was caused by her cervical cancer vaccinations. However, the patient stated that "the doctor's don't believe (stroke) had anything to do with it". At the time of reporting on 18-FEB-2009, the patient had recovered from stroke and had been back playing football but still had "parts of me that are numb down my left side". Information received on 18-FEB-2009 contained the following adverse experience: "bad knee" (2009) resulting in the patient probably not being able to play football for another two years. Additional information is not expected.

MedDRA PT Asthenia, Chest pain, Dyspnoea, Fatigue, Infectious mononucleosis, Malaise

Symptom Text: Information has been received from a teenage female athlete (runner) via a news report who in May 2008, was vaccinated with GARDASIL. In May 2008, within days of getting the vaccine, the patient became mysteriously ill and was hospitalized. The patient said she couldn't breathe and was really fatigued. Her chest was beginning to hurt like she was having an allergy or asthma attack. In July 2008, doctors diagnosed the patient with mononucelosis. As of 19-FEB-2009, the patient had not recovered and was still too weak to run. The patient's family thinks GARDASIL was responsible, but the patient's physician's did not know if her condition was related to the vaccine or if it was a coincidence. Additional information is not expected.

MedDRA PT Confusional state, Dehydration, Malaise, Oropharyngeal pain, Pyrexia

Symptom Text: Information has been received from a medical assistant concerning a 15 year old female with no previous medical history or drug allergies reported who on 17-DEC-2008 was vaccinated with the first dose of GARDASIL (Lot # 661044/0548X), 0.5 mL, I.M. On around 05-JAN-2009, the patient became really sick, had a fever of 104 F, a sore throat, and was dehydrated. The patient was awakened in the middle if the night but was not fully alert. Her mother, who spoke with her that night, said that she did not know where she was. On 05-JAN-2009, the patient was taken to the emergency room. She was given MOTRIN and IV fluids. The emergency room could not find a cause for her illness. On 17-FEB-2009, the symptoms were resolved. The patient was followed up on 21-FEB-2009 by her primary care. The symptoms were considered to be an other important medical events by the medical assistant. Additional information has been requested.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy, Pregnancy test

Symptom Text: Information has been received from a physician, for the Pregnancy Registry for GARDASIL, concerning a 26 year old female who was vaccinated with first and second 0.5mL doses of GARDASIL on 29-JUN-2007 and 29-SEP-2007. The physician reported that they believed the patient was pregnant on 10-DEC-2007. On 29-DEC-2007, the patient was vaccinated with the dose of GARDASIL. On 24-JAN-2008 the patient experienced miscarriage. Lab test performed included unspecified pregnancy test. This is one of two reports concerning the same patient. Upon internal review miscarriage has been considered an other important medical event. Subsequently in June 2008 the patient became pregnant again and on August 2008 the patient had another miscarriage (WAES #0902USA04455). Additional information has been requested.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Confusional state, Convulsion, Loss of consciousness, No reaction on previous exposure to drug, Syncope

Symptom Text: Initial information was received on the 23-FEB-2009 by the foreign Health Authority (reference number ES-AGEMED-318545244) regarding a 14 year-old female who was administered on the 27-NOV-2008 the second dose of a GARDASIL vaccine by intramuscular route. According to the reporter the patient has presented with 3 syncope episodes with chronic convulsions and loss of consciousness. These episodes occurred on the 16-DEC-2008, 19-JAN-2009 and on the 06-FEB-2009, each episode lasted for 2 minutes approximately. The events began with prodromes and at the end of each crisis the patient was confused, no esphinter relaxation. After the second episode, in order to perform some test, the patient was hospital admitted during 1 week. Prior dose was administered on the 28-SEP-2008 and was well tolerated by the patient. Other business partner numbers include: E2009-01624. Upon internal review, clonic convulsion was determined to be an other important medical event. No further information has been reported.

Other Meds: Prior dose was administered on the 28-SEP-2008 and was well tolerated by the patient.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Convulsion, Fall, Head injury, Immediate post-injection reaction, Loss of consciousness, Syncope

Symptom Text: Information has been received from a registered nurse concerning a 15 year old female with neurological disorder who on 03-MAR-2009 was vaccinated with a dose of GARDASIL vaccine in her left arm (LOT# 1432X, this lot is valid for another MSD product). Concomitant therapy included MENACTRA in her right arm (LOT# 62927AA). The onset of adverse event was immediate. The patient experienced as either convulsion, seizure or potential syncope episode. The patient passed out, leapt off the table and fell on floor, and hit her head on the floor. The patient has a history of neurological problems so they went immediately to a neurologist to do an EEG. The results were still outstanding at the time of the reporting. As far as long term effects there were none reported at the time of the report. The patient was still being monitored. The patient visited an urgent care facility because the mother felt the patient was still out of sorts. The outcome of adverse events was unknown. It was reported that the patient was still out of sorts. The outcome of adverse events were unknown. It was reported that the patient sought medical attention: visit an urgent care facility. Upon internal review convulsion, seizure was determined to be an other important medical event. Additional information has been requested

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Headache, Migraine, Syncope

Symptom Text: Information has been received from a certified medical assistant concerning a 15 year old female with no drug reactions or allergies and history of migraine but under reasonable control with IMITREX therapy who on 3-JUL-2008 was vaccinated IM with the first 0.5 ml dose of GARDASIL (lot # 0250X). On 16-FEB-2009 the patient was vaccinated IM with the second 0.5 ml dose of GARDASIL (lot # 661046/0546X). Concomitant therapy included IMITREX and unspecified oral contraceptive. On 16-FEB-2009 the patient fainted after getting GARDASIL. The patient was caught by the nurse and did not have any head injury. She recovered and was sent home. That night the patient developed a severe headache. Either the night of 16-FEB-2009 or the following day the patient went to the emergency room because of migraine symptoms. There was information on the ER treatment or test. Mother of the patient reported that she averaged about 1 migraine every couple of months. Since GARDASIL, the patient had been getting at least 1 headache/migraine a day that lasted at least 30 minutes. The patient was referred to pediatric neurologist but the patient's mother refused a brain MRI fro the patient. On 19-FEB-2009 urine pregnancy test was done and the result was negative. It was reported that the patient had been having continuous headaches for 2 and 1/2 weeks. At the time of this report, the patient's symptoms persisted. Additional information has been requested.

MedDRA PT Inappropriate schedule of drug administration, Syncope

Symptom Text: This case was reported by a regulatory authority (# AGEMED-330827440) and described the occurrence of syncope in a 29-year-old female subject who was vaccinated with DITANRIX, GARDASIL. Previous to vaccination the subject referred fear and anguish to vaccines. On 2 February 2009 the subject received booster dose of DITANRIX adult (intramuscular), unspecified dose of GARDASIL (intramuscular). On 2 February 2009, less than one day after vaccination with DITANRIX adult and GARDASIL, the subject experienced syncope. The regulatory authority reported that the events was clinically significant (or requiring intervention). On 2 February 2009, she totally recovered without problem. The regulatory authority reported that the event was possibly related to vaccination with DITANRIX adult and GARDASIL. No further information was expected as this was all the information that regulatory authorities had. Therefore this case has been closed.

MedDRA PT Chest pain, Contraception, Dysmenorrhoea, Dyspnoea, Loop electrosurgical excision procedure, Palpitations, Papilloma viral infection, Smear cervix abnormal, Tachycardia

Symptom Text: I went in for the 1st of three Guardisil vaccinations. I had a recent previous pap smear that normal, no HPV, no abnormal cells, nothing. After another pap (after having the vaccine) it was found that I did in fact now have HPV and a lession that needed a LEEP procedure to be removed. My gyno was stunned at how quickly this lesion manifested and how dangerous it had become so very quickly. I was lucky to have it removed when I did as my gyno said one more week and more than likely it would have been cancerous. I now need pap tests every 6 months to make sure I don't get cervical cancer (from a shot that was meant to protect me from it). I now have HPV forever, and I never had it before I got the vaccine. Married, monogamous (as is spouse), how did I get it then? And is it a coincidence that it happened very shortly after the HPV vaccine was administered? I think not. 4/7/09 Received PCP vaccine record & medical records for 4/27/07. FINAL DX: none provided. Records reveal patient was new patient to practice & experienced menstrual cramps since 1/07 when out of BCPs. Exam was WNL. 4/7/09 Received additional PCP records of 8/23/07. FINAL DX: chest pain, tachycardia Records reveal patient experienced chest pain, heart racing, SOB x 1 day. Began right after starting new BCP. Exam in office WNL. Referred for echocardiogram & BCP d/c'd. No further medical records or echocardiogram report available.

MedDRA PT Convulsion

Symptom Text: Information has been received from a physician concerning a 16 year old female who in September 2006, was vaccinated with the first 0.5 ml dose of GARDASIL (lot # 653735/0688F). Concomitant therapy included BOOSTRIX on the same day. On 22-JAN-2007, the patient was vaccinated with the second dose of GARDASIL (lot # 655165/1425F). In July 2007, the patient was vaccinated with the third dose of GARDASIL (lot # not provided). On 09-JUN-2008 the patient developed seizures after getting all three doses of GARDASIL. At the time of this report, the patient's seizures persisted. Unspecified medical attention was sought. Upon internal review, seizure was considered to be other important medical event. Additional information has been requested.

MedDRA PT Caesarean section, Drug exposure during pregnancy, Hydronephrosis, Induced labour, Missed labour

Symptom Text: Information has been received from a gynecologist, concerning a 18-year-old female patient on 11-JUN-2008 was vaccinated with the third dose of GARDASIL route IM into deltoid muscle. On 23-JUN-2008, the patient was found to be pregnant. The last menstrual period was on 01-MAY-2008. Estimated date of birth 05-FEB-2009. No adverse effect occurred up to the time of reporting. Additional information received from a gynaecologist on 25-FEB-2009. It was reported that the patient developed hydronephrosis during pregnancy (onset date unknown). Due to hydronephrosis a medical induction of labour was started. Because of missed labor, a cesarean section was performed and the patient gave birth to a sound baby on 30-JAN-2009. The postnatal examination of mother and child showed no pathologies. Upon medical review, hydronephrosis and cesarean section were considered to be other important medical events. Other business partner numbers include E2008-05899. The case is closed. Additional information is not expected.

MedDRA PT Monoplegia

Symptom Text: Information has been received from a physician concerning a 25 year old female who in December 2008, was vaccinated with GARDASIL first dose. In December 2008, the patient experienced arm paralysis for two weeks. Subsequently, the patient recovered from arm paralysis. The physician indicated that the consumer (the patient's mother) reported to her about the event approximately one and half month posts the event by phone call. The adverse event was termed by the consumer as an "arm paralysis" and "could not move her hand". The reporting consumer indicated that the patient did not refer to a physician for examination at the time of the event. The physician advised the patient to refer for examination however the patient was not examined by the time of this report. The physician felt that the relation of arm paralysis to therapy with GARDASIL first dose is unknown. The physician raised the possibility that the event was not paralysis per se but rather pain from the injection however since the patient was not examined the physician could not determined that. Upon internal review, monoplegia was considered to be an other important medical event. Additional information is not expected.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy, Vaginal haemorrhage

Symptom Text: Information has been received from a licensed practical nurse concerning a 26 year old female with no known medical history and drug allergies, who on 12-DEC-2008 was vaccinated with a first dose of GARDASIL (lot # 660620/0571X) on 12-FEB-2009. The patient received a 0.5 mL second dose of GARDASIL (lot # 661764/0650X), intramuscularly. There was no concomitant medication. It was reported that the patient was pregnant. It was noted that the patient had experienced vaginal spot bleeding that was bright red. It was also reported that the patient miscarried. She was in her first trimester and probably only a couple weeks pregnant. Beta levels were negative and she will not require a dilation and curettage procedure. The patient sought medical attention through a phone call to the practice. Upon internal review, miscarried was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Abdominal pain, Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Information has been received from a physician assistant and a licensed practical nurse, for GARDASIL, a Pregnancy Registry product, concerning a 20 year old female patient with asthma and no known drug allergies or reactions who on 02-DEC-2008 (after a negative pregnancy test) was vaccinated with the first 0.5 ml IM dose of GARDASIL (lot #0152X). Concomitant therapy included albuterol. It was noted that the patient got pregnant around the end of December 2008. About 6-7 weeks ago, the patient was assumed to undergo a miscarriage. She experienced abdominal pain. On 04-JAN-2009 the patient was seen at a hospital. On 06-JAN-2009 the patient was seen at the emergency room, experiencing a threatening spontaneous abortion, with no evidence of gestation sack and no evidence of embryonic pole. She was given birth control after the miscarriage. It was reported that unspecified blood was drawn and testing was done. On 26-JAN-2009 the patient had a HCG quant level of 16, and on 03-FEB-2009 a quant level of 5. But the patient never got her period. On 16-FEB-2009 physician assistant spoke with the patient's physician's office to confirm her lack of pregnancy and gave her a pregnancy test with negative result. On 16-FEB-2009 the patient received the second 0.5 ml IM dose of GARDASIL (lot #01423X). The patient also had an adverse event after this second dose (WAES # 0903USA00527). Upon internal review, miscarriage was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Arrhythmia, Clonus, Convulsion, Feeling abnormal, Loss of consciousness, Trismus, Urinary incontinence

Symptom Text: Information has been received from a general practitioner concerning a 19 year old female patient who received the first dose of GARDASIL on 14-JAN-2009 (lot #0779X, batch# NJ32820) IM. About two years ago the patient was taken oral contraceptive with HARMONET, 0.015 mg and 0.06mg. On 16-JAN-2009, two days after vaccination, the patient experienced one episode of loss of consciousness and convulsion crisis with clonic movement, loss of urinary sphincter control (urination occurred) and trismus. The episode started with a "feeling something in the head" as the patient was standing next to the vehicle after lunch. The duration of the episode was unknown. The patient recovered spontaneously without hospitalization or any medical treatment. The reporting physician stated that she was only informed about the event on 21-JAN-2009. In order to find a possible etiology, several tests were performed by the general practitioner who followed the patient: CAT scan, blood test and echocardiogram without abnormal results. An electroencephogram showed a "slight slow dysrhythmia (theta band), without a clear zone Predominance". The electroencephalogram will be repeated in March 2009. More information is expected. To be noted that the patient had no personal or family history of pathology or similar events. The case was not considered as serious by the reporter, nevertheless it was upgraded according to the company policy and seizure was considered to be an other important medical event. Other business partner number included E200901807.

Other Meds: Harmonet

Lab Data: Computed axial tomography, without abnormal results; Diagnostic laboratory test, without abnormal results; Echocardiography, without abnormal results; Electroencephalography, slight slow dysrthytmia (theta band), without a clear zone predom

Seriousness: ER VISIT, HOSPITALIZED, SERIOUS

MedDRA PT Aggression, Agitation, Aphasia, Blood product transfusion, Chemotherapy, Confusional state, Delirium, Depressed level of consciousness, Encephalitis, Encephalopathy, Gastrointestinal tube insertion, Intensive care, Mental status changes, Oxygen saturation decreased, Perseveration, Plasmapheresis, Speech disorder, Thrombosis

Symptom Text: Information has been received from a physician concerning a female patient who in July or August of 2008, was vaccinated with her second dose of GARDASIL. In September 2008, the patient had NMDA antibody receptor and encephalitis. Drug treatment was required. The patient presented at the emergency room and was hospitalized for 2 months. At the time of reporting the patient was recovering from the NMDA antibody receptor encephalitis. The patient was told that she could have recurring episodes. It was unknown if there would be significant disability. Additional information has been requested. 4/24/09 Received hospital medical records of 9/29-11/25/2008. FINAL DX: NMDA receptor positive encephalopathy; delerium; g-tube placement; left brachiocephalic IVC clot associated w/PICC line placement; antiphospholipid antibodies. Records reveal patient symptoms noted in outlying ER in addition to aggression began approx 5 days prior. Course waxed & waned w/intermittent decreased alertness & delerium, decreased O2 sats & was in/out of PICU. Tx w/IVIG x 5 days, steroids, IV antibiotics/antivirals, plasmaphersis x 4 days, antineoplastics, feeding tube placement & anticoagulants. Neuro, Rheum & Psych consult done. Slowly improved & d/c to home w/PCP, Thrombophilia, Rheum, REhab & surgery clinic appts. 4/7/09 Received hospital medical records of 9/27-9/29/2008. FINAL DX: probable encephalitis Records reveal patient experienced acute confusion, mental status change, repetitive garbled speech then aphasia, excitable. In hospital had alternating periods of quiescence & agitation, speech garbled, perseverating, neologisms & frequently aphasic. ID & Neuro consults done. Transferred to higher level of care.

MedDRA PT Loss of consciousness, Syncope, Syncope vasovagal

Symptom Text: Information has been received from a Health Authority (reference number ES-AGEMED-389255339), concerning a 21 year old female patient who in July 2008 (exact date not reported), was vaccinated with the first dose of GARDASIL (Batch number, route and site not reported). It was reported that after receiving the vaccine, the patient presented a vasovagal syncope with loss of consciousness, ten minutes afterwards the patient recovered. The patient received the second and third doses with no adverse events. Case reported as serious by the HA with other medically important condition as criteria. Syncope, syncope vasovagal and loss of consciousness were considered to be an other important medical event. Other business partner numbers (E2009-01832). No further information is available. Case is closed.

MedDRA PT Amnesia, Convulsion, Disorientation, Drooling, Loss of consciousness, Tonic clonic movements, Tremor

Symptom Text: Initial information received on the 26-FEB-2009 from the Health Authorities (Reference number ES-AGEMED-608197236) regarding a 14 year old female who on 23-SEP-2008 was vaccinated with the third dose of GARDASIL (batch number not reported) by intramuscular route (site not reported). It has been reported that on 28-FEB-2008 when she woke up, the patient had a tremor on her right arm, and when she stood-up she had a convulsive crisis with loss of consciousness, tonic-clonic movements and drooling. No sphincter incontinence or ocular reversion. The patient presented a postcritical state (disorientated and couldn't remember anything until she was at the scanner). The patient was moved by a medical home care service (arterial pressure: 72/47; heart rate: 107, disorientated). The patient was didn't have a medical history of convulsive crisis. The patient had a normal physical exploration. Neurological exploration: no meningeal signs, nor nuchal rigidity, nor petechiae, normal cranial pairs, strength, feeling and nociception conserved. Presented reflexes. On 29-SEP-2008 an electroencephalogram was performed, several interference's appear with a spike morphology also several acute waved in the temporal areas, specially in the left side, these were more active during hyperpnea. The patient was discharged and diagnosed as a first convulsive episode. EEG was repeated after 10 days, patient remained without any medical treatment until this test. The results for EEG were pending. Convulsive seizure was considered to be an other important medical event by the HA. Other business partner numbers include E2009-01808.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Blood product transfusion, Coagulopathy, Haematoma, Haemorrhage, Mouth haemorrhage, Petechiae, Pruritus, Tooth extraction, Vaccine positive rechallenge

Symptom Text: Information has been received via a health authority (case no. 95400, local case no. IT077/09) concerning a 11 year old female who was affected by cheilo-palatoschisis (cleft palate), congenital dislocation of the hip and severe scoliosis who on 10-NOV-2008 was vaccinated with the first dose of GARDASIL. The following day (11-NOV-2008) she presented with intense itching of the lower limbs and then of the abdomen, followed by the onset of a large hematoma on the left calf (not related to any apparent trauma). The mother initially thought that the itching was connected to a brace the child was wearing for the scoliosis, thus she used creams (NOS) that did not calm the symptoms. Also reported coagulation difficulty following a tooth extraction, the child bled for 2 days. On 15-JAN-2009 the patient was vaccinated with the second dose of GARDASIL (lot # 1864U, batch # NJ16970). Following the administration of the second dose on 15-JAN-2009, the itching became more and more intense with onset of several petechiae on the limbs and hematomas on the legs, petechiae reported also in the oral cavity. On 29-JAN-2009 the pediatrician prescribes a blood drawing and has the child admitted to the hospital because platelets 3000mm. Upon admission the child was in good general condition with diffused petechiae on the limbs and oral cavity and hematomas on the arms. She was treated with immunoglobulins IV without improvement and then from 09-FEB-2009 with PREDNISONE. She was discharged on 12-FEB-2009. Her condition had improved. No further information is available. The case is closed. Other business partner number included E200901740.

MedDRA PT Facial spasm, Lacrimation increased

Symptom Text: Information has been received from a physician concerning a female who in August 2008, was vaccinated with GARDASIL second dose. In August 2008, five or six days post vaccination, the patient experienced facialis. Therapy with GARDASIL was interrupted. The reporter indicated that the patient is improving but still cannot completely closed the eye and the eye is teary. The reporter indicated that the reporting attending physician felt that facialis was not related to therapy with GARDASIL second dose. The reporter felt that he cannot relate facialis to therapy with GARDASIL second dose. Upon medical internal review facialis was considered to be disabling and other important medical event. Additional information has been requested.

MedDRA PT Anaphylactic reaction, Chest pain, Dyspnoea, Hyperhidrosis, Pruritus, Rash generalised, Respiratory distress, Stridor, Tachypnoea, Urticaria, Vaccination complication

Symptom Text: Patient received Gardasil and Menactra vaccinations on Friday, Feb. 27th at about 2 pm. She also had completed a course of Zithromax, but had previously received 2 courses of this medication. Patient felt fine throughout the weekend, but on Monday around 130 pm developed itching and slight rash. Played golf from 4-5 pm and rash worsened with sweating. That evening her mother gave her diphenhydramine and Calamine lotion which helped the rash decrease in size and decreased pruritis associated with the rash. On Tuesday morning the rash was very light, but again worsened throughout the day and greatly increased in size after golf from 4-5 pm. Mother described rash as now spread throughout body including abdomen, breasts, back, neck, and palms of hands and soles of feet. Patient began having breathing difficulties and was brought to an urgent care facility around 7 pm. She received epinephrine and IV methylprednisolone and was discharged after the breathing improved and the rash decreased in size. At about 1230 am that night the patient again experienced breathing difficulites and worsened rash and presented to the ER. She was given another dose of epi, IV steroids, and antihistamines. Patient was sent home after improvement, but again presented Wed am, this time to the TEC. Patient was admitted and received 2 more rounds of epi, scheduled methylprednisolone (25 mg IV q6h), scheduled hydroxyzine (50 mg po q6h), and Pepcid (20 mg IV q12h). Patient weighed 54.2 kg. Patient was discharged on Friday March 6th with an epi pen, prn hydroxyzine, oral steroids, H2 antag, etc. Medical residents described rash as hives. Patient reported no changes to diet or unusual outdoor triggers. When looking at literature, it appeared the majority of documented cases with Menactra were within 24hrs, but when looking at a study of Australian teenage girls receiving Gardasil, it appeared several of the cases were delayed in nature (up to a several days). Please contact PharmD for literature links. We felt given history of

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Drug exposure during pregnancy, Foetal disorder

Symptom Text: Information has been received from a nurse, for the Pregnancy Registry for GARDASIL, concerning a 17 year old female who on 06-MAR-2008 was vaccinated IM, 0.5mL with a 1st dose of GARDASIL (lot# 657737/0522U). Secondary suspect therapy included MMRII (lot# and dose not reported). Other concomitant therapy included MENACTRA (lot# not reported). On an unspecified date the patient took a home pregnancy test. On 08-FEB-2008 the patient had an ultrasound and was positive for pregnancy (LMP approximately 29-SEP-2007, EDD 07-JUL-2008). The patient sought unspecified medical attention in the physician office. Additional information has been received from the nurse who stated that the patient's baby was fine. The baby originally spent three weeks in the NICU (neonatal intensive care unit) under bililights due to hereditary spherocytosis. The nurse stated that "this was not all due to the GARDASIL because it was a hereditary condition." Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Abdominal pain, Eosinophilia, Leukocytosis

Symptom Text: This case was reported by regulatory authority and described the occurrence of leukocytosis in a 14-year-old female patient who was vaccinated with DITANRIX adult (GlaxoSmithKline) and GARDASIL vaccine (non-GSK). On 17 December 2008 the patient received a single dose of DITANRIX adult (0.5 ml, unknown). From 14 January 2009 to 17 January 2009 the patient received IBUPROFEN for influenza symptoms. It was reported that on an unknown date "at the end of January" the patient experienced abdominal pain on the left iliac fossa and abdominal ultrasound revealed normal results. The patient was prescribed IBUPROFEN from 01 February 2009 to 04 February 2009. It was reported that "the family physician requested a test and changed the medication to BUSCAPINE". On 5 February 2009, approximately 50 days after vaccination with DITANRIX adult and GARDASIL, the patient experienced leukocytosis and eosinophilia. This case was assessed as medically serious by GSK. At the time of reporting the outcome of leukocytosis and eosinophilia were unknown. The outcome of abdominal pain was resolved. The regulatory authority considered the causal relationship between the events and the suspect drugs was "conditional".

MedDRA PT Abdominal pain

Symptom Text: Initial information received on the 26-FEB-2009 by the Health Authority (reference number ES-AGEMED-918560244) regarding a 14 year old female who was vaccinated with GARDASIL (batch number not reported) by intramuscular route (site of administration not reported), 0.5ml, on 17-DEC-2008. On the same date, the patient also received a dose of DITANRIX (route unknown, site not reported). It was also reported that the patient had taken oral Ibuprofen (manufacturer unknown) to treat flu-like symptoms, from the 14-JAN-2009 until the 17-JAN-2009. By the end of January, the patient presented with abdominal pain in the left iliac fossa, the patient was attended in the emergency room where an abdominal sonogram was performed. Ibuprofen was prescribed from the 01-FEB-2009 until the 04-FEB-2009. The patient's general practician ordered some blood test and treatment with Ibuprofen was replaced with Buscapina, treatment start and end dates not reported. Test results for blood-tests on the 05-JAN-2009 were: Leukocytes 30900; Eosinophiles 14000 (48%), the rest of the biochemistry lab results were normal (hepatic, renal, amylase), the rest of hematologic series were normal. Abdominal pain had disappeared (date not reported). On the 12-FEB-2009 blood-test showed: Leukocytes: 11000, Eosinophiles 4000. No previous records of allergies or parasitosis. Case reported as serious by the Health Authority with other medically important condition as criteria. No further information has been received. Other business partner numbers include E2009-01825.

MedDRA PT Pityriasis rosea, Tinea infection

Symptom Text: Around February of this year my daughter came up with a few ringworm's on her stomach and thigh. I bought the over-the-counter medication and was applying it 3 times a day to no avail then approximately three weeks after the initial outbreak she started getting more all over her stomach back and legs the other areas originally infected were not healing at all. I took her to our doctor and he diagnosed her with pityriasis rosea and has since put her on a steroid dose pack.. when I learned what it was I started doing some research to try and figure out how she had contracted the virus...then I read that it is possibly caused by a papilloma virus and that got me wondering if this also could be a side effect to the GARDASIL shot...my daughter got the 3rd GARDASIL shot 1/29/09 and the first hearld patch appeared less that a week later however I did not attribute it to the shot until I started doing some research... Could someone please let me know if this is a possible side effect that has just not been listed yet... I find it odd that she gets this virus, one I have never heard of before shortly after the injection...thank you

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Central nervous system inflammation, Incorrect route of drug administration, Visual acuity reduced

Symptom Text: Information has been received from the health authorities (reference numbers LL20090063 and LL0900064) concerning a 17 year old female patient with no relevant medical history who on 07-FEB-2008 was vaccinated with the first dose of GARDASIL (lot number, site and route not reported). On 30-APR-2008, the patient received the second dose of GARDASIL (lot number and site not reported) via an inappropriate route i.e. subcutaneous route instead of intramuscular route. On 05-OCT-2008 the patient presented with right visual acuity decreased. After work-up (clinical examination, MRI, no lumbar puncture because the patient refused it) diagnosis was first inflammatory event of central nervous system (or clinically isolated syndrome). There was a 100 percent recuperation after a bolus of Solumedrol 3 g. There was hospitalization (unspecified dates). The patient was vaccinated with a third dose of GARDASIL (lot number, site and route not reported) on 10-OCT-2008. Evolution: 3 months control MRI showed 2 new lesions without any gadolinium contrast uptake. There was no diagnosis of multiple sclerosis in this case due to the absence of temporal dissemination. At time of reporting the patient had not recovered from inflammation of central nervous system. The Health Authorities assessed the causal relationship between the reported reaction(s) and vaccination was "doubtful" (C1 S1 L1) according to the foreign method of assessment. Other business partner numbers included: E2009-01933. Additional information has been requested.

Other Meds: Unknown

Lab Data: Magnetic resonance imaging, 05?Oct08, diagnose was first inflammatory event of central nervous system; Magnetic resonance imaging, two new lesions without any gadolinium contrast uptake

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Fall, Head injury, Syncope, Tonic clonic movements

Symptom Text: This case was reported by a regulatory authority (ES-AGEMED-630821440) and described the occurrence of syncope in a 12-year-old female subject who was vaccinated with TWINRIX pediatric (GlaxoSmithKline), GARDASIL (non-GSK). On 18 February 2009, the subject received unspecified dose of TWINRIX pediatric (intramuscular, unknown injection site), unspecified dose of GARDASIL (intramuscular, unknown injection site). On 18 February 2009, less than one day after vaccination with GARDASIL and TWINRIX pediatric, the subject experienced syncope followed by tonic clonic movements that lasted few seconds. The subject felt down with head trauma. The subject required observation during about two hours at emergency room. The regulatory authority reported that the events were clinically significant (or requiring intervention). On 18 February 2009, the events were resolved. The regulatory authority reported that the events were possibly related to vaccination with TWINRIX pediatric and GARDASIL. No further information is expected, this case has therefore been considered closed.

MedDRA PT Fall, Head injury, Syncope, Tonic clonic movements

Symptom Text: Initial information received on the 05-MAR-2009 by Health Authority (reference number ES-AGEMED-630821440) regarding an 11 year-old female who was administered on the 18-FEB-2009 a dose of a GARDASIL (lot# and batch# not reported) by intramuscular route (site not reported). On the same day the patient received a dose of TWINRIX (manufactured by GlaxoSmithKline) by intramuscular route (site not reported). In the report sent by the Health Authorities, syncope has been coded as adverse event with start/stop date on 18-FEB-2009. In the narratives it is reported that this syncope was accompanied with tonic-clonic movements, the patient fell and had a cranial traumatism. The events lasted for a few seconds. The patient remained in the emergency room under observation for a few hours. The patient recovered. Case reported as serious by the HA with other medically important condition as criteria. Other business partner numbers include: E2009-01972. Case is closed.

Seriousness: LIFE THREATENING, SERIOUS

MedDRA PT Fatigue, Thirst, Type 1 diabetes mellitus, Urine output increased, Vision blurred, Weight decreased

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. On 10-SEP-2008 a 13 year old female patient with acne was vaccinated with the first dose of GARDASIL (Lot # 659184/0843X) intramuscularly into her left arm. Concomitant therapy on the same date included MENACTRA (Lot # U2661AA) (Sanofi Pasteur) intramuscularly into her right arm. Mom was requesting VAERS done one month after receiving MENACTRA and the first dose of GARDASIL on 10-SEP-2008. The patient had blurred vision. Three months later was diagnosed with type 1 diabetes. On 16-MAR-2009 a Magnetic Resonance was received from the primary care provider including endocrine consult. On 10-SEP-2008 the patient was seen for WCC (well child check up). The assessment: the patient was healthy; physical examination was within normal limits after the vaccines were given. The patient was seen by an ophthalmologist for intermittent blurry vision with visual acuity OK. On 29-JAN-2009 the patient was seen with complain of onset excessive thirst, recent weight loss and increased urinary output. It was reported that the patient was feeling tired. The patient was diagnosed with new onset diabetes type 1 after laboratories performed. The patient was referred to endocrine and was diagnosed with Insulin-Dependent Diabetes Mellitus (IDDM). A fasting glucose was performed: 247, Urinalysis (+) for glucose and mod ketones. Hgb A1C 11.1%. Standard lot check investigations were performed on lot # 659184/0843X. All in-process quality checks for the lot numbers in question were satisfactory. In addition, expanded lot check investigations were performed. The testing performed on the batches prior to release met all release specifications. The lots met the requirements of the research center and were released. The original reporting source was not provided. The VAERS ID # is 341638. No further information is available.

Seriousness: ER VISIT, PERMANENT DISABILITY, SERIOUS

MedDRA PT Asthenia, Dizziness, Headache, Pain, Paraesthesia

Symptom Text: Information has been received from a registered nurse (R.N.) concerning a 20 year old female with allergies to BENADRYL and BACTRIM who on 18-AUG-2008, 24-NOV-2008 and 05-MAR-2009 was vaccinated with a first, second and third dose of GARDASIL (lot # 1702X, 0.5 ml, IM into the left arm for dose 3), respectively. Concomitant therapy given on 05-MAR-2009 included ADACEL. On 06-MAR-2009 after receiving her third dose, the patient experienced dizziness, headache, weakness, pain and tingling in both arms. The patient sought medical attention via phone call to the physician's office. The patient was treated in the emergency room with IV fluids, COMPAZINE and TORADOL, and then released. The patient's heart rate in the emergency room was 124. An electrocardiogram (EKG) was performed with results within normal limits. As of 19-MAR-2009, the patient's symptoms have improved but she continued to have arm pain. The reporter considered the adverse events to be disabling. Additional information has been requested.

MedDRA PT Caesarean section, Drug exposure during pregnancy, Failed induction of labour

Symptom Text: Information has been received from the mother concerning her 16 year old daughter with no medical history and no allergies reported, who on an unspecified date was vaccinated with the first dose of GARDASIL. On 12-DEC-2007, the patient was vaccinated with her second dose of GARDASIL, 0.5 ml. Concomitant therapy included prenatal vitamins. On 28-DEC-2007, the patient found out she was pregnant. Her last menstrual period (LMP) was on 06-DEC-2007 ("8 weeks 5 days" ago). The patient sought medical attention. On an unspecified date, the patient had blood work performed (unspecified). Her estimated date of delivery is 11-SEP-2008. The third dose of GARDASIL was not administered. Follow-up information was received on 09-MAR-2009 from a female at a pediatrician's office, who reported that on 16-SEP-2008 the patient delivered a healthy normal, female, who weighed 10 lbs 1 oz, by cesarean section for a failed induction of labor at 41 weeks gestation. It was noted that the patient had a maternal pregnancy weight gain of 60 lb. The patient brought her baby to the physician's office. The physician said the baby was "fine and well-no problems". It was reported that the patient had recovered from the c-section on an unspecified date and was "doing well also". Upon internal review, cesarean section was determined to be an other important medical event. No further information is available.

Other Meds: vitamins (unspecified)

Lab Data: hematology, blood work

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Caesarean section, Drug exposure during pregnancy, Failed induction of labour

Symptom Text: Information has been received from a medical assistant for the pregnancy registry for GARDASIL concerning a 15 year old female patient with type 1 diabetes mellitus and sulfonamide allergy who on 04-MAR-2008 was vaccinated IM in the right arm with the first 0.5 ml dose of GARDASIL (659182/1757U). Concomitant therapy included MENACTRA and insulin. The patient received her first dose of vaccine when she was pregnant. The physician did a vaginal exam (unspecified date) which found that the patient had a 16-18 week uterus size with a LMP of 07-DEC-2007, and an estimated delivery date of 12-SEP-2008. Unknown medical attention was sought in the office. Patient outcome was unknown. No product quality complaint was involved. Follow up information has been received from a certified medical assistant on 09-MAR-2009. It was reported that the patient delivered a healthy, normal male, a "few weeks early". The patient had an induction of labor secondary to her history of preexisting insulin-dependent diabetes. The induction failed and she had a cesarean section. The baby weighed a little over 7 lbs. The reporter said the mother recovered "fine" and the baby was released for adoption, so they have no further information on the baby beyond this. Upon internal review, induction of labor that failed was determined to be an other important medical event. Additional information is not expected.

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a physician from local health authorities in foreign country through the Sanofi Pasteur MDS GARDASIL on 23-OCT-2008. The case is not enrolled in the registry (patient's initials unknown). A 17 year old female patient received the first dose of GARDASIL (batch number not reported) on an unspecified date during the first trimester of her pregnancy. At the time of reporting the patient had no adverse effect. Follow up information received from the reporter by phone on 10-MAR-2009: Case upgraded to serious by the company. The patient requested a voluntary termination of pregnancy. The case is closed. Upon internal review, voluntary termination of pregnancy was determined to be an other important medical event. Other business partner numbers included: E2008-09930.

MedDRA PT Convulsion, Cough, Dyspnoea, Facial palsy, General physical health deterioration, Infection, Lividity, Loss of consciousness, Nasopharyngitis

Symptom Text: Case received from a healthcare professional on 05-MAR-2009. It was reported by a gynecologist that a 19-year-old female patient was vaccinated with a third dose of GARDASIL (batch number NH15200, lot number 1427U) IM into the upper arm on 22-JUL-2008. She sent with the reporting form a letter of the mother of the patient in which the AE's were described. Two days p.v. a series of infections (not otherwise specified) started. In the course she was treated for common cold and persisting cough. Her general condition worsened. End of November 2008 she experienced "facial palsies" which lasted for 1-2 seconds about 1 to 3 times a day. On 13-JAN-2009 she developed a seizure with unconsciousness for the first time during the night. The patient was hospitalized from 14-JAN-2009 until 19-JAN-2009. EEG, CT, MRI and lumbar puncture showed normal results. On 25-JAN-2009 she developed a mil fit with facial palsy for 1 or 2 minutes and dyspnoea but without unconsciousness. On 10-FEB-2009 she had a severe convulsion with unconsciousness, dyspnea and lividity of the lips. The final outcome was not reported. D1 (batch number NE35170, lot number 655101/0513F) and D2 (batch number NG14300, lot number 0467U) of GARDASIL administered on 22-NOV-2007 and on 07-FEB-2008 were well tolerated. Other business partner numbers include E200901962. Additional information has been requested.

MedDRA PT Adverse event, Syncope

Symptom Text: Information has been received from a pharmacist, via agency as part of a business agreement (manufacturers control No. CSL 2009 03 10 LS 2) concerning a female student who on approximately 10-FEB-2009, "approximately four weeks ago" was vaccinated with GARDASIL as part of a school vaccination program. Subsequently the patient was hospitalised (reason for hospitalisation was not reported). At the time of reporting on 10-MAR-2009, the patient had fully recovered. The vaccination program included approximately 100 students and there was one other adverse event reported of a female who fainted (NWAES 0903AUS00046). Additional information has been requested.

MedDRA PT Acute leukaemia, Haematoma, Inappropriate schedule of drug administration, Injection site haematoma, Lip swelling

Symptom Text: Information has been received from a health professional and transmitted by the subsidiary (Reference number NL0903-054-IN) concerning a 28 year old female patient with no reported medical history who on 03-MAR-2009 was vaccinated with her second dose of GARDASIL (batch number 41500 072010, route not reported, in the right arm). Three days after the vaccination, that was on Friday, 06-MAR-2009, she developed massive hematomas, left as well as right sided and on her upper body as well as lower torso and on her right (injected) upper arm and elbow, under the right eye, right wrist, lower parts of her legs and upper legs and she also developed a swollen lip. The first dose of GARDASIL (lot number, site and route not reported) was administered on an unknown date by her father. The general practitioner referred the patient to an internist and stated that the hematologist suspected acute leukemia as the patient had low amounts of platelets in her blood. According to the reporter, there was a possibility that there was an underlying cause for the adverse event and that vaccination may have had a triggering effect. Other business partner numbers included: E2009-02052. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Eye rolling, Muscle spasms, Reaction to previous exposure to any vaccine

Symptom Text: Information has been received from a gynaecologist concerning a 22 year old female patient who was vaccinated with a first dose of GARDASIL (lot number, injection route and site not reported) on an unspecified date. Three minutes post vaccination the patient experienced cramp like movements (reported term) and eyes rolling. The patient was laid down and she recovered immediately. An EEG for investigation will be carried out. The patient experienced similar reaction in the past after vaccination with tetanus toxoid (manufacturer, lot number and date of administration not reported). The reporting physician considered the eye rolling and cramp like movements to be other important medical events. Other business partner numbers included: E2009-02095. Additional information has been requested.

MedDRA PT Eczema, Hyperaemia, Joint swelling, Vaccine positive rechallenge

Symptom Text: Information has been received from the Health Authority (reference number ES-AGEMED-120752341) regarding a 14 year old female who was administered on the 04-FEB-2009 the second dose of GARDASIL (lot # not reported) by intramuscular route (site of administration not reported). Prior dose had been administered on 01-DEC-2008. It was reported that 10 days after administering the first dose the patient began with dorsal hand moist eczema with hyperaemia and interphalangeal joint oedema. These events worsened 24 hours after vaccination with the second dose. The reporter considered the adverse experiences to be other important medical events. Other business partner numbers included: E2009-02128. No further information is available.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Anxiety, Balance disorder, Computerised tomogram normal, Dizziness, Ear, nose and throat examination normal, Gait disturbance, Hypotension, Immunology test normal, Inflammation, Lumbar puncture, No reaction on previous exposure to drug, Ophthalmological examination normal, Vertigo, Vision blurred

Symptom Text: Initial information received on 10-MAR-2009 from a Foreign Health Authority (reference number ES-AGEMED-413082438) regarding an 18 year-old female who was administered on 19-SEP-2008 the second dose of GARDASIL (batch number, lot number, route and site not reported). The patient doesn't have a relevant medical history. One day after vaccine administration, on the 20-SEP-2008, the patient experienced dizziness, blurry vision and spinning sensation (vertigo-like sensation). The patient went to the emergency room where they verified a mild hypotension they began the patient on fluid therapy and TORECAN, symptoms did not cease. She remained in observation for 24 to 36 hours. The ENT exploration, ophthalmology test and CAT scans were normal. The patient was discharged from the hospital with a 15 day antiinflamatory treatment (NSAIDs). When the treatment ended, on the 20-OCT-2008, the patient experienced a similar symptomatology in addition she also experienced balance disorder and gait disorder, the patient went to the hospital's emergency room once again. On the 23-OCT-2008 the patient was hospital admitted in the neurology ward for 10 days with no medication. A battery of microbiology tests were performed, including a lumbar puncture with CSF extraction, immunology tests were normal. A brain MRI was also performed and a mild inflammation at cerebellum level was detected that was considered as a possible cause of the symptomatology. The inflammation appeared to in remission so the patient was discharged from hospital without medication. The patient had received the first dose of GARDASIL (batch number, lot number, route and site not reported) on 10-JUL-2008 without problem. On the 02-JAN-2009 the patient received the third dose of GARDASIL without any complications. Currently, the patient is in psychological treatment and is taking ALPRAZOLAM to treat anxiety (the patient is scared that the episode will happen again). No further information has been reported.

Other Meds: Unknown

Lab Data: magnetic resonance imaging, a mild inflammation at cerebellum level was detected

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Headache, Migraine, Nausea, No reaction on previous exposure to drug

Symptom Text: Information has been received from a nurse practitioner concerning a 23 year old female who on 09-JAN-2009 and 09-MAR-2009 was vaccinated with her first (lot number 661764/0650X) and second (lot number 661952/1129X) dose of GARDASIL 0.5ml IM into her deltoid respectively. Concomitant therapy included NUVARING. The patient did not have any reactions after the 1st dose of GARDASIL. On 09-MAR-2009, 2 hours after the vaccination the patient developed nausea. On 10-MAR-2009, one day after the vaccination the patient experienced a severe headache. Unspecified time the patient experienced migraine. The nurse practitioner felt an intervention to prevent serious criteria was "the patient received NSAIDs". The patient sought medical attention by phone and an office visit. The patient's outcome was recovering. Additional information has been requested.

Other Meds: NUVARING

MedDRA PT Abdominal pain, Anorexia, Asthma, Chest pain, Colitis, Crohns disease, Diarrhoea haemorrhagic, Dizziness, Dyspnoea, Gastrointestinal tube insertion, Impaired gastric emptying, Malaise, Nausea, Vomiting, Weight decreased

Symptom Text: Information has been received from a registered nurse concerning a 14 year old female patient with no pertinent medical history, no drug reactions/allergies, who on 16-AUG-2007 was vaccinated intramuscularly with the first 0.5 mL dose of GARDASIL. On 11-OCT-2007, the patient was vaccinated intramuscularly with the second 0.5 mL dose of GARDASIL. There was no concomitant medication. On 10-JAN-2008 the patient was diagnosed with gastroparesis and was having abdominal pain. The patient had been hospitalized (dates of admission were not known by the reporter). On 11-FEB-2008, the patient was vaccinated intramuscularly with the third 0.5 mL dose of GARDASIL. The patient had had a nasogastric tube placed since the spring to Summer of 2008 for nutritional support. The reporter stated that the physicians were unable to determine the etiology of the diagnosis. At the time of the reporting, the patient had not recovered. Additional information has been requested. 3/27/09-records received for DOS 4/30-5/4/08-DC DX: Crohns Disease. Presented with 2 month history of abdominal cramping, bloody diarrhea and 28 pound weight loss. 3 month history of diarrhea, weight loss and intermittant abdominal pain. Records-DC DX for 7/28-7/30/08 gastroparesis. DC DX: 8/7-8/15/08-Chronic gastroparesis. Presented with malaise, anorexia and weight loss and NJ feeds. Severe abdominal pain one day prior to admission. DC DX:10/29-11/1/08-Gastroparesis, nausea and vomiting. C/O 2 days of abdominal pain and feeding intolerance. NJ feeding problems. MedDRA PT Abdominal pain, Activities of daily living impaired, Amnesia, Apnoea, Cough, Dyspnoea, Gaze palsy, Headache, Hypoaesthesia, Loss of consciousness, Malaise, Migraine, Posture abnormal, Syncope

Symptom Text: Information has been received from a consumer concerning his 14 year old granddaughter with a history of migraine who in September 2008, was vaccinated with a dose of GARDASIL. In October 2008 (on an unspecified time after vaccination), the patient experienced abdominal pain and headaches. Her symptoms had been getting more pronounced and more frequent. Since December 2008, the patient had spent more time out of school than in school. On approximately 18-FEB-2009 ("three weeks ago") the patient was doing homework and was feeling well. Then she began to look unwell and laid down on the couch. As her grandparents watched, the patient's body started to "draw up", her hands became claws, and she developed numbness in her legs and hands. Then she developed extreme shortness of breath and coughing. Her head rolled back, her eyes crossed, she passed out and stopped breathing. Paramedics were called and she was taken to a hospital. This was about the seventh time the patient had gone to the ER in the last two months. Oxygen was given in the ambulance. By the time she reached the hospital the patient was responding. After this episode the patient lost her memory for a week and only recognized a few people. The patient was later released from the ER. In the last 2.5 months the patient had spent two nights in the hospital. While at a children's hospital for testing, the patient fainted and was admitted for testing for one week. The patient had had migraines lasting as long as a month. Numerous MRIs and CAT scans were performed. On 10-MAR-2009 (" Last night") the patient went to the ER. All tests had come up with no diagnosis. Unknown medications had not worked. At the time of reporting, the adverse events persisted. Additional information has been requested.

MedDRA PT Asthenia, Lethargy

Symptom Text: Case considered as not medically confirmed transmitted by a sales representative from another company on 10-MAR-2009. Case poorly documented reported by a gynecologist (not identified). It was reported that a female patient on an unspecified date was vaccinated with a dose of GARDASIL. 15 days after she received the vaccine, the patient experienced "a neurological incident of the leg" and was hospitalized. The outcome was not reported. Additional information received by phone from the sales representative and also from the general practitioner on 13-MAR-2009. The case became medically confirmed. The patient was 14 years old. She received the third dose of GARDASIL in DEC-2008. 15 days later, the patient presented with lethargy and asthenia. The patient was hospitalized (unspecified dates). Magnetic Resonance Imaging showed fixation of central grey matter. There was no diagnosis reported. At the time of reporting, the patient's outcome was not specified. A new control MRI was scheduled 3 months later i.e. in APR-2009. Other business partner numbers include E2009-02064. Additional information has been requested.

MedDRA PT Haemoptysis, Haemorrhagic diathesis, Idiopathic thrombocytopenic purpura, Immediate post-injection reaction, Inappropriate schedule of drug administration, Rash erythematous

Symptom Text: Information has been received from a health care provider concerning a 43 year old female who on 12-JAN-2009 was vaccinated with GARDASIL. After two weeks of injection (approximately 26-JAN-2009) the patient developed red spots over the body which was immediate. She also had blood streak on coughing, bleeding tendency was positive, especially brushing of teeth. Her platelet count decreased to 7. She was treated by hematologist and recovered completely. The doctor diagnosed her as having idiopathic thrombocytopenia (ITP). A laser vaporization test was done on the patient (results not reported). After two weeks of that, there was red inflammated spots like mumps all over the body. She took treatment and has recovered. She is currently taking MEDIXON and IMURAN. Upon internal review idiopathic thrombocytopenia (ITP) was considered to be an other important medical event. Additional information is expected.

MedDRA PT Abasia, Abdominal pain upper, Arthralgia, Asthenia, Back pain, Balance disorder, Cystitis, Dyspnoea, Fatigue, Gait disturbance, Headache, Hyperhidrosis, Movement disorder, Musculoskeletal chest pain, Myalgia, Nausea, Photophobia, Pyelonephritis, Pyrexia, Sensory loss, Syncope, Tenderness, Tremor, Urinary tract infection, Vomiting, Wheelchair user

Symptom Text: Information has been received from a nurse practitioner concerning 16 year old female who was intramuscularly vaccinated with 1st, 2nd and 3rd 0.5 ml doses of GARDASIL (1st lot #658560/1062U, 2nd lot#659439/1267U, 2nd lot#659439/1267U, 3rd lot#660553/0070X) on 24-SEP-2007, 19-NOV-2007 and 20-MAY-2008, respectively. Concomitant therapy included YAZ, MACROBID and "septim (ceptim)". On 11-SEP-2008 the patient experienced urinary tract infection. On 12-SEP-2008 she experienced fever, vomiting and severe back pain. She went to the ER. On 14-SEP-2008 she had headaches, couldn't move her head and was shaky. She was weak and couldn't walk up stairs. A CAT scan was negative. On 25-SEP-2009 she went to a medical center for leg weakness, severe headache, costal vertebral tenderness and photophobia. An MRI done was negative. The patient was treated with morphine drip for her headaches. She was suggested by someone that it could be fibromyalgia. Other lab diagnostics studies included: STD check, vaginal culture, "kidney test", "urinary tract infection (UTI) test" and "e-coli test". All tests done were negative except for the one for her UTI. It was unknown if the patient was ever admitted to a hospital for adverse events. The patient was recovering at the time of reporting. Follow up information was received from a physician who reported that the 16 year old female student with penicillin allergy and post concussion syndrome was intramuscularly vaccinated with 3 doses of GARDASIL (1st dose into right deltoid, 2nd and 3rd doses into the left deltoid). There was no illness at time of vaccination. On 11-SEP-2008, the patient presented in the physician's office with urinary tract infection (UTI), low back pain, blood and leukocytes in urine. She was prescribed MACROBID 100 mg, po, Bid 7. On 12-SEP-2008 she went to emergency room (ER) due to worse syndromes and suggested to perform CT scan. Pyelonephritis was treated with axid ceftin. Nausea, vomiting and fever were treated with pyridine. She also complained of joint pain, could n

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Acute disseminated encephalomyelitis, Central nervous system lesion, Headache, Musculoskeletal stiffness, Vision blurred

Symptom Text: Information has been received from a physician concerning a 14 year old female who in 2008 was vaccinated with first and second dose of GARDASIL. Patient received third dose on 9-AUG-2008. No concomitant medications were given. On 23-AUG-2008 the patient experienced headache, stiff neck and blurring of vision and was hospitalized. MRI results done on approximately August 2008 show brain lesions were present. Subsequently, the patient recovered from headache, headache, stiff neck, blurring of vision and was discharged. In October 2008, the patient again experienced headache, stiff neck and blurring of vision and was hospitalized. MRI results done in October 2008 show lesion were increasing in size. Diagnosis made at that time was pseudotumor cerebri or benign endocranial hypertension. Subsequently, the patient recovered from headache, stiff neck and blurring of vision and was discharged. In November 2008, the patient experienced similar symptoms and was hospitalized. Subsequently, the patient recovered from headache, stiff neck and blurred vision and was discharged. In January 2009, the patient experienced headache, stiff neck and blurring of vision and was hospitalized. MRI results done in January 2009 show that lesions increased in size. Patient was treated with steroids which helped improve patient's condition. Subsequently, the patient recovered from headache, stiff neck and blurring of vision and was discharged. On 22-FEB-2009 the patient experienced the same symptoms and was hospitalized. Diagnosis made by the reporter is acute disseminated encephalomyelitis. The patient's acute disseminated encephalomyelitis persisted. The reporter felt that acute disseminated encephalomyelitis was possibly related to therapy with GARDASIL as there was no family history or other concomitant medications taken at the time of the event. The physician felt that the vaccine could possibly be one of the causes of acute disseminated encephalomyelitis. Additional information is not expected.

MedDRA PT Drug exposure during pregnancy, Foetal disorder, Premature baby

Symptom Text: Information has been received from a registered nurse, for the Pregnancy Registry for GARDASIL concerning a 15 year old female with attention deficit/hyperactivity disorder who denied she was pregnant on 06-MAY-2008 and was vaccinated IM with a first 0.5 mL dose of GARDASIL (lot # 659437/1266U). Concomitant therapy on the same day included a dose of MENACTRA (Sanofi Pasteur). Other medications included "STRAITERA", but has stopped taking this. On 27-MAY-2008 the patient saw her family doctor and a pregnancy test confirmed the pregnancy. On 09-JUN-2008, the patient was seen in the health department office stating she was pregnant and was enrolled in the WIC program. The patient's LMP was reported to be 23-APR-2008. Follow-up information was received from the registered nurse via a completed pregnancy questionnaire. It was reported that the female patient had no concurrent medical conditions (also reported as unknown) and smoked 3 cigarettes per day when first pregnant. The patient had no previous pregnancy. On 09-JUN-2008 the patient stated that she was taking STRATTERA before pregnancy and did not take during pregnancy. The medication used during this pregnancy was unknown. The patient had some bleeding in early pregnancy. On 08-OCT-2008 a baby girl was delivered prematurely at 26 weeks gestation in a hospital. The baby weighed 1 pound and 11 ounces. The length was 12 inches. The head circumference was 21.5 inches. The baby had congenital heart and breathing problems. It was reported that the complication during labor/delivery, the diagnostic test during pregnancy and the infections or illnesses during pregnancy was unknown. Upon internal review, born prematurely at 26 weeks and birth weight 1 pound and 11 ounces were considered to be other important medical events. Additional information is not expected.

MedDRA PT Abdominal pain, Injection site erythema, Nausea

Symptom Text: Information has been received from a health authority (reference number ES-AGEMED-520783341) concerning a 14 year old female who on 16-FEB-2009 was vaccinated with a dose of GARDASIL by intramuscular route (site of administration not reported) (Lot# not reported). It was reported that 10 minutes after vaccine administration the patient presented with an injection site erythema and began with abdominal pain and nausea. The patient had recovered from the injection site erythema, recovery date not reported. According to the reporter the patient had not recovered from the other events. It had been reported that the patient was hospital admitted. Hospital admission and hospital discharge dates had not been reported. Case reported as serious by the HA with other medically important condition and hospitalization as criteria. Other company numbers included: E2009-02110. Additional information has been requested.

MedDRA PT Drug exposure during pregnancy

Symptom Text: Initial information has been received through the Merck Pregnancy Registry for GARDASIL from a registered nurse concerning a 20 year old female with a penicillin allergy and attention deficit/hypersensitivity disorder who on 03-JUN-2008 was vaccinated with the first dose of GARDASIL (LOT# 660387/1967U). There was no concomitant therapy. Subsequently, she became pregnant. On 06-AUG-2008, an ultrasound was performed with the result "looks okay". The date of her last menstrual period was 01-MAY-2008 and the estimated delivery date is 14-FEB-2009. The patient's outcome was unknown. The patient called the physician's office. Follow-up information has been received from a registered nurse to report the pregnancy outcome. On 15-JAN-2009 the patient delivered a normal, healthy male baby weighing 6 pounds 13 ounces. The baby's length was 19.5 inches and head circumference was 13.5 inches with unsure apgar score. There were no congenital anomalies. The baby wouldn't suck. He was placed in neonatal intensive care unit (NICU) and received tube feeding for 8 days. During pregnancy, there was no complication, infection and illness for the patient. The patient took prenatal vitamins daily. There was also no complication during labor/delivery. Additional information is not expected.

Other Meds: vitamins (unspecified)

Lab Data: ultrasound, 08/06/08, looks okay

MedDRA PT Abasia, Activities of daily living impaired, Amenorrhoea, Arthralgia, Bacterial infection, Cellulitis, Chest pain, Dyspnoea, Fatigue, Feeling abnormal, Headache, Insomnia, Lethargy, Malaise, Migraine, Muscular weakness, Phonophobia, Photophobia, Rash generalised, Vaccine positive rechallenge

Symptom Text: Information has been received from a pharmacist via CSL as part of a business agreement (manufacturer control # GARD 2008 10 30 003) concerning a 15 year old female who in March 2008, was vaccinated with the first dose of GARDASIL. In March 2008, after vaccination the patient experienced headaches and felt "off colour". Subsequently, the patient recovered from headache and feeling "off colour". In the last week of September 2008 ("last week of school term in September"), the patient was vaccinated with the second dose of GARDASIL. The patient felt fine for 2 weeks of school holidays and then in October 2008, the patient developed headaches following a bacterial infection in the foot with some cellulitis before experiencing extreme malaise. At the time of reporting, the patient had joint pain and muscle weakness in neck, back and legs and extreme malaise. The patient cannot walk or hold a phone to her ear and her headaches have subsided. It was also reported that anti-inflammatory treatment provided her with temporary relief. Information was received on 30-OCT-2008 contained the following adverse experiences: a bacterial infection in the foot with some cellulitis (October 2008). Follow up information was received from the reporting pharmacist, via CSL, as part of a business agreement (manufacturer control No. 2009 03 10LS1). In approximately April/May 2008 (previously reported as March 2008) the patient was vaccinated with her first dose of GARDASIL. In approximately May/June 2008, one month after vaccination with GARDASIL, the patient developed a body rash, a migraine-like headache which was not responsive to codeine, menstruation stopped for 3-4 months, pain in her joints, pain in her large leg muscles and limb weakness. These symptoms occurred on-and-off (each lasting for 7-14 days) with a total of three episodes with 3-4 weeks in between. In approximately August/September 2008 (previously reported as September 2008), the patient was vaccinated with her second dose of GARDASIL. Within 24 hours of vaccination wi

MedDRA PT Fatigue, Local swelling, Lymphadenopathy, Neck pain, Parotid gland enlargement, Thyroiditis subacute

Symptom Text: Information has been received from a healthcare professional concerning an 18 year old female who in approximately November 2008 or December 2008, was vaccinated with a second dose of GARDASIL. On 09-JAN-2009, she developed submaxillary adenopathies. On 14-JAN-2009 she underwent ultrasound of the neck and was diagnosed with an episode of subacute thyroiditis. She experienced the following symptoms two months post vaccination: pain in the neck, submaxillary cervical lymph nodes, fatigue, "voluminous" neck, mild nodule and hypertrophy of parotids. The symptoms lasted during one month or so. Laboratory tests revealed biological signs of inflammation: increased C-reaction Protein and Erythrocyte Sedimentation Rate, increased antithyroid antibodies (over 2000) and negative toxoplasmosis. According to the reporting physician, signs and symptoms could be due to viral infection, but not confirmed. But the reporter also evoked HASHIMOTO's thyroiditis. The patient was seen by an endocrinologist and an infectious diseases specialist who advised her to postpone the third injection. It was noteworthy that the patient had well tolerated previous vaccinations and had no relevant medical history. The subacute thyroiditis was considered to be an other important medical event by the reporter. Other business partner numbers included: E2009-02073. Additional information has been requested.

Other Meds: Unknown

Lab Data: ultrasound, 14Jan09, subacute thyroiditis; serum C-reactive protein, ??09, increased; serum antithyroid antimicrosomal Ab, ??09, increased (over 2000); erythrocyte sedimentation rate, ??09, increased; Toxoplasma antibody screen, ??09, negat

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Arthralgia, Flushing, Headache, Rosacea

Symptom Text: Information has been received from a nurse concerning a 13 year old female patient who on 10-DEC-2008 was vaccinated with her third dose of GARDASIL. The patient since 10-DEC-2008 had rosacea on the face that was worse in the evening. On 10-DEC-2008 later evening the patient had a bad headache, flushed face and achy joints. The patient had visited physician's office for medical attention. Follow-up information has been received from the nurse that the patient was vaccinated with her first dose of GARDASIL (lot # 659962/1740U) on 30-MAY-2008. The patient was vaccinated with her second dose of GARDASIL (lot # 659964/1978U) on 05-AUG-2008. The patient was vaccinated with her third dose of GARDASIL (lot # 660616/0570X) on 10-DEC-2008. The nurse stated that no labs were performed. A physician may ask if there was any correlation of rosacesa and GARDASIL. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Papilloma viral infection

Symptom Text: Information has been received from a consumer concerning her daughter who was vaccinated with a dose of GARDASIL (dose, route and lot number not reported). The consumer reported that her daughter had experienced HPV infections after she had received a dose of GARDSIL. It was not specified if the patient sought medical attention. This is one of two reports from the same source. Additional information has been requested.
