MedDRA PT Dizziness, Injection site pain, Nausea

Symptom Text: Information has been received from a physician concerning a 20 year old female patient with no pertinent medical history and no known drug allergies/drug reactions who on 08-JAN-2009 was vaccinated intramuscularly with the first dose of GARDASIL (Lot # 661046/0546X). There was no concomitant medication. It was reported that on 08-JAN-2009 after receiving the first dose of GARDASIL, the patient experienced dizziness, nausea and pain at the injection site. On 08-JAN-2009, the patient's vital signs after receiving GARDASIL were pulse 88, blood pressure 114/62, and neurological checks were within normal limits. It was reported that on an unknown date, after injection was given, the patient had gone to the emergency room due to her reactions. It was reported that she was given a lotion to apply to the injection site on her right arm. As of 25-FEB-2009 it was unknown if the patient continued to get the GARDASIL vaccine and she has recovered from the dizziness, nausea and pain at the injection site. Additional information has been requested.

MedDRA PT Drug exposure during pregnancy, Induced abortion failed

Symptom Text: Information has been received from a physician, for the Pregnancy Registry for GARDASIL, concerning a 19 year old multiracial female with no history of pregnancies and no significant past medical history or concurrent medical conditions who on 18-SEP-2008 was vaccinated with the first dose of GARDASIL (lot #: 0947X). It was reported that the patient was pregnant at the time of vaccination. The patient's date of last menstrual period was 05-SEP-2008, estimated delivery date was 11-JUN-2009. 0n 31-OCT-2008, the patient took one dose of MIFEPROSTONE and MISOPROSTOL for attempted abortion. On 10-FEB-2009, ultrasound was performed to assess anatomy and confirm dates, which revealed that the patient was doing well and was at 22 weeks gestation. The estimated date of confinement (EDC) was 12-JUN-2009. Additional information has been requested.

MedDRA PT Anxiety, Depression, Diarrhoea, Dysuria, Fungal infection, Headache, Micturition urgency, Panic attack, Pollakiuria, Urinary tract infection, Vaccine positive rechallenge, Vertigo, Vision blurred, Vomiting

Symptom Text: UTI like symptoms, frequent urination, burning on urination beginning 11 days after initial dose, continuing sporadically to present time, 9 months later. Treated twice with Macrobid, once with Augmentin. Also treated in March 09 for yeast infection. Persistant headache, vertigo, blurry vision incapacitating, beginning two months after second dose and continuing for another two months. During these months also experienced anxiety/panic attacks/depression, diarrhea, vomiting. Blood and urine tests all normal. MRI and CT scan revealed nothing. Pap test revealed abnormal cells at the moderate level. All symptoms were beginning to improve when the last dose was given because no one had yet connected the dots....Then exactly two months after the last dose all symptoms returned in full. Headache, blurry vision, vertigo, frequent and burning urination. Patient is now 3 months from the last dose of gardasil and is now starting to feel less bad!

Other Meds: generic ortho-tri-cyclen

Lab Data: Blood, urine, MRI, CT scan all normal. Pap test taken six months after initial dose revealed abnormal cells in moderate range.

MedDRA PT Back pain, Paraesthesia

Symptom Text: Information has been received from a consumer concerning her 16 year old daughter with allergy to AMOXICILLIN who in August 2008, was vaccinated with the first dose of GARDASIL (Lot # not provided), in OCT-2008, was vaccinated with the second dose of GARDASIL (Lot# not provided). Concomitant therapy included MENACTRA which she received with the first dose of GARDASIL. Then in the first week of November 2008, the patient started to have severe lower back pain. Then the back pain progressed over the week with some tingling in her legs. The patient then saw a physician who recommended physical therapy and to see a chiropractor. The patient had a MRI which showed everything was fine. The patient had been doing better with the physical therapy, but then two weeks ago the back pain started to bother her again. The reporter was not sure if the back pain and tingling in the legs was related to GARDASIL, but she decided not to give the third GARDASIL at this point in time. The patient was not recovered from back pain and tingling in her legs. She went to the doctor, chiropractor, physical therapy, MRI. This was one of several reports from the same source. Additional information has been requested.

MedDRA PT Caesarean section, Drug exposure during pregnancy, Foetal disorder, High risk pregnancy, Pre-eclampsia, Sinusitis, Uterine infection

Symptom Text: Initial information has been received through the Merck Pregnancy Registry from a medical assistant concerning a 19 year old female with asthma who on 22-OCT-2007 was vaccinated intramuscularly with the 0.5 ml first dose of GARDASIL and on 26-FEB-2008 was vaccinated intramuscularly with the 0.5 ml second dose of GARDASIL. On 19-JUN-2008 the patient was vaccinated intramuscularly with the 0.5 ml third dose of GARDASIL and she was pregnant at that time. The date of her last menstrual period was 28-APR-2008 and her estimated delivery date is 02-FEB-2009. No adverse events reported. The patient's outcome was unknown. The patient called the physician's office. Follow-up information has been received from a physician concerning a 19 year old female with moderate persistent asthma (better past couple of years) and allergies and a history of hospitalization due to her asthma prior to 1996. There was no history of pregnancy. It was reported that the patient received a prior dose of GARDASIL on 28-FEB-2007. Concomitant therapy included fluticasone nasal spray (during allergy season), montelukast sodium (MSD) and QVAR (since before pregnancy). On approximately 26-AUG-2008, during pregnancy, the patient experienced sinus infection. AUGMENTIN and amoxicillin were prescribed. The patient also used other medications for asthma including prednisone and ADVAIR. Ultrasounds were done in 4 times due to the patient was in high risk. All the results were normal. On 22-FEB-2009 the patient delivered a normal, healthy female baby weighing 7 pounds 2 ounces. The baby's length was 19.25 inches and head circumference was 13 inches with Apgar score 8/9. There were no congenital anomalies and other complications/abnormalities. On approximately 22-FEB-2009, during labor, the patient experienced pre-eclampsia and uterine infection. The patient underwent c-section and had meconium birth. The patient's outcomes were unknown. Upon internal review, c-section was determined to be an other important medical event. Additional information has been re

MedDRA PT Mobility decreased, Pain

Symptom Text: Information has been received from a consumer concerning her daughter (a 16 year old female) who in March 2008, was vaccinated with her first dose of GARDASIL. About 24 hours after receiving the vaccine (March 2008), the patient felt like there was stakes going through her arms and legs for about 2 weeks after receiving the vaccine. Caller stated it was intense pain and she had difficulty moving. At the time of the report (23-FEB-2009) patient had not received the second or third dose. It was reported that therapy with GARDASIL was discontinued in March 2008. The patient was recovered about 2 weeks after receiving the vaccine. The patient sought unspecified medical attention. No further information is available.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Abortion induced, Drug exposure during pregnancy, Nausea

Symptom Text: Initial and follow-up information has been received from a certified medical assistant for the pregnancy registry for GARDASIL concerning a 22 year old female who on 21-SEP-2007 was vaccinated intramuscularly with the first dose of GARDASIL (658490/0802U). Subsequently, the patient discovered that she was pregnant (LMP=10-AUG-2007). The patient returned to the physician's office on 05-DEC-2007 because her cycle was late and the office performed a pregnancy test that was positive. During the 05-DEC-2007 office visit, the patient was asked to have an ultrasound obtained. The patient was seen in the office again on 26-DEC-2007 and had not yet had the ultrasound completed. The scheduled date for the ultrasound was unknown. Per the reporter, the pregnancy has been unremarkable thus far. No additional information was available. Patient outcome was not reported. Follow up information received on 13-MAR-2009 from an initial and an outcome pregnancy questionnaire stated that the patient had no concurrent medical conditions reported. Medication used during the pregnancy includes ZOFRAN in January 2008 through February for the treatment of nausea. The patient was also taken prenatal vitamins. There were not birth defects and infant complications in previous pregnancies, the patient had a previous full term delivery and no fetal deaths, spontaneous abortions and pre term deliveries. The patient had an elective pregnancy termination in May 2007 at 7 weeks from LMP. The products of the conception were examined. The patient did not experience infections or illness during pregnancy. The patient had an ultrasound and a serum alpha-fetoprotein test (MSAFP), both were normal. Upon internal review, elective termination was determined to be an other important medical event. No further information is available.

MedDRA PT Immediate post-injection reaction, Syncope

Symptom Text: Information has been received from a physician concerning a 16 year old female with no pertinent medical history and no known drug allergies who on 20-FEB-2009 was vaccinated intramuscularly with a second 0.5 ml dose of GARDASIL (Lot # 654741/1208F). On the same day she also received a dose of secondary suspect vaccine, hepatitis B vaccine (manufacturer unknown) and a dose of concomitant therapy, "meningitis vaccine" (manufacturer unknown). "Three minutes after administration of the second dose of GARDASIL", the patient fainted. She "quickly" recovered. No lab diagnostics studies were performed. It was reported that the lot number and date of administration of the first dose of GARDASIL were unknown. Unspecified medical attention was sought. Additional information has been requested.

MedDRA PT Dyspnoea, Local swelling, Oropharyngeal discomfort, Swelling face

Symptom Text: Information has been received from a nurse concerning a 17-year-old female with no known relevant medical history nor drug allergy, who on 10-FEB-2009 was vaccinated IM with the first dose of 0.5 ml GARDASIL (lot # 661952/1129X) in her deltoid. There was no concomitant therapy. On 12-FEB-2009 the patient's mom called to office to seek medical attention concerning the patient's reaction that took place on 11-FEB-2009. The patient's face was described as "puffy from the neck up to her cheeks". The patient felt it was a little difficult to breathe and her throat "felt funny". She took BENADRYL 2 doses on 11-FEB-2009 and on 12-FEB-2009 she took CLARITIN. No laboratory test was performed. On an unspecified date, the patient recovered from the event. Her primary physician and school nurse felt the reaction was due to GARDASIL and recommended discontinuing the series. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Hypoaesthesia, Injected limb mobility decreased, Injection site pain, Injection site swelling, Injection site warmth

Symptom Text: Information has been received from a Registered Nurse concerning a 14 year old female with a history of back pain and pin in hip, and no drug reactions/allergies, who on 04-FEB-2009 was vaccinated with the first dose of GARDASIL (lot# 661766/0652X), 0.5 ml intramuscular into her left arm. There was no concomitant medication. On 04-FEB-2009 the patient experienced some pain as the injection went into her arm. This pain went away but then two weeks later the patient began to experience swelling of the injection site area. It was the size of a palm and was hot to the touch. There was no redness. The patient then wasn't able to lift up her arm because of the pain. She also developed numbness of her whole arm down to her hand. On 19-FEB-2009, it was numb nut only from the elbow down to her hand. It was not as tender but it still hurt. There was less swelling. On unspecified date, the patient sought unspecified medical attention, no lab diagnostics studies performed. The patient was not recovered. This is one of several reports from the same source. Additional information has been requested.

MedDRA PT Abdominal discomfort, Arthralgia, Henoch-Schonlein purpura, Leukocytoclastic vasculitis, Purpura

Symptom Text: This case was reported by a regulatory authority (ES-AGEMED-718657244) and described the occurrence of henoch-schonlein purpura in a 14-year-old female subject who was vaccinated with DITANRIX adult (GlaxoSmithKline), GARDASIL (non-GSK). Previous vaccination included GARDASIL (non-GSK) (Sanofi Pasteur MSD; intramuscular; unknown injection site) given on 22 September 2008. On 17 November 2008, the subject received unspecified dose of DITANRIX adult (intramuscular, unknown injection site), 2nd dose of GARDASIL (intramuscular, unknown injection site). On 7 January 2009, 51 days after vaccination with DITANRIX adult and GARDASIL, the subject experienced purpuric rash in legs, forearms and buttock. She also had joint pain and abdominal discomfort. In a skin biopsy performed on 20 January 2009, it was observed a leukocytoclastic vasculitis (henoch-schonlein purpura). The subject improved with prednisone treatment. Disease of fluctuating course. On 27 February 2009 the subject was not still recovered. She required hospitalization. At the time of reporting the events were improved. No further information is expected; this case has been considered closed.

MedDRA PT Smear cervix abnormal

Symptom Text: Information has been received from a female 21 years old who on 14-DEC-2007 was vaccinated with the first doses of GARDASIL 0.5 ml. On 12-FEB-2008 the patient was vaccinated with the second dose of GARDASIL and on 26-JUN-2008 was vaccinated with the third dose of GARDASIL. Concomitant therapy included hormonal contraceptives (unspecified). Subsequently in 2008 the patient had an abnormal pap smear result after completing the three doses of GARDASIL 0.5 ml. Disability and life threatening is unknown. The patient's abnormal pap smear persisted. The patient sought unspecified medical attention. Additional information is not available.

MedDRA PT Rash, Vaccine positive rechallenge

Symptom Text: Information has been received from a patient's mother concerning a 19 year old female who was vaccinated with second of GARDASIL. The patient's mother reported that after the administration of the second dose (unknown date), her daughter experienced rash around the umbilical and tops of both thighs. The patient was taken to a dermatologist and was prescribed an unspecified topical cream. The mother stated that the cream did not improve the systems but that rash resolved "eventually" on an unknown date. On an unspecified date, the patient was vaccinated with the third dose of GARDASIL. The reporter said that the patient developed a similar rash, with the same distribution, after the third dose. The mother stated that the second occurrence of the rash developed "just recently" and at the time of the report had not been resolved. Additional information has been requested.

MedDRA PT Abdominal pain upper, Abdominal tenderness, Activities of daily living impaired, Chest pain, Chills, Dizziness, Eczema, Fatigue, Headache, Malaise, Nausea, Pyrexia, Tremor, Vomiting, Weight decreased

Symptom Text: Information has been received from a consumer concerning her 15 year old daughter with no past medical history and no drug reactions or allergies who in August 2008, was vaccinated with the first dose of GARDASIL. In October 2008, the patient received the second dose of GARDASIL. There was no concomitant medication. The consumer reported that the patient developed a low grade fever and felt "sick" the day after receiving her second dose of GARDASIL. During October and November of 2008, the patient experienced intermittent "stomaches", nausea and vomiting. Starting December of 2008 until the time of this report, she had experienced persistent extreme stomach pains and vomiting. The patient had been examined by three gastroenteriologists who were not able to determine the cause of her symptoms. She had missed 60 days of school. Lab diagnostics studies included a stomach empty test, CAT scan and blood tests with no results available. At time of this report, the patient had not recovered. The patient sought medical attention by an office visit. Upon internal review, low grade fever, felt "sick", intermittent "stomaches", nausea, vomiting and persistent extreme stomach pains were considered to be disabling. Additional information has been requested. 3//25/09 MR received from parent which include several GI consults and diagnostic testing. Per MR pt began having intermittent vomiting in Sept 2008. Usually at night waking pt, accompanied by abdominal pain, H/A and associated with shaking/shivering/chills. Occ nausea. 6-7 lb wt loss. ROS (+) for fatigue and chest pain. PE WNL except for eczematous rash on hip, iliac crest and axilla. Some improvement with Reglan but now c/o dizziness. W/U essentially (-). No final DX. 2nd GI consult seen 1/9/09. PE (+) for tenderness to palpation of the epigastrium, RUQ and RLQ. Has missed 28 school days since Sept 08. Labs and diagnostics: Upper GI WNL. CBC WNL. Chem WNL. H. pylori (-). BX of esphagus and stomach WNL. Some inflammation of lamina propria of duodenum. Uppe

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Asthenia, Dizziness, Endoscopy upper gastrointestinal tract, Helicobacter infection, Iron deficiency anaemia, No reaction on previous exposure to drug, Rash, Stool analysis

Symptom Text: Initial information received by Foreign Health Authority (reference number ES-AGEMED-6186213144) regarding a 16 year old female who was administered on 07-NOV-2008 the second dose of GARDASIL (batch number not reported) site and route not reported. It is reported that 10 to 12 days after vaccination DEC-2008, exact date not reported, the patient presented asthenia, the patient presented dizziness episodes that increased progressively. On JAN-2009 the patient visited the emergency room. Objectively HB of 5.2 g/dl, is considered an evolved aenemia, the patient is diagnosed with an iron deficiency aenemia. It was decided not to transfuse, so the patient was prescribed 5 intravenous iron vials, the first was administered in the emergency room the rest to be administered by her primary care doctor. A treatment with oral iron is prescribed. One month later, Hb 11.1g/dl. The patient has a profile of nutritional deficiency, celiac disease is discarded. Helicobacter positive, eradication treatment prescribed (no other information reported). No other possible causes for aenemia have been determined. Mother denies any possible problems regarding the patient's diet. First dose of GARDASIL was administered on the 08-SEP-2008. No adverse events were reported. Case reported as serious by the HA with other medically important condition as criteria. On the 13-MAR-2009 a similar case was received from a health care professional regarding her daughter. Age at time of event, haemoglobin values and first analysis date, vaccination dates, medical history triglyceride levels decreased, helicobacter positivity match up for both cases. The patient's mother has reported that her daughter presented with exanthema in both arms from shoulder to hand that started on 15-16-JAN-2009 and finished one month later without treatment. The patient's mother has also reported that iron was administered on 20-JAN-09 and 23-JAN-09 (two dosage forms). It has also been reported that a gastroscopy and stool collection were performed. Some haemoglobin levels

MedDRA PT Musculoskeletal pain, Oedema peripheral, Pain in extremity, Rheumatoid arthritis

Symptom Text: Information has been received from a consumer concerning her 28 year old daughter with no pertinent medical history, allergies or drug reactions, who was vaccinated with the first dose of GARDASIL, on 29-MAY-2007 and was vaccinated with the third dose in November 2008. There was no concomitant medication reported. The reporter stated that in November 2008 (also reported as about a month after receiving the last dose) her daughter started experiencing pain and swelling of feet and arms, especially on her left side. It was also reported that she woke up because of the pain in her extremities and shoulders. She was diagnosed with rheumatoid arthritis in December 2008. Laboratory test performed included "blood work" and "x-rays" (no results were provided). The patient's rheumatoid arthritis persisted. The patient sought unspecified medical attention. Follow up information has been received from a registered nurse concerning a 28 year old female with a history of mild dysplasia cervix who on 29-MAY-2007 was vaccinated intramuscularly (IM) in right deltoid (RD) with first 0.5mL dose of GARDASIL (lot number 657736/0389U), on 07-AUG-2007 was vaccinated IM in left deltoid with second 0.5mL dose of GARDASIL (lot number 657868/0523U) and on 23-NOV-2007 (previously reported as November 2008) was vaccinated IM in RD with third 0.5mL dose of GARDASIL (lot number 659437/1266U). There was no concomitant medication. The nurse reported that the she did not have information about the patient rheumatoid arthritis and therefore cannot comment on her condition. The nurse was unable to provide any information on the primary physician of the patient as she only had his/her last name. Additional information has been requested.

MedDRA PT Abdominal pain upper, Headache, Pain in extremity

Symptom Text: Information has been received from a physician concerning a 13 year old female who in July 2008, was vaccinated with the first dose of GARDASIL. Concomitant therapy included FLONASE and PROVENTIL. After getting the first dose (onset date reported as January 2009), the patient experienced pain in hands, stomach ache and headache. Magnetic resonance imaging (MRI) was performed but the result was unknown. At the time of reporting, the patient's pain in hands and stomach ache and headache persisted. The patient will not be taking the second and the third dose of GARDASIL. Additional information has been requested.

MedDRA PT Alopecia, Alopecia areata

Symptom Text: Information has been received from a physician concerning a 21 year old female with attention deficit/hyperactivity disorder and a history of depression who in January 2007, was vaccinated with a first dose of GARDASIL. The physician stated the patient received three doses of GARDASIL but the dates of administration of the second and third dose were unknown. Concomitant therapy included CELEXA and ADDERALL tablets. In February 2007, the patient developed hair loss. On unknown date, the patient visited the office. In January 2009, the patient was examined and was diagnosed with alopecia areata. The patient was prescribed topical steroids and unspecified pulse systemic steroid therapy. The patient has noticed slight improvement in the symptoms. The physician added that thyroid levels, antinuclear antibody, sed rate, complete blood count, and comprehensive metabolic panel results were normal. Additional information has been requested.

Other Meds: ADDERALL tablets; CELEXA

Lab Data: Serum TSH, normal; Serum ANA, normal; Erythrocyte, normal; Complete blood cell, normal; Laboratory test, comprehensive metabolic panel results are normal.

History: Depression

MedDRA PT Drug exposure during pregnancy, Fungal infection, Headache, Muscle spasms, Pain

Symptom Text: Information has been received from a consumer, for GARDASIL, a Pregnancy Registry product, concerning her daughter in law, an 18 year old female with no drug allergy who on 02-SEP-2008 was vaccinated with the first dose of GARDASIL while few weeks pregnant. Concomitant therapy included poliovirus vaccine (manufacturer unknown) and RECOMBIVAX HB. The patient was now 24 weeks pregnant and was experiencing some cramping, headaches, occasional spasm in the rib cage area, yeast infections and general body aches. She already had a yeast infection when getting GARDASIL and was prescribed and unspecified medication for it; however the infections were coming back. The patient performed pregnancy test and ultrasounds. The first ultrasound came back normal. The patient had a second ultrasound done. At time of the report the patient was not recovered. The patient sought medical attention. Additional information has been requested.

Other Meds:

Lab Data: Ultrasound, first came back normal.

History:

Prex Illness: Pregnancy NOS (LMP = 8/25/2008); Yeast infection.

MedDRA PT Hypoaesthesia, Injection site anaesthesia, Musculoskeletal pain, Neck pain, Pain in extremity

Symptom Text: Information has been received from a Nurse Practitioner (N.P.) concerning a 31 year old female who on 06-FEB-2009 was vaccinated intramuscularly in the left arm with her first 0.5 ml dose of GARDASIL (661046/0546X). Concomitant therapy included YASMIN, TOPAMAX, WELLBUTRIN, ALLI, aspirin and vitamins. On 06-FEB-2009 the patient developed pain in her injection arm after her initial dose of vaccine. The pain has persisted at the same intensity since then. The arm was not warm, not swollen, and not red. The pain was from the neck to below the elbow and at the time of reporting was from the shoulder to the elbow. The pain has been described as "feeling like she has been working too long at the computer." The patient also experienced numbness in the left arm the night of 09-FEB-2009 which resolved the morning of 10-FEB-2009. She has treated the pain with TYLENOL, aspirin, heat, and BEN GAY with no relief. Patient is considering not completing the series because of this reaction. Additional information has been requested.

MedDRA PT Abortion induced, Drug exposure during pregnancy, Ectopic pregnancy

Symptom Text: Information has been received from a registered nurse concerning a 14 year old female patient with a history of pre-eclampsia and BELL's palsy during a prior pregnancy who on 04-FEB-2009 was vaccinated with the first IM dose of GARDASIL (655618/0186U) while she was pregnant. A pregnancy test and prenatal blood screen were performed. Her last menstrual period was 10-JAN-2009 and the estimated delivery date is 17-OCT-2009. The patient was started on prenatal vitamins (unspecified) and iron (unspecified). No adverse effect was reported. Follow-up information has been received from a registered nurse concerning the patient. It was reported that the patient was diagnosed with tubal pregnancy. The patient was admitted to the hospital the week of 16-FEB-2009 and a therapeutic abortion was performed. The date of the surgery was unavailable. On 04-MAR-2009 the patient was seen in the office and had fully recovered. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Abdominal pain upper, Amnesia, Condition aggravated, Dizziness, Gaze palsy, Loss of consciousness, Musculoskeletal stiffness, Petit mal epilepsy

Symptom Text: Information has been received from a physician concerning 10 year old female, her daughter, with a history of cyanosis and motion-related loss of consciousness who on 04-MAR-2009 was vaccinated with first dose of GARDASIL. No concomitant medications were reported. On 04-MAR-2009 the patient experienced dizziness followed by stiffening, upward eye rolling and loss of consciousness which lasted for approximately three to four seconds. On 04-MAR-2009, the patient recovered from dizziness, stiffening, upward eye rolling and loss of consciousness. The patient said she did not remember any of the events that occurred. Post ictal events include epigastric pain and feeling very light. The reporter felt that the patient experienced absence seizure because of the symptoms mentioned. The reporter also mentioned that the patient had no apprehension or fear about receiving the vaccine, as the patient was the one insisting on getting the vaccination. The reporter felt that absence seizure was related to therapy with GARDASIL. Upon internal medical review, absence seizure was considered an other important medical event. Additional information is not expected.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Dizziness, Headache, Nausea, Paraesthesia, Vertigo

Symptom Text: Information has been received from a gynaecologist concerning a 25 year old female who was vaccinated with a third dose of GARDASIL (lot# 0467U, batch# NG14290) into the deltoid muscle on an unspecified date. Four to six weeks post vaccination, the patient developed dizziness. The patient was hospitalized for clarification and diagnosis on an unspecified date. The patient had not recovered at the time of this reporting. The first dose of GARDASIL (lot# 0510U, batch# NG20180) was administered on 01-FEB-2008 and the second dose of GARDASIL (lot# not reported) was administered on an unspecified date. Toleration of the 1st and 2nd doses was not reported. Follow-up information was received on 12-MAR-2009. The reporting form and the hospital report were provided. On the reporting form only 2 doses of GARDASIL were mentioned. The second dose of GARDASIL, (lot# 0467U, batch# NG14290) was administered IM into the upper arm on 13-MAY-2008. On 03-SEP-2008 the patient was admitted to hospital because of prolonged vestibular vertigo with nausea and right-sided headache of unknown origin since about 6 weeks. A few days prior to hospitalization vertigo and nausea worsened. At admission neurological and orthopaedical investigation had been performed and showed normal results. On 03-SEP-2008 a CCT showed no pathologies. On 08-SEP-2008 the ears, nose, and throat investigation as a thermic examination of the external ear canal showed a transient slight reduced excitability of the right horizontal semicircular canal with complete central nerve system compensation. On 16-SEP-2008 a cardiological consultation was normal. Under treatment with rheological infusions including cortisone and pentoxifyllin (Pentoxifylline), the symptoms improved. For a short time the patient complained of paraesthesia of cheeks and lower extremities but a neurological examination showed no pathological findings. The patient denied further investigations to clarify the symptoms. The diagnosis of phobic vertigo and transient slight reduced excitability of the

MedDRA PT Brain oedema, Convulsion

Symptom Text: Information has been received from a physician concerning a 21 year old female ("who is a family friend of the physicians") who was vaccinated with her second dose of GARDASIL at another physician's office. Two weeks later the patient experienced seizure and brain swelling and was hospitalized for two or three weeks. Therapy with GARDASIL was discontinued. On unspecified date, the patient recovered. The physician also reported the patient has now returned to college. Attempts to verify the existence of a patient have been unsuccessful. No further information is available.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Arthralgia, Eye movement disorder, Facial palsy, Hypoaesthesia oral, Injection site pain, Neck pain, Vision blurred

Symptom Text: Information has been received from a health professional (nurse) concerning a 16 year old female who on "29-JAN-2009" was vaccinated with the first dose of GARDASIL by intramuscular route. It hasn't been reported whether the patient had any adverse event after this first dose or not. On 29-JAN-2009 the patient was vaccinated with the second dose of GARDASIL (batch number not provided) by intramuscular route in the deltoid. On 29-JAN-2009, after being vaccinated, the patient presented with pain in the arm where she was vaccinated. She recovered from this adverse event some days later. It is reported that on 25-FEB-2009 the patient presented facial palsy on half of the face, the patient could not close the left eye and had paralyzed lips, the patient attended the emergency room because she could not close the left eye. Symptoms started on 24-FEB-2009 when she felt tongue numbness, retro-joint pain and cervical pain. On 25-FEB-2009 she began feeling numbness in the lips and had blurry vision while blinking or looking downwards, the patient did not present dizziness. The patient was given eye drops, corticosteroids and DACORTIN (30 mg, 2 dosage forms/day) to treat adverse event. Neurological exploration was normal. The patient had difficulty looking upward and closing the right eye (the reporter has obtained the information from the patient's medical history, but she thinks that this is an error, it is the left eye). Tendon reflex was symmetrical. On 02-MAR-2009 the patient was referred to the ear-nose-throat doctor, who changed DACORTIN to 10 mg during 5 days. This doctor also prescribed NEUROBION 5000 by intramuscular route. Facial palsy, cervical pain, joint pain and pain in arm were considered to be other important medical events. Other business partner numbers include E2009-02183. Additional information has been requested.

MedDRA PT Arthralgia, Back pain, Monoparesis, Neuromyelitis optica, Paresis, Pyrexia, Syncope, Visual impairment

Symptom Text: Information has been received via a health authority concerning an 18 year old female patient who was vaccinated with a second dose of GARDASIL (Lot-no., injection site and route not reported) in May-2008. In Jul-2008 the patient experienced fever up to 38.5 degrees C for 10 days. In Oct-2008 she developed back pain and leg paresis for 2 to 3 weeks. In November 2008 she experienced pain in the hip and back, duration not reported. In Oct/Nov 2008 elevated values for antibodies (not otherwise specified). In Jan-2009 the patient experienced syncope, paresis of arm and leg, and almost blindness of an eye. Neuromyelitis optica was diagnosed on an unspecified date. The patient was hospitalized, dates not reported, and had not recovered at the time of reporting. The first dose of GARDASIL was administered in March 2008 and was well tolerated. Additional information has been requested. Other business partner numbers include E2009-02187 and PEI2009004696.

MedDRA PT Abdominal discomfort, Abdominal pain, Activities of daily living impaired, Asthenia, Back pain, Chest pain, Convulsion, Dehydration, Gastrointestinal tube insertion, Haematochezia, Headache, Heart rate increased, Hypophagia, Hypotension, Pain in extremity, Pancreatic sphincterotomy, Paraesthesia, Peripheral coldness, Respiratory arrest, Similar reaction on previous exposure to drug, Staring, Syncope, Urinary tract infection, Vomiting

Symptom Text: Patient received her first shot 5/24/07 - she had soreness in her arm and headaches but tollerated them. On 10/1/2007 patient was at basketball practice and collasped on the gym floor with severe abdominal pain and chest pain. The abdominal pains remained. In March 2008 she began vomiting bile and the abdominal pains worsened. They continued to get worse and in June 08 she had her second shot. Again, her pain increased. She got her 3rd shot in September 2008. We were at the hospital 4 days after her 3rd shot with adominal pain, high pulse, low blood pressure, and chest pain. By December patient was beginning to have seizure like episodes of staring and not breathing for 30-45 seconds at a time. She was beginning to have lower back pain as well as the abdominal pain and chest pain. She began to complain of burning in her stomach - like it was on fire. She had a tingling sensation in her legs and her feet - complaining of them being on fire, but her feet were freezing cold when I would touch them. Patient had a few urinary track infections and several bouts with dehydration. She also had blood in her stool. She became very weak and has only been to school 4 full days since November 2008. Patient was on numerous types of medicine but nothing seemed to help because of these episodes. Everyime she would eat it would make it worse and would be especially more intense during her monthly cycle. She was on a feeding tube for over 3 weeks as well as hospitalized 3 different times. We have been to the ER over 13 times. Records received - 05/01/2009 - multiple ED visits and hospital admissions 10/04/2008 to 02/10/2009. Prior psych hx of ADHD, LD, anxiety reaction. GI hx chronic functional dyspepsia.ED evaluations for nausea, vomiting, abdominal pain. Diagnoses have included GERD, functional abdominal pain, biliary diskinesia, pancreatitis, pancreatic divisum.GI, med imaging, and psych consultations.Sugical procedures have included cholecystectomy, ERCP, MRCP, feeding tube. Diagnosis: Chronic generalized abdominal pain of

MedDRA PT Clonic convulsion, Dizziness, Syncope

Symptom Text: This case was reported by a regulatory authority (# ES-AGEMED-918714344) and described the occurrence of syncope in a 14-year-old female subject who was vaccinated with DITANRIX ADULT (GlaxoSmithKline), GARDASIL (non-gsk). On 3 February 2009, the subject received unspecified dose of DITANRIX ADULT (unknown route and injection site), unspecified dose of GARDASIL (intramuscular, unknown injection site). On 3 February 2009, 5 minutes after vaccination with DITANRIX ADULT and GARDASIL, the subject experienced syncope with dizziness and clonic convulsion. The subject recovered and when she changed to another health center desk information, she experienced another syncope. The subject stayed some hours under observation and the event didn't recur. The mother stated that her daughter usually feels dizzy when she received a shot. This case was assessed as medically serious by GSK. On 3 February 2009, the events were resolved. The regulatory authority reported that the events were possibly related to vaccination with DITANRIX adult and GARDASIL. No further information is expected as the foreign regulatory authority has provided all the information available. This case has therefore been closed.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Asthenia, Injection site mass, Injection site pain, Muscular weakness, Myalgia

Symptom Text: My primary care physician informed me on the use of GARDASIL and how it prevents cervical cancer. After reading a small pamphlet on the drug I agreed to be administered my first dose sometime in October 2008. One month after the first initial injection I got a golf ball size knot on my left shoulder exactly where the injection was given. I had such terrible deep within the muscle so I opted not to have another injection, but I wonder to this day what would have happened if I had, since my arm has never been the same. I still have some muscle weakness in that arm at the times along with pain where the injection was given. As well as less of strength in that arm. Now I told my MD my thoughts and concerns and he just said that maybe it was a good idea I didn't have another. But like I said what if I had. I am concerned with this drug. After my incident I have researched and found that I am not alone, GARDASIL has also been reported to cause moderate to severe migraines. I really think that more studies should be done on this drug. And until those studies have been done neither of my daughters will ever have that vaccine!

Other Meds:

Lab Data: My MD opted not to test me for any adverse reactions since she says "It's been a month, I just don't see it."

History: I falsely tested positive for HPV two years prior to receiving GARDASIL, that's why my MD wanted to administer the vaccine.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Information has been received from a registered nurse and a nurse practitioner, for GARDASIL, a Pregnancy Registry product, concerning a 16 year old female patient who on 20-Jan-2009 was vaccinated with the first dose of GARDASIL (lot # 661764/0650X). The patient was pregnant. LMP was 04-JAN-2009, and estimated delivery date was 11-OCT-2009. The patient's mother had history of coagulation disorders, so blood work was taken on the patient with results pending to determine if the patient also had any unknown medical conditions that would affect the pregnancy. On 03-FEB-2009 urine pregnancy test was performed with positive result. The patient sought unspecified medical attention. Follow-up information was received from a nurse practitioner, for GARDASIL, a Pregnancy Registry product, concerning a 16 year old female patient with a history of 0 previous pregnancies and 0 of previous live births, who on 10-FEB-2008 (5 weeks from LMP) had a spontaneous abortion. The patient had not received any prenatal testing. The products of conception were not examined. The patient's mother had a history of coagulopathy which was not diagnosed. Upon internal review, spontaneous abortion was determined to be an other important medical event. Additional information has been requested.

Other Meds: Unknown

Seriousness: HOSPITALIZED, PERMANENT DISABILITY, SERIOUS

MedDRA PT Disability, Juvenile arthritis, Lymphadenopathy

Symptom Text: Information has been received from a physician, via CSL as part of a business agreement (manufacturer control No. 2009 03 03 JV2), concerning a 22 year old female who in September 2008, was vaccinated with GARDASIL. Subsequently the patient developed adult onset Still's disease. The patient's ferritin level was really high at 20,000 (units not specified). Additional information was received from the physician on 17-MAR-2009. It was reported that the patient was hospitalised and sustained a permanent or substantial disability from the adverse event of adult onset Still's disease. An erythrocyte sedimentation rate (ESR) was done and the result was 64 (unit not specified). A computerised tomography scan (CT) was also done which showed small cervical lymphadenopathy. The patient will undergo a biopsy to rule out a lympho-proliferative disorder. The patient will be started on prednisone soon as the severe inflammatory arthritis subsides. The reporting physician considered the causality of adult onset Still's disease as unknown. The adverse event of adult onset Still's disease was considered to be disabling by the reporting physician. Additional information is not expected.

Other Meds: Hormonal contraceptives (unspecified)

Lab Data: Computed axial tomography, 04Oct08, small cervical lymphadenopathy; Serum ferritin assay, 04Oct08, 20000, units not specified; Erythrocyte sedimentation rate, 04Oct08, 64

MedDRA PT Caesarean section, Drug exposure during pregnancy, Large for dates baby

Symptom Text: Information has been received from a consumer, who was the guardian of the patient, for the Pregnancy Registry for GARDASIL, concerning a 14 year old female with no pertinent medical history or drug reactions or allergies who on 08-APR-2008 was vaccinated with a 0.5 ml dose of GARDASIL. On the same day, the patient was also vaccinated with VARIVAX (Merck), tetanus toxoid vaccine, diphtheria toxoid vaccine, meningococcal conj vaccine (unspecified), hepatitis A virus vaccine (unspecified) (manufacturer unknown) and "ACHD". Concomitant therapy included calcium (unspecified), iron (unspecified) and prenatal vitamins. It was reported that the patient would be delivering next week. There were no lab tests performed. It was reported that the patient had no ill effects from this. The patient sought unspecified medical attention via the physician. Follow-up information was received from a staff member in the physician's office via phone call. It was reported that the patient delivered a healthy and normal baby boy on 05-OCT-2008 via C-section. The C-section was performed because the baby was "like 12 lbs". The reporter did not have any additional information to provide. Upon internal review, the baby was "like 12 lbs" that required C-section was considered to be other important medical event. Additional information is not expected.

Other Meds: Calcium (unspecified); Iron (unspecified); Vitamins (unspecified)

MedDRA PT Pneumothorax, Surgery

Symptom Text: Information has been received from Health Authorities (Ref nr: DHH-N2009-44151) concerning a 16 year old female who was vaccinated with the first dose of GARDASIL (batch nr unknown) via intramuscular route on 18-DEC-2007 on an unspecified site. She received the second dose of GARDASIL on 18-FEB-2008 and the third dose on 19-JUN-2008, both via intramuscular route (batch nr and administration site not reported). It was reported that the patient experienced a catamenial pneumothorax as from December 2007 and that this condition was recurring following GARDASIL injection. It was not clear whether the onset of the catamential pneumothorax occurred before or after the first GARDASIL injection of 18-DEC-2007. The patient underwent 2 surgical interventions and was considered as recovered with sequel (ae) in February 2009, no further details provided. It was specified that the patient has not been hospitalized. No relevant medical patient history reported, except allergy to grass and trees. No alcohol or tobacco abuse. Pneumothorax spontaneous was reported as other medically important condition. Additional information has been requested. Other business partner numbers include E2009-02314.

MedDRA PT Epilepsy, No reaction on previous exposure to drug

Symptom Text: Information has been received from a Health Authority (reference number PEI2009004668) concerning a 12 year old female patient who on 31-JUL-2007 was vaccinated with her first dose of GARDASIL (lot number, site and route not reported) which was well tolerated. On 11-SEP-2007, the patient was vaccinated IM with her second dose of GARDASIL (lot number, site and exact date not reported). Post vaccination (exact date not reported), the patient developed absence epilepsy which was finally diagnosed on 22-DEC-2008. The patient's mother had absence epilepsy with few grand mal seizures. The reporting neuropaediatrician stated that even though there was a positive family history epilepsy could have been triggered by the GARDASIL vaccination. The patient had not recovered at the time of reporting. The event of epilepsy was considered to be an other Medical Event. Other business partner number included: E2009-02385. No further information is available. The file was closed.

MedDRA PT Abdominal discomfort, Arthralgia, Henoch-Schonlein purpura, Purpura

Symptom Text: Information has been received from a Health Authority (reference number ES-AGEMED-718657244) on 18-MAR-2009 concerning a 14 year old female who was administered on 17-NOV-2008 the second 0.5 ml dose of GARDASIL (lot # not reported) by intramuscular route (site of administration not reported). On the same day the patient also received a dose of DITANRIX by intramuscular route (site not reported). It is reported that on the 07-JAN-2009 the patient presented with a purpuric rash on legs, buttocks and forearms, arthralgia and abdominal discomfort. According to the skin biopsy, performed on 20-JAN-2009 the patient presented a leukocytoclastic vasculitis (Shonlein-Henodi syndrome). The patient improved after treatment with prednisolone, with fluctuance. By the 27-FEB-2009 the patient had not completely recovered yet. Hospital admission was required (dates not informed). It was reported that the patient received the first dose of GARDASIL on 22-SEP-2008 intramuscularly. It was not reported whether the patient had any adverse event after this dose of vaccine or not. Other business partner numbers included: E200902370. No further information is available.

MedDRA PT Crying, Skin exfoliation, Swelling

Symptom Text: Information has been received from a consumer concerning someone she saw on the television news, a female who was vaccinated with GARDASIL of unknown dose and frequency on an unknown date for an unknown indication. The patient's relevant medical history, concomitant medications and relevant past drug history were unknown. Subsequently the patient was crying and her skin was peeling and swollen really bad. It was unknown if any laboratory testing had been performed. As of 07-FEB-2009, it was unknown if the patient continued to take GARDASIL and the outcome of the crying, skin that was peeling and swollen were unknown. The mother of the patient said that "she wished she had known, because her daughter would have never gotten GARDASIL". Additional information is not expected. Attempts made to verify the existence of an identifiable patient and reporter have been unsuccessful. This is one of several reports received from the same source.

MedDRA PT Syncope

Symptom Text: Information has been received from a physician concerning a 11 years old female patient who on 02-FEB-2009 at afternoon was vaccinated with the third dose of GARDASIL intramuscularly into her arm. Concomitant therapy included a second dose of HAVRIX,which administered on the same day intramuscularly into her arm. It was reported that on 02-FEB-2009 the patient had syncopal episode more than 5 minutes later in room. It was reported that the patient recovered in less 1 minute but had to lay on table for 1/2 hour. The reporting physician considered the syncopal episode to be other important medical event. Follow up information was received on 12-FEB-2009 from a physician who stated that the patient experienced syncope. It was reported that a blood pressure measurement and pulse rate count were performed (results not provided). It was reported that the physician allowed her to rest for 45 minutes. It was reported that intervention to prevent serious criteria was not actually required. The patient had recovered at the time of this report. Additional information has been requested.

Other Meds: Unknown

MedDRA PT Papilloma viral infection, Smear cervix abnormal

Symptom Text: Information has been received from a physician concerning a 23 year old female with a history of papanicolaou smear abnormal in January 2006 but was not tested for HPV at that time. On 13-NOV-2006, the patient was vaccinated with the first dose of GARDASIL. On 15-JAN-2007, the patient was vaccinated with the second dose of GARDASIL (lot number was reported as 1426S, which is a available lot number of dexamethasone acetate). On 12-JUL-2007, the patient was vaccinated with the third dose of GARDASIL (lot # 658100/0525U). Concomitant therapy included ORTHO TRI-CYCLEN. On 16-JAN-2009 the patient experienced abnormal PAP smear that was positive for high risk HPV. The specific type of HPV she had was unknown. The patient was scheduled to have a colposcopy. Additional information has been requested.

Other Meds: ORTHO TRI-CYCLEN

Lab Data: Pap test, 01/16/09, abnormal without HPV test; Pap test, 01/??/06, abnormal which was positive for high risk HPV

MedDRA PT Biopsy, Cervical dysplasia, Colposcopy, Dysplasia, Papilloma viral infection, Uterine cervical squamous metaplasia

Symptom Text: Information has been received from a physician concerning a female (approximately 24 year old) with history of an abnormal Atypical squamous cells of undetermined significance (ASCUS) PAP smear in 2006 and 2007 who was vaccinated with her first (lot#656048/0187U), second (657621/0387U) and third (658558/1061U) dose of GARDASIL on 06-MAR-2007, 07-MAY-2007 and 05-SEP-2007 respectively. Concomitant medications included unspecified birth control. They did not test for HPV at the PAP smear in 2007. She had another PAP smear in November 2007 which showed high grade dysplasia. The patient had a colposcopy which showed that she had high grade squamous epithelial lesions. She also had a cold cone biopsy on 21-DEC-2007 which came back positive for squamous metaplasia. The first PAP smear she received in 2008 was normal but the second came back as positive for HPV. She had another PAP smear in January 2009 that came back as normal. The outcome is unknown. The patient's sister also experienced an adverse event following vaccination (WAES# 0902USA01061). The patient sought medical attention. Additional information has been requested.

MedDRA PT Blood aluminium increased, Gastrointestinal pain, Pelvic pain, Weight decreased

Symptom Text: Information has been received from a nurse practitioner concerning a 15 year old female patient with a history of appendectomy conducted in December 2007 and a gall bladder removed in April 2008 who was vaccinated with the first dose of GARDASIL. Four weeks later the patient experienced gastrointestinal and pelvic pain. The patient was diagnosed as having high aluminum content and lost approximately 10 pounds. At the time of this report, the patient recovered and was still undergoing nutrition therapy. It is unknown if the patient sought medical attention. Additional information has been requested.

MedDRA PT Hypersensitivity, Injection site hypersensitivity, Oedema peripheral, Pruritus, Urticaria

Symptom Text: Information has been received from a physician concerning a female with a history of injection site reaction (vaccine unknown) who was vaccinated with the first dose of GARDASIL 0.5ml (Lot number not provided). Subsequently the patient experienced "allergic reaction" at the injection site. The outcome of the adverse event was unknown. The physician was not going to give the patient the rest of the series. It was reported that the patient sought unspecified medical attention. Additional information has been received from a physician concerning the 22 year old female with allergies to CECLOR, AUGMENTIN and PENICILLIN who on 20-JAN-2009 was vaccinated IM with the second dose of GARDASIL 0.5ml in the arm (Lot number 661766/0652X). "2 days after the vaccine administration" (on 22-Jan-2009), the patient developed lower extremity pruritis. "On third day" (on 23-Jan-2009) the patient experienced swelling of hands, pruritis of the feet and scattered "hives" by description. The symptoms resolved at time of exam. The patient reported similar prior reaction to CECLOR. Further information is not available.

MedDRA PT Dysmenorrhoea, Menorrhagia, Menstruation irregular

Symptom Text: Information has been received from a healthcare worker concerning her daughter, a 15 year old female with no pertinent medical history and no known drug allergies who on 26-NOV-2008 was vaccinated intramuscularly with the first 0.5 mL dose of GARDASIL. There was no concomitant medication. On 05-JAN-2009 the patient began a 15 days menstrual cycle. She experienced irregular menstrual and cramping after vaccination. On 26-JAN-2009 the patient was vaccinated intramuscularly with the second 0.5 mL dose of GARDASIL. On 02-FEB-2009 the patient experienced pain with her menstrual cycle. The patient took MIDOL tablets but the cramping did not subside. The patient never had cramping and irregular cycles prior to the first dose of GARDASIL. The patient's symptoms persisted. The patient sought medical attention by consultation with nurse practitioner. Additional information has been requested.

MedDRA PT Alopecia, Biotin deficiency, Contusion, Thyroid function test abnormal

Symptom Text: Information has been received from a consumer concerning her daughter, a 21 year old female with no medical history or drug allergy who was vaccinated with all 3 doses (first dose on 16-JAN-2007) of GARDASIL. There was no concomitant medication. Subsequently the patient started loosing her hair in fall 2007, before getting the third dose, she always had very thick hair and she lost about 35-40% of it already. The caller also mentioned that she started experiencing excessive bruising on her legs around the same time the hair loss started. The bruising was all gone, and the hair was not coming out as bad as it use to. She had multiple tests (including tested vitamin levels (a little low on Biotin), thyroid test, Cushing's disease test, PCOS and urine test) done to see what was wrong. She had thyroid test done and it did spike but when the second test was done it came back normal. All other tests came back normal as well. At the time of the report the patient was not recovered. The patient sought medical attention. Additional information has been requested.

Other Meds: None

Lab Data: diagnostic laboratory - Cushing's disease test: normal; serum biotin test - a little low on Biotin; thyroid function test - first test-it did spike; thyroid function test - second test - normal; venous blood pCO(2) - polycystic ovarian synd

MedDRA PT Caesarean section, Drug exposure during pregnancy, Herpes simplex, Wound dehiscence

Symptom Text: Information has been received from a health professional through the Merck pregnancy registry concerning a 17 year old female who on 22-JAN-2008 was vaccinated with the first dose of GARDASIL (lot# 657868/0523U). On 26-MAR-2008 the patient came to the physician's office for the second dose and told the nurse that she was "3 to 4 months pregnant" (LMP = 31-DEC-2007). The patient did not receive the second dose. No adverse reactions were reported and no other information was available. Follow up information has been received from the nurse practitioner who indicated that the baby was born on 02-SEP-2008 at 39 weeks of gestation by cesarean-section was performed because the baby failed to descend the birth canal. The mother remained in the hospital for an extended 6 days total because her cesarean-section wound dehisced. The mom had also experienced "out break of HSV" two weeks prior to delivery on approximately 19-AUG-2008, and was treated with Valtrex. The date the baby was developmentally normal, "cheerful" and "thriving". She reported that were not known birth defects, the baby is normal. She also mentioned that the baby was seen in the office on 19-MAR-2009 for some nasal congestion "like a any child in a day care". The mother of the baby was in school and shared care with the foster mother. Upon internal review, C-section performed because the baby failed to descend was determine to be an other important medical event. Additional information is not expected.

Seriousness: PERMANENT DISABILITY, SERIOUS

MedDRA PT Anogenital warts, Papilloma viral infection, Rash pruritic

Symptom Text: Information has been received from an Agency and a physician concerning a 17 year old (grade 12) not sexually active female (no contact), nulli gravida, menstruation irregular, non-smoker, denies the use of alcohol, asthma, hypersensitivity (no details provided) and a family history of breast cancer, bone cancer and leukemia who on 22-NOV-2007 was vaccinated with GARDASIL (lot # field illegible). Concomitant medications included unspecified asthma medications and unspecified allergy medications. On approximately 29-NOV-2007 the patient experienced HPV type(s) 16 (initially reported as localized itchy rashes (areas of localization illegible)). On 04-FEB-2008 the patient underwent a gynecological examination which revealed an abnormal external genitalia. The patient had clusters of condylomatous like lesions down both sides of both labia majora. She had some isolated small condylomatous type lesions scattered about the perineal area (looked flat to the gynecologist). The patient's vagina and cervix were grossly normal. A Pap smear was taken (no results provided). On 04-FEB-2009 a colposcopy was performed and on external genitalia the above areas were noted. The physician could not see any vascular markings. The gynecologist was suspicious that these were actually condylomata. Under local anesthetic a small one was removed using a punch biopsy. Bleeding was controlled with Monsel solution. It was reported that the punch biopsy was positive for HPV type(s) 16. Additional information has been received from a physician concerning a 17 year old female with asthma exercise induced (previously reported as asthma) and rhinitis allergic (previously reported as hypersensitivity). On approximately 01-DEC-2007 (previously reported as approximately 29-NOV-2007) the patient experienced HPV type(s) 16. The physician reported that the patient was without prior sexual activity (previously reported) presented with biopsy positive (previous reported) for type 16 condylomata on external genitalia within two weeks of receiving first do

Other Meds: Unknown

Lab Data: colposcopy, 04Feb08, suspicion of condylomata; skin biopsy, 04Feb08, bleeding controlled with Monsel solution; positive for HPV type(s) 16; gynecological examination, 04Feb08, see narrative for details; diagnostic laboratory test, 21Feb08,

History: Family history of cancer

Prex Illness: Not sexually active; Nulli gravida; Asthma exercise induced; Rhinitis allergic; Hypersensitivity; Menstruation irregular; Non-sm

MedDRA PT Abortion spontaneous, Blighted ovum, Drug exposure during pregnancy

Symptom Text: Information has been received from a physician, for the Pregnancy Registry for GARDASIL, concerning a 23 year old female who was vaccinated with the first or second dose of GARDASIL 0.5ml (Lot# not reported). Couple days later, the patient called the office and informed that she think she was pregnant. The patient had a home pregnancy test, the result was not reported. The outcome of adverse event was unknown. It was reported that the patient sought unspecified medical attention. Follow-up information was received from the registered nurse who reported that the patient on 26-NOV-2008 was vaccinated with the first dose of GARDASIL (Lot# not reported), on 26-JAN-2009 was vaccinated with the second dose of GARDASIL (Lot# not reported) 0.5ml. The registered nurse reported the patient was not pregnant when she received GARDASIL. The patient's LMP Was unknown. On an unspecified date, the patient miscarried. An ultrasound on 16-MAR-2009 showed "blighted ovum and no gestational sack". Upon internal review, the miscarried and blighted ovum were determined to be an other important medical event. Additional information is not expected.

MedDRA PT Blindness, Cyanosis, Deafness, Loss of consciousness, Pallor, Sensation of heaviness, Similar reaction on previous exposure to drug

Symptom Text: Information has been received from a physician assistant concerning a 16 year old female with no allergies who on 12-NOV-2008 was vaccinated with the first dose of GARDASIL. On 12-MAR-2009 the patient was vaccinated with the second dose of GARDASIL . Concomitant therapy included MENACTRA on 12-MAR-2009 into opposite arm, LEXAPRO and RECLIPSEN. On 13-MAR-2009, almost exactly 24 hours after administration, she experienced blacking out, legs feeling like "dead weight", her lips turned blue, she had an ashen color to her skin, and she could not see or hear. She visited the physician assistant who admitted her to the hospital. She was given saline and was monitored on telemetry for cardiac function. She also had a CT scan (results not reported). She was discharged after 24 hours. Her blood pressure was 94/54. The patient recovered on an unspecified date. The patient's mother also told the physician assistant that after the first dose similar symptoms occurred but no black-outs. The symptoms occurred 24 hours after receiving first dose but the patient did not seek medical attention and had recovered. The events occurring 13-MAR-2009 were considered to be disabling. Additional information has been requested.

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a physician for the pregnancy registry for GARDASIL, concerning a 24 year old female patient with no known drug allergies, who on 26-APR-2008 was vaccinated with her first dose of GARDASIL (lot# 654272/0073X). There was no concomitant medication. On 08-APR-2008 the patient had her LMP and in MAY-2008 (6 weeks from her LMP), the patient had an elective termination. At the time of reporting the outcome of the patient was unknown. Subsequently, the patient again experienced vaccine exposure during pregnancy and an elective termination of pregnancy while on therapy with GARDASIL (MSD, WAES_0903USA04267). Upon internal review elective termination was considered as an Other Important Medical Event. Additional information has been requested.

MedDRA PT Chest discomfort, Dyspnoea, Fatigue, Intensive care, Vertigo

Symptom Text: Information has been received from a physician concerning a 25 year old female with a history of drug hypersensitivity (chest tightness and dyspnea) of unknown drug name who on 16-MAR-2009 at 10:00 was vaccinated IM with the first 0.5 mL dose of GARDASIL. On 16-MAR-2009 at 14:00, the patient experienced dyspnea and chest tightness and was hospitalized. She felt mild dyspnea and chest tightness. At 17:00, she felt severe dyspnea, chest tightness and vertigo. Therefore she came to the ICU of the general hospital and was treated with DEMEROL and DEPO MEDROL and oxygen until 21:00. The patient was completely conscious when she came to the ICU. After that, the patient's condition was better and the hospital let her come home, but she still felt tired and asked to stay in the hospital, so she stayed in the ICU. The patient was then transferred to an internal department for follow up. The patient was discharged recovered at 02:00 17-MAR-2009. The physician reported that it was unknown if the patient's dyspnea and chest tightness were related to therapy. The reporting physician considered dyspnea and chest tightness were other important medical events. Additional information has been requested.

MedDRA PT Nausea, Paraesthesia, Pharyngeal oedema, Pruritus, Vomiting

Symptom Text: Information has been received from a Health Care Professional on 17-MAR-2009 concerning a 16 year old woman who was vaccinated with a first dose of GARDASIL (lot # 1883U, batch # NH50860) on 09-FEB-2009. The same evening the patient felt nauseous and vomited. The nausea and vomiting continued for 1 week with 2-3 vomits per day. On 12-FEB-2009 the patient developed pruritus on the body. The symptoms worsened gradually and on 15-FEB-2009 there was also prickling sensations and symptoms in the throat and she visited an emergency unit. At the hospital she felt throat swelling and was treated with BETAPRED, (12 single doses) and EPINEPHRINE (IM, injection). On advice from the physician on the hospital she stopped taking oral contraceptives YASMIN which she stated taking on 06-FEB-2009. After this treatment she got better but pruritus was continuing and on 18-FEB-2009 the patient got prescription on ATARAX and BETAPRED. On 05-MAR-2009 the patient was fully recovered. The physician considered YASMIN as suspected cause of at least some of the adverse events but cannot rule out GARDASIL as causative agent. The adverse experiences were considered to be other important medical events. Other business partner numbers included: E2009-02340. No further information is available. Case is closed.

MedDRA PT Convulsion, Urticaria, Viral infection

Symptom Text: Information has been received from a health authority (reference number ES-AGEMED-818649244) regarding a 14 year old female with no medical records related with epilepsy or convulsive episodes who on 23-DEC-2008 was vaccinated with a dose of GARDASIL (batch# not reported). On the same date the patient received a dose of DITANRIX (route and site of administration not reported). 3 or 4 days after vaccination the patient presented urticaria that had been ongoing. On FEB-2009, exact date not reported, the patient visited the doctor due to a clinical picture compatible with viriasis. The patient was prescribed with Rino-Ebastel, also a special diet was advised and cotton clothing was recommended. The cutaneous clinical picture was not related to the vaccine. On the 25-FEB-2009 while the patient was attending a class she presented a convulsion, she was taken to hospital where she remained under observation for 24 hours. She did not present another convulsive episode, epileptogenic focus was found and a treatment was prescribed (treatment information not reported). No further problems were reported. According to reporter, events were not considered to be related with treatment. It was reported to the HA by a vaccination center. Case reported as serious by the HA with other medically important condition as criteria. Other business partner number included E2009-02352. The case was closed. No further information is available.

MedDRA PT Smear cervix abnormal

Symptom Text: Information has been received from a 21 year old female with no pertinent medical history or drug allergy who on 20-NOV-2008 was vaccinated with a first dose of GARDASIL. On 15-JAN-2008 was vaccinated with a second dose of GARDASIL. Concomitant therapy included vitamins (unspecified) and birth control pills. On 15-JAN-2009 the patient was performed a papanicolaou (PAP) smear which came back positive. At the time of reporting, the patient's PAP smear positive persisted. Additional information has been requested.

Other Meds: Hormonal contraceptives; Vitamins (unspecified)

Lab Data: Cervical smear, 01/15/09, positive

History: None

MedDRA PT Papilloma viral infection

Symptom Text: Information has been received from a registered nurse reporting that she received an e-mail from a woman who stated that she received the complete GARDASIL series and has now tested positive for HPV. It was reported that the woman is not the nurse's patient. Attempts are being made to verify the existence of an identifiable patient and reporter. Follow-up information was received from the RN, who is a senior member of an HPV Health Board, and stated that she receives and responds to many anonymous emails. She indicated that on the patient's email, the woman mentioned that she was diagnosed with HPV but could not confirm the strain. The nurse stated that she is waiting for the woman to provide this information and will call back when/if she receives it. The nurse stated that there was no way for her to determine the name of the patient since the emails are anonymous. Additional information is not expected.

MedDRA PT Dysuria, Pollakiuria, Pyrexia, Urinary tract infection

Symptom Text: Information has been received from a Registered Nurse concerning a 22 year old female with psychiatric disorders and a history of pyelonephritis who was vaccinated intramuscularly with her second 0.5 ml dose of GARDASIL (lot#660616/0570X) on 29-JAN-2009. There was no concomitant medication. Subsequently, the patient developed urinary tract infection. After receiving the dose, she complained of high fever of 102 degrees F along with burning sensations when she urinates. She also had increased frequency of urination. Urine analysis showed presence of leukocyte, protein, but no blood. The patient was treated with CIPRO for 1 week. Urine culture was negative. At the time of reporting the patient was recovered. The patient had received her first dose of GARDASIL on 16-OCT-2008. The patient sought medical attention and was seen by the nurse. Additional information has been requested.

MedDRA PT Gaze palsy, Loss of consciousness

Symptom Text: Information has been received from a certified medical assistant (C.M.A) concerning a 19 year old female with no medical history and no known allergies who on 08-Jan-2009 was vaccinated with the first dose of GARDASIL (lot#0947X) and as the patient was about to pay at the front desk her eyes rolled back and the person at the front desk went around and caught the patient before she hit the ground. It was reported that when the patient was caught she started to come to and eat in the office for about 19 minutes and then was fine to leave the office. The patient was recovered on 08-Jan-2009. Follow up information was received from a certified medical assistant concerning the 19 year old female patient with no pre-existing allergies, birth defects, or medical conditions who on 08-Jan-2009 was vaccinated intramuscularly in the right arm with the first dose of GARDASIL (lot# 0947X). There was no illness at the time of vaccination. On 08-Jan-2009 at 12:00 pm the patient passed out in office approximately 10 minutes after being vaccinated with the vaccine. The patient was recovered on 08-Jan-2009. The patient sought unspecified medical attention. Additional information has been requested.

MedDRA PT Headache, Intensive care, Intraventricular haemorrhage, Vomiting

Symptom Text: This report was identified from a line listing obtained on request by the company from the FDA under the Freedom of Information Act. An 18 year old female with no pertinent medical history who on 18-MAR-2009 was vaccinated with a second dose of GARDASIL (Lot # 661846/1312X) intramuscularly into the left arm. Concomitant therapy included TDAP. On 19-MAR-2009 approximately 36 hours after vaccination she experienced headache and vomiting. On 21-MAR-2009 she was admitted to surgical intensive care unit for observation and close monitoring for intraventricular hemorrhage. Magnetic resonance imaging, magnetic resonance angiography of brain, computed axial tomography were performed. Headache, intensive care, intraventricular haemorrhage and vomiting were considered to be immediately life-threatening. No further information is available. A standard lot check investigation was performed. All in-process quality checks for the lot # 661846/1312X in question were satisfactory. In addition, an expanded lot check investigation was performed. The testing performed on the batch prior to release met all release specifications. The lot met the requirements of the Center and was released. This was originally reported by a consumer. The VAERS # ID is 342730.

MedDRA PT Drug exposure during pregnancy, Inappropriate schedule of drug administration

Symptom Text: Information has been received from a registered nurse, for the Pregnancy Registry for GARDASIL, concerning a 17 year old female with no previous medical history and no known allergies who on 05-DEC-2007 was vaccinated with her first dose of GARDASIL (Lot# not reported). On 14-MAY-2008, the patient was vaccinated with her second dose of GARDASIL (Lot# not reported) and tested as pregnant with an office pregnancy test. The patient stated that her LMP was last week (estimated LMP = 07-May-2008). LMP or gestation was uncertain. There was no concomitant medication. There were no problems reported. Unknown medical attention was sought in the office. The patient's outcome is unknown. Follow up information was received from registered nurse and phone call. It was reported the patient's last menstrual period (LMP) was 20-MAR-2008 (previously reported as "estimated LMP = 07-May-2008") and estimated delivery date (EDD) was 02-JAN-2009. On 20-AUG-2008 the patient had serum alpha-fetoprotein test (MSAFP) done and the result was negative. The mother declined amnio testing. On 20-AUG-2008 (at 14 weeks gestation) ultrasound did show sonographic markers for trisomy however the repeat ultrasound in 18-DEC-2008 was normal. On 24-DEC-2008 the patient delivered a 7 pounds 7 ounces male baby without complication during pregnancy or labor/delivery and without infection or illnesses during pregnancy. It had been a vaginal delivery and there were no congenital anomalies. The baby had spent one week in the hospital with fever of unknown origin and received unspecified antibiotics but was otherwise healthy and normal. The patient had returned for postpartum visit since. Her baby was "fine". No further information was available.

Other Meds: None

Lab Data: ultrasound, 08/20/2008, sonographic markers for trisomy; ultrasound, 12/18/08, normal; beta-human chorionic, 05/14/2008, pregnant; serum alpha-fetoprotein, 08/20/2008, negative

MedDRA PT Drug exposure during pregnancy, Oligohydramnios

Symptom Text: Information has been received from a certified nurse midwife concerning a 23 year old pregnant female who is bipolar and has a history of depression, anxiety, abnormal pap test and had a loop electrosurgical excision procedure. On 02-NOV-2007 the patient was vaccinated IM with the first dose of GARDASIL vaccine (lot # 658563/1063U). On 09-JAN-2008 the patient was vaccinated IM with the second dose of GARDASIL vaccine (lot #659437/1266U). The last menstrual period was reported to be on 10-JAN-2008. An urine pregnancy test was performed with positive results. On 12-JAN-2008 a maternal serum alpha-fetoprotein test was performed within normal results. On 05-MAR-2008 an ultrasound was performed (NP). It was also reported that this is the patient's first pregnancy. The estimated delivery date is 16-OCT-2008. The certified nurse midwife reported she wishes to register the patient on the pregnancy registry. Follow-up information has been received from certified nurse midwife concerning the patient, who was also reported to be a smoker with no history of previous pregnancies. On 01-MAY-2008, MSAFP screening test as performed and results were within normal limits. It was reported he mother developed oligohydramnios during the pregnancy. On 21-OCT-2008, 41.1 weeks from the last menstrual period, the patient delivered a normal male baby who weighted 7 pounds and 13.8 ounces. His length was 19 feet. His Apgar score was assessed to be 8/9. No complications occurred during the labor. No further information is available.

MedDRA PT Blood calcium decreased, Drug exposure during pregnancy, Gonorrhoea, Nausea, Staphylococcal infection

Symptom Text: Information has been received through the Merck Pregnancy Registry via a physician concerning a 19 year old female with a history of tobacco abuse and cannabis abuse who on 20-Feb-2008 was vaccinated with the first dose of GARDASIL 0.5ml, IM, (lot #, not reported). Concomitant therapy included prenatal vitamins (manufacturer unknown). On 21-Apr-2008 the patient was given the second dose of GARDASIL 0.5ml, IM to the left deltoid, (lot # 659655/14860). After the patient received her second dose, she later reported her pregnancy. Unspecified medical attention was sought and routine prenatal tests (data and names unspecified) were performed with results not reported. Therapy has been discontinued as of 07-May-2008. Patients last menstrual cycle was reported on 20-Feb-2008, her due date was calculated to be 26-Nov-2008. No adverse events were reported. No product quality complaint was involved. Follow-up information has been received from a physician concerning a female patient with nicotine dependence, THC use during pregnancy and a history of abnormal Papanicolaou smear and no previous pregnancies. It was reported that on 4-Apr-2008, on 22-Jul-2008 and on 10-Sep-2008 routine screening test were performed, all of them within normal results. On 26-Nov-2008, 39+ 0 weeks from the last menstrual period, the patient delivered a normal healthy female baby weighing 5 pounds 5 ounces. The baby's length was 19 inches, her APGAR score 9/9 and her head circumference was 11 1/2 inches. It was reported that during the pregnancy the patient developed a meticillin resistant staphylococcus aureus (MRSA) abscess which was treated with Clindamycin (Unspecified) 150mg, QID during 7 days. Also the patient was taking calcium + vitamin D (unspecified) , 500/200 mg, BID for the treatment of poor calcium mass, fish oil (unspecified) , 500 mg daily for nutrition and metoclopramide (unspecified), 5mg, QID/ PRN for the treatment of nausea. It was also reported that on an unspecified date the patient had gonorrhea infection.

Unspecified pregnancy lab work has been completed through the obstetrician. The expected date of delivery was calculated to be 12-JUN-2008. No outcome information has been provided. No product quality complaint was involved. Follow-up information has been received from the nurse practitioner concerning the patient. She stated that the patient has not been seen in the office since June 2008. Follow-up information has been received from a nurse practitioner concerning the patient. It was reported that she had a normal, vaginal delivery at 39 +3/7 weeks on 21-JUN-2008. The baby who's gender was not specified, weighted 6 lb and 1 oz, and had APGAR scores of 9 and 9. The baby appeared normal on exam and on her postpartum exam the patient stated that everything was fine for her and her baby. However, the patient is not bringing her baby to the pediatric clinic that she went to, so there is no newborn exam notes on the baby. The nurse also reported prenatal information. The patient's LMP was 15-SEP-2007 and her estimated delivery date was 25-JUN-2008. On 17-Oct-2007, early in the first trimester, the patient was treated with BACTRIM for a urinary tract infection. She had routine prenatal screening test, a QUAD screen and MID-trimester anatomy survey ultrasound, which were both within limits. She was prescribed several other medications for use during her pregnancy. On 07-NOV-2007 she was orally treated with PHENERGAN, 25 mg, as needed every 6 hours for the treatment of nausea until DECEMBER 2007. From 04-JAN-2008 to

MedDRA PT Drug exposure during pregnancy, Premature labour, Urinary tract infection

Symptom Text: Initial and follow up information has been received from a certified nurse midwife for the Pregnancy Registry for GARDASIL, concerning a 22 year old white female with bipolar disorder and allergic reaction to KEFLEX and no previous pregnancies who on 03-OCT-2007 was vaccinated with a first dose of GARDASIL (lot # 658558/1061U). On 04-DEC-2007 the patient was vaccinated with a second dose of GARDASIL vaccine (lot # 659437/1266U). Concomitant therapy included SEROQUEL (lot # not reported) and ABILIFY for the treatment of bipolar disorder. The patient's LMP was reported as 15-FEB-2008. The patient's pregnancy was verified with an office pregnancy test during an office visit on 24-MAR-2008. An ultrasound performed on 01-APR-2008 revealed a 6.4 week intrauterine pregnancy. On an unspecified date in April 2008, therapy with quetiapine fumarate and aripiprazole was discontinued. The patient sought unspecified medical attention. No problems were reported. Follow up information has been received from a certified nurse midwife concerning a female patient concerning a female patient (Rh negative) who was vaccinated with a first and the second dose of GARDASIL on 03-OCT-2007 and 04-DEC-2007. Concomitant therapy included WELLBUTRIN SR, SEROQUEL (reported) and ABILIFY. The patient was treated for pre-term labor (2008) with TERBURALINE and was also treated for an urinary tract infection (2008) with MACROBID and AMOXICILLIN. On 27-OCT-2008 (36 weeks from LMP) delivered a healthy female baby (7 lb 8 oz, 20 in length, head circumference 13.75 cm and APGAR score 8 at 1 minute/ 9 at 5 minutes). The patient had not had a Group B strep test done so she was treated with AMPICILLIN 2 grams IV one time dose . She also received a dose of RHOGAM. Additional information is not expected. (Rh negative)

Other Meds: ABILIFY; WELLBUTRIN SR; SEROQUEL

MedDRA PT Beta haemolytic streptococcal infection, Drug exposure during pregnancy

Symptom Text: Information has been received from a consumer and a nurse practitioner for the Pregnancy Registry for GARDASIL concerning herself, a 26 year old female with no medical history, and no drug reactions/allergies, who on 29-APR-2008 was vaccinated with her first dose of GARDASIL (lot # unspecified). On 02-May-2008 (three days later), the patient became pregnant (LMP estimated as 15-Apr-2008). Concomitant therapy included azithromycin (ZITHROMAX). The patient sought unspecified medical attention. At the time of this report the outcome was unknown. No further information available. Follow-up information received on 17-FEB-2009 from a nurse practitioner who reported the patient is Hispanic and has a history of smoking 2-5 cigarettes a day which she stopped with pregnancy, and an abnormal PAP s/p LEEP. Patient has had a previous pregnancy, no previous full term deliveries and a miscarriage. On 15-Jul-2008 patient had an ultrasound, which showed 12 weeks and 4 days pregnant ERA normal. On 13-AUG-2008 patient had a MSAFP testing with normal results. The lot # of the first dosage of GARDASIL received is 659180/1758U. Concomitant medications during pregnancy included prenatal vitamins (unspecified) which patient started taking on 18-JUN-08 (27 mg of Iron and folate 1mg daily) and on 08-JAN-2009 penicillin (unspecified) 3000000 international units every 4 hours for the treatment of bacterial infection due to streptococcus, group B. Date of last menstrual period on 18-APR-2008 (previously reported as 15-APR-2008) and estimated delivery date on 23-JAN-2009. Patient had a normal baby on 09-JAN-2009, male, who weighed 2975 grams, length 49 cm, Apgar score 9/9, head circumference 33.5 cm. No congenital anomalies or other complications or abnormalities. No complications during pregnancy, or during labor and/or delivery. No further information is available.

Other Meds: ZITHROMAX, vitamins (unspecified)

MedDRA PT Drug exposure during pregnancy, Inappropriate schedule of drug administration

Symptom Text: Information has been received through the pregnancy Registry for GARDASIL from a nurse concerning a 20 year old female with no pertinent medical history and no history of drug reactions or allergies who on 04-Feb-2008 was vaccinated intramuscularly with the first 0.5ml dose of GARDASIL. On 07-May-2008 the patient had her last menstrual period. On 29-May-2008 the patient was vaccinated intramuscularly with the second 0.5ml dose of GARDASIL (lot# 659964/1978U). Concomitant medication included doxycycline for the treatment of a chlamdia infection. On an unspecified date, a pregnancy test revealed the patient was pregnant. The patient had not experienced any known symptoms. On 07-Jul-2008, an ultrasound was performed, the results were within normal limits. The patient sought medical attention with a physician office visit. The patient was pregnant once previously, and it was a pre-term delivery. Follow up information has been received from a physician on 16-Feb-2009. It was reported that the 20 year old female patient was vaccinated on 14-Feb-2008 with the first dose of GARDASIL. The patient delivered a healthy baby on 06-Feb-2009. The pregnancy was normal except for induction for advance cervical dilation. On 16-Feb-2009, the patient was vaccinated with the third dose of GARDASIL. Additional information has been requested.

MedDRA PT Anaemia, Drug exposure during pregnancy, Inappropriate schedule of drug administration, Infection, Premature labour

Symptom Text: Initial information has been received from an 18 year old female with no pertinent medical history or drug reactions or allergies, for the Pregnancy Registry for GARDASIL. In November 2007, the patient was vaccinated with the first dose of GARDASIL. In June 2008, the patient received "her second dose of GARDASIL while pregnant". There was no concomitant medication. The patient did not know she was pregnant at the time of vaccination. As of 10-JUL-2008, the patient was one and a half months pregnant. The patient did not seek medical attention. Follow-up information was received from the physician which reported that the vaccine was not administered in her office. The patient had no previous pregnancy and a history of papanicolaou smear abnormal. The LMP of the patient was 23-MAY-2008. The estimate delivery date was 27-FEB-2009. ON 25-AUG-2008, ultrasound was performed for twin pregnancy and the results revealed normal twins. ON 15-SEP-2008, maternal serum alpha-fetoprotein screening was performed and the results were normal. Follow-up information has been received from a completed pregnancy questionnaire. On approximately 03-SEP-2008, the patient developed infection. On 03-SEP-2008, the patient was prescribed ROCEPHIN, 250 mg once and AZITHROMYCIN, 1 gram once for the treatment of infection. The outcome of infection was not specified. On approximately 01-DEC-2008, the patient developed anemia. On 01-DEC-2008, the patient was prescribed REPLIVA, daily for the treatment of anemia. The outcome of anemia was not specified. On 22-JAN-2009, the patient delivered normal twins baby girls with no congenital anomalies at the 33.3 weeks gestation. It was considered prematurity. One of the baby weighed 3 pounds 14 ounces and another weighed 3 pounds 10 ounces. The Apgar scores of both babies were 8/9. It was reported that there was no complication during pregnancy and delivery. Additional information is not expected.

MedDRA PT Beta haemolytic streptococcal infection, Chlamydial infection, Drug exposure during pregnancy, Vaginitis bacterial

Symptom Text: Initial and follow-up information has been received from a nurse, for the Pregnancy Registry for GARDASIL, concerning a 23 year old female smoker with a history of one pregnancy which the infant had gastroschisis and was pre-term premature rupture of fetal membranes at 32 weeks and pre-term delivery. On 19-MAY-2008 the patient was vaccinated intramuscularly with the first 0.5 ml dose of GARDASIL (lot no. 659182/1757U) into the right deltoid. There was no concomitant medication. The patient is now pregnant. On 18-JUN-2008 the patient had ultrasound done for dating and the result was normal embryo. On an unspecified date the patient had routine blood and laboratory tests done and no results reported. No problems reported. The patient sought unspecified medical attention. Follow-up information has been received from a complete pregnancy questionnaire. The patient was taking prenatal vitamin, 1 tablet daily in the entire pregnancy. On approximately 15-SEP-2008 the patient developed bacterial vaginosis. On 15-SEP-2008, the patient was prescribed metronidazole, 500 mg, twice a day for 7 days for the treatment of bacterial vaginosis on 15-SEP-2008, the patient developed chlamydia. On 16-SEP-2008, the patient was prescribed ZITHROMAX, 1 gram once for the treatment of chlamydia. On an unspecified date, the patient developed Group B streptococcal infection. The outcome of the events was unknown. On 07-FEB-2009, the patient delivered a normal baby girl with no congenital anomalies for complications at the 40 weeks gestation. The baby weighted 7 pounds and 4 ounces. The length was 21 inches (53.3 cm). The Apgar score was 8/9 and the head circumference was 33.5 cm. It was reported that there was no complication during pregnancy and delivery. Additional information is not expected.

MedDRA PT Drug exposure during pregnancy

Symptom Text: Information has been received from a licensed practical nurse through the pregnancy registry for GARDASIL concerning an 18 year old female with asthma and amoxicillin allergy who on 02-JUN-2008 was vaccinated with a first dose of GARDASIL (Lot # 659962/1740U) 0.5 ml intramuscularly. Concomitant therapy included prenatal vitamins. The nurse reported that the patient who received her first dose of GARDASIL is pregnant. No complications are reported. Medical attention was sought. On 19-JUN-2008, ultrasound revealed the patient had 10.1 weeks gestation at that time (gestation also reported as 5 weeks). Date of LMP was 09-APR-2008. Estimated date of delivery is 14-JAN-2009. There was no product quality complaint. Follow up information was received from a licensed practical nurse concerning an 18 year old female who on 02-JUN-2008 was vaccinated with a first dose of GARDASIL (Lot # 659962/1740U). Concomitant therapy included vitamins (unspecified). The LPN reported that on 19-JUN-2008 an ultrasound was performed which showed 10.1 weeks of gestation and confirm due date. On 22-AUG-2008 a routine ultrasound was performed: no problems were seen. The patient declined a Maternal Serum Alpha Fetoprotein Test. Date of LMP was 09-APR-2008. Estimated date of delivery is 14-JAN-2009. Follow up information was received from the pregnancy registry which reported that the patient delivered a normal healthy male baby on 15-JAN-2009. APGAR SCORE 8/9, weight: 8 pounds. The baby had no congenital anomalies, complications or abnormalities. The nurse reported fetal malpresentation and non reassuring fetal heart rate tracing during labor. It was also reported by the licensed practical nurse that the lot no. of first dose of GARDASIL was 661764/0650X (previously reported as Lot # 659962/1740U). Additional information has been requested.

MedDRA PT Abortion, Drug exposure during pregnancy

Symptom Text: Information has been received from an office manager and a physician, for the Pregnancy Registry for GARDASIL, concerning a 23 year old female who on 25-OCT-2007 was vaccinated with a 0.5 mL first dose of GARDASIL (Lot # 658488/1264U). On 22-JAN-2008 the patient was vaccinated with a 0.5mL second dose of GARDASIL (Lot # 659657/1487U). At the end of January the patient had a positive pregnancy test (LMP: 15-Jan-2008, EDD: 21-OCT-2008) and is now two months pregnant. The patient sought unspecified medical attention. Follow up information was received from a healthcare worker who reported that at the time of reporting the patient had not "actually" delivered her baby, although, "everything was fine now." Upon internal review, implied pregnancy loss was considered as an other important medical event. Additional information has been requested.

MedDRA PT Anaphylactic reaction, Food allergy, Lip swelling, No reaction on previous exposure to drug, Pruritus, Respiratory distress

Symptom Text: Information has been received from a nurse practitioner concerning a 16 year old female with history of mild reaction (itching) to orange who on 23-DEC-2008 was vaccinated with the first dose of GARDASIL (Lot# not reported), on 5-MAR-2009 11:00 AM was vaccinated IM with the second dose of GARDASIL (Lot# 655604/0052X) in the upper deltoid. On 05-MAR-2009 the patient had an anaphylactic reaction. The patient left the office at 11:45 AM with no reactions. The patient went back to school, had basketball practice and around 4 PM ate an orange and took a shower. The patient's lips at an unspecified time started to swell. The mother of the patient called the office and the patient went back to the office. The patient arrived at the office at 4:30 PM and the patient went into respiratory distress. The patient was treated with Epipen, Benadryl and a breathing treatment while waiting for the ambulance. The patient's "pulse ox" was 78 when she 1st arrived at the office. The patient's "pulse ox" was 92 or 93 after treatment and when the ambulance arrived. The patient was taken to medical center. The nurse practitioner checked on the patient at 7 PM and the patient had fully recovered and was released that same night. The mother of the patient mentioned that the patient had shown a mild reaction (itching) to an orange before. The nurse practitioner mentioned there had been reports of people having reactions after eating oranges in her center. The nurse practitioner would not giving the 3rd dose of GARDASIL. The patient did not have any problems with the 1st dose of GARDASIL. It was reported that the patient sought medical attention: in the office. Respiratory distress, lip swelling and anaphylactic reaction were determined to be other important medical events, and life threatening. Additional information has been requested.

MedDRA PT Abscess drainage, Injected limb mobility decreased, Injection site abscess, Injection site erythema, Injection site inflammation, Injection site pain, Injection site swelling, Malaise, Pyrexia

Symptom Text: Information has been received from a paediatrician concerning a 16 year old female who was vaccinated with a first dose of GARDASIL (lot# 1316U; batch # NH45640) I.M. into the left upper arm on 16-FEB-2009. Concomitantly, she was vaccinated with a third dose of spring-summer encephalitis virus vaccine (FSME Immun, lot VMR1617F, Man Baxter) I.M. into the left upper arm. On 18-FEB-2009 the patient developed severe injection site inflammation with swelling, redness and pain. On 23-FEB-2009 she developed malaise and fever. The injection site inflammation increased and high inflammatory parameter (not otherwise specified) were detected. On 24-FEB-2009 abscess on the vaccinated arm was detected by sonography. Abscess drainage was performed on the same day and the patient was treated with antibiotics. At the time of reporting the patient still complained about decreased mobility of arm, she had not recovered. The reporter assessed the reaction to be an other important medical event. The reporter assessed the reaction to be related with GARDASIL and not with FSME-Immun. Other business partner's numbers includes: E2009-02381. Additional information has been requested.

MedDRA PT Dizziness, Headache, Hypotension, Lyme disease, Syncope

Symptom Text: Information has been received from a nurse practitioner concerning a 22 year old female with pertinent medical history of birth control who on 24-APR-2008 was vaccinated with first 0.5mL dose of GARDASIL (route not reported, lot number 658556/1060U). Concomitant therapy included TRI-SPRINTEC. The nurse practitioner reported that the patient experienced fainting, dizziness and headache after getting first dose. Subsequently the patient was diagnosed with Lyme disease. At the time of reporting patient had not recovered from the event. No labs studies were performed. The patient sought unspecified medical attention. Follow up information has been received from a nurse practitioner concerning a 22 year old Caucasian female with no illness at the time of vaccination, who on 24-APR-2008 was vaccinated in the right deltoid with first 0.5mL dose of GARDASIL (route not reported, lot number 658556/1060U). Concomitant therapy included TRI-SPRINTEC. The nurse practitioner reported that on a telephone call made by the patient on 27-MAR-2009, she stated that had had dizziness, fainting, low blood pressure and headaches since she received the second dose. The patient did not receive a second dose of GARDASIL. She was diagnosed with Lyme disease and was being treated with doxycycline. The patient received the first dose on 24-APR-2008. There were no complaints at the visit on 25-JUN-2008. On 29-AUG-2008, the patient had her annual exam; she refused GARDASIL but had no complaints at the time. The patient was diagnosed with Lyme disease on Jun-2008. The patient called on 07-OCT-2008 and reported that she fainted in the subway and was taken to an emergency room. It was reported that the patient was being care of elsewhere. Outcome was reported as unknown. Additional information is not expected.

MedDRA PT Fall, Gaze palsy, Malaise, Salivary hypersecretion, Syncope, Tonic clonic movements

Symptom Text: This case was reported by a regulatory authority (#ES-AGEMED-230889440) and described the occurrence of vasovagal syncope in a 11-year-old female subject who was vaccinated with TWINRIX pediatric (GlaxoSmithKline), GARDASIL (non-GSK). On 17 February 2009, the subject received unspecified dose of TWINRIX pediatric (intramuscular, unknown injection site, lot number not provided), unspecified dose of GARDASIL (intramuscular, unknown injection site). On 17 February 2009, less than one day after vaccination with GARDASIL and TWINRIX pediatric, the subject experienced vasovagal syncope. The subject experienced two sickness episodes including fall, tonic clonic movements, maxilla rigidity, sialorrhea and ocular retroversion. During the episodes the subject has the perception of what's going on. It's not clear if there was really It's not clear if there was really loss of consciousness. The regulatory authority reported that the events were clinically significant (or requiring intervention). On 18 February 2009, the events were resolved. The regulatory authority reported that the events were possibly related to vaccination with TWINRIX pediatric GARDASIL. No further information is expected; this has therefore been considered closed.

MedDRA PT Dizziness, Nausea, Viral infection, Vomiting

Symptom Text: Information has been received from a Health Authority concerning a 13 year old female patient with hypothyroidism and no known drug allergies/drug reactions, who on 13-FEB-2009 was vaccinated with the first dose of GARDASIL (Lot # not reported) intramuscularly. Concomitant therapy included LEVOTIROXINA 50.0 ug daily. It was reported that on 16-FEB-2009 the patient experienced dizziness, vomiting and nausea. It was reported that the patient was prescribed corrective treatment with metoclopramide 20-30 mg/day and the treatment was started on 17-FEB-2009. However nausea and vomiting persisted and the patient could not tolerate neither food nor water. It was reported that on 18-FEB-2009 the patient consulted and was diagnosed with a viral infection. It was reported that the patient recovered from nausea, dizziness and vomiting in three days. It was reported that the patient also recovered from viral infection. It was mentioned that previous history of adverse reactions to other drugs was unknown. Other business partner numbers include E2009-02479. No further information is available.

MedDRA PT No reaction on previous exposure to drug, Rash, Skin discolouration

Symptom Text: Information has been received from a gynaecologist concerning a 20 year old female patient who in April 2008, was vaccinated with her first dose of GARDASIL (lot number, site and route not reported) and was well tolerated. In May 2008, the patient received her second dose of GARDASIL (lot number, site and route not reported). Four weeks post the vaccination, the patient developed exanthem from which she recovered on an unknown date with remaining white spots. In Oct 2008, the patient was admitted to a dermatological clinic. At the time of reporting the patient still had the white spots. The reporter was informed about this event at the time of reporting. Up to now he had no hospital report. Other business partner number include: E2009-02386. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Erythema multiforme, Mucocutaneous rash, Skin lesion

Symptom Text: Case received from Foreign Health Authority on 19/03/2009 under reference 2009-00751. It was reported that a 19 years old female adult received her second dose of GARDASIL (date and site of administration not reported. Batch No. not reported) approximately on 27/12/2008. Approximately 15 days later, on 10/01/2009 she experienced erythema multiform with muco-cutaneous involvement. She was seen by a dermatologist, who made the diagnosis and who excluded other potential causes of the symptoms, like concomitant infection, other drugs or other allergies. She was treated with local steroid agents (product not reported). The symptoms lasted three weeks and were resolving at the time of this report. Follow up 17/03/2009. NO flu symptoms which could explain the symptoms. No other medication involved. Herpes infection was excluded. Mycoplasma infection excluded. Skin lesions: mainly the arms and upper body parts. NO lateral lesions, therefore Herpes has been ruled out. The primary reporter and the Health Authority classified this case as "serious". Other business partner numbers include E2009-02430.

MedDRA PT Blood pressure normal, Diarrhoea, Dizziness, Headache, Laboratory test normal, Malaise, Paraesthesia, Vomiting

Symptom Text: Case received from a physician on 20-MAR-2009. A 16 year old female with no relevant medical history reported received the first dose of GARDASIL (batch number not reported) via intramuscular route on 19-MAR-2009. 5 minutes later the patient experienced dizziness during more than 5 minutes. The dizziness disappeared after the torso was bent forward. At 14pm she felt general malaise and sat down. The patient had light brown diarrhoea from after 14pm. At 17pm she felt almost as she would faint and then vomited her lunch (2 chocolate cream sandwiches and a cola). She also felt tingling in her feet considered as paraesthesia by the physician. At 18 pm she went to the hospital emergency. Occipital pain without further description was mentioned. Patient's body temperature was at 37 'C, the physician did not consider it as being clearly fever. Her blood pressure was normal. She had no previous similar episode in the past. She had recovered after spending the night at the hospital for observation. She was discharged on 20-MAR-2009. Lab tests conducted showed normal results with negative salmonella typhi. More information expected regarding other tests and second dose re-challenge. Other business partner numbers include E2009-02534.

MedDRA PT Amnesia, Encephalitis

Symptom Text: This case was reported by a foreign regulatory authority (#DE-Pei-PEI2009005743) and described the occurrence of primary AE in a 16-year-old female subject who was vaccinated with TWINRIX adult (GlaxoSmithKline). Co-suspect vaccinations included (non-GSK) GARDASIL (Sanofi Pasteur MSD) and tick-borne encephalitis vaccine (FSME-IMMUN adult, Baxter). Previous vaccinations included the first two doses of GARDASIL vaccine (non-GSK) (GARDASIL, Sanofi Pasteur MSD), given on 21 November 2007 and 30 March 2008. On 13 February 2009 the subject received the first dose of TWINRIX adult (0.5 ml, unknown, unknown deltoid), the first dose of FSME-IMMUN adult (0.5 ml, unknown, unknown deltoid) and the third dose of GARDASIL (0.5 ml, unknown, unknown deltoid). Approximately 19 days post vaccination with TWINRIX adult, FSME-IMMUN adult and GARDASIL, on 04 March 2009, the subject experienced encephalitis with acute arising amnesia. The subject was unable to recognise attachment figures any longer. The subject was hospitalised for an unknown period of time. The events were confirmed by cranial magnetic resonance tomogram (MRT) including cerebral angiogram, cranial computed tomogram (CCT), cerebrospinal fluid (CSF) examination and serology. By differential diagnosis explicitly not excluded was dissociative amnesia, a psychiatric disorder of the dissociative (conversion) disorder spectrum. At the time of reporting, on 13 March 2009, the events were unresolved. The vaccination courses with TWINRIX adult, FSME-IMMUN adult and GARDASIL were discontinued. No further information will be available.

MedDRA PT Amnesia, Encephalitis, No reaction on previous exposure to drug

Symptom Text: Case received from health authority on 23-Mar-2009 under HA reference no. PEI2009005743. It was reported that a 16-year-old female patient was vaccinated with a third dose of GARDASIL (Batch # NG29050, Lot# 1201U) into the upper arm on 13-Feb-2009. Concomitantly the patient was vaccinated with a dose of FSME-Immun Erwachsene (Baxter, lot# not reported) into the upper arm and with TWINRIX (ERWACHSENE (GSK, lot# AHABB119BA) into the upper arm. On 04-Mar-2009 the patient developed encephalitis with acute amnesia ("she had not recognized closely related persons anymore"). The patient was hospitalized on an unspecified date. Cranial MRI (with angiography), CCT, CSF investigations and serology confirmed diagnosis of encephalitis. According to the reporting physician, a psychic disease of the spectrum of dissociative disorders (dissociative amnesia) was not ruled out. The patient has not recovered at time of reporting. It was reported that the patient received her first dose and second dose of GARDASIL (Lot numbers not reported) on 21-NOV-2007 and 03-MAR-2008, respectively and were well tolerated. Other business partner numbers include E2009-02495.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Bite, Contusion, Convulsion, Delirium, Epilepsy, Loss of consciousness, Psychomotor skills impaired, Tongue haemorrhage

Symptom Text: Information has been received from a physician concerning a 16 year old female with a history of drug hypersensitivity to SUMETROLIM (rash, 1995), AUGMENTIN (rash, 2001) and WILPRAFEN (rash, 1997) who on 29-JAN-2009 was vaccinated with the first dose of GARDASIL, and at 6 am on 16-MAR-2009 with the second. There was no concomitant medication. The patient went on vacation between 27-FEB-2009 and 06-MAR-2009 where she ate much salad, but was not sick. At 11pm at night on 17-MAR-2009 the patient was asleep for 30-60 minutes when her mother heard strange noises from her room and checked on the patient. The patient's tongue was bleeding, she was delirious and was convulsing. Ambulance was called, and the patient was taken to the emergency room. The reporting investigator (gynaecologist who administered the vaccine) wrote on the report that the neurologist (unspecified) feels that the event is not related to therapy with GARDASIL. The below information was included in the patient's discharge report: The patient was taken to the emergency room in the hospital by ambulance. On the night of 17-MAR-2009 the patient lost her consciousness, her next memory is the arriving ambulance staff. The patient's family heard strange noises from her room, ran to her, the patient was delirious and did not recognize her family, her tongue was bleeding. Convulsions were not noted, and by the time the ambulance arrived (about 20 minutes) the patient was generally clear. The patient is normally developed and fed. Oedema, icterus and cyanosis cannot be detected. Mycoderms are normal, tongue normal, on the left side there is a small bruise due to bite, small amount of blood clump. Normal chest and breathing. Normal heart sounds. Normal abdomen. The patient is conscious, clear, oriented. Normal blood pressure, heart rate and ECG. Urgent laboratory examination was performed after midnight. Neurological examination: Based on heteroanamnesis the family found her in her room, most probably she was having an epyleptic attack. In approx. 20 minutes

MedDRA PT Arrested labour, Caesarean section, Cephalo-pelvic disproportion, Drug exposure during pregnancy

Symptom Text: Information has been received from a nurse practitioner, for the Pregnancy Registry for GARDASIL, concerning a 24 year old female with a history of lactose intolerance and 1 miscarriage who on 30-NOV-2007 was vaccinated with a 1st dose of GARDASIL (lot# 659055/1522U). Concomitant therapy included prenatal vitamins. Subsequently, 2 to 3 weeks after getting her vaccination the patient became pregnant (LMP 12-dec-2007). It was reported that on 31-JAN-2008 the patient has an ultrasound, routine obstetrical diagnostic tests, and cystic fibrosis screening (results negative). It was reported that on 28-FEB-2008 the patient had serum alpha-fetoprotein test (results within range). No adverse event was reported. Follow up information was received from a charge nurse who stated that the patient delivered a healthy and normal male, at term, on 16-SEP-2008. It was reported that the patient's labor progressed to second stage, when she had an arrest of descent and was diagnosed with CPD for this birth. It was reported that the patient had a cesarean section. The reporter stated that the patient had an uncomplicated prenatal course, with the usual pregnancy related complains, nothing more. No further information is available.

MedDRA PT Burning sensation, Cerebrovascular accident, Confusional state, Conversion disorder, Dysarthria, Dyskinesia, Hypoaesthesia, Local reaction, Loss of consciousness, Musculoskeletal stiffness, Pain in extremity, Paralysis, Postictal state, Rash, Speech disorder, Tenderness

Symptom Text: Information has been received from a physician concerning a 15 year old female patient with atypical seizure disorder (started following an episode of head trauma) characterized by lip smacking and dysarthria (not tonic clonic movements). She was on treatment for this. On 10-MAR-2009, the patient was vaccinated with the first dose of GARDASIL (Lot # 661841/0653X) in the right buttock and had only minor localized tenderness. Subsequently, in March 2009 the patient developed paralysis, dysarthria, pain in legs and "stroke-like symptoms". In follow-up, the physician reported that on 13-MAR-2009, 3 days after the dose, the patient developed a rash in the distribution of her quadriceps on both legs which lasted 3 days before resolving. ON 17-MAR-2009, 1 week after the dose, the patient developed dysarthria without other seizure symptoms. There were no new medications or change in medications. The patient was admitted to the hospital for evaluation: EEG, CT, CBC, blood chemistries all came back normal. She was discharged without any specific treatment. On 24-MAR-2009, the patient saw her neurologist for the dysarthria. An MRI with gadolinium was negative. That evening at home she stood up and lost consciousness. The patient complained of numbness in her right arm and leg. On 25-MAR-2009, the patient had been complaining of burning pain in the right leg (front and back) without focality. There were no objective physical findings. At the time of reporting, the patient's dysarthria persisted. Upon internal review, paralysis and stroke-like symptoms were considered to be other important medical events. Additional information has been requested. 5/7/09 Hospital notes received from 3/18/09 to 3/19/09. FINAL DIAGNOSIS: Seizure Disorder Unwitnessed seizure, mother states prolonged postictal phase, confused, slurred and repetitive speech. Additional seizure in ED, shaking, eyes rolling, tongue moving, arms flexed. Returned to previous postictal state. PE WNL other than dialated pupils. Consider possible conversion diso

Seriousness: PERMANENT DISABILITY, SERIOUS

MedDRA PT Anaphylactic shock, No reaction on previous exposure to drug, Psychotic disorder

Symptom Text: Information has been received from a health authority (reference number PEI2009004916) via a physician concerning a 16 year old female with a history of developmental delay who was vaccinated with a second dose of GARDASIL (lot # and injection site not reported) IM on 10-JAN-2008. One day p.v., on 11-JAN-2008, the patient experienced an allergic shock. Subsequently she developed an unspecified psychosis. She was hospitalized for ten weeks and recovered "with sequelae" (not specified). First vaccination with GARDASIL on 11-OCT-2007 was well tolerated. Other business partner numbers included: E2009-02497. No further information is available. File closed.

MedDRA PT Dizziness, Dyskinesia, Immediate post-injection reaction, Loss of consciousness, Malaise

Symptom Text: Upon injection, My daughter immediately put her head back and said I don't feel very good. I feel like I'm going to faint. The nurse was standing behind her I was in front of her and she passed out in my arms. The attending nurse and I laid her back on the table and she started to involuntarily jerking. I put my head out of the door and started calling for help. The whole incident lasted less than a minute. I was scared to death. I have never seen an immediate reaction to a vaccine before. I understand that there are three shots to be given. She will not get the remaining two shots. At first I thought my daughter just fainted, When we arrived home we looked up fainting on the internet to reassure my daughter that she would be fine and all I saw was all these web sited on the HPV vaccine. This also gave me cause for concern. I guess at this point I would take my chances with the virus then have my daughter get any more adverse reactions. When I read the side effects on the (What you need to know sheet) It said that the HPV vaccine does not appear to cause andy serious side effects. (?) Then I found all these web sites where people have died and fainted with seizures, Severe illness, Vomiting. None of these symptoms were listed on the (What you need to know) informational sheet. Why not? If I had known any of this she would not have received this injection. I will continue to monitor my daughter through the night. I pray this is all the reaction she will have with this vaccine. Thank you for your time in this matter.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Drug exposure during pregnancy, Foetal disorder, Inappropriate schedule of drug administration

Symptom Text: Information and follow up has been received from a physician for the Pregnancy Registry for GARDASIL concerning a 18 year old female with sulfonamide allergy and a history of low grade squamous intraepithelial lesion who on 12-DEC-2007 was vaccinated with her first dose of GARDASIL (lot# not reported). There was no concomitant medication. On 09-JAN-2008 the patient was vaccinated with her second dose of GARDASIL (lot# not reported) and then learned she was pregnant after a positive pregnancy test. The patient's estimated LMP was 04-FEB-2008 with an EDD of 13-NOV-2008. On 20-MAR-2008 the patient had an ultrasound to check dating. On an unspecified date, the patient began taking prenatal vitamins (unspecified). It was reported that the patient had no previous pregnancies. Subsequently the patient experienced no adverse event and on an unspecified date she sought unspecified medical attention at her physician's office. Follow-up information has been received from a completed questionnaire. On 08-NOV-2008, 38 weeks from her LMP, the patient delivered a live normal male infant weighing 7 pounds 8 ounces via spontaneous vaginal route. The infant was 20.25 inches in length and 13 inches in head circumference, with an Apgar score of 8/9. No congenital anomalies, complications or abnormalities were reported. Medication during her pregnancy included prenatal vitamin (unspecified) once daily. There were no complications, infections or illnesses during her pregnancy and delivery. Pediatric medical records were received and reviewed and the following experience was identified: On 12-DEC-2008, the 35-day-old infant presented to the clinic with his mother. His mother noticed purulent material in his eyelashes for the past month. He was doing well otherwise and had breast feeding every 3 hours. He has not had any fevers, illness or problems with constipation. There was no passive tobacco smoke exposure. Physical examination regarding his eyes revealed: Positive red reflex bilaterally. No conjunctival infection but he has purulen

Other Meds: Vitamins (unspecified)

Lab Data: Ultrasound, 03/20/08, dating; Beta-human chorionic, positive

History: Low grade squamous intraepithelial lesion

MedDRA PT Abortion induced, Drug exposure during pregnancy, Vaginal haemorrhage

Symptom Text: Information has been received from a nurse for GARDASIL, a Pregnancy Registry product, concerning a 21 year old female with no medical history or drug allergy who was vaccinated with the first dose of GARDASIL (lot # 660553/0070X) IM, 0.5ml, on 02-OCT-2008. The patient was pregnant when she was administered her second dose of GARDASIL (lot # 660616/0570X) IM, 0.5ml, on 15-JAN-2009. There was no concomitant medication. No adverse effect reported. The patient performed urinalysis, pregnancy test. Her LMP was 12-NOV-2008. The patient sought medical attention by office visit. At the time of the report the outcome of the patient was unknown. Follow-up information has been received from a physician concerning a patient who had ultrasound on 03-FEB-2009 for vaginal bleeding and the test indicated the fetus was 6 weeks and 3 days intrauterine gestation. The patient had elective termination on 06-FEB-2009 (6 weeks and 6 days from LMP). The products of conception were not examined. It was unknown if the fetus normal. Upon internal review, elective termination was determined to be an other important medical event. No further information is available.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Dyspnoea, Flushing, Pruritus, Pyrexia, Swelling, Urticaria

Symptom Text: Initial case was reported by a consumer to a company representative on 20-MAR-2009. Additional information was received on 24-MAR-2009. It was reported that a 16-year-old female was vaccinated with GARDASIL (batch#, route and site of administration not reported) on 05-MAR-2009. Five minutes after vaccination the patient developed breathing problems, urticaria, and fever. She was treated with BETAPRED (15 tablets), CETRIZINE and BRICANYL. She was sent home in the evening and with prescription of decreasing dose of BETAPRED. On 13-MAR-2009, when the dose was decreased to 2 tablets of BETAPRED, she was worse in the night and in the morning, she went to emergency unit with breathing difficulties, flushing and pruritus. She was treated with an injection of adrenaline (mfr unk), BETAPRED (15 tablets), allergy medicine (mfr unk, one tablet, sublingual) and BRICANYL. She was admitted to hospital during the day. She again started a decreasing medication scheme. On 16-MAR-2009 she was worse again and was treated again with BETAPRED (15 tablets) and cortisone (mfr unk). She was still on medication with cortisone at the time of reporting and was swollen as a consequence of cortisone treatment. Breathing difficult, urticaria, fever, pruritus and flushing were considered to be an other important medical event by the reporter. The patient has allergy to nuts, shellfish, pollen and cats as well as exercise induced asthma. Other business partner numbers include: E2009-02483. No further information is available.

MedDRA PT Carcinoma in situ, Colposcopy abnormal, Dysplasia, Human papilloma virus test positive, Smear cervix abnormal

Symptom Text: Information has been received from a physician concerning a 19 year old female who was vaccinated with unknown how many doses of GARDASIL. On unknown date the patient had positive PAP tests for carcinoma in situ. It was believed that the patient was HPV positive prior to GARDASIL as the patient was sexually active. The patient was in office on 26-MAR-2009. Upon internal review, had positive PAP tests for carcinoma in situ was determined to be an other important medical event. Additional information has been requested. Follow-up from Merck: On 14-APR-2009, in addition to supplying the above information, a nurse reported that this female pt. was seen initially in their office on 14-APR-2008 because of an abnormal PAP with atypical cells. Another PAP was performed on 14-APR-2008 which detected HPV type 18 and 16 by a molecular diagnostic study. The physician then performed a specific type test and type 16 was detected. The final diagnosis was that high grade epithelial lesion (HSIL) could not be excluded. A colposcopy was performed on 30-APR-2008 along with biopsies at 10, 12, 3, and 6 o'clock with ECC. The 10 and 12 o'clock positions showed low grade mild dysplasia. The 3 o'clock position showed high grade mild dysplasia, while the 6 o'clock position showed high grade, carcinoma in situ with ECC High Grade. A cold knife cone biopsy performed on 16-JUN-2008 showed cervical carcinoma in situ, but no invasive tumor was identified. Sylvia reported that a repeat PAP was performed on 22-OCT-2008 which was negative and benign for changes. The patient was scheduled for another PAP on 14-APR-2009. According to the office, the April 14, 2009 pap was negative also.

MedDRA PT Eye movement disorder, Fall, Masked facies, Muscle rigidity, Salivary hypersecretion, Syncope, Tonic clonic movements

Symptom Text: Information has been received from a Health Authority (reference number ES-AGEMED-230889440) concerning an 11 year old female who on 17-FEB-2009 was vaccinated with a dose of GARDASIL (batch number not reported) by intramuscular route (site of administration not reported). The same day the patient was vaccinated with a dose of TWINRIX (batch number not reported) by intramuscular route (site of administration not reported). According to the reporter's narrative, the patient had 2 fainting episode with fall, tonic clonic movements, maxillary rigidity, sialorrhea and ocular deviation. During the episodes the patient was aware of what was happening, thus it is not clear if there was a loss of consciousness. The reporter has coded vasovagal syncope and tonic clonic movements as adverse events. Case reported as serious by the HA with other medically important condition as criteria. Other business partner numbers included E2009-02684. Additional information has been requested.

MedDRA PT Ovarian cyst

Symptom Text: Information has been received from a Health Authority (reference number ES-AGEMED-118715344) concerning a 16 year old female who on 05-JAN-2009 was vaccinated with a second dose of GARDASIL (batch number not reported) route unknown, site not reported. Prior dose of GARDASIL was administered on 04-NOV-2008 by unknown route. It has not been reported whether the patient presented any adverse event after this first dose of vaccine or not. In February 2009, exact date not reported, the patient diagnosed with a fast growing giant ovarian cyst. According to the reporter the event is not related to vaccination, but the vaccination coincides in time with the beginning of first symptoms. Case reported as serious by the HA with other medical important as criteria. Case is closed. Other business partner numbers included E2009-02677. No further information was available.

MedDRA PT Computerised tomogram, Convulsion, Electroencephalogram

Symptom Text: Initial information received on the 26-MAR-2009 by the foreign Health Authority (reference number ES-AGEMED-130888440) regarding a 12 year-old female who was administered on the 16-DEC-2008 a dose of GARDASIL (batch number not reported) by intramuscular route (site of administration not reported). It is reported that several hours after receiving vaccination, on the 17-DEC-2009 in the morning, the patient experienced a convulsion while sleeping, (seen by the patient's mother) thus she was taken to the hospital emergency room. While in hospital the patient presented another convulsion episode. A CAT scan and electroencephalogram were performed on the 17-DEC-2008, results are pending. Currently the case is under study. Case reported as serious by the HA with other medically important condition as criteria. No further information has been reported. Relevant test/laboratory data: A CAT scan and electroencephalogram were performed on the 17-DEC-2008, results are pending. Other business partner numbers included E2009-02672. Additional information has been requested.

MedDRA PT Clavicle fracture, Fall, Haematoma, Immediate post-injection reaction, Injection site erythema, Injection site pain, Loss of consciousness, Tongue biting

Symptom Text: Information has been received from the health authorities in a foreign country under reference number BS20090154 and BS0900145 concerning a 19 year old female with no relevant medical history reported who on 14-FEB-2009 was vaccinated with GARDASIL (batch number not reported) via intramuscular route. During the injection the patient experienced a severe injection site pain, the physician slowed down the end of the injection the patient complaint with injection site pain during the injection. Between 40 to 60 seconds after vaccination the patient fall down from the physician's table, probably a vasovagal malaise with loss of consciousness, frontal hematoma, tongue biting. Arterial pressure was at 11/7, pulse rate at 65. She had an injection site erythematous plaque (diameter=15 cm). The fall induced a fracture of her clavicle leading to the patient's hospitalization. Therefore, at time of reporting the patient had recovered with sequelae. The physician remained very astonished and did not want to vaccine anymore with GARDASIL. The health authorities assessed the causal relationship between the reported reactions and vaccination as "probable" according to the foreign method of assessment. Other business partner number included E200902685.

MedDRA PT Venous thrombosis

Symptom Text: Case received from a foreign health care professional on 23-MAR-2009. It was reported by gynecologyst that a 19 years old female patient with a medical history of heterozygote Factor V mutation was vaccinated with a first dose of GARDASIL (batch # NH06410, lot number: 1068U) IM into the upper arm on 27-MAY-2008. Concomitant treatment include BELLARA since June-2005. On 17-Jun-2008 the patient developed pelvic vein thrombosis with formation of collaterals and was hospitalized on the same day. Antiphospholipid syndrome was suspected. The patient had been treated with MARCUMAR. The patient fully recovered end of JUL-2008. A causal relation to the vaccine considered to be "likely" on the reporting form. Other business partner include E2009-02494.

MedDRA PT Injection site abscess

Symptom Text: Information has been received from an agency, via CSL, as part of a business agreement, concerning a 15 year old female who on 30-MAR-2008 was vaccinated with GARDASIL (Lot # 655423/0597F, Batch # NE43240, Expiry date 26-MAY-2009). Subsequently, after vaccination, the patient experienced injection site abscess which required intervention. The severity of injection site abscess was reported as severe. At the time of reporting to the agency in June 2008, the outcome of injection site abscess was unknown. The agency considered that injection site abscess was probably related to therapy with GARDASIL. The original reporting source was not provided. The agency considered the event of injection site abscess to be medically significant. Additional information is not expected.

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a registered nurse, for GARDASIL, a Pregnancy Registry product, concerning a 20 year old female patient with no pertinent medical history and no known drug allergies who on an unspecified date was vaccinated with the first dose of GARDASIL (Lot # unknown), IM 0.5 mL, and on 11-MAR-2009 was vaccinated with the second dose of GARDASIL (Lot # 659655/0940X) 0.5 mL, intramuscular administration. It was reported that the patient was pregnant and was administered GARDASIL. The patient was given PLAN B which was not effective. LMP was 12-FEB-2009 and EDD was 19-NOV-2009. Laboratory test performed on an unspecified date included PAP smear, GC/Chlamydia and beta hCG. No adverse effect was reported. The patient sought unspecified medical attention. Follow-up information was received from a registered nurse, via telephone call, indicating that the patient was planning to terminate the pregnancy. The nurse reported that the reason for terminating the pregnancy was that the patient and her husband "were not ready for a family". Upon internal review, "Termination of pregnancy" was considered to be an other important medical. Additional information has been requested.

Seriousness: ER VISIT, HOSPITALIZED, SERIOUS

MedDRA PT Arthralgia, Cellulitis, Cough, Dizziness, Erythema, Gait disturbance, Joint swelling, Oedema peripheral, Pyrexia, Rash maculo-papular, Upper respiratory tract infection, Viral pharyngitis

Symptom Text: 2/22/09 to 2/24/09 Fever by report from mom. 2/27/09 Patient began experiencing ankle pain. 2/28/09 Ankle began to swell with redness. 3/1/09 Patient seen in the office with bilateral lower leg swelling and redness from ankles to below knees. Fever 101.7F. Pt diagnosed with cellilitis and started on oral Clindamycin. 3/3/09 Pt continued to have fever to 104 and swelling. Also redness with streaking up bilateral inner thighs noted. Pt referred to ER and was admitted for IV Clindamycin. 3/3/09 to 3/6/09 Pt hospitalized for IV clindamycin with slow partial resolution of swelling and redness. At discharge, pt still had redness on lower 2/3 of lower leg but signifantly less swelling. Pt discharged home on oral Clinda. 3/11/09 Pt had drug reaction on Clindamycin so antibiotic was stopped. 3/18/09 Pt re-evaluated: fading redness on lower legs with minimal swelling mostly localized to lateral right achilles. No pain or tendereness. 3/25/09 Swelling almost completely resolved, redness fading, no pain or tenderness. 4/6/09-records received-office visit 2/28/09-fever 37 degrees 4 days ago, ankle pain, dizzy after receipt of vaccines. 3/1/09-both ankles swollen started 3-4 days ago, no trauma. Cough, Rash on legs only. Bilateral leg swelling and erythema. Assessment:questionable cellulitis. Presented to ED 3/4/09-pain in legs red and swelling of legs. Macular papula rash on belly and chest. Pain when walking. Fever up to 104 prior to arrival. Assessment: cellulitis. 3/25/09 office visit C/O cold.Assessment viral pharyngitis and URI. 4/15/09-records received for DOS 3/3-3/4/09-DX:Cellulitis. Bilateral cellulitis of lower extremities. -C/O painful red legs, 5-6 days history of bilateral leg pain increasing in severity accompanied by fever. Onset as muscle pain without fever then minimal redness and increasing pain.

MedDRA PT Heart rate increased, Hypotension, Presyncope

Symptom Text: This case was reported by a healthcare professional and described the occurrence of near fainting in a 13-year-old female subject who was vaccinated with HAVRIX (GlaxoSmithKline), GARDASIL. The subject's medical history included MRSA infection of the skin. On 2 February 2008 at 09:30 the subject received 2nd dose of HAVRIX (.5 ml, left arm) and the 1st dose of GARDASIL. On 2 February 2008, 12 hours after vaccination with GARDASIL and HAVRIX, the subject experienced near fainting, low blood pressure and rapid heartbeat. The subject was seen in the emergency room. At the time of reporting the outcome of the events were unspecified. On 28 February 2008 follow-up was received via the healthcare professional. She reported that on 02 February 2008, the subject experienced near fainting, low blood pressure and rapid heartbeat. The events resolved on 08 February 2008. On 11 February 2008, diagnostic test for influenza, CBC, ESR and CPK were normal. A CT scan of the head, chest x-ray and EKG were also normal. She considered that the events were not serious and she considered that the events were possibly related to the use of HAVRIX. She also stated that she was unsure which product were suspect.

Other Meds:

Lab Data: Blood pressure, 02Feb2008, low; CBC, 11Feb2008, normal; CT scan, 11Feb2008, normal; Chest x-ray, 11Feb2008, normal; Creatine phosphokinase, 11Feb2008, normal; Electrocardiogram, 11Feb2008, normal; Erythrocyte sedimentation rate, 11Feb2008,

History: MRSA Infection. History: MRSA infection of the skin. No known drug allergies. No adverse events following previous vaccinations.

MedDRA PT Anal haemorrhage, Anogenital warts, Papilloma viral infection, Skin lesion

Symptom Text: Information has been received from a medical assistant concerning her 16 year old daughter who on 11-FEB-2008 was vaccinated the third dose of with GARDASIL. During the last week of February 2009, the patient experienced anal bleeding and approximately 3 lesions around the anus. She was treated by a physician assistant in the office. The lesions were at that time "burned off". One week later the bleeding returned and the daughter had more than 30 lesions around her anus. Follow-up information was received from the physician's assistant concerning the 16 year old female patient with no known allergies and no illness at time of vaccination who on 04-APR-2007 was vaccinated IM with the first dose of GARDASIL (lot #: 655503/0012U) into the left thigh, on 21-AUG-2007 was vaccinated IM with the second dose (lot #: 658556/1060U) into the right thigh and on 12-FEB-2008 was vaccinated IM with the third dose (lot #: 657736/0389U) into the right thigh. In approximately January 2009, the patient developed multiple warts on rectum. On 05-MAR-2009, rectum biopsy was performed. The tissue of genital wart (rectum) was tested. It was reported the specimen consisted of a single tan, irregularly shaped tissue fragment measuring 0.3x0.3x0.2 cm. The surface was regular. The margin was inked black. The physician's diagnose by the rectum biopsy was condyloma. There was viral cytopathic effect characteristic of HPV infection. No high-grade dysplasia was seen. The patient was treated with podophyllin and "hyphinkater". Multiple warts on rectum/condyloma and characteristic of HPV infection were considered to be other important medical events. Additional information has been requested.

MedDRA PT Convulsion, Dizziness, Immediate post-injection reaction, Myoclonus, Syncope

Symptom Text: Initial information received on the 26-MAR-2009 from a Foreign Health Authority (reference number ES-AGEMED-918714344) regarding a 14 year-old female who was administered on 03-FEB-2009 a dose of GARDASIL (lot# not reported) by intramuscular route (site not reported). On the same day the patient also received a dose of DITANRIX (GlaxoSmithKline, route unknown, site not reported). 5 minutes after vaccination the patient experienced dizziness, syncope and a convulsion (as myoclonias). The patient recovered. Before leaving the health center, the patient presented another syncope. The patient was kept in observation for a few hours. She did not present any further symptoms so she was discharged. The mother has informed that the patient normally gets dizzy with needles. The reporter has coded this adverse events as convulsions and syncope. Case reported as serious by the HA with other medically important condition as criteria. Other business partner numbers include: E2009-02690.

MedDRA PT Arthralgia, Condition aggravated, Juvenile arthritis, Oropharyngeal pain, Respiratory tract infection, Rhinorrhoea

Symptom Text: Information has been received from a physician via CSL as part of a business agreement (manufacturer control # CSL 2009 02 23 JV1) concerning a female with polyarticular juvenile arthritis who was vaccinated with GARDASIL. Subsequently the patient experienced a flare of polyarticular juvenile arthritis. The patient is part of a trial conducted by a children's hospital and a flare was defined as more than 40% increase in swollen joint count and a more than 40% increase in patient global assessment. It was reported that an increase in three of six criterion is equivalent to a flare. Follow up information was received from a the physician on 26-MAR-2009 concerning an 18 year old female with no allergies, no adverse experiences following previous vaccination and with osteopenia and nausea secondary to methotrexate and on long term treatment for polyarticular juvenile arthritis, who on 10-OCT-2008 was vaccinated on the left deltoid with the first dose of GARDASIL (Batch J2299, Lot No. 657874/0582U, Expiry date 26-FEB-2010). Concomitant therapy included methotrexate, MOBIC, ondansetron, calcium (unspecified) and calcitriol. The patient developed a respiratory tract infection a few days post immunisation described as sore throat, runny nose and more pain on the joints of the hands. On 15-OCT-2008 the patient experienced a minor flare of arthritis activity. Clinically there was increased activity in several small hand joints but no increase in inflammatory markers. The patient was treated with 2 weeks of oral prednisone with full resolution of symptoms. The reporting physician considered that the minor flare of arthritis activity could be attributed to interrcurrent infection or immunisation. The adverse event of minor flare of arthritis activity was considered to be an other important medical event by the reporting physician. Additional information is not expected.

Other Meds: calcitriol; calcium (unspecified); meloxicam; methotrexate; ondansetron

MedDRA PT Alopecia, Cough, Ear pain, Erythema, Fatigue, Headache, Mononucleosis syndrome, Oropharyngeal pain, Pharyngitis, Upper respiratory tract infection

Symptom Text: Unexplained sudden and severe hair loss resulting in many visits to dermatologists over the last year and a half. This has resulted in meds prescribed by two dermatologists without significant results. Our daughter has also experienced several episodes of mono-like symptoms resulting in visits to the campus doctor and local doctor with negative test results. She continues to be extremely fatigued even when well-rested and has unexplainable headaches. 4/8/09 PCP notes received. Pt seen 3/23/07 for OV with c/o planter's wart on foot, anxiety r/t school work and difficulty focusing, keratosis on arms and allergy sx. PE (+) for allergic facies, boggy nares with some throat drainage. Sent for derm consult and allergy meds prescribed. 1st HPV vax given. Seen again 7/6/07 with c/o URI with ear pain, cough and sore throat. Assess: Nasal Pharyngitis. Per TC with MD-not aware of any AE from vax. Has not been seen since 7/6/07 visit. 4/14/09 Derm consults received. Pt presented 6/19/08 with c/o warts: thumb and plantar, and 8 month hx of hair loss. Generalized hair thinning noted. Warts removed and shampoo rx. Returned 7/10/08 for wart and mole check. F/U 3/19/09 for warts, acne and hair loss from the scalp. PE (+) for circular patches of hair loss with moderate flaking and minimal erythema of the scalp.

Other Meds: Clobex and luxiq foam for hair loss. If no results, the next step is cortisone shots into the scalp.

Lab Data: Continuous and ongoing lab/blood work to determine cause of fatigue, mono-like illnesses and extreme hair loss. Labs: CBC WNL. TSH 1.87 (N)

History: Hives when taking meds containing red dye. PMH: Planter's wart on foot, anxiety r/t school work and difficulty focusing, keratosis on arms and allergy sx. Mono-summer 2007

MedDRA PT Autopsy, Hypertrophic cardiomyopathy, Sudden death

Symptom Text: Information has been received from a physician, via agency, as part of a business agreement (manufacturer control No. GARD 2009 03 27 LS2), concerning a 23 year old female who in November 2008 was vaccinated with GARDASIL. Concomitant therapy included hormonal contraceptives (unspecified) in the form of a vaginal contraceptive ring. On 26-NOV-2008, a few days after vaccination with GARDASIL the patient died suddenly. The cause of death was attributed to hypertrophic cardiomyopathy. It was reported that an autopsy was performed (report not provided). A few days prior to her death, the patient had visited her physician to discuss contraception. She was not taking any other drugs other than contraception and had no underlying conditions or hereditary conditions. The reporter considered that hypertrophic cardiomyopathy was not related to therapy with GARDASIL, stating "I'm sure it was not directly related". Additional information has been requested.

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received via Sanofi Pasteur MSD. Case initially received on 04-Aug-08. It was reported by a gynecologist, for the Pregnancy Registry for GARDASIL, concerning a 16 year-old female with a history of pain in arm and thorax after the first dose of GARDASIL (WAES# 0803USA03005) who was vaccinated with a second dose of GARDASIL (lot no., route, injection site not reported) on 29-APR-08. At the time of reporting the patient was pregnant (gestation week 11), expected date of delivery on 24-FEB-09. So far, the patient had not experienced any adverse event. Follow-up information was received by pregnancy follow-up reporting form on 24-MAR-2009 and by phone call with the gynecologist on 27-MAR-2009. Upon receipt of new information, this case was upgraded to serious: Abortion was induced on the patient's wish in the 11th week of pregnancy. Up to then the pregnancy was timely and without pathologies. Case closed. Other business partner number includes E2008-07430.

MedDRA PT Condition aggravated, Demyelination

Symptom Text: Information has been received from the health authority on 01-APR-2009 under reference number NC20090132. A 26 year old female patient received an injection of GARDASIL (Batch and lot number not reported) in October 2008 and another dose of GARDASIL in January 2009, both doses were administered via intramuscular route. On 09-FEB-2009, the patient presented with a flare of demyelination. At the time of reporting, the patient had recovered. Evolution was favorable. She was giving cortico therapy. The patient had medical history of transitional multiple sclerosis of which first manifestation could date to the adolescence period when she presented an episode of hypoaesthesia of fingers of both hands during several months and resolved after magnesium treatment. Her mother had post partum dysthyroidism. Her sister had auto immune dermatomyositis since the age of 11. The health authorities assessed the causal relationship between the reported reaction and vaccination as doubtful (C1 S1 I1) to the foreign method assessment. Demyelination was considered to be an other important medical event. Other business partner numbers included: E2009-02887. Additional information has been requested.

Seriousness: ER VISIT, HOSPITALIZED, LIFE THREATENING, SERIOUS

MedDRA PT Drug exposure during pregnancy, Induced labour, Pre-eclampsia, Premature labour

Symptom Text: Information has been received from a Nurse Practitioner for the Pregnancy Registry for GARDASIL concerning an 18 year old female patient with no drugs reactions or allergies who on 11-APR-2008 was vaccinated with a first dose of GARDASIL (Lot# not reported). On 18-JUN-2008 she received third dose of GARDASIL (Lot# not reported). On 01-APR-2009 she received third dose of GARDASIL (Lot# not reported). There was no concomitant medication. When the patient received first and second dose of vaccine she became pregnant. The patient experienced pre-eclampsia and the physician had to induce delivery and used magnesium sulfate during labor. The patient was hospitalized. Delivery was at 36 weeks and 4 days. The patient had a healthy baby boy on 27-JAN-2009. In July - 2008 Cervical smear was performed and showed normal results. The patient sought medical attention was at office. The Nurse practitioner considered pre-eclampsia and premature to be other important medical events and life threatening. Additional information has been requested.

MedDRA PT Cervical dysplasia, Drug exposure during pregnancy, Foetal disorder

Symptom Text: Information has been received from a nurse for the pregnancy registry for HPV concerning a female with a history of vulvar condyloma with Trichloroacetic acid (TCA), treatment who was already pregnant when she was vaccinated IM with GARDASIL on 04-FEB-2008. The patient sought unspecified medical attention. At the time of this report, the patient was 9 months pregnant. Follow up information has been received from the physician reporting that other medication during this pregnancy included Prenate Advance and Meningitis (MCVH) immunization on 04-FEB-2008. The patient had a possible kidney stone in summer of 2007 and smoked marijuana during the early pregnancy. On 11-MAR-2008, the patient had a PAP exam which was abnormal/atypical squamous cells of undetermined significance. The patient was also screened for cystic fibrosis for which she was a negative carrier. On 17-MAR-2008, the patient had an ultrasound because she was unsure of her last menstrual period and it was normal, the EDC was 29-SEP-2008. On 21-APR-2008, the patient had a maternal serum alfa-fetoprotein test (AFP) which was normal. On 22-JUL-2008, the patient had sonogram for size less than dates which was normal. On 19-SEP-2008, the patient had another sonogram for size greater than dates which revealed fetal prominence of left renal pelvis. On 04-OCT-2008, the patient delivered a normal male baby vaginally. The baby had the cord wrapped around the left shoulder but there was not a complication. Pediatric medical records were received and reviewed and the following experiences were identified: On 04-OCT-2008 (baby's date of birth the baby's birthweight: 3684 grams (8 lbs, 2 ozs), length was 20.5 inches, head circumference was 35 1/2, apgars: 7/9, temperature: 99.5, Pulse: 144, respiratory rate: 52. The baby was given 1mg of PHYTONADIONE IM and ERYTHROMYCIN ointment to eyes. On examination he was noted to have molding head, bruising and caput left caephalohematoma, and mongolian spot. His skin was pink and he had some acrocyanosis. He passed his hearing

MedDRA PT Dysarthria, Flank pain, Hypoaesthesia, Local reaction, Loss of consciousness, Pain, Paraesthesia, Paralysis, Rash, Tenderness

Symptom Text: Information has been received from via the physician of a patient whose mother found the current case online. The current case concerns a female patient who on an unspecified date was vaccinated with a dose of GARDASIL. The mother of the other patient stated that the current patient had the "exact same problem" as her daughter: minor localized tenderness, developed a rash, dysarthria without other seizure symptoms, had loss of consciousness, complained of numbness and tingling, pain in side, burning pain, paralysis and stroke-like symptoms. The patient sought a specialist. Attempts are being made to verify the existence of an identifiable patient and reporter. Upon internal review, paralysis and stroke-like symptoms were considered to be other important medical events. This is one of several cases from the same source. Additional information has been requested.

MedDRA PT Fatigue, Headache, Hepatitis, Influenza, Jaundice, Myalgia, Photophobia

Symptom Text: Case received from a general practitioner on 01-APR-2009. An 18 year old female patient with no relevant medical history reported received the first dose of GARDASIL (batch number not reported) on 16-MAR-2009. On 25-MAR-2009 the patient experienced muscular pain, fatigue, cephalgia and photophobia. She was hospitalized (unspecified date). As per the physician of the hospital it was an adverse effect linked to the vaccination. On 27-MAR-2009 they diagnosed a flu syndrome. On 31-MAR-2009 she had a subicterus. Biological work-up (unspecified date) revealed increased bilirubin, SGOT at 900, transaminases at 1000, diagnosis was a hepatitis. At time of reporting the patient had not recovered. Other business partner numbers include E200902894.

Other Meds: Unknown

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Activities of daily living impaired, Convulsion

Symptom Text: Information has been received from a physician concerning a 17 year old female who was vaccinated with her second dose of GARDASIL, 0.5 mL, IM. The physician stated that the patient's mother had contacted him and questioned him about the vaccine. It was reported that the patient had been having seizures "almost every day" since getting the second dose. She had been "to a lot of specialists" who had not been able to make a diagnosis. The reporter was not the patient's physician. It was unknown if there were any seizures after the first shot or if they only appeared after it was reintroduced. The patient would not be completing the series. The patient had not been able to go to school because of this experience. As of 01-APR-2009 the patient had not recovered. Laboratory diagnostic studies performed included "all kinds of different tests" (results not provided). Upon internal review the patient's seizure was considered to be an Other Important Medical Event. Additional information has been requested.

MedDRA PT Acute disseminated encephalomyelitis, Multiple sclerosis

Symptom Text: Information has been received from a female who was vaccinated with GARDASIL. The initial reporter's patient received information from a colleague regarding another female who was vaccinated with GARDASIL and subsequently experienced acute disseminated encephalomyelitis or multiple sclerosis. Upon internal medical review, multiple sclerosis is considered an important medical event. No further information is available. Attempts are being made to verify the existence of an identifiable patient and reporter.

MedDRA PT Activities of daily living impaired, Asthenia, Fatigue, Headache, Muscular weakness, Nausea, Presyncope

Symptom Text: Information has been received from a foreign health authority (reference number ES-AGEMED-289273439) concerning a 14 year-old female with no relevant history who was administered on 03-NOV-2008 the second dose of GARDASIL (lot number 0569U, batch number NG39340) by intramuscular route (site of administration not reported). On the 05-NOV-2008 the patient began with nausea (which ceased), asthenia, fatigue, muscular weakness and cephalgias. Currently the patient presents cephalgia, asthenia and muscular weakness, especially in lower limbs, the patient is unable to do sports, also the patient easily gets fatigue. It is reported that upon hospital admission (admission and discharge dates not reported), the patient presented a presyncopal clinical picture. The patient has recovered from the presyncopal clinical picture on an unspecified date. Electrocardiogram, echocardiogram and a brain MRI were performed on 2008 (exact date not reported) with normal results. Other business numbers include E2009-02761. No further information has been reported.

MedDRA PT Asthma, Condition aggravated, No reaction on previous exposure to drug

Symptom Text: Information has been received from a general practitioner on 21-NOV-2008. A 14-year-old female patient with medical history of asthma and who had well tolerated the first dose of GARDASIL (unspecified date) received the second dose of GARDASIL (dose, batch number, route and lot number not reported) in November 2008. 48 hours later the patient experienced a crisis of asthma with difficult recovery. The patient had recovered in a few days. There was no other information. Follow-up information has been received reporting that the patient's mother had eczema. The patient received the vaccine (batch#NH36020, lot# 1526U) via intramuscular route in her left deltoid on 17-NOV-2008. The patient presented with 2 crisis of asthma of moderate intensity within 24 hours (previously reported as 48 hours). She had recovered on an unspecified date. There was no local reaction. She had no concomitant treatment. She had corrective treatment with VENTOLINE which was not very effective therefore the patient also had cortisone orally and antihistamines. The physician suggested her to have antihistamines before the next injection of GARDASIL as a precautionary principle. Follow up information has been received through a letter on 02-APR-2009. Case was upgraded to serious. The patient received a third dose of GARDASIL (dose, batch number, route and lot number not reported) on an unspecified date. 24 hours after, she experienced a crisis of asthma which led her to a short hospitalization. It is noteworthy that she had been given antihistamines the day before the injection. According to the reporter, the crisis of asthma had been provoked by the injection. As the time of reporting, the outcome was not specified. Other business partner numbers include E2008-10845. No further information is available.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Abortion induced, Drug exposure during pregnancy, Inappropriate schedule of drug administration

Symptom Text: Information has been received from a nurse practitioner, for the Pregnancy Registry for GARDASIL, concerning a 15 year old female with iron deficiency anaemia and no known drug allergies who on 27-NOV-2007 was vaccinated intramuscularly with a 0.5 ml first dose of GARDASIL (Lot# 658554/0928U). On 16-MAY-2008, the patient was vaccinated intramuscularly with a 0.5 ml second dose of GARDASIL (Lot# 659964/1978U). The patient was asked if she was pregnant before each dose which she denied. After receiving the second dose, the patient said she might be pregnant. Blood work for pregnancy in the office confirmed the pregnancy (LMP March 2008). There was no concomitant medication. Unspecified medical attention was sought in the office. The patient's outcome is unknown. Follow-up information was received which reported that the patient terminated pregnancy. A phone call was made on 06-APR-2009 but no further information obtained. Upon internal review, the patient terminated pregnancy was considered to be other important medical event. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Caesarean section, Drug exposure during pregnancy, Incisional drainage, Labour complication, Wound

Symptom Text: Information has been received from a physician assistant concerning a 24 year old pregnant female with a history of penicillin allergy who on 12-FEB-2008 was vaccinated IM with the first 0.5 mL dose of GARDASIL (lot # 658556/1060U). Concomitant therapy included vitamins (unspecified). On 26-FEB-2008 the patient was examined in the doctor's office and the pregnancy was confirmed by urine pregnancy test. The patient was referred to an obstetrician for care. No problems were reported. The patient's status is unknown. Follow up information received on 13-MAR-2008. It was reported that the patient a female with a history of depression, upper endoscopy for pill stuck in her throat in 2004, and ex-smoker was given a dose of GARDASIL (lot # 658556/1060U) and she knew she was pregnant. The expected delivery date is 26-OCT-2008. It was also reported that the patient was treated with ZOLOFT for depression and that she stopped therapy with ZOLOFT in August 2007. The patient stopped smoking on 26-FEB-2008. There were no previous pregnancies, full term deliveries, pre-term deliveries, spontaneous abortion, elective terminations or fetal defects. Follow up information received from an outcome pregnancy questionnaire on 02-APR-2009 stated that the patient's husband had Methicillin Resistant Staphylococcus aureus (MRSA). Concomitant medication includes prenatal vitamins started on 26-FEB-2008. The patient had no complications during pregnancy and delivered a normal female liveborn on 04-NOV-2008 at 40 6/7 weeks from LMP, who had 7 pounds 12 oz weight and 21 inches length. Apgar score was 4/8/9 and head circumference was 13 inches. The patient had a C/section due to failure to progress. The patient had a wound and an incision and drainage was performed at the physician's office. The patient was prescribed VICODIN or TYLENOL for pain after the incision and drainage of the wound. Laboratories studies performed include a glucose tolerance test (GTT) on 01-AUG-2008, 83 mg/dl. Follow up information received on 03-A

Other Meds: vitamins (unspecified)

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Dysstasia, Fatigue, Gait disturbance, Hypersensitivity, Lymph node pain, Lymphadenopathy, Malaise, Pain, Pelvic pain

Symptom Text: I had the HPV vaccine Gardisil on March 31, 2009. The next day I was feeling soar and tired, but did not think anything about it. By Friday evening (April 3) I was still feeling tired, my body was aching, in general I did not feel well. I also noticed that my lymph nodes in me neck and groin were very swollen and very painful. This continued throughout the weekend and did not get better. It became very painful to sit, stand and walk. Pain radiated through my pelvis, so I went to an urgent care clinic on Monday March 6th. There I went through a pelvic exam, palpation of my swollen glands, lab work and an ultrasound. I recieved a shot of rochephin and rocephin to take at home for 10 days, in case there was some kind of infection. I have had no fever. My sonogram was normal, other than showing my swollen glands. Labs are not back yet, but I believe they will be normal. However I still have painful swollen neck and groin glands. The groin glands are bothering me the most. 4/13/09-records received for DOS 9/6/08-C/O allergies. 4/6/09-C/O swollen glands and not feeling very good.

Other Meds: I take lo estrin 24 daily, No other daily home medications, No other medications were taken that week, I do recieve allergy shots nut skipped the week of March 31, 2009

Lab Data: Pelvic exam- noramal, palpation of swollen glands, labds including a cbc- results not back, pelvic sonogram- normal, other than swollen glands

History: Seasonal allergies, have been reciebing allergy shots weekly for 3 1/2 years, No allergies to yeast. I have never had a reaction to any vaccine before this one 4/13/09-records received-PMH:migraines.

Seriousness: EXTENDED HOSPITAL STAY, HOSPITALIZED, LIFE THREATENING, SERIOUS

MedDRA PT Abdominal pain, Biopsy bone marrow, Blood bilirubin increased, Diarrhoea, Fatigue, Hepatic enzyme abnormal, Hepatic failure, Hepatitis, Hepatitis viral test, Hepatomegaly, Jaundice, Pharyngitis, Rash erythematous, Rash papular, Rash pruritic, Splenomegaly, Urine analysis abnormal, Urine bilirubin increased, Urobilin urine present, Vomiting

Symptom Text: At time and the months up to March there was no local or systemic reaction to any of the Immunizations given on 12/19/08. On March 3 patient came to the office with s/sx of fatigue, abd pain,and jaundice. UA done showed 3 plus Bilirubin and 2 plus Urobilirubin. She had hepatomegaly and splenomegaly and pharyngitis. Labs revealed Epstein Barr Positive IgG antibody which may indicate a past infection-mono. Patient returned to the clinic with severe jaundice, Negative Hepatitis panel with abnormal Hepatic levels. Was consulted with Pediatric Infectious Disease Specialist, repeat labs showed increases in liver enzymes and bilirubin level and US showed enlarged grossly thickened gallblader wall, mild hepatomegaly and mod splenomegaly. There was no evidence of bilary duct obstruction or pancreatic abnormality noted. Hospital consulted and patient was admitted where her hepatic levels continued to rise as well as her INR. She was at hospital for almost three weeks and a bone marrow was done. She was discharged 4/5/2009 and her hepatic functions and INR are continuing to be monitered. This form is filled out at the request of physicians in the event the vaccines contributed to the illness. We can send copies of hospital visit and labs if needed. Dr. is calling this "seronegative hepatitis". 4/16/09-records received-for DOS 3/17-4/5/09-DC DX:DC DX: Liver failure. Rash. Presented with sudden onset of emesis,l abdominal pain, diarrhea and jaundice 3 weeks prior to admission. Developed erthematous pruritic papular rash.

Other Meds: none

Lab Data: May fax if needed copies of labs and reports 4/16/09-records received-Transaminases elevated. Needle biospy showed acute hepatitis without necrosis. Hepatitis differential diagnosis is infectious versus autoimmune. Skin biopsy showed slig

MedDRA PT Anxiety, Aphasia, Dizziness, Headache, Heart rate increased, Paraesthesia, Vaccine positive rechallenge

Symptom Text: Case linked to non serious case E2009-02945 (same patient, same reporter, different events). Case received from a physician on 12-MAR-2009. The 13 year old female adolescent received on 23-OCT-2008 the first dose and on 27-NOV-2008 the second dose of GARDASIL (Lot #, batch # and site of administration not reported) IM. Four days after the first vaccination she developed headache, paraesthesia and anomia. The patient has the fear to lose consciousness. No itching, skin reactions, no asthma, no swallowing disorders. She recovered after foot reflex zone massage. A few hours after the second dose was administered on 27-NOV-2008 she developed dizziness and paraesthesia and experienced high pulse rate and anxiety. Again she recovered after foot reflex zone massage. Upon internal review anemia was considered a medically significant event. Other business partner numbers include E2009-02182. No further information is available.

MedDRA PT Abdominal pain, Activities of daily living impaired, Anorexia, Anxiety, Arrhythmia supraventricular, Asthenia, Dizziness, Eye pain, Headache, Hypotension, Nausea, Ocular hyperaemia, Sinus tachycardia, Syncope, Tachycardia paroxysmal

Symptom Text: Information has been received on 30-MAR-2008 through a company representative from a health care professional concerning an adult female (exact age not reported) had no allergies or toxic habits and had an appendectomy and plastic surgery breast augmentation with implant, who was vaccinated with the first and second and the third dose of GARDASIL vaccine (batch number not reported) on 31-OCT-2007, 31-DEC-2007 and 29-APR-2008 respectively. According to the report sent by one of the doctors, a cardiologist, it was reported that a few months ago, exact date not reported, the patient visited the doctor due to paroxistic tachycardia, dizziness and syncope. The patient reported that these symptoms began months ago. The first syncope episode occurred on the 31-DEC-2008, the day she received the second dose of GARDASIL vaccine. From that day on, the patient presented a varied clinical picture with several symptoms including asthenia, adynamia, nausea, appetite loss, diffuse abdominal pain, hyperemia appeared in both eyes. Several times a fainting sensation and tachycardia had had preceded the hypotension episodes, these occurred while resting or during normal activity, they were not triggered by a stressful situation. She attended the emergency room several times , due to these events, and the patient would often be diagnosed with an anxiety attack, this fact had hidden and delayed the proper diagnosis. According to information sent by the reporter: Physical examination: baseline ECG, echocardiogram, stress test and Holter ECG were all normal. In the arterial pressure Holter test a sustainable hypotension was found. Several ECG were performed during tachycardia and hypotension crisis, sinus tachycardia and some episode of atrial rhythm was registered, atrial rhythm showed a similar frequency to the sinus. The patient was initially attended by ophthalmologist due to the ocular hyperemia and ocular pain. Initially it was thought to be a pheochromocytoma or a similar tumor vs carcinoid. Routine blood tests with hemogram an

MedDRA PT Crepitations, Feeling abnormal, Subcutaneous emphysema, Wrong technique in drug usage process

Symptom Text: Information has been received in a published article concerning a 21 year old female who was vaccinated with GARDASIL. Subsequently, approximately 2 hours after receiving her GARDASIL, the patient presented to a hospital emergency department complaining of a 'funny feeling' in the skin overlying the left deltoid muscle. There were no other symptoms. Physical examination revealed her to be systemically well. There was a small punctum in the mid zone of the skin overlying the left deltoid muscle, with a surrounding zone of crepitus several millimeters in diameter. Neurovascular examination of the affected limb was unremarkable. A diagnosis of subcutaneous emphysema secondary to quadrivalent HPV vaccination was made and the patient was reassured and discharged. Subsequently, the patient's recovery from subcutaneous emphysema secondary to quadrivalent HPV vaccination was uneventful with complete resolution over 3 days. The author concluded that it appeared that subcutaneous emphysema secondary to quadrivalent HPV vaccination was not related to therapy with GARDASIL itself but due to an error in the injection technique. Additional information is not expected. A copy of the published article is attached as further documentation of the patient's experience.

MedDRA PT Cyanosis, Fatigue, Lethargy, Loss of consciousness, Pallor, Sensation of heaviness, Similar reaction on previous exposure to drug, Syncope, Vaccine positive rechallenge

Symptom Text: Patient is a 16-year-old female who presents today with mother. The patient states she was with her mom earlier getting her prom dress fitted when she blacked out. Her mom states her face when pale and her lips turned blue in color. The patient was out for about 2 minutes. She did not fall to the floor, because her mom was able to hold her up. The patient did stated that she had her knees locked while she was standing. She did say everything went black. When she woke up she did remember where she was at. She was very tired upon waking up and is still very lethargic. She did receive a GARDASIL shot in her right shoulder yesterday and meningitis shot in her left shoulder yesterday. Patient did have a similar episode back in November, the day after her first GARDASIL shot was given. The patient denies any vision changes, headache, nausea, chest pain, shortness of breath, bladder or bowel changes. She states she is still very tired and her legs feel very heavy. 4/10/09 ER record received for DOS 3/13-14/2009 with D/C DX: Syncopal event 2' to Gardasil. Depression. Pt presented after episode where pt had episode of pallor then LOC with lip cyanosis. Similar event after receiving 1st Gardasil vax. PE (+) for pallor and leg heaviness with difficulty lifting legs. Admitted for observation. D/C'd in am after ambulating.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy, Wrong drug administered

Symptom Text: Information has been received from a health professional for GARDASIL, a Pregnancy Registry product, concerning a female who became pregnant during the series of vaccinations. The patient was being seen at a different clinic for the series. The patient received her first dose "a few months ago" (date unspecified). The patient's LMP was 10-Jan-2008. The patient returned to the clinic two weeks ago for a pregnancy test and was inadvertently administered a second dose of GARDASIL. On approximately 20-MAR-2008, the patient was vaccinated with her second dose of GARDASIL (lot number unspecified). Concomitant therapy included PEDIARIX and a third vaccine (name not known at the time of report). The patient has had a urine pregnancy test that was positive and blood work completed. She also had an ultrasound performed on 26-Mar-2008 and the results are pending. The patient has not reported any difficulties thus far. Follow up information was received from a Licensed Practical Nurse who reported that the patient had not returned to her clinic, the patient received her prenatal care at another clinic. The L.P.N had gotten in contact with the patient's mother. It was reported that the pregnancy ended in spontaneous abortion at five months (approximately on 10-JUN-2008). The patient was RH negative and had not received any Rhogam in preparation for the pregnancy. The patient's doctor stated that this was the reason for the miscarriage and that it was not related to the vaccination with GARDASIL. The L.P.N indicated that the patient is pregnant again and "everything was going well with the pregnancy". No further information is available.

MedDRA PT Complication of delivery, Drug exposure during pregnancy

Symptom Text: Information has been received from a registered nurse for the pregnancy registry for GARDASIL concerning a 17 years old female patient with no pertinent medical history and no known drug allergies/drug reactions who in June 2008 was vaccinated with the second dose of GARDASIL. There was no concomitant medication. It was reported that the patient had not received the third dose and it has been determined to be pregnant. it was reported that on 02-FEB-2009 a prenatal ultrasound was performed and it revealed a normal pregnancy. Last menstrual period was approximately 16-JUN-2008 and the estimated delivery date was on 25-MAR-2009. The patient sought medical attention with a office visit. Follow up information from a registered nurse concerning the patient with a history of Chlamydia and no concurrent medical conditions who in June 2008 was vaccinated with the second dose of GARDASIL (lot # unknown). Date of last menstrual period was 18-JUN-2008 and estimated conception date unknown. The estimated delivery date was 25-MAR-2009. Follow up information from a registered nurse concerning the female patient who on 16-MAR-2009 delivered a normal male baby without congenital anomalies weighting 2945 gm, apgar score 6/7 (38 6/7 weeks from LMP). Complications during delivery included nuchal cord x1 (tight), and resuscitation was performed at delivery and the baby was admitted to the special care nursery for grunting. During pregnancy there were no complications, infections or illnesses, and no diagnostic tests were performed. Upon internal review, nuchal cord x1 (tight) requiring resuscitation was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Amenorrhoea, Flushing, Heart rate irregular, Lividity, Paraesthesia, Peripheral vascular disorder, Skin exfoliation, Syncope, Weight decreased

Symptom Text: Information has been received from a general practitioner that his 19 year old daughter was vaccinated with a second dose of GARDASIL (lot number not reported) IM into the upper arm on unspecified date in 2007. "Between 2nd and 3rd vaccination" (third dose of GARDASIL was administered in FEB-2008) the patient experienced amenorrhoea and weight loss 17-18 kilogram up to the time of reporting. Concomitant therapy included hormonal contraceptives. The patient was hospitalized on a not reported date for gynecological and internistic examinations. Results were not reported. a psychotherapeutic investigation was carried out and showed no pathological results. At the time of reporting the patient felt well but suffered still from lost weight and amenorrhoea. Follow up information received on 2-Apr-2009. It was reported by a general practitioner who sent the reporting form and the doctor's letter that the patient was vaccinated with a first dose of GARDASIL, lot# 1339F batch #: N F23310 into the deltoid muscle on 12-AUG-2007. Mid of SEP-2007 the patient developed syncopes, flush and irregular pulse rate. Since May-2008 until Nov-2008 the patient experienced a weight loss of 15 kg. Since Oct 2008, paresthesia of the extremities. Additionally, she developed desquamation of the face skin. On 19-AUG-2008 the patient was referred to the cardiologist. A doctor's letter was provided. It was reported that she experienced recurrent circulatory disorder when sitting or lying. Occasionally, she had lividity of the finger nail and legs. Echocardiography showed normal results as well as ergometry. No indication of a myocardial ischemia induced on effort and circulatory dysregulation. According to the cardiological results there was no indication of a structural cardiovascular disease. The cardiologist assumed that the syncopes were based on a neurocardiogenic cause. No medication was recommended. Laboratory findings showed on 31-OCT-2007 normal values for thyroid (total T3 and T4). On 18-FEB-2008, hepatitis Bs antibody titer showed 3

MedDRA PT Aplastic anaemia, Blood product transfusion, Epistaxis, Fatigue, Gingival bleeding, Headache, Malaise, Nausea, Oropharyngeal pain, Pancytopenia, Petechiae, Pharyngitis, Purpura, Pyrexia, Tachycardia, Transfusion, Upper respiratory tract infection, Vision blurred, Vomiting

Symptom Text: Information has been received from a consumer concerning his 18 year old daughter with no pertinent medical history or no known drug allergies, who on approximately 29-AUG-2008 (reported as last week of August 2008) was vaccinated with the first dose of GARDASIL (Lot not reported). In December 2008 she received the second dose of GARDASIL (Lot not reported). There was no concomitant medication. On approximately 08-SEP-2008 (reported as the second week of September), the patient was diagnosed with aplastic anemia. She was having blood work every week and several other tests were performed. On an unspecified date, the patient stayed in the hospital for 10 days. As of 03-MAR-2009, the patient had not recovered from aplastic anemia. Additional information has been requested. 4/14/09 Received hospital medical records of 2/24-3/5/2009. FINAL DX: very severe aplastic anemia; profound pancytopenia Records reveal patient experienced progressive anemia & fever, HA, blurred vision, sore throat, epistaxis, gum bleeding, nausea, 1 episode of emesis x 1 mo. Developed petechiae & wet purpura, tachycardia, HA. Tx w/IV antibiotics, multiple blood & plt transfusion & immunosuppressive therapy. Gradually improved & d/c to home on oral antibiotics, continued immunosuppresants to be f/u in clinic 4/14/09 Received PCP medical records of 2/21-2/24/2009. FINAL DX: none provided Records reveal pt had been seen in urgent care 2/21 for sore throat, fever, nausea, vomiting, fatigue, malaise. Had been exposed to sick contacts at school. Dx w/pharyngitis & URI.

Other Meds: None

Lab Data: hematology LABS: WBC 1.5(L), ANC 400, H/H 4.7/13.2, plts 3,000. Bone marrow biopsy. Strep & mono c/s neg. CXR WNL.

History: None PMH: asthma, pneumonia x 2 2006 & 2008, oral contraception.

MedDRA PT Abdominal pain, Arthralgia, Asthenia, Diarrhoea, Disturbance in attention, Dizziness, Gastrointestinal disorder, General physical health deterioration, Headache, Iron deficiency, Myalgia, Night sweats, No reaction on previous exposure to drug, Reticulocytopenia, Transfusion

Symptom Text: Information has been received from a health authority concerning a 15 year old female patient who was vaccinated with a second dose of GARDASIL (lot #, injection route and site not reported) on 13-DEC-2008. In January 2008 she developed gastrointestinal disorder, dizziness, asthenia, impaired concentration, headache, muscle and joint pain. In June 2008 the symptoms aggravated. Iron deficiency was diagnosed. The patient was treated with iron preparations and developed abdominal cramps and diarrhea (after intake of iron preparations). In September 2008 blood samples showed persisting iron deficiency and reticulocytopenia. The patient received 6 transfusions. In November 2008 the patient was hospitalized. Gastroscopy and colonoscopy showed normal results. In December 2008 the patient recovered from the gastrointestinal disorder, the other events were persisting. In February 2009 the patient received another 6 transfusions. In March 2009 the patient additionally experienced nocturnal perspiration and her general condition was reduced. The patient had not recovered at the time of reporting. D1 of GARDASIL, lot # not reported, administered on 14-JUN-2007 was well tolerated. Other business partner's numbers includes: E2009-02879. No further information is available. The case is closed.

MedDRA PT Postural orthostatic tachycardia syndrome, Syncope

Symptom Text: Case received from a health care professional on 27-MAR-2009. It was reported by a hospital internist that a 16 year old female who on 02-FEB-2009 was vaccinated with the first dose of GARDASIL (lot #, injection site and route not reported). Approximately 4 weeks post vaccination, the patient developed recurrent syncope. The patient was hospitalized on an unspecified date. Neurological and internal investigations including cranial MRI and Schelling's test showed normal results. The patient had not recovered at the time of reporting. The reporter did not see a causal relation to GARDASIL vaccination. He contacted us on request of the patient's father who had seen a telecast with negative information about GARDASIL vaccines. Previous unspecified vaccinations were well tolerated. Follow-up information received on 01-APR-2009. The reporting form was sent: the patient was vaccinated with a first dose of GARDASIL (lot # 1477U, batch # NH25390), IM into the upper arm. The relapsing syncope occurred approximately since 16-MAR-2009 and lasted "for seconds" each. Postural tachycardia syndrome was evoked. Therapy included "volume therapy" and high sodium diet. The final outcome was unknown to the reporter. File closed. Other business partner numbers include E2009-02696.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Angioedema, Arthralgia, Fatigue, Gait disturbance, Injection site vesicles, Joint swelling, Musculoskeletal stiffness, Pain, Pruritus, Rash generalised, Serum sickness, Urticaria

Symptom Text: Information has been received from a physician concerning a 24 year old female with allergies to tomatoes and pollen, migraine, rhinitis seasonal, deviated septum and band-aids and a history of GERD who was vaccinated with the first and the second dose of GARDASIL July 2007 and October 2008 respectively at her OB/GYN. Concomitant therapy included ADVIL and ORTHO TRI-CYCLEN. The patient developed some reactions a week or 2 after getting the 2nd dose of GARDASIL. The patient experienced swelling of the joints starting from the left knee and then moving to other areas. The patient had stiffness of her hands, angioedema of the lips and generalized urticaria. The joint conditions subsided somewhat and she still had minor stiffness. The welts were still ongoing and itchy. She treated herself with ADVIL as needed, used 1 dose of BENADRYL, and was given an unspecified NSAID. She was just given a new antihistamine, XYZAL on 24-MAR-2009. Around the same time of these events the patient was given an unspecified antibiotics when she had a wisdom tooth removed. Physician was investigating both serum sickness reactions. The patient was seen by a group of physicians throughout the time period of the symptoms. The patient's C reactive protein was slightly elevated. Other labs were pending: CBC panel, latex and food allergies, thyroid, etc. Follow-up information has been received from a consumer who a few days after receiving the second dose of GARDASIL started to experience swelling in her knee, fatigue, and a blister at the injection site. Then she started to develop swelling and pain in other joints which made it difficult to walk. The consumer reported that she saw her primary care physician a few times and thought it may be Lyme disease or lupus, but after a few months of this going on, the patient realized that she received GARDASIL. The patient then saw a rheumatologist in January 2009 and she had blood work done which showed she had elevated C reactive proteins. Around the time she saw the rheumatologist, the patient deve

MedDRA PT Injected limb mobility decreased, Musculoskeletal pain, Pain in extremity, Similar reaction on previous exposure to drug, Sleep disorder, Tendon injury, Wrong technique in drug usage process

Symptom Text: Information has been received from a nurse practitioner concerning a 24 year old female who on 18-FEB-2009 was vaccinated with her second dose of GARDASIL (lot number, route and site not reported). On 18-FEB-2009 when she received this vaccination it was noted that the vaccine was "hard to inject". The patient's left arm became "quite sore" and it became hard for her to raise her arm. She had "deep discomfort". On 26-FEB-2009 the patient was seen by the NP continuing symptoms, sleep problems and pain in the front of her shoulder. An X-ray was negative. A magnetic resonance imaging reported reabsorption in the humeral head and a tiny partial thickness tear of the distal tendon. The diagnosis was possible vaccine injection into the bone. Her complete blood count was normal. The patient also reported less intense pain after her first dose vaccination with GARDASIL (lot number, route and site not reported). The patient did not recover at the time of reporting. Possible vaccine injection into the bone, left arm quite sore, sleep problems and pain in the front of her shoulder were considered to be disabling. Additional information has been requested. 5/12/09 PCP records received. In for routine GYN exam 2/18/09 with normal PE. HPV#2 given in L arm. RN reported injection was difficult. RTC 2/26/09 with c/o worsening arm soreness, now difficult to raise. Pain with ROM on exam, otherwise WNL. tx: ice, NSAIDS. RTC 3/16/09 with continued c/o arm pain, now disturbing sleep. Now localized to front of shoulder joint. Sent for X-rays/MRI which showed a partial bursal side thickness tear of the distal supraspinatus tendon and a partial thickness tear of distal infraspinatus tendon. Assess: Pain in Limb.

Other Meds: Unknown

Lab Data: X-ray, ?/?/09, negative; magnetic resonance, ?/?/09, reabsorption in the humeral head and a tiny partial thickness tear of the distal tendon; complete blood cell, ?/?/09, normal. Labs and diagnostics: MRI L shoulder (+) tendon tear). shou

Seriousness: ER VISIT, HOSPITALIZED, SERIOUS

MedDRA PT Benign intracranial hypertension, Condition aggravated, Dizziness, Electroencephalogram abnormal, Epilepsy, Erythema, Fall, Headache, Nausea, Oedema peripheral, Pain in extremity, Pyrexia, Vomiting

Symptom Text: Client recieved four vaccines on 4/2/09. The client parent requested all vaccine be given in the same extremity due to a previous injury in the other arm and the client fear of being unable to walk if we used the lower extremities. The parent reports that the Right arm was swollen and became very red and sore on 4/4/09. The client also had reported a headache which began on that date and a low grade fever. Her mother treated her with Motrin. On 4/6/09 the mother called to report that the client began vomiting the night before and that her arm was still swollen but not warm to touch and appered to be improving. The mother was advised to take her daughter to her doctor to be evaluated. The client's mother was contacted on 4/8/09 and informed that the client had been admitted to Hospital. On 4/13 futher follow up revealed that the client was home and has been diagnosed with parietal epliepsy. 4/16/09 MR received for DOS 4/8-10/2009 with D/C DX: Morbid Obesity. Pseudotumor Cerebri. Abnormal EEG. Pt initially presented to PCP with c/o dizziness upon standing, one episode of nausea and vomiting, and worsening of chronic H/A (~9 month hx). Pt recently fell out of a chair but did not have LOC. Pt sent to local hospital and transferred to current facility for neuro w/u. Started on Topamax after abnormal EEG. Pt still reporting mild dizziness and H/A at d/c.

Other Meds: None Known.

Lab Data: Blood work and a spinal tap were performed in the hospital. Labs and Diagnostics: MRI brain WNL except maxillary sinusitis. CSF WNL except increased opening pressure. EEG abnormal.

History: None Known PMH: Chronic H/A x 9 months. Bells Palsy 7/2008. Mono 2009. Strep throat. RAD

MedDRA PT Abdominal pain, Chest discomfort, Chest pain, Dyspnoea, Fatigue, Headache, Nausea

Symptom Text: My daughter is 13 yrs old and has received the gardasil vaccine during which before receiving the 3rd vaccine I was notified that there would be some information broadcasted. I did decide not to give her the third vaccine due to her having some of the symptoms which included headaches, abdominal pain, nausea, fatigue, shortness of breath, chest pain or tightness, I have taken her to the emergency room twice this month for those symptoms and the physicians are not sure what is happening and say it could be asthma but I am concerned that it is more than that. Please let me know what else we need to do. Thank you.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Asthenia, Dizziness, Fear, Headache, Injected limb mobility decreased, Injection site mass, Injection site pain, Myalgia, Nausea, Scar, Syncope, Vision blurred, Vomiting

Symptom Text: After first dose, there was a very sharp, deep pain at injection site. When I went to leave office I felt dizzy, nauseous, and vision started blurring and going black. Nurse brought me back into room and I fainted. I awoke a few minutes later and vomited. My vision and steadiness had still not returned for about 30 minutes. A month later, the arm of the injected site was still sore and a deep muscular ache was constant. A very sharp pain would be felt if tried to raise my arm higher than horizontally in front of me. -Parallel to ground. - After two months, I still have discomfort while raising it or moving it up and down, but the pain is less intense. I feel like after the vaccination, I've had a weaker immune system - more susceptible to illnesses- than I've ever been in the past, and a lack of energy. I've had an increase of headaches that are reoccurring. There is still a scar on my arm and a raised bump from the injection. I don not feel safe getting the second or third dose, because I am afraid more serious side effects may likely occur.

MedDRA PT Activities of daily living impaired, Headache, Mental disorder, Nausea, Nervousness, Paraesthesia, Syncope

Symptom Text: It was reported by a gynecologist that a 14-year-old female patient was vaccinated with a third dose of GARDASIL (batch number NH13130, lot number 1172U) IM into the upper arm on 14-AUG-2008. In NOV-2008 the patient developed recurrent syncope, tingling of the legs, headache, nervousness and nausea. The patient was hospitalized on an unspecified date for diagnostics. Neurological and internal investigations including cranial magnetic resonance imaging (MRI) showed normal results. A psychogenic cause was evoked by the hospital physicians. The patient not recovered at the time of reporting. Meanwhile the girl's teachers refused to bear the responsibility, so she cannot visit school anymore. D1 (batch number NH04240, lot number 1113U) and D2 (batch number NH06410, lot number 1068U) of GARDASIL, administered on unspecified dates were well tolerated. Other business partner numbers included E200902921. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Headache, Immediate post-injection reaction, Injected limb mobility decreased, Injection site anaesthesia, Migraine

Symptom Text: Information has been received from a pharmacist concerning an adolescent female with no medical history of migraine who in March 2008, was vaccinated with the first dose of GARDASIL in the arm. Concomitant therapy included hormonal contraceptive (unspecified). At the moment of injection, the patient complained of severe headache. Ever since, i.e. for one year, she has developed regular migraines. Furthermore, she also experienced numbness in the arm of the injection site, sometimes to the point where she cannot lift it anymore. She was given an unspecified antimigraine treatment. At the time of reporting, cerebral scanner was planned within one or two weeks. The patient had not yet recovered. According to the patient's mother, the reported "reactions" were linked to the vaccine, but the physician may have assessed the causal relationship between the vaccine and the reactions as doubtful. The pharmacist considered numbness of limbs, injected limb mobility decreased, and headache to be other important medical events. The pharmacist also considered that the migraines for one year were significant event because disabling for the patient. Additional information has been requested.

Other Meds: Hormonal contraceptives (unspecified)

MedDRA PT Abdominal pain upper, Back pain, Condition aggravated, Fatigue, Headache, Post lumbar puncture syndrome, Vaccine positive rechallenge

Symptom Text: Information has been initially received from a gynaecologist on 17-NOV-2008. It was reported by a gynaecologist that a 16 year old female patient was vaccinated with a third dose of GARDASIL (lot #1427U, batch #NH15200) into the deltoid muscle on 16-OCT-2008. Four weeks post vaccination, the patient developed headache, tiredness and fatigue. The patient was hospitalized on an unspecified date. The events were still persisting for months at the time of reporting and the patient had not yet recovered. Dose one of GARDASIL, (lot #0278U, batch #NF56940) administered on 15-NOV-2007 was well tolerated. The second dose of GARDASIL, (lot #0482U, batch # NG09920) administered on 24-JAN-2008. After the second dose the patient developed headache, tiredness and fatigue 4 weeks post vaccination. Follow up information was received on 06-APR-2009: The hospital report was provided: The patient was hospitalized from 03-DEC-2008 until 10-DEC-2008. One year prior to hospitalization the patient complained of recurrent headache, mainly in the occipital and temporal area. Additionally, she suffered from back pain and upper abdominal pain for 10 weeks. She was treated with omeprazole before admission. On 26-NOV-2008 a cranial MRI in an outpatient department had shown normal findings. In hospital several investigations (physical, laboratory findings, wake EEG, ECG, gastroscopy, ophthalmological and psychological examinations) showed normal results. A lactose and fructose test showed a suspicion of intolerance of lactose and no indication of fructose intolerance. A nutritional advice was performed. CSF puncture showed an increased CSF pressure whereas ophthalmological examination showed no papilledema so that the diagnosis of cerebral pseudotumor could not be established. A further ophthalmolgoical examination control was recommended. The patient was discharged with persisting relapsing headache. On 17-DEC-2008 the patient was hospitalized again. All extended preceding diagnostical investigation did not result in a leading diagnosis. Cur

MedDRA PT Dry skin, Eczema, Erythema, Pruritus, Rash

Symptom Text: States 2-3 days after recieving 1st Gardasil dose in LD, she developed a red, dry, itchy skin rash to left arm, shoulder to knuckles. Also present on knuckles. Self-treated initially with hydrocortisone cream. Seen at health center for same symptoms on 1-27-09. Treated with rx for triamcinolone cream. Diagnosis at that time was eczema. No prior hx of same. Resolved after approx. 2 weeks; student gave this history upon returning for 2nd Gardasil dose on 3-31-09. After discussion with manufacturor and MD, second dose was not given due to the possibility of an allergic reaction and student advised that it would be recommended that she discontinue series at this time. Student given info. sent from Merck as well as CDC and websites for further information.

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a registered nurse, for the Pregnancy Registry for GARDASIL, concerning a 19 year old female who on 21-AUG-2008 and 03-MAR-2009 was vaccinated with her second and third dose of GARDASIL (lot number of the 2nd and 3rd dose was 661952/1129X, the lot number of the 1st dose was 659184/0843X) 0.5ml IM. There was no concomitant medication. The patient had a pregnancy test and was now pregnant. The last menstrual period was 27-JAN-2009. The estimated delivery date was 03-Nov-2009. The patient had not experienced any known symptoms. The patient sought medical attention. Follow-up information has been received from the nurse via a pregnancy questionnaire. The patient with a questionable no previous pregnancies and a questionable history of rheumatoid arthritis on 20-MAR-2009 underwent elective termination (methotrexate). Products of conception were not examined. No further information is available.

MedDRA PT Asthenia, Chest pain, Computerised tomogram, Convulsion, Dizziness, Dyspnoea, Electroencephalogram, Fatigue, Laboratory test, Nausea, Nuclear magnetic resonance imaging

Symptom Text: Information has been received from a consumer concerning her 17 year old daughter with no pertinent medical history and no known drug allergies/drug reactions who on 16-FEB-2009 was vaccinated with the first dose of GARDASIL. Concomitant therapy included meningococcal vaccine (manufacturer unknown). It was reported that "2 hours after getting the vaccine" the patient started having trouble breathing and feeling chest pains. The patient was taken to the emergency room but was not admitted overnight. "A full work up was performed at the emergency room (results not provided), also a computed axial tomography scan, electroencephalography and magnetic resonance imaging were performed (results not provided). It was reported that she had couple more breathing episodes since. The patient also experienced seizure like activity starting on 11-MAR-2009. It was reported that the first seizure was pretty severe and the patient did not calm down until she was given ATIVAN. It was reported that the patient overall was experiencing tiredness, weakness, chest pains, dizziness and nausea. The patient was seen at the practice. It was reported that the patient had not recovered at the time of the report. Upon internal review, seizure-like activity was determined to be other important medical event. Additional information has been requested.

MedDRA PT Drug exposure during pregnancy, Foetal disorder

Symptom Text: Information has been received from an 18 year old female with migraine and no allergies for GARDASIL, a Pregnancy Registry product, who in February 2007, was vaccinated with the first dose of GARDASIL (lot# not reported). Concomitant therapy included vitamins (unspecified). In April 2007, the the patient received her second dose of GARDASIL (lot# not reported) 0.5 mL when she was 2 weeks pregnant. The patient requested a pregnancy test before receiving the shot of second dose however it was never given to her. On 13-FEB-2008, the patient delivered a baby. It was reported that the baby experienced unexplained fever almost every other day as well as seizures. The baby was also congested all the time and was diagnosed with asthma. The reporter felt that the baby's unexplained fever, seizures and asthma were related to therapy with GARDASIL. Unspecified medical attention was sought. Upon internal review, seizure was considered to be an other important medical event. No further information is available.

MedDRA PT Caesarean section, Drug exposure during pregnancy

Symptom Text: Information has been received from a 26 year old female for GARDASIL, a pregnancy registry product, concerning herself with no pertinent medical history or no allergies who in December 2007, was vaccinated with the first dose of GARDASIL. In February 2008 the patient was vaccinated with the second dose of GARDASIL. There was no concomitant medication. In March 2008 she found out she was one month pregnant by doing many pregnancy test which all came out positive. The patient reported that all the sonograms that she had during the pregnancy were normal, and at the time of delivery the babies head was turned in the cervix and the umbilical cord was caught so the patient had a c-section. The patient was at hospital for three days. The patient reported that the baby was delivered on 26-DEC-2008 and the baby was healthy. On 10-APR-2009 the patient was vaccinated with the third dose of GARDASIL. Additional information has been requested.

MedDRA PT Caesarean section, Drug exposure during pregnancy, Herpes simplex

Symptom Text: Information has been received from a nurse practitioner, for the Pregnancy Registry for GARDASIL, concerning a 22 year old female with no medical history and no drug allergies, who on 13-NOV-2007 was vaccinated with a first dose of GARDASIL. On 11-JAN-2008 the patient was vaccinated with a second dose of GARDASIL. There was no concomitant medication. Subsequently, the patient was approximately four or five weeks pregnant. The patient's last menstrual period was 24-DEC-2007 and her estimated delivery date was 29-SEP-2008. It was reported that the patient had not seen a physician but would be seeing a nurse practitioner. No laboratory diagnostics were performed. At the time of the report, the outcome of the patient was unknown. No product quality complaint was involved. Follow-up information was received from the nurse practitioner regarding the outcome of the patient. It was reported that the patient had a primary cesarean section at 37+6/7 weeks secondary to an active outbreak of HSV (herpes simplex virus). The baby weight 2785 grams and had Apgar scores of 9&10. The reporter also stated the baby was fine without any problems. There were no reported complications for the mother or baby. Upon internal review, active outbreak of HSV (herpes simplex virus) was determined to be an other important event. No further information is available.

MedDRA PT Anorexia, Autoimmune thyroiditis, Goitre, Hypochromic anaemia, Malaise, Muscle spasms, Muscle swelling, Myositis, Oedema, Pain in extremity, Pyrexia, Splenomegaly, Weight decreased

Symptom Text: Information has been received from a pharmacist. It was reported that a female patient (age not reported) was vaccinated with a dose of GARDASIL (lot # not reported) on an unspecified date. Subsequently, the patient developed lymphoma (date not reported). No further information on the outcome etc has not been made available at the time of reporting. Further information was requested. Follow up information received on 07-APR-2009. The hospital report, the reporting form and a doctor's letter was provided. It was confirmed that the patient did not develop a lymphoma, this was reported by mistake by the pharmacist. It was reported that the 17 year old female patient was vaccinated IM with a first dose of GARDASIL (batch # NH06410, lot #1068U, injection site illegible) on 30-APR-2008. On 03-MAY-2008 to 31-MAY-2008 and on 03-JUN-2008 to 04-JUN-2008 the patient developed increasing gain and cramps of the calves on effort. Due to these symptoms she was hospitalized from 08-JUN-2008 until 10-JUN-2008. Vein thrombosis was excluded by a specialist. The patient was treated with ibuprofen. After discharged the complaints were persisting. On 20-JUN-2008 the patient was hospitalized again in a pediatric hospital. She had fever and CRP increase of 140 mg/l. Antibiotic therapy with cefuroxime, clindamycin and Vancomycin was initiated. Purulent myositis was suspected. MRI showed an enhancement of the calf muscles. Sonography showed edema of several calf muscle. As the antibiotic therapy was not sufficient enough the patient was transferred to another hospital to clarify by a muscle biopsy the suspicion of an autoimmunologic or vascular disease on 02-JUL-2008. At that time the patient complained of malaise, feeling swollen of the calves, appetite lost and weight loss (6kg) during the last 4 weeks. On 02-JUL-2008 CRP was increased (8.48 mg/dl), Hb was decreased 9.0 g/dl. Autoimmune diagnostic showed ANA slightly increased (1:160), thyreogolobulin and anti-TPO antibodies were increased (478U/ml and 2900U/ml). Serology for enteroviru

MedDRA PT Convulsion, Gaze palsy, Immediate post-injection reaction, Syncope

Symptom Text: Information has been received from an agency, via agency, as part of a business agreement, concerning a 14 year old female who on 11-MAR-2009 was vaccinated with GARDASIL (Lot No. 1283U, Batch No. NJ11440), 0.5 ml, intramuscularly, as prophylaxis. On 11-MAR-2009, instantly after vaccination with GARDASIL, the patient experienced eyes rolling, convulsions and syncope, all of which were reported as not severe. At the time of reporting to the agency in March 2009, the patient had recovered without sequelae from eyes rolling, convulsions and syncope. The agency considered that eyes rolling, convulsions and syncope were probably related to therapy with GARDASIL. The original reporting source was not provided. Upon internal medical review, convulsions was considered to be an Other Important Medical Event.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy, Incorrect route of drug administration

Symptom Text: Information has been received from a registered nurse concerning a 20 year old female with no past drug history, who on 06-DEC-2008 was vaccinated with a 0.5 mL second dose of GARDASIL (lot # 661703/0651X), subcutaneously. There was no concomitant medication. It was reported that in January 2009 the patient had a pregnancy. On 23-MAR-2009 the patient had a spontaneous abortion. There were no laboratory studies performed. On 11-APR-2009 the patient received her third dose of GARDASIL. Follow up information received on 16-APR-2009 from a registered nurse stated that the patient received the first dose of GARDASIL on 03-AUG-2008; second dose on 06-DEC-2008 (lot # 661703/0651X) and third dose on 11-APR-2009 (lot # 661846/1312X). There was no mention of pregnancy at the time of the 06-DEC-2008 dose (second dose). The LMP date was not indicated in the chart, nor was the # of weeks from LMP to the time of the spontaneous abortion (not an elective termination). Also not indicated in the notes was whether or not the products of conception were examined. This was the patient's first pregnancy. Upon internal review spontaneous abortion was determined to be an other important medical event. No further information is available.

Seriousness: ER VISIT, EXTENDED HOSPITAL STAY, HOSPITALIZED, SERIOUS

MedDRA PT Activities of daily living impaired, Akathisia, Anxiety, Anxiety disorder, Asthenia, Bipolar disorder, Condition aggravated, Depression, Discomfort, Exercise tolerance decreased, Fatigue, Muscular weakness, Obsessive-compulsive disorder, Restless legs syndrome, Restlessness, Self injurious behaviour, Suicidal ideation, Tic, Tourettes disorder

Symptom Text: Previous diagnosis to vaccine-Hypothyroidism, Hashimotos,Acid Reflux, Anxiety, Depression, OCD and had occassional eye tics. Exacerbation of previous symtoms such as reslessness, restless legs, fatigue, weakness, eye and neck tics, anxiety, OCD and depression escalated after receiving vaccines. At time of 1st vaccine, pt was on Zoloft for 2 yrs, Synthroid and Nexium. After vaccines, different meds were prescribed by psychiatrist to treat pts symptoms. Beg Oct, it seemed as if everything got worse. Attendance in school affected beg Nov 07 she was barely attending in Dec 07 and officialy diagnosed with mild Tourettes. Everything was atributed to medication/akathasia, as any medical professional who was asked said "no side effects" with the vaccine, since she has a hx of anxiety, everything's assumed to be anxiety,so she was treated purely psychologically. The discomfort was unbearable for her leading to suicidal thoughts. Pt ended up in ER 2x, 1/22/08 admitted to adolescent inpt psych unit for almost 3 weeks, then partial hospitalization completed 4/11/08. After hospital-pt on 8 medications (6 psych). Never fully recovered, previous to vaccines, pt exercised daily for 2 hrs/day-still unable to exercise. Pt returned to school 9/08 with accommodations. Pt again experienced worsening of tics eye/neck and restlessness, muscle weakness and fatigue end of Feb 08. Attendance affected in school and unable to attend for 6 weeks beginning of March-home tutored. I believe that previous ailments were escalated by the vaccine. Still being treated for restlessness, muscle weakness, fatigue...gave #2 on 11-20-07 and #3 on 3-28-08. 5/13/09 Received hospital discharge summary DOS 1/22/08-2/8/08. FINAL DIAGNOSIS: Bipolar Affective Disorder, Generalized Anxiety Disorder, Tourette's Disorder Records reveal restlessness, aggression, suicidal ideation, self-injurious behaviors. Neurological tics. Hashimoto's thyroiditis, esophageal reflux. 5/1/09 Received vaccine & PCP medical records of 11/07-1/09. FINAL DX: none provided R

Other Meds: Synthroid, Zoloft, Nexium at time of vaccine

Lab Data: Brain MRI, EEG-normal; bloodwork done 5/13/09 Received hospital discharge summary DOS 1/22/08-2/8/08. LABS and DIAGNOSTICS: Metabolic panel WNL. TSH WNL. Pregnancy (-). Prealbumin WNL. Hematology, CBC, urinalysis WNL. Blood Mercury WNL.

History: Hypothyroidim, Acid Reflux, Hashimotos, Anxiety, Depression, OCD, eye tics Varicella(Merck) #2 Lot # 1182U given 10/26/07, LA; HPV #2, Lot # 1267U given 11/20/07, IM/LA; HPV #3, Lot #1978U given 3/28/08, IM/LA. 5/1/09 Received vaccine & PCP medical records of 11/07-1/09. Hypothyroidism, 23# weight loss, anxiety, depression, HAs, dizziness. Family hx: parent w/MS, tics, OCD.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Arthritis, Fatigue, Lupus-like syndrome, Myalgia, Vaccine positive rechallenge

Symptom Text: Information was obtained on request by the Company from the agency via a Public Case Detail Form concerning a 22 year old female who was vaccinated with GARDASIL. Concomitant therapy included oral contraceptives (unspecified). Subsequently the patient experienced Lupus-like syndrome, arthritis, fatigue and myalgia which required a visit to the physician. It was described that the patient developed arthritis typical of Lupus, myalgia and fatigue after the first dose of GARDASIL. The patient saw her physician after the second dose of GARDASIL when the symptoms markedly worsened within 2 weeks of the injection. The patient was found to be "seropositive anti-ana + ana". The patient was treated with high dose of oral steroids. At the time of reporting to the agency on 08-JAN-2009, the outcome of Lupus-like syndrome, arthritis, fatigue and myalgia was unknown. It was also reported that the immunologist thought that GARDASIL triggered the Lupus and certainly worsened it. The agency considered that Lupus-like syndrome, arthritis, fatigue and myalgia were possibly related to therapy with GARDASIL. The original reporting source was not provided. Upon internal medical review, Lupus-like syndrome was considered an other important medical event. Additional information is not expected.

Other Meds: hormonal contraceptives (unspecified)

Lab Data: serum ANA, seropositive anti-ana + ana

History: Unknown

MedDRA PT Facial paresis, Vestibular disorder

Symptom Text: Information has been received from a Health Authority (case n. 97302) concerning a 11 year old female patient who underwent surgery (NOS) in November 2008, who on 27-MAR-2009 was vaccinated with the first dose of GARDASIL (Lot # 0779X and Batch # NJ36070) intramuscularly. On 02-APR-2009 the patient presented with right facial hemiplegia, grade II-III on the HOUSE-BRACKMANN scale. She was prescribed rest, prednisone, vitamin B and an antibiotic cream for the right eye. Blood work performed (NOS) within normal limits. ENT consultation: negative. Impendenzometry and audiometry: slight sufference right vestibule. Neuropsychiatric evaluation: right facial hemiparesis. At the time of reporting the patient had not yet recovered. The reporter determined that Hemiplegia (right) was other important medical event. Other business partner numbers include: E2009-03236 and IT155/09. No further information is available. The case was closed.

Other Meds: Unknown

Lab Data: diagnostic laboratory test, blood work (NOS); within normal limits; ears, nose, and throat examination, negative; diagnostic laboratory test, impendenzometry; slight sufference right vestibule; auditory evoked potential, audiometry; slight

Seriousness: ER VISIT, PERMANENT DISABILITY, SERIOUS

MedDRA PT Juvenile arthritis, Musculoskeletal pain, Neck pain

Symptom Text: Initial and additional information has been received from a nurse practitioner concerning a 14 year old female who on 17-OCT-2006 was vaccinated with the first 0.5 ml dose of GARDASIL (lot #: 653735/0688) into the left shoulder. Concomitant therapy included ZYRTEC. In February 2007, the patient developed neck and right shoulder pain, later the patient was diagnosed with juvenile rheumatoid arthritis. The patient was seen by a rheumatologist. On 18-APR-2007, the patient's laboratory test revealed homogeneous antinuclear antibody (ANA) pattern 1 per 80. On 24-APR-2007, the patient's laboratory revealed rheumatoid factor 24.7 and C-reactive protein (CRP) 2.7. On 25-SEP-2007 the patient was seen by another rheumatologist. The patient also saw another physician and a homeopathic physician. On 21-APR-2008, the patient was seen by an orthopedist. On 09-APR-2009, the patient was seen by the physician in the reporter's office. The reporter stated that while the patient was waiting to see the physician, she was seated in a cross-legged position. It was reported the patient's mother request the patient to receive a whole body MRI. The physician was unable to examine the patient due to the patient's pain. The whole body was not ordered by the physician. The reporter stated that she thought the patient's mother was relating the patient's condition to the GARDASIL. Follow-up information was received from a medical assistant in a rheumatologist's office. The medical assistant stated that the patient was first seen the rheumatologist on 18-APR-2007. The patient's laboratory tests revealed a positive rheumatoid factor and a positive anti-CCP (anti-cyclic citrullinated peptide) test. The patient was diagnosed with juvenile rheumatoid arthritis. The medical assistant stated that there was no mention of the patient receiving the GARDASIL vaccine in the physician's notes. The patient was no longer a patient of the rheumatologist. Juvenile rheumatoid arthritis was considered to be disabling. Additional information has been requested.

Other Meds: ZYRTEC

Lab Data: serum ANA protein, 04/18/07, 1/80; serum rheumatoid factor, 04/24/07, 24.7; serum C-reactive, 04/24/07, 2.7; serum cyclic citrulline, 04/18/07, positive

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Leukocytoclastic vasculitis, Pain, Palpable purpura, Proteinuria, Prurigo, Pruritus, Purpura

Symptom Text: Initial information received from on the 06-APR-2009 by the foreign Health Authority (reference number ES-AGEMED-224776332) regarding a 14 year old female who was administered on JAN-2009, exact date not reported, a dose of GARDASIL (batch number not reported) route and site not reported. Two days after vaccination the patient began with pruriginous and painful purpuric lesions on lower limbs. No abdominal pain, no hematuria, no rectorrhagia, the patient presents a catarrhal clinical picture. It is reported that 10 days before the patient presented a catarrhal clinical picture with pharyngeal pain, cough and expectoration which had been treated with PARACETAMOL, IBUPROFEN and ANTITUSSIVES. Blood work performed on the 14-JAN-2009: normal hemogram with normal biochemistry and coagulation, complement normal and Antinuclear antibodies negative. Proteinuria 15.7mgl/dl (normal value <12). On the 20-FEB-2009 she was asymptomatic without skin lesions, acute-phase reactants were normal, hepatic serology was negative. Palpable purpura, proteinuria, pruritis and pain were considered by the reporting business partner to be symptoms of leukocytoclastic vasculitis and were not reported as adverse events, although it was noted that the health authority report included leukocytoclastic vasculitis, palpable pupura and proteinuria as coded adverse events. The Health Authorities did comments of this case: vasculitis is not included in GARDASIL SmPC. Schonlein Henoch are described for other vaccines. A second alternative cause is the catharral clinical picture. Case reported as serious by the HA with other medically important condition as criteria. No further information was received. Case is closed. Other business partner numbers included E20090387. No further information is available.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Activities of daily living impaired, Inappropriate schedule of drug administration, Inflammation, Lethargy, Monoplegia, Nausea, Pain in extremity

Symptom Text: Information has been received from CSL as part of a business agreement. It was reported in a newspaper article dated 31-MAR-2009 that a 17 year old female was vaccinated with her first dose of GARDASIL as prophylaxis. It was reported in the newspaper article that the patient "had been vaccinated twice since the introduction of treatment a month ago". After her first vaccination, the patient experienced a sore arm. After her second vaccination with GARDASIL in approximately March 2009, the patient experienced nausea and a paralysed left arm. Blood tests (not specified) revealed "inflamed, elevated markers". It was reported that the patient stated that she "didn't link the vaccine with the pain I was feeling until after the second shot as side effects can kick in a month after the vaccination." Subsequently, the patient was unable to go to school for one week. The patient consulted a naturopath and her symptoms were treated with a cleansing of her system. At the time of reporting in the newspaper article dated 31-MAR-2009, the patient hoped to return to school that week, despite prolonged lethargy and a "dead" arm. The reporter felt that sore arm, paralysed left arm, prolonged lethargy, nausea and inflamed elevated markers were possibly related to therapy with GARDASIL. Upon internal medical review, the patient's arm paralysis was considered to be an Other Important Medical Event. Additional information is not expected.

MedDRA PT Drug exposure during pregnancy, Foetal disorder

Symptom Text: Information has been received through the Merck pregnancy registry from a Physician's Assistant concerning a female who is social alcohol drinker and smoker who on 11-MAY-2007 was vaccinated IM in the left arm with the first 0.5 mL dose of GARDASIL (Lot #655503/0012U). There was no concomitant medication. The patient received the second 0.5 mL dose via IM of GARDASIL (Lot #658554/0928U) on 22-JAN-2008. The patient reported that she became pregnant. Her LMP is December 2007. Follow up information was received. The patient a female had her last menstrual period on 01-DEC-2007. Her estimated delivery date was reported as 06-SEP-2008. The patient had no previous pregnancies. Follow-up information was received from the 18 year old mother who on 15-SEP-2008 delivered a full-term, health and normal girl, weighing 9LBS 7 OZ. She had an uncomplicated, spontaneous vaginal delivery. She said her pregnancy was fine-there were no complications. The baby was doing well, and was diagnosed at 3 month with "some eczema". The baby had gotten treatment (not specified) for the eczema and was ok with no problems. The mother stated that she was also well and had recovered from the pregnancy without any complications. No further information is available.

MedDRA PT Drug exposure during pregnancy

Symptom Text: Information has been received via the Merck pregnancy registry, from a registered nurse, concerning a 15 year old female patient, who on 03-MAR-2008 was vaccinated with a dose of GARDASIL (lot # not reported). During the appointment, the patient mentioned that her period began on 02-MAR-2008. However, after the physical exam, the physician ordered a pregnancy test, and the results were positive (date of LMP and gestation details were not provided). On 03-MAR-2008, a physical exam and urine pregnancy test were positive. No systems have been reported. Information has been received from a physician concerning a 14 year old female with eczema, asthma, left clubfoot and refractive error with a history of 0 pregnancies and 0 live births and a history of bacterial infection due to streptococcus, group b and positive for Chlamydia trachomatis and gonococcus, who on 03-MAR-2008 was vaccinated with first dose of GARDASIL (dose, route not reported, lot number 659657/1487U). Concomitant therapy included FLOVENT and albuterol. The physician reported that on 05-JUN-08, the patient delivered a normal, healthy female baby weighing 7 pounds 8 ounces. A hearing test was performed on 05-JUN-2008 and 06-JUN-2008 and failed for right ear both times. Apgar score was 8/9. Hearing test was performed again on 24-FEB-2009 and the patient passed the test for both ears. No further information is available.

Other Meds: albuterol; FLOVENT, 110 microgm

MedDRA PT Drug exposure during pregnancy, Herpes simplex

Symptom Text: Information and follow up information have been received from a nurse practitioner for the Pregnancy Registry for GARDASIL concerning 23 year old female who on 15-FEB-2008 was vaccinated intramuscularly with her first dose of GARDASIL (lot# 659655/1486U) and was pregnant. Other medications used during pregnancy included PRENATE ELITE taken daily during entire pregnancy and VALTREX which was from 20-MAR-2008 to 23-MAR-2008 for the treatment of herpes simplex. The patient's LMP was 19-JAN-2008 with an estimated due date of 25-OCT-2008. She had a positive pregnancy test and on 06-MAR-2008 a fetal ultrasound for dating (results were within normal limits). The patient was seen in the doctors office. Follow up information has been received from a nurse practitioner concerning the now 24 year old female patient who on 03-NOV-2008, 42 weeks after her last menstrual period delivered a healthy and normal baby female, weight: 8 pounds 5.2 ounces, and height: 20.08 inches. Apgar score 8/9. There were no congenital anomalies, complications or abnormalities. Additional information is not expected.

Other Meds: PRENATE ELITE

MedDRA PT Drug exposure during pregnancy, Labour complication, Urinary tract infection

Symptom Text: Information has been received from a certified medical assistant concerning a 16 year old female who on 27-FEB-2008 was vaccinated with her first dose of GARDASIL (658094/0524U) and is now pregnant. Concomitant medication included DOXYCYCLINE from 03-MAR-2008 to 05-MAR-2008 and ZITHROMAX on 06-MAR-2008 for the treatment of Chlamydia and ORTHO TRI-CYCLEN. The patient's LMP was 25-JAN-2008 with an EDD of 01-NOV-2008. The patient sought medical attention in the office. Follow up information has been received from a complete questionnaire for the pregnancy Registry for GARDASIL from a Physician concerning a 16 year old female with cervical dysplasia. During the second trimester of pregnancy in approximately April 2008, the patient experienced a UTI (urinary tract infection) and treated on 16-APR-2008 with ROCEPHIN. On 04-NOV-2008 there was an occiput posterior (OP) position of the infant and a vacuum assisted delivery was necessary. The patient delivered a normal, healthy female baby weighting 7 pounds 2.3 ounces. Additional information was received on 27-MAR-2009, from a certified medical assistant who stated that the patient delivered the baby and the outcome was "fine/normal". Additional information is not expected.

MedDRA PT Drug exposure during pregnancy, Foetal disorder

Symptom Text: Information has been received through the Merck pregnancy registry, for GARDASIL, concerning a 14 year old female patient with attention deficit disorder and no drug allergies reported, who on 07-APR-2008 was vaccinated with the first dose of GARDASIL (Lot # 659964/1978U). Concomitant therapy included a dose of HAVRIX, a dose of MENACTRA and RITALIN. Subsequently, it was reported that the patient was pregnant at the time she received the GARDASIL. At the time of this report, the patient is presently fourteen weeks pregnant. The patient did not have any adverse experiences as a result of the vaccine. The patient sought unspecified medial attention. A pregnancy test was performed. At the time of this report the patient's outcome was unknown. No product quality complaint was involved. Follow up information indicated that the patient delivered a 6.8 pound normal baby boy on 03-NOV-2008 at 39 weeks. There were no complications, abnormalities or congenital anomalies. The patient also used vitamins and calcium during pregnancy. Pediatric medical records were received. On 12-NOV-2008 the 9 day old baby went in for a pediatric visit. The newborn screen results were normal. The birth history included the baby being induced due to possible leakage. The Apgar score was 8/9.5. The physician commented the baby was alert and looking about. The assessment was the baby was back to the birth weight. The plan was feeding and G&D was discussed. Weight check was in 3 weeks. On 26-NOV-2008 at the age of 3 weeks the baby came in for a well child visit for weight check and growth. There was occasional spitting. The baby was having bowel movements daily; does grunt/cry with stooling. Diluted juice was used if needed. There were no hard stools now but did have. The baby was waking up 2 to 3 times a night. Impression was a 3 week infant with excellent growth. Discussed stools - normal versus constipation. Discussed fever and illness again. Call if any concerns. On 17-DEC-2008 at the age of 6 weeks. There was no spitting. Bowel Movement was

MedDRA PT Drug exposure during pregnancy

Symptom Text: Information has been received from a certified medical assistant for the Pregnancy Registry for GARDASIL concerning a female who on 26-MAR-2008 was vaccinated intramuscularly with her first dose of GARDASIL (lot# not reported). There was no concomitant medication. On 28-MAY-2008 the patient was vaccinated intramuscularly with her second dose of GARDASIL (lot# not reported) and was pregnant. The patient's LMP was approximately 15-APR-2008. Subsequently the patient experienced no known symptoms. The patient has a positive pregnancy test on 10-JUN-2008. The patient's outcome was not reported. Follow-up information has been received from a physician for the Pregnancy Registry for GARDASIL concerning the 25 year old female with asthma and anxiety, a history of 1 pregnancy and 1 normal delivery and a history of vaginal disorder and some complication on 26-MAR-2008 was vaccinated IM with the first dose GARDASIL, on 28-MAY-2008 was vaccinated with the second dose and on 11-MAR-2009 was vaccinated with the third dose (lot #: 660553/0070X). The patient became pregnant in April 2008, the date of last menstrual period was 18-APR-2008, estimated delivery date was 25-JAN-2009. On 22-JAN-2009 the patient delivered a normal, female infant with no congenital anomalies. The baby's weight was 7 LB 14.5 ounce, length was 21.75 inch, head circumference was 14.25 inch. Apgar test score was 8/9. On an unspecified date, group B strep test of the infant was positive. Initial complete blood count secondary to group B strep positive was 9 band. C-reactive protein test was negative and blood culture was negative. At the time of this report, bandemia resolved. No further information is available.

Other Meds: None

Lab Data: diagnostic laboratory, group B strep positive (baby); beta-human chorionic, 06/10/08, positive; Apgar score, 8/9, baby; complete blood cell, 9 bands;bandemia (baby); serum C-reactive protein, negative (baby); blood culture, negative (baby)

MedDRA PT Drug exposure during pregnancy

Symptom Text: Information has been received from a medical assistant for the pregnancy registry for GARDASIL concerning an 18 year old female with no known allergies or pertinent medical history who on 31-OCT-2007 was vaccinated IM with the first dose of GARDASIL 0.5 ml. There was no concomitant medication. The medical assistant reported that on 31-OCT-2007 the patient received her first dose of GARDASIL and was subsequently determined to be pregnant. On 18-JAN-2008 Urine pregnancy test was performed (result:positive). Last menstrual period was reported as October 2007. The patient sought medical attention, "office visit". There was no product quality complaint. The patient has not received her second or third dose of GARDASIL. Follow-up information has been received from a physician concerning the patient. It was reported that the patient had a spontaneous vaginal delivery of a healthy normal-appearing male on 16-JUL-2008, at term. The baby's APGARS were 8 and 9. The mother had a normal prenatal course, with normal fetal anatomy survey at 20 weeks estimated gestational age, though the spine was not fully visualized due to the fetal positioning. The mother was treated with antibiotics in labor as she was found to be group beta strep positive in her urine prenatally. The mother was seen again for a postpartum visit in August 2008: she was doing well and reported that the baby was also doing well. No further information is available.

Other Meds: None

Lab Data: fetal monitoring tests, normal anatomy survey: 20 weeks EGA; urine beta-human, 01/18/08, positive; urinalysis, GBS +

MedDRA PT Drug exposure during pregnancy, Headache, Muscle spasms, Pollakiuria

Symptom Text: Information has been received from a registered nurse (R.N.) for the pregnancy registry for GARDASIL concerning a female patient who on an unspecified date was vaccinated with the second dose of GARDASIL (Lot #, date and route not reported). It was reported that the patient received the second dose of GARDASIL just before finding out she was pregnant. The patient sought medical attention at the office. Follow up information was received from a Registered Nurse (R.N.) concerning a 16 year old white primigravida female patient with history of chickenpox, no known drug allergies and with allergy to dogs and birds, who on 24-NOV-2008 was vaccinated with the first dose of GARDASIL. On 22-JAN-2009 the patient received the second 0.5 ml dose of GARDASIL intramuscularly into the upper right arm. It was reported that the patient received the second dose of GARDASIL when she was pregnancy. Concomitant therapy on 24-NOV-2008 included a 0.5 ml dose of DTP (+) Poliovirus vaccine inactivated (+) Tetanus toxoid intramuscularly into the upper left arm. It was reported that the patient was taking contraceptives pills (unspecified). It was reported that the interval of the menstrual period was 28 days, the duration was normal and the patient had experienced cramps in the past. It was reported that on unspecified date (present pregnancy) the patient experienced cramps, headache and urinary was high frequency. The blood pressure was measured and the result was 102/58. The last menstrual period was on 12-DEC-2008 and the estimated delivery date was on 18-SEP-2008. Family history was reported, hypertension and diabetes (grand mother and grand father), multiple pregnancy (mom). Additional information has been requested.

Other Meds: DTP

MedDRA PT Incorrect route of drug administration, Injection site pain

Symptom Text: Information has been received from a nurse concerning a 9 year old female patient with a history of migraine headaches and no known drug allergies who on 24-FEB-2009 was vaccinated with her first dose of GARDASIL (lot number 661766/0652X, site not reported) by subcutaneous route for prevention of the human papilloma virus. There was no concomitant mediations or past drug history. The nurse reported that the patient was fine, no syncope, and the injection site looked fine. There was no relevant laboratory date. As of 24-FEB-2009, it was unknown if the patient would continue to get GARDASIL injections and the patient was fine. Follow-up information was received from the nurse indicating that the patient was given GARDASIL Subcutaneous in her right arm in error and the patient experienced pain at the injection site which lasted for 2 days. There were no further problems. No further information was available.

MedDRA PT Activities of daily living impaired, Convulsion, Fatigue, Gaze palsy, Myalgia, Mydriasis, Syncope, Unresponsive to stimuli

Symptom Text: Initial information has been received from a physician and follow up information has been received from a registered nurse concerning a 15 year old female with no medical history, who on 14-APR-2009 was vaccinated with a first dose of GARDASIL (lot # 661846/1312X). There was no concomitant medication. The patient had blood work drawn a few minutes after receiving the vaccination. After the blood work was drawn. The patient fainted for approximately 15 seconds and may have had a minor seizure. The patient's eyes rolled to the back of her head and she became unresponsive for about 15 seconds. It was reported that her pupils were dilated and she was out for about 15 seconds. The patient regained consciousness and was given juice to drink. No medications or treatment were given to the patient. The patient stated that she did not have much to drink prior to the physician's visit. The patient was not hospitalized. The patient was observed for a little while and then was sent home with her mother. It was reported that the patient stayed home from school the next day and reported she was tired and had some muscle aches. On 15-APR-2009 the patient's mother was instructed to call the physician back if the patient continued with any problems. The physician advised the patient not to receive the remaining doses of GARDASIL. The patient did not receive any other vaccinations other than GARDASIL on 14-APR-2009. The patient had an appointment to see the physician on 07-MAY-2009. Upon internal review seizure was determined to be an other important medical event. Additional information has been requested.

Symptom Text: Case reported by health authority (case n. 97347) through a foreign health authority (local case n. IT157/09). Initial report received on 14-APR-2009. An 18 year old female was vaccinated on 08-JAN-2009 with the first dose of GARDASIL (Lot # 1475F, batch n. NF35170). On 10-FEB-2009 she presented with paresthesia of the lower left limb and of the IV and V finger of the left hand, demyelinating encephalomyelitis was hypothesized. She was hospitalized and treated with steroid i.v. It was also reported that the patient was vaccinated with the second dose of GARDASIL (batch n. reported as NG22820 which was valid for montelukast sodium (MSD) 4 mg tablet) on 12-MAR-2009. During admission a brain and bone marrow Magnetic Resonance Imaging (MRI), evoked potential and rachicentesis were performed (results not reported). The final outcome was not reported. Other business partner numbers include E200903277.

MedDRA PT Apraxia, Condition aggravated, Convulsion, Disorientation, Headache, Hypoaesthesia, Hypokinesia, Malaise, Muscle twitching, Mydriasis, Pallor

Symptom Text: My daughter received her second GARDASIL vaccine and had 2 30-45 second seizure 15 minutes after the injection in the doctors office on the floor. She became pale, disoriented, her pupils were dilated and she kept saying she doesn't feel good thereafter the whole night long. She experienced a glaze for hour after, slow movement numbness to both legs and a headache and has twitching in her left arm still at the present time. I took her to the ER on my own judgement because the pediatrician said there was no need this was normal following this vaccine and she had bloodwork drawn and now has to have an EEG today. Something has to be said to this company. 5/5/09 Received medical records DOS 1/2/09 to 4/23/09. Includes imminzation records. FINAL DX: Seizures Two 'quick seizures' post vaccination. Also several episodes of eyes rolling, and twitching.

Other Meds:

Lab Data: A neurologist had received her results today I have to go see him in the office to find out where we go from here. We left the er after 5 hours and were exhausted so they said I didn't have to wait for the results she was negative the neur

History: She is learning disabled, she has apraxia, sensory integration dysfunction, and had a run of myoclonic seizures 5 years ago.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Asthenia, Convulsion, Gaze palsy, No reaction on previous exposure to drug, Pallor, Tremor

Symptom Text: Information has been received from a nurse concerning a female with no known drug allergies, asthma, verbal aphasia, sensory integration disturbance, developmental delay and myoclonus and a history of seizure (but the last one was in 2005) who on 21-Apr-2009 at 16:15 was vaccinated with the second dose of GARDASIL (lot# not reported) (lot# 661846/1312X). 0.5ml IM. The nurse reported that there was no adverse event after the patient was vaccinated with the first dose of GARDASIL (lot# not reported). On 21-Apr-2009 at 16:15 the patient experienced mild seizure which lasted about 15 seconds after she was vaccinated with the second dose of GARDASIL. The patient went to a Hospital for a follow up. It was unspecified if she was admitted to the Hospital. Additional information was received from the physician's nurse manager (a registered nurse) reported that this event was probably already reported by the patient's mother (a nurse) or by pharmacist friend of the mother. In follow up the physician reported on 21-Apr-2009 at 16:15 the patient experienced mild seizure. The patient was waiting in the room for 5 minutes. The mother of the patient stated the patient was fine. The patient had no known reaction to the first dose of the vaccine. After her second dose, she went down when nurse got to side and noticed shaking event, eyes rolled back and patient sat up immediately. The patient was responsive to her name. The patient was made to lay down for 15 minutes, secondary to weakness and pallor. The patient wakened sitting up for 10 minutes. The patient required emergency room visit and recovered. Upon internal review, mild seizure was determined to be an other important medical event. No further information is available.

MedDRA PT Hypoaesthesia, Pain in extremity

Symptom Text: Information has been received from a physician concerning a 19 year old female with penicillin allergy who on 19-FEB-2009 was vaccinated IM into the left arm with a first 0.5 ml dose of GARDASIL (661046/0546X). Concomitant therapy included hormonal contraceptives (unspecified). On 19-FEB-2009 the patient experienced pain and numbness in left arm and forearm. The patient sought medical attention at physician's office on 26-FEB-2009. No lab test were performed. The patient was told to take ADVIL and to call the office if her symptoms did not improve within a week. The physician has not heard from the patient. As of 2-MAR-2009, the patient's outcome was unknown. It was reported that the patient did not want to continue the series. Additional information has been requested.

MedDRA PT Amenorrhoea

Symptom Text: Information has been received from a nurse concerning a 13 year old female who on 26-AUG-2008 was vaccinated with her first dose of GARDASIL 0.5 ml, IM. The patient received her second dose of GARDASIL 0.5 ml, IM on 2-NOV-2008 and her third dose of GARDASIL 0.5 ml, IM on 3-MAR-2009. She mentioned she had not had a menstrual period "since my last dose of vaccine". Her last menstrual period was "at the end of November 2008". A urine pregnancy test performed in the office on 3-MAR-2009 was negative. A serum pregnancy test had been ordered but the results were pending. The patient's absence of period persisted. Additional information has been requested.

MedDRA PT Lichen nitidus, No reaction on previous exposure to drug, Rash generalised

Symptom Text: Information has been received from a physician assistant concerning a female under 18 year old who on unspecified date was vaccinated with her third dose of GARDASIL (lot number, route and site not reported) About 6 weeks after the third dose of GARDASIL the patient broke out in a rash all over her body. The patient had gone to a dermatologist who diagnosed the patient with lichen nitidus. The physician assistant was not sure if it was from the GARDASIL since the patient had no reaction with the first and second dose of GARDASIL, but the dermatologist believed it was from GARDASIL. Subsequently, the patient recovered from lichen nitidus. Additional information has been requested.

Seriousness: ER VISIT, LIFE THREATENING, PERMANENT DISABILITY, SERIOUS

MedDRA PT Activities of daily living impaired, Alopecia, Amnesia, Anxiety, Asthenia, Autoimmune disorder, Condition aggravated, Disturbance in attention, Dizziness, Dyspnoea, Fatigue, Fibromyalgia, Flushing, Headache, Hyperhidrosis, Hypoaesthesia, Insomnia, Musculoskeletal stiffness, Myalgia, Pain, Presyncope, Raynauds phenomenon, Vision blurred, Visual impairment

Symptom Text: autoimmune disease fibromyalgia, raynods, numbness, flushing/sweats, anxiety,headaches, exhaustion to the point where its impossible to work, total body pain constantly,hair loss, vision problems,stiff and sore muscles,insomnia, trouble focusing and concentrating, memory loss, weakness, trouble breathing,and dizziness near syncope. All the side effects happened and intensified during December through January so I had an anti nuclear antibody blood test that was positive revealing the autoimmune disease fibromyalgia and raynods. My ANA blood test has come back positive several times. The doctors put me through a ridiculous amount of tests to try to figure out a diagnosis and why this had come out of nowhere. They thought I had at one point every different type of autoimmune disease including lupus but settled on FIbromyalgia with raynods and the possible beginnings of Lupus. I have to frequent a rheumatologist, neurologist,and primary care doctor several times a month. The side effects have made me very weak and unable to live my life normally, its hard for me to work. I teach children which take a lot of energy when I have none what so ever. I used to be strong and able to work out and ride horses and live a healthy active lifestyle, now I cannot enjoy any of it. My body is in such pain all the time that its impossible for me to have a normal life. I wanted this vaccine to help prevent problems, when all it did was destroy my life.

Other Meds: pentoxifllyne,

Lab Data: positive anti nuclear antibody blood test.

History: Fibromyalgia, raynods, beginnings of lupus.

MedDRA PT Confusional state, Dizziness, Dyspnoea, Foaming at mouth, Grand mal convulsion, Headache, Mitral valve incompetence, Nasal congestion, Nausea, Salivary hypersecretion, Tricuspid valve incompetence, Unresponsive to stimuli

Symptom Text: Initial and follow up information has been received from a consumer, a certified medical assistant and medical records concerning the consumer's 18 year old female daughter with no pertinent medical history and no drug reactions or allergies. The patient did not smoke or drink. There was no related family history and no history of seizure disorder in the family. On 02-FEB-2009 she was vaccinated with the first dose of GARDASIL (lot # 661766/0652X) and seemed fine. On 07-APR-2009 the patient was vaccinated with second dose of GARDASIL (lot # 661766/0652X). There was no concomitant medication. On 15-APR-2009 the patient stated that the first thing she remembered before having an apparent seizure witnessed by her parents was waking up feeling that she had a lot of saliva in her mouth, so she went to the bathroom to wash her mouth out and then her parents were in another room and heard a sound. They walked into the bathroom and found her having a tonic/clonic seizure that, in their estimation, lasted 5 minutes. She was foaming at the mouth was unresponsive initially and the seizure resolved on its own. Initially, after the seizure ended, she was quite confused, and gradually, since being brought in by ambulance, she had become less and less confused and was able to converse and now knew the date. She initially only knew the President's name. The patient complained of headache that was mild to moderate. She denied any weakness. She had been getting a workup done recently for dizziness. She had no other associated symptoms. She was slightly nauseous. She was treated with Zofran and morphine. She had an echo, which showed some abnormalities with mitral and tricuspid regurgitation, which seemed mild. An EKG was done, which showed sinus rhythm with a rate of 75. No ischemic changes. CBC showed a positive normal CBC, negative UA, normal comprehensive metabolic panel, negative beta HCG. A urine toxicology screen was only positive for opiates. She was given morphine in the emergency department for her headache. CT of head wa

MedDRA PT Dizziness, Injection site erythema, Injection site papule, Tinnitus

Symptom Text: Information has been received from a nurse concerning a 17 year old female patient who on 28-FEB-2009 was vaccinated with the first dose of GARDASIL (lot number and route not reported) in her arm. After receiving the vaccination, the patient felt dizzy and had ringing in her ears. So the office had the patient lay down for 10 minutes with an ice pack on her head and then she was "ok" to leave the office. The nurse stated that on 5-MAR-2009 the patient called the office and stated that she woke up with a red bump on her arm near the injection site. The patient was told to put ice on the bump and if the bump would not go away or get worse by the weekend then she should call the office back. The red bump on her arm persisted at the time of this report. Additional information has been requested.

MedDRA PT Abdominal pain upper, Activities of daily living impaired, Anorexia, Asthenia, Back pain, Chest discomfort, Chest pain, Condition aggravated, Constipation, Diarrhoea, Dizziness, Dysmenorrhoea, Dyspnoea, Ear discomfort, Eructation, Eustachian tube dysfunction, Fatigue, Gastrooesophageal reflux disease, Haemorrhage, Headache, Influenza like illness, Initial insomnia, Malaise, Nausea, Pyrexia, Rash, Sinusitis, Somnolence, Stress, Throat tightness, Upper respiratory tract infection, Vomiting, Weight decreased

Symptom Text: Information has been received from a consumer concerning a her daughter 21 year old with penicillin allergy and no pertinent medical history who in June-2008 was vaccinated with first dose of GARDASIL (Lot # not provided) 0.5ml, intramuscularly. After the patient received first dose of vaccine she experienced nausea and recovered from rash. On 20-SEP-2008 the patient received second dose of GARDASIL (Lot # not provided) 0.5ml, intramuscularly. There was no concomitant medication. Then after the patient received second dose of GARDASIL she became nauseous again, developed a fever, and had headaches "all the time". It was reported that she no longer had the fever but she still felt nauseous and had headaches. She also "had no energy", "no appetite" and lost 25 pounds. She received NEXIUM and Omeprazole and "each one worked for a day" and then stopped working. She also received ZITHROMAX for her fever and she developed a rash after she stopped taking it. Blood test was performed to check her stomach and her gall bladder (results not reported). At the time on the report on 07-JAN-2009 the patient was recovering. The patient sought unspecified medical attention. Follow up information was received from doctor's office and medical record. It was reported that the patient had variable bleeding from 02-APR-2008 to 06-MAY-2008 and moderate bleeding 22-MAY-2008 to 17-JUN-2008. On 17-JUN-2008 the female patient with cyst and always bowel problem was vaccinated with a first dose of GARDASIL (Lot # 660393/0067X) 0.5ml, intramuscularly into left deltoid. She was having some menstrual irregularity at the time of her first vaccination. Since she had no bleeding when she was on DMPA. On 14-JUN-2008 her bleeding was very light. At that time she was prescribed FEMCON. The physician's impression was that the patient had abnormal uterine bleeding. On 19-AUG-2008 she was vaccinated with the second dose of GARDASIL lot # 660612/0229X into right deltoid IM. Approximately on 19?AUG-2009 the patient experienced nausea, anorexia, low grade

Symptom Text: Case received from Health Authority in a foreign country on 15-APR-2009 under Health Authority reference No. PEI2009007468. It was reported that a 20 year old female patient with a medical history of nasal septum deviation, pollen and house dust allergy and cachexia was vaccinated with a second dose of GARDASIL (Lot # 1068U, batch # NG42070) IM into the upper arm on 02-MAY-2008. Concomitant treatment included hormonal contraceptives. Several hospital reports and reports of findings were sent by the patient's parent to Health Authority. Short after vaccination the patient experienced rhinitis, dizziness and tiredness. Few dates later she developed fever and "circulatory breakdown" twice. She was admitted to the hospital first time from 15 till 17-MAY-2008. At that time she complained of pain in the area of the ethmoidal sinuses (face) and showed signs of exsiccosis. Examinations (MRI sinuses) revealed diagnosis of polysinusitis. Additionally she suffered from a urinary tract infection and an unspecific inflammation / infection on the left foreleg (possible insect bite). Inflammatory laboratory parameters were increased. Antibiotic treatment with UNACID and inhalations were started. The leg was treated with LAVASEPT bandages. She was discharged in "almost recovered" condition. The patient was hospitalized again from 19-MAY-2008 till 04-JUN-2008. At that time she suffered from a high-feverish infection, acute sinusitis and urinary tract infection. Additionally reactive arthritis and reactive pericarditis was diagnosed as well as euthyroid sick syndrome. The general condition was reduced. The patient complained of abdominal pain, arthralgia, chills, sore throat and headache. Fever raised up to 40 C. Enterococcus faecium was found in nasal secretion and urine. Abdominal sonography, blood culture, electrocardiogram, echocardiography showed initially normal results. Electrocardiogram follow up on 23-MAY-2008 revealed negative T-waves in III, VI - V4. Diagnosed of secondary pericarditis in the scop

Other Meds: hormonal contraceptives (unspecified)

MedDRA PT Back pain, Bacteriuria, Chills, Haemangioma, Headache, Malaise, Muscle rigidity, Nervousness, Pyrexia

Symptom Text: Information has been received from a health care professional on 13-APR-2009 concerning a patient who vaccinated with GARDASIL (batch number NJ0020) was in hospital, the reporter was unable to identify a patient or the adverse reaction at the time. On the 14-APR-2009 further information was received. The patient an 18 year-old female was administered on the 06-APR-2009 the second dose of GARDASIL route and site not reported. The reporter was unaware of the patent's adverse event, but confirmed that the patient was hospital admitted. On the 15-APR-2009 the doctor was contacted, who did not want to give any information until he had the report. On the 16-APR-2009 the doctor, who had not yet sent any information regarding the patient, was contacted again. The doctor only informed that the patient was very nervous, he believed that it was due to a lumbar punction. He would send the report. According to the hospital report received on the 17-APR-2009 the patient, a female who was vaccinated on the 06-APR-2009 with the second dose of a GARDASIL route and site not reported. The patient was allergic to pantomicine and Atypical background. She didn't have toxic habits. The patient had ovarian cysts, she is currently being treated with oral contraceptives. She was a smoker, 15 cigarettes per day. The patient has been taken fluoxetine, lorazepam, ketoprofen, DIANE, AUGMENTIN, scopolamine, Itraconazole, ciclopirox, ibuprofen, Hidroxyl b1, b6, b12, INZITAN and TORADOL. After vaccine administration, approximately one hour later, the patient started with an oppressive frontal cephalea that evolved into a hemicraenal cephalea which lasted all night long. On that same night the patient presented with shivers and general malaise. The patient took Paracetamol GELOCATIL to treat adverse effects. The next morning the patient continued to have a headache, which was spreading to the back area, and also presented fever. These symptoms did not cease with GELOCATIL thus the patient was taken to the emergency room. According to the hospital

MedDRA PT Convulsion, Vaccine positive rechallenge

Symptom Text: Information has been received from an agency as part of a business agreement, concerning a 17 year old female who was vaccinated with a dose of GARDASIL (date not reported). Subsequently the patient experienced convulsions. Subsequently the patient recovered from convulsions. On 03-FEB-2009 she was vaccinated with another dose of GARDASIL (Batch # NJ11440, Lot # 1283U). On 17-FEB-2009, less than one month after vaccination the patient experienced another episode of convulsions and was hospitalised which was reported as severe. At the time of reporting to the agency in March 2009, the patient had recovered without sequelae from convulsions. The agency considered that the second episode of convulsions was possibly related to therapy with GARDASIL. The original reporting source was not provided. Upon internal medical review, the first episode of convulsions was considered an other important medical event. Additional information is not expected.

MedDRA PT Haemoptysis, Malaise, Wegeners granulomatosis

Symptom Text: Information has been received from foreign Health Authority (H.A. Ref # 0901268). Additional information was received from the Health Authority on 15-Apr-2009. It was reported that the 15 year old woman was vaccinated with GARDASIL (second dose, batch number not reported) on unspecified date in June-2008. Health Authority reported Wegner's granulomatosis (causality unclassified) with onset 3-NOV-2008. It was reported that a previous healthy patient developed malaise and bloody rheum about 4 months after the second dose of GARDASIL. She was evaluated at the ear-nose-neck department was hospitalized at the rheumatologic clinic. High resolution Computed Tomograhy (HRCT) showed bilateral infiltrate corresponding to the diagnosis Wegener's granulomatosis. Sinus computed tomography indicated a swelling in the nose ventricle with bilateral bone destruction in the bone wall to sinus maxilaris. The clinical picture reminded of vasculitis. Patho-anatomical diagnosis (PAD) indicated a severe inflammatory cell infiltration but there was no suspicion of malignity. After the final result from HRCT the diagnosis was changed from a limited Wegener's granulomatosis to Wegener's with lung affection. The patient started treatment with PREDNISOLON, PFIZER and METHOTREXAT, Onion. A position regarding CYCLOPHOSPHAMIDE, BAYER treatment was planned. Results for lab analysis performed on unspecified date: S-ANA (antinuclear antibodies) via ELISA was negative, S-ANCA (Ig G) (Anti-Neutrophil Cytoplasmic antibodies) was positive, S-P-ANCA (Ig G) was negative, S-PR3-ANCA (Protinase 3) a.b. (Ig G) quantity was 200 E/ml (ref <10), S-ANCA-MPO (Myeloperoxidase) a.b. (Ig G) quantity was <20 E/ml (ref <20), S -cArdiolipin -a.b. (Ig G) was <10 E/ml (ref <10) and S-Cardiolipin -a.b. (Ig M) as <7 E/ml (ref <7). The patient received first dose of GARDASIL in April-2008 and no adverse reaction was reported. The outcome was at the time of reporting not yet recovered. No further information was available. Other business partner include E2009-03255. Case

MedDRA PT Asthenia, Haematoma, Muscle spasms, Panic attack, Paraesthesia, Syncope

Symptom Text: Information has been received from Health Authority (H.A. Ref # PEI2009007496). This case was linked with serious case E2009-03313 (same patient, different reactions after first dose of the vaccine). (WAES# 0904USA03128). It was reported that a 16 year old female patient was vaccinated with a second dose of GARDASIL (lot number:1113U, batch number:NH04240, injection route not reported) into the left upper arm on 6-MAY-2008. Two weeks post vaccination, the patient experienced paraesthesia, generalised muscle cramps, asthenia, panic attacks. Six weeks post vaccination, the patient developed hematoma at the right thigh medial and the crook of the right arm. Ten months post vaccination, the patient developed syncope of unknown origin. The patient was admitted to hospital for diagnostics 3 times in total. Diagnostics include cranial MRI, ophtalmological and ENT examination, EEG, ECG and lumbal puncture, results were not reported. The patient recovered from haematoma after one week, all other symptoms were ongoing at the time of reporting to Health Authority 7-APR-2009. The patient received her first dose of GARDASIL, lot number:0253U, batch number:NF58540 on 4-MAR-2008 and experienced recurrent headache, dizziness and staggering, nausea and diarrhoea two weeks post vaccination (see case E2009-03313). The patient had also not recovered from these symptoms at the time of reporting to HA (7-Apr-2007). Other business partner include E2009-03313, E2009-03314.

Other Meds: Unknown

Lab Data: magnetic resonance imaging, Cranial MRI-results not reported; ophthalmological exam, Results not reported; spinal tap, Results not reported; otorhinolaryngologic surgery, Results not reported; electroencephalography, Results not reported; e

MedDRA PT Epilepsy, No reaction on previous exposure to drug

Symptom Text: Information has been received from a general practitioner concerning a 16 year old female who was administered her first dose of GARDASIL (Lot# not reported) on an unspecified date was well tolerated. On 17-JAN-2008 she was vaccinated with a second dose of GARDASIL (lot# 0352U; batch # NG00320) IM into the left upper arm. On 22-MAR-2008 the patient experienced three epileptic fits and was hospitalized on the same day. She was treated with antiepileptics (not otherwise specified). The patient recovered after 1 day. A neurologist assessed a possible relationship to therapy with GARDASIL. Other company numbers included: E2009-03323. No further information is available.

MedDRA PT Loss of consciousness, Tonic clonic movements

Symptom Text: Information has been received from a health care professional via SPMSD concerning a 14 year-old girl who was vaccinated on 08-APR-2009 with the second dose of GARDASIL (batch number not reported, route and site of administration not reported). It is reported that on the 11-APR-2009, the patient presented with loss of consciousness and tonic clonic movements events ceased after a few minutes. It is reported that the patient was at the beach when the events occurred. The patient was taken to the emergency room for a check-up. The patient was in perfect condition, she did not require any assistance or treatment. The case has been sent by the reporter to the Health Authorities, with other medically important condition as criteria. Loss of consciousness and tonic clonic movements were determined to be an other important medical event. This case is linked to case E2009-03320 (WAES # 0904USA03476, same reporter, same product, same adverse event). Other business partner numbers include E2009-03321. No further information is reported. Case is closed.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Dyskinesia, Feeling cold, Gaze palsy, Pain in extremity, Pallor, Skin discolouration, Unresponsive to stimuli

Symptom Text: Patient seated on a chair in exam room one with mother and younger brother present. Patient given HPV, Tdap, and Menactra vaccines at 4 pm by RNs. Patient chatted following the vaccine, said her arms really hurt, and was encouraged to move her arms using a small stacking toy, which she did. I discussed with patient's mom the vaccines and providing Tylenol/Advil to patient as needed. Toy suddenly fell onto the floor; patient's head leaned back against the wall, and patient's eyes rolled back into her head. Patient's mother shook her and spoke her name loudly several times with no response. Patient's color was becoming pale and slightly green. Patient's right hand briefly clenched into a fist and flexed at the wrist. I asked support staff to call 911 and ambulance was requested. Patient's mother and I lowered patient to floor and placed head onto floor and elevated legs onto chair. Patient opened eyes and eyes focused on us. Pulse and BP taken by RN and results were normal. RN made ready and available anaphylactic reaction medical protocol supplies. Patient covered with blanket and cool compress applied to forehead. Supervisor RN observed patient and noted that patient was now responding verbally and respirations were normal; ambulance request cancelled. Patient stated she was cold. Patient said she had not eaten much for lunch. Patient's coloring returned to normal. Patient's pulse continued to be normal. Patient assisted to a sitting position on the floor, given sweatshirt to wear, and drank 8 oz water. Patient assisted to standing position at 4:45 pm. Mother instructed to monitor patient's breathing and to take patient to ER immediately if breathing problems developed. Patient said she felt well enough to walk. Patient left to return home with mother and brother.

MedDRA PT Convulsion, Inappropriate schedule of drug administration

Symptom Text: Information has been received from Health Authorities (reference number ES-AGEMED-320844341) regarding a 37 year old female who on 14-APR-2008 was administered the second dose of GARDASIL (batch number not reported) by intramuscular route (site of administration not reported). On 02-OCT-2008 the patient suffered a generalized convulsive crisis. She recovered on the same date (02-OCT-2008). The patient had a demyelinating disease, later on it had been diagnosed as a possible multiple sclerosis. After the first episode no other seizures had been registered, the patient was being treated with KEPPRA anticonvulsive medication 500 every 12 hours. The patient received the first dose of GARDASIL (batch number not reported, route and site of administration not reported) on 14-FEB-2008. It hadn't been reported whether the patient had had any adverse event after this first dose or not. Case reported as serious by the HA with other medically important condition of convulsive seizure as criteria. Other business partner numbers include: E2009-03500. No further information is available. The case is closed.

MedDRA PT Petechiae

Symptom Text: Information was obtained on request by the company from the agency, via a Public Case Details forms, concerning a 25 year old female who on 19-DEC-2008 was vaccinated with GARDASIL IM (therapy dose, site and lot # unknown). Concomitant therapy included LEVLEN ED. On 30-DEC-2008 the patient experienced petechial rash on legs and was hospitalized. Laboratory investigations included Hemoglobin of 14.0, "pit" of 1, WCC of 9.1, Neutrophils of 7.76, and viral and immune disease screen non-contributory. The patient was given PREDNISOLONE 50mg daily. Subsequently, on 04-JAN-2009 the patient recovered. The reporter felt that petechial rash on legs was possibly related to therapy with GARDASIL. The original reporting source was not provided. Additional information has been requested.

Other Meds: LEVLEN ED

MedDRA PT Osteomyelitis, Swelling

Symptom Text: Information has been received from a health care professional concerning an 11 year old female patient who on an unspecified date was vaccinated with a dose of GARDASIL. It was reported that the patient called the next day after receiving GARDASIL with complaints of swelling. It was reported that this adverse event occurred four to five months ago (approximately in December 2008). It was reported that two weeks later the patient was at the office and was referred to the Emergency Room and was provided antibiotics. The patient was identified with osteomyelitis and was hospitalized for three to four days. It was reported that the patient had recovered at the time of the report. Additional information has been requested.

MedDRA PT Influenza like illness, Pyrexia

Symptom Text: Information has been received via a Health Authority from a pharmacist who was informed by the patient's mother that her adult daughter (18 to 20 years old) received an injection of GARDASIL (lot # not reported and number in series of the dose were unknown) via intramuscular route on 27-FEB-2009. On 28-FEB-2009 the patient presented with important fever and flu-like syndrome qualified as resistant to antibiotics. At time of reporting the outcome was unknown. Very few information, the case was reported to the pharmacist by the patient's mother. The patient was lost to follow up, no more information could be obtained. Case reported as serious due to the necessity of consultation and treatment. The health Authorities assessed the causal relationship between the reported reaction(s) and vaccination as "doubtful" according to the method of assessment. The case is closed. Additional information is not expected. Other business partner numbers include E2009-03502, NT20090221 and NT0900233.

MedDRA PT Cheilitis, Cytomegalovirus test negative, Echocardiogram normal, Hypotonia, Incorrect route of drug administration, Inflammation, Mononucleosis heterophile test negative, Myalgia, Pain, Palmar-plantar erythrodysaesthesia syndrome, Pyrexia, Rash vesicular, Skin exfoliation, Strawberry tongue, Toxoplasma serology negative

Symptom Text: Information has been received from the health authorities under the reference number NY20090213 NY0919283 concerning a 16 year old female who in February 2009, was vaccinated with the second dose of GARDASIL (batch number not reported) via subcutaneous route instead of intramuscular route (exact date not provided). 15 days after vaccination, the patient experienced an abrupt bout of fever at 40.7 centigrade degree, associated with a palmoplantar erythema, a cheilitis with strawberry tongue, myalgias and a decrease of muscle tone in the hands associated with pain when bending fingers. It was noteworthy that the patient also complained of a microvesicular eruption of both trunk and abdomen on an unspecified date. There was no adenopathy nor organomegaly. Cardiopulmonary auscultation revealed normal and cardiac ultrasonography without any particularity. Biological work-up showed an inflammatory syndrome with C-reactive protein at 200mg/L. Toxoplasma, cytomegalovirus and infectious mononucleosis serologies revealed negative. Antibiotherapy was given as corrective treatment. The inflammatory syndrome resolved, but desquamation at the palm of the hands and decrease of the muscular tone persisted. The patient was hospitalized. The evolution was unknown. The health authorities assessed the causal relationship between the reported reactions and the vaccination as "doubtful" according to the foreign method of assessment. Other business partner numbers include E200903501. No further information is available. The case is closed.

MedDRA PT Loss of consciousness, Tonic clonic movements

Symptom Text: Information has been received from a health professional via a company representative concerning a 14 year old female who on 23-MAR-2009 was vaccinated with the second dose of GARDASIL (batch number not reported, route and site of administration not reported). On 09-APR-2009 the patient experienced tonic clonic movements and loss of consciousness, and these events ceased after a few minutes. The patient was taken to a private clinic for a check-up. The patient was in perfect condition, she did not require any assistance or treatment. Loss of consciousness and tonic clonic movements were considered to be other important medical condition. No further information is available. The case is closed. Other business partner number included: E200903320.

MedDRA PT Immediate post-injection reaction, Musculoskeletal stiffness, Pain in extremity, Pallor, Tremor

Symptom Text: Client received Tdap without any symptoms of concern. Then, immediately after HPV vaccine was given, the client complained that her arm hurt. She turned her head away and when I checked on her(within seconds), her upper body stiffened and her head and arms started shaking. She was very pale. Shaking lasted 15-30 seconds, then her eyes were opened very wide and she seemed to be aware that something had just happened. She did not complain of dizziness, nausea, discomfort other than her right arm, headache or any other symptoms. Vitals lying down - 10:20 am: BP 118/70, pulse 88; 10:23 am BP 122/74, Pulse 64, Resp 14; 10:38 am BP 118/60, pulse 76; 10:46 am BP 108/68, resp. 20,pulse 80, temp 98.4. Vitals sitting upright - 10:53 am BP 110/70; pulse 76; 11:02 BP 118/40, Pulse 68, Resp. 16. Client was given Tylenol, peanut butter crackers and orange juice and reported feeling much better. Telephone messages left for parent.

Other Meds: Given Acetaminophen 650 mgs at 10:58 a.m.

Seriousness: PERMANENT DISABILITY, SERIOUS

MedDRA PT Activities of daily living impaired, Dizziness

Symptom Text: Information has been received from a physician concerning a 15 year old female who on 06-MAR-2009 was vaccinated with GARDASIL IM 0.5ml. Concomitant therapy included a recent shot of DEPO-PROVERA. The patient experienced dizziness on 06-MAR-2007, 07-MAR-2009 and 09-MAR-2009. The physician did not say if there was any dizziness occurring on 08-MAR-2009. The patient "had to leave school". The patient sought unspecified medical attention. Dizziness was considered to be disabling. Additional information has been requested.

MedDRA PT Abdominal pain, Back pain, Influenza, Urinary tract infection

Symptom Text: Information has been received from a nurse practitioner concerning a 16 year old female with not sexually active and a history of meningitis as a baby who in August 2008, was vaccinated with the first dose of GARDASIL (Lot# not reported), on 20-OCT-2008, was vaccinated with the second dose of GARDASIL (Lot# not reported). There was no concomitant medication. And the patient had had an unspecified number of urinary tract infections, frequent lower back pain, abdominal pain and got the flu for the first time. The first dose and second dose were given by another unspecified provider's office. Prior to receiving GARDASIL, the patient had "always been healthy all her life" (as reported by the patient's mother). The patient went to emergency room in January 2009 for the flu. The nurse practitioner assumed urine culture and sensitivity test done by another unspecified provider's office. The reporter nurse mentioned although she did not feel the patient's symptoms were related to the GARDASIL, the third dose of GARDASIL would not be given. Subsequently, the patient recovered from unspecified number of urinary tract infections, frequent lower back pain, abdominal pain and flu on unknown date. It was reported that the patient sought medical attention: office visit. Additional information has been requested.

MedDRA PT Congenital uterine anomaly, Drug exposure during pregnancy, Ovarian cyst

Symptom Text: Information has been received from a registered nurse for the pregnancy registry for GARDASIL concerning a 23 year old female with asthma and no known drug reactions/allergies, who on 21-JAN-2009 was vaccinated with the first dose of GARDASIL, 0.5ml intramuscularly. Concomitant therapy included albuterol. The registered nurse reported that the patient was pregnant. On an unspecified date, the patient had a positive beta-human chorionic gonadotropin pregnancy test. Date of last menstrual period was on 24-OCT-2008. The estimated delivery date is 31-JUL-2009. The patient sought medical attention and was seen at the practice. Follow-up information was received from a questionnaire completed by a gynecologist indicating that the patient was a female, with cervical dysplasia and with a history of 1 pregnancy, 1 live birth and no pre-term deliveries, spontaneous abortions, elective terminations nor fetal deaths, who on 21-JUN-2009 was vaccinated with the first dose of GARDASIL (Lot # 661703/0651X). Concomitant therapy included albuterol. Medications taken during the pregnancy included folic acid and prenatal vitamins. Routine prenatal testing included a routine ultrasound performed on 06-MAR-2009, which detected bicornuate uterus and fluid filled cyst. Follow-up information was received on 19-MAR-2009 from the licensed practical nurse, clarifying that the bicornuate uterus and fluid filled cyst was in the mother and not in the fetus. She also mentioned that it was a left ovarian ovarian fluid filled cyst. Additional information has been requested.

MedDRA PT Abdominal pain upper, Fatigue, Nausea, Vomiting, Weight decreased

Symptom Text: Information has been received from a Registered Nurse (R.N) concerning her 16 year old daughter with juvenile rheumatoid arthritis, and allergies to BACTRIM, ZITHROMAX, CECLOR, potatoes, tree nuts, peaches, pears and apples who in November 2008 was vaccinated with the first dose of GARDASIL. There was no concomitant medication. It was reported that the patient received the first dose of GARDASIL and has been sick for 6-8 weeks. It was reported that the patient was fatigued, nauseous, vomited, stomach hurt and lost 8 pounds. It was reported that the patient's stomach hurting was getting better but she was still fatigued and had not gain the 8 pounds of weight back that was lost. No significant disability was reported however the patient has seen three unspecified physicians and has missed school. A gastrointestinal work up, allergy work and blood work were performed (results not provided). It was reported that the patient saw the pediatrician on 10-MAR-2009. It was reported that the patient took one pill of an unspecified "gastrointestinal medication" that gave the patient a bad stomachache. It was reported that the "gastrointestinal medication may have been PREVACID or pills (MSD). Additional information has been requested.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy, Vaginal haemorrhage

Symptom Text: Information has been received from a licensed visiting nurse, for the GARDASIL a Pregnancy Registry concerning a 23 year old female with hypothyroidism and a history of 3 pregnancies: 1 live birth at 39 week from LMP, 2 spontaneous abortions including an ectopic pregnancy in March 2008 (5-6 weeks from LMP), with no birth defects of infant complications in previous pregnancies who on 20-MAR-2009 was vaccinated with the first dose of GARDASIL (lot# 661952/1129X). Concomitant therapy included levothyroxine Na. The nurse reported that the patient was pregnant. Her LMP was 03-MAR-2009 and her EDD was 08-DEC-2009. On 26-MAR-2009 the patient started spotting. The nurse stated that the patient was having heavy bleeding and was in the process of miscarrying. Laboratory tests included urine beta-human chorionic gonadotropin test and progesterone performed on 03-APR-2009. On 06-APR-2009 an ultrasound was performed due to her spotting with result intrauterine pregnancy early vs missed abortion. On the same date an urine beta-human chorionic gonadotropin test was done. Additional ultrasounds performed on 09-APR-2009 due to the patient's spotting revealed fetal cardiac activity as well on 13-APR-2009 there was fetal cardiac activity. On 17-APR-2009 the patient experienced spontaneous abortion (7 weeks from LMP), and she has chosen to wait and see if the fetus will pass on its own. It was reported that the patient has a follow up visit in 2 weeks and will have an ultrasound. If the fetus does not pass the patient will be scheduled for a dilation and curettage. On 21-APR-2009 an ultrasound revealed no fetal cardiac activity, there was no fetal heartbeat. Upon internal review in the process of miscarrying was considered to be an other important medical event. Additional information is not expected.

MedDRA PT Drug exposure during pregnancy, Pain

Symptom Text: Information has been received from a 23 year old female with allergy to anything in the "cillin family" and a history of cesarean section and tuberculosis exposure, for the Pregnancy Registry for GARDASIL, who on 05-SEP-2008 was vaccinated with the first dose of GARDASIL. On 05-NOV-2008 the patient was vaccinated with the second dose of GARDASIL. On 16-MAR-2009 the patient was vaccinated with the third dose of GARDASIL. Home pregnancy test was done. The patient was pregnant now. Her LMP was 16-FEB-2009. On approximately 17-MAR-2009, "currently", she was experiencing sharp pains located "4 inches below her belly button and 4 inches to the left of her belly button". She stated the pain might be due to a previous cesarean section. Unspecified medical attention was sought by phone call. Follow-up information was received from the physician via a completed initial pregnancy questionnaire. It was reported that the patient had one previous pregnancy and one full term delivery. There were no birth defects or infant complications in the previous pregnancy. The patient's PPD tuberculin test was positive. The patient was taking isoniazid and vitamin B6 for the positive PPD concurrently. The lot number for the third dose of GARDASIL was provided as 661953/1130X. No other information provided at the this time. Additional information has been requested.

MedDRA PT Activities of daily living impaired, Cough, Lymphadenopathy, Musculoskeletal stiffness

Symptom Text: Information has been received from a registered nurse concerning her daughter, an 11 year old female patient with no pertinent medical history and no known drug allergies, who on 23-OCT-2008 was vaccinated with the first dose of GARDASIL (lot# not reported) and 20 minutes later developed a stiff neck while riding home from the doctor's office. There was no concomitant medication. The stiff neck resolved after the ride. On 23-DEC-2008, the daughter had a second dose of GARDASIL (lot# not reported) and within 11 days she developed a "constant cough and an enlarged lymph node at the cervical area". There was no concomitant medication. Patient was seen at the doctor's office. No abnormal labs. The cough lasted all of January and February and impeded in her basketball activity. She was given Z-PACK and TESSALON PEARLS but it did not help. She was also given Hydrocodone and TUSSIONEX that helped some days but made her drowsy. Both the cough and enlarged lymph nodes resolved by March. Additional information has been requested.

MedDRA PT Feeling abnormal, Headache, Nausea, Vomiting

Symptom Text: Information has been received from a physician concerning a 16 year old female patient with no known drug allergies who on 19-JAN-2009 was vaccinated with her first dose of GARDASIL (lot number 661703/0651X, site and route not reported). Concomitant medication included "LOVLO" which was a birth control pill. On 19-MAR-2009, the patient went in the office for her second dose of GARDASIL (lot number, site and route not reported) and she reported that in the evening of 19-JAN-2009, when she received the first dose, she experienced nausea and vomiting which lasted for two days. The patient sought unspecified medical attention. Follow-up information was received from the physician who reported that the patient got a headache shortly after receiving vaccine on 19JAN2009 whose lot number was reported as 660616/0570X at this time. That evening she complained of nausea and vomited 3 times. She did feel bad for two days after. The patient did not notify office until 19-MAR-2009 when she came for second dose of GARDASIL. It was noted that the patient recovered. The patient and her mother decided to receive the second dose on 19-MAR-2009 with no pressure. No further information was available.

MedDRA PT Incorrect product storage

Symptom Text: Information has been received from a health department nurse concerning a patient who on 04-MAR-2009 was vaccinated with a dose of GARDASIL (lot number, site and route not reported) which was stored at 35F for 24 hours on 23-FEB-2009. No details about the patient were known. Also reported as out of range for one day on 04-MAR-2009. The reporter answered and reported that they only had one patient who received a first dose of GARDASIL (lot number 660389/1968U, site and route not reported) on 04-MAR-2009. There was no adverse event was reported. No further information was expected.

MedDRA PT Drug exposure during pregnancy

Symptom Text: Information has been received from a registered nurse, for GARDASIL, a Pregnancy Registry product, concerning a 20 year old female with no known drug allergies and no medical history who on 12-JAN-2009 was vaccinated with the first dose of GARDASIL (Lot# 661531/1311X), IM. There was no concomitant medication. The patient was subsequently determined to be pregnancy by an unspecified Planned Parenthood clinic. Her last menstrual period was 07-JAN-2009. The patient sought medical attention. There was no lab and diagnostic test performed. No problems were reported. The patient's estimated delivery date was 14-OCT-2009. Additional information has been requested.

MedDRA PT Menstruation delayed, Night sweats

Symptom Text: Information has been received from a physician concerning a 20 year old female with a history of human papillomavirus high risk. On 11-FEB-2009, the patient came in the office because she had an upper respiratory infection and was given ALERXPE (manufacturer unspecified) and Azithromycin manufacturer unspecified). On 19-FEB-2009, the patient came into the office and received her first dose of GARDASIL (lot # 661044/0548X) (dose not report). The mother then called the office and said after receiving GARDASIL the patient experienced night sweats and her period was eleven days late. The mother of the patient mentioned that she was unsure if the patient should receive the second dose of GARDAIL. On unspecified date, the patient sought unspecified medical attention. On an unknown date, the physician reported that the patient had recovered but there were still unsure if she could receive the second dose of GARDASIL. Additional information has been requested.

MedDRA PT Abdominal discomfort, Abdominal distension, Constipation, Diarrhoea, Dyspepsia

Symptom Text: Information has been received from a certified medical assistant concerning a 21 year old female with dysmenorrhea and no known drug allergies who was intramuscularly vaccinated with 1st, 2nd and 3rd 0.5 ml doses of GARDASIL (1st lot #0250X, 2nd lot #660620/0571X, 3rd lot #661846/1312X) on 23-SEP-2008, 24-NOV-2008 and 23-MAR-2009, respectively. Concomitant therapy included YAZ and FAMVIR. In November 2008, prior to the 2nd dose, the patient experienced sensitivity to wheat. It was reported that bread and pasta products caused severe bloating, a churning feeling in her stomach, and difficult digestion. Then she got either constipation or diarrhea. These symptoms occurred about 15 minutes after any wheat consumption. When she did not not eat those products, she felt much better. At the time of reporting, she did not recover. The patient called the office for medical attention. Additional information has been requested.

MedDRA PT Asthenia, Injection site pain, Malaise, Pain in extremity

Symptom Text: Information has been received from a female who in September 2008, was vaccinated with her first dose of GARDASIL. On an unspecified date, she was vaccinated with the third dose of GARDASIL. She stated that she became ill "week" after the third dose was given. She was experiencing pain at the injection site, pain up and down the arm, and feeling weakness in the legs. She also stated the pain had become painfully worse. She stated that the pain in her arm was a "sharp pain" and had been getting "progressively worse" and hurt "when I move my arm in a certain way." As of 23-MAR-2009, her experience didn't improve. No laboratory diagnostic studies were performed. The patient sought unspecified medical attention. Additional information has been requested.

MedDRA PT Arthralgia, Dizziness, Headache, Wheezing

Symptom Text: Information has been received from a physician concerning a female who was vaccinated with a dose of GARDASIL, 0.5 mL. The patient experienced "headaches, wheezing, dizziness and joint pains" after the vaccination. The physician did not know if this was the patient's first, second or third dose, and did not know if she got any shots of GARDASIL after this experience. Follow-up information was received from an employee at the physician's office who stated that the vaccine was not administered at the office therefore she could not provide additional information. This is one of several reports from the source. Additional information has been requested.

MedDRA PT Drug exposure during pregnancy, Gastroenteritis viral

Symptom Text: Information has been received from a 24 year old female, for the Pregnancy Registry for GARDASIL who on 16-DEC-2008 was vaccinated with a first dose of GARDASIL. On approximately 2-FEB-2009 was vaccinated with a second dose of GARDASIL intramuscularly o.5 ml and had a pregnancy test and found out that she was "about 2 weeks pregnant" at the time of the vaccination (The patient was 9 weeks and 3 days pregnant at the time of reporting, so the last menstrual date was estimated as on 19-JAN-2009 and the estimated delivery date was 25-OCT-2009). An ultrasound was done and "everything looked normal". On 16-FEB-2009, (also reported "about 2 weeks ago"), the patient was really sick and couldn't eat or keep anything down. She went to emergency room but was not admitted. This was diagnosed as "stomach virus". The patient recovered from stomach virus after 4 days. Additional information has been requested.

Other Meds: Unknown

MedDRA PT Asthenia, Claustrophobia, Dyspnoea, Fatigue, Flushing, Headache, Injection site pain

Symptom Text: Information has been received from a registered nurse concerning a 19 year old female patient with a history of mononucleosis at age of 15 who on 16-MAR-2009 was vaccinated with her first dose of GARDASIL (lot # unknown). The patient experienced soreness at the injection site the day the vaccine was administered on 16-MAR-2009. The patient was experiencing difficulty breathing, hear rate of 90-100, flushed face, weakness, fatigue, "air hunger" or claustrophobic feeling and severe headache on 25-MAR-2009 9 days after her vaccination. The patient had visited the physician's office for medial attention. The only medication the patient was on was ZOVIA (manufacturer unspecified) for the completion problems and painful menstrual cycles. The patient never had any heart rate problems or headache before. At the time of reporting the patient's difficulty breathing and heart rate of 9--100 and flushed face and weakness and fatigue and "air hunger" and claustrophobic feeling and soreness at the injection site and severe headache persisted. Additional information has been requested

MedDRA PT Arthralgia, Fatigue, Infectious mononucleosis, Pallor, Rash

Symptom Text: Information has been received from a physician assistant concerning a 16 year old female with penicillin allergy and sulfonamide allergy who on 05-JUN-2008 was vaccinated with a first dose of GARDASIL (lot number 659657/1487U). On 05-AUG-2008 the patient was vaccinated with a second dose of GARDASIL (lot number 659657/1487U) (injection site and route not reported). There was no concomitant medication. The patient developed a rash around her stomach lasting one week after the first vaccination. The rash came and went since the first vaccination. The patient also developed extreme fatigue, joint pain and was pale. The patient was tested positive for a variety of medical conditions. The patient had been tested for rheumatoid arthritis and mononucleosis but the results had not been received. The patient was prescribed prenatal vitamins, but she was not pregnant. The patient was seen in the physician's office. Laboratory test included pregnancy test, mononucleosis, AlC, blood cell count, MMA, thyroid and swallow study H. pylori Complete medical panel (results unspecified). The patient's mother refused the third dose due to the adverse events. At time of this report, the patient's events persisted. Follow-up information was received from the physician assistant concerning the 16 year old female. The Physician's assistant reported that it was determined on 27-MAR-2009 that the patient's mononucleosis and not the fact that she received two of three doses of GARDASIL resulted in the reported adverse events. Additional information is not expected.

MedDRA PT Convulsion

Symptom Text: My daughter was given all three doses of Gardasil on 8/28/08, then on 11/1/08, and the last on 3/7/09. On April 11, 2009 my daughter suffered with two seizures on this day and was hospitalized for five days. There is no history of seizures in my family. She was then put on Keppra. A week and a half later she suffered with three more seizures. Patient was again hospitalized. Keppra was then increased to 1500 mg twice a day. Now we are going to the neurologist to try to pinpoint the cause. I did research and found the side affects of Gardasil and one of them were seizures.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Acute disseminated encephalomyelitis, Agitation, Anxiety, Disinhibition, Disturbance in attention, Dysgraphia, Echolalia, Enuresis, Expressive language disorder, Hypersomnia, Obsessive-compulsive disorder, Regressive behaviour

Symptom Text: Information has been received from the Health Authority under the reference number PB20090202. A 14 year old female patient had received the first dose of GARDASIL (batch # and lot # not reported) on 08-OCT-2008, and the second dose (batch # and lot # not reported) on 23-DEC-2008. She had a medical history of adenoidectomy in 1995 and viral meningitis in Dec 2001. She was born at full term, eutrophic, with a normal psychomotor development. She had a healthy 9 year old brother and was the eldest. There was no particular family medical history. On 01-JAN-2009, the patient developed hypersomnia, characterized by nights of 14 to 16 hours of sleep plus naps. Appetite was normal, but she developed a secondary enuresis in the context of a behavioral regression. After 15 days, the patient went back to a normal rhythm between waking and sleeping, but enuresis persisted. Then the patient presented with behavioral disorders such as agitation, affective regression and some elements in favour of frontal syndrome: disinhibition, echolalia, gibberish with the addition of English words at the end of sentences, concentration troubles with the impossibility to read longer than 10 minutes, and a few obsessive-compulsive disorders such as anxiety at closing doors. Little by little the troubles progressively eased. MRI was performed on 29-JAN-2009 which revealed T1 hypersignals at the level of the central gray nucleus, predominant on the right, and this despite of the artifacts due to the dental appliance. Besides, head CT scan performed in the same time, with and without injection, showed hypodensity at the level of the right central nucleus correlation with MRI images. On 02-FEB-2009 the patient was taken to ambulatory care where her cerebrospinal fluid was explored. Results were a clear fluid, not hypertensive, 2 red blood cells, 0 white blood cells. The following serologies were performed: Lyme disease, A and B influenza, enteroviruses, varicella-zoster virus, HSV-1 and 2, HHV6 and CMV. All were negative in PCR. (Except for negat

MedDRA PT Peripheral vascular disorder, Pyrexia, Rash, Similar reaction on previous exposure to drug

Symptom Text: Information has been received from a gynecologist concerning a female adolescent (exact age of onset not reported) who on an unspecified date, was vaccinated with the second dose of GARDASIL (Lot # not reported), intramuscularly into the upper arm. In the evening post vaccination the patient developed severe rash and high fever. The patient recovered within an unspecified time. A similar reaction had occurred after administration of first dose (Lot # not reported) (unspecified date of vaccination). Follow up information received on 24-APR-2009. This case was upgraded to serious due to hospitalization. The 17 year old patient was vaccinated with D2 of GARDASIL (Lot # 0278U; batch # NF56940) on 04-DEC-2007. Concomitant therapy included hormonal contraceptives. Three to four days p.v., the patient developed rash, fever of 41.3 C and peripheral circulatory disorder. The patient was hospitalized on an unspecified date. No information was given regarding the exams performed during hospitalization and the length of the stay. The exact duration of rash, fever and circulatory disorder was not reported, but complete recovery was after 2 weeks. After dose 1 administered 05-OCT-2007 (lot #0251U, batch NF43780), the patient developed similar symptoms (rash and fever). The patient was not hospitalized after dose 1 and recovered after 2 weeks. Other business partner numbers included E2009-02432. No further information is available. The case is closed.

MedDRA PT Dizziness, Loss of consciousness, Tonic clonic movements

Symptom Text: Information has been received from a health authority (reference number ES-AGEMED-818821344) regarding a 14 year old female who on 04-SEP-2008 and 18-NOV-2008 was vaccinated with the first 0.5 ml dose and second dose (respectively) of GARDASIL intramuscularly. It was reported that after vaccine administration on the 18-NOV-2008 the patient presented with dizziness, probably because she has an aversion to needles, this also happened every time the patient had blood extraction. The patient recovered spontaneously. After vaccination the patient had experienced 2 episodes of loss of consciousness accompanied with tonic clonic movements, which lasted for a short period time, episodes occurred on the 18-DEC-2008 and on the 29-JAN-2009, both episodes took place during a neck massage. The case was being studied by neurologists. Case reported as serious by the HA with other medically important condition as criteria. Other business partner numbers include E200903460. No further information is available. Case is closed.

MedDRA PT Hodgkins disease stage II, Lymphadenopathy

Symptom Text: Information has been received from the Health Authority (reference # ES-AGEMED-008183336) concerning a 16 year old female patient with acaridae allergy who on 07-AUG-2008 was vaccinated with the second dose of GARDASIL (Batch # not reported) by intramuscular route (site of administration not reported). It was reported that a few days after the administration of the second dose of GARDASIL, August 2008, exact date not reported, the patient presented with swollen cervical lymph nodes ipsilateral to vaccine administration site. Ear, nose, throat exploration, a 15 day treatment with VARIDASE was prescribed (start and stop dates not reported), the patient did not improve, an ECO-PAF was performed with normal results, although, it was observed that other lymph nodes had grown in size in the neck and mediastinum. Biopsy results came out positive for a stage II Hodgkin lymphoma. On 12-FEB-2009 the patient was diagnosed with supradiaphragmatic stage II Hodgkin's disease. Hodgkin's disease NOS stage II supradiaphragmatic presentation and lymph nodes cervical swollen were coded in the Health Authority's report as adverse reaction. The patient had not recovered at the time of the report. The reporter determined that Hodgkin's disease NOS stage II supradiaphragmatic presentation was an other important medical event. Other business partner numbers include: E2009-03531. No further information is available.

MedDRA PT Ageusia, Fall, Hypotonia, Loss of consciousness, Muscular weakness, Nystagmus, Paraesthesia, Reaction to previous exposure to any vaccine, Sensation of heaviness, Sensory loss, Vertigo, Vision blurred

Symptom Text: Information has been received from the a health professional regarding her daughter, a 14 year old female who was administered on the 04-DEC-2008 the second dose of GARDASIL (Batch #, route and site of administration not reported). After receiving the second dose of GARDASIL, dates have not been reported, the patient presented with loss of consciousness (even while seated), blurry vision, vertigo, nystagmus, weakness of legs, loss of muscular tone, loss of posture (the patient while walking would lean to the left side losing control of her posture). Two months later after vaccine administration the patient had to be hospital admitted (admission date has not been reported) due to symptoms. No information has been reported concerning medications used to treat events, performed tests or test results. The patient was discharged from hospital on March 2009, exact date not reported, the patient has improved. She has not suffered vertigo, dizziness or nystagmus for the last month. The patient sometimes felt heaviness in her legs and has not recovered her muscle tone completely. Four months after the administration of the second dose of GARDASIL the patient had lost sense of taste, causing a difficulty detecting salty taste. Also the patient had lost sensitivity to temperature, it was noticed that the patient showered with very hot water, not being able to detect the high temperature of the water. This had also improved lately. It was also reported that after receiving the first dose of the vaccine on 19-SEP-2008 the patient experienced an injection site inflammation and fever (reaching 40 degrees C). Ibuprofen was used to treat adverse events. The patient was taken to the emergency room due to high fever where she was diagnosed with an otitis which was treated with AUGMENTIN. The patient had refused to have the third dose of vaccine. Other business partner numbers include: E2009-03555. This is one of several cases from the same source. No further information is available.

MedDRA PT Complex partial seizures, Vaccine positive rechallenge

Symptom Text: Initial information received on the 24-APR-2009 from the Health Authority (reference number ES-AGEMED-618726347) regarding a 21 year old female who was administered on the 26-FEB-2009 the second dose of a GARDASIL (lot number not reported) by intramuscular route (site of administration not reported). Two or three days after vaccination and during 48 to 72 hours, the patient had 6 episodes of complex partial epileptic crisis of the temporal lobe. The patient did not require hospital attention; she attended an external medical consultation. Exploration is normal; EEG and MRI results are pending. The patient was vaccinated with the first dose of GARDASIL on 26-DEC-2008, it was reported that she had the same adverse events. From the 05-JAN-2009 to the 10-JAN-2009 she presented 3 or 4 episodes of complex partial epileptic crisis of the temporal lobe that lasted for a few minutes. It has been reported that according to the patient, the episodes after the second dose were more critical. Case reported as serious by the Health Authority with other medically important condition as criteria. Other business partner numbers include: E2009-03598. Case is closed.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Convulsion

Symptom Text: Information has been received from a TV news report and the patient's father concerning his 16 year old daughter who in March 2008, was vaccinated with GARDASIL. The patient's father reported that in March 2008 just after the vaccination, he received a phone call in which he was informed that his daughter had a seizure and was on her way to the ER. The patient's father stated that although the doctors were not connecting seizures with the vaccine, he thought it was too much of a coincidence that the vaccination was involved at the same time, closely related with the only seizure his daughter has had in her life. The patient's father felt that the GARDASIL had absolutely something to do with the seizure. It as reported that the patient survived and is healthy today. Upon internal review, seizure was considered an important medical event. This is one of two reports received from the same source. Additional information has been requested.

MedDRA PT Anogenital warts, Smear cervix abnormal

Symptom Text: This case was initially reported to agency by a health care professional on 24-APR-2009 (no: 80737). This case concerns a 23 year old female patient. Details of the patient's medical history and concomitant medication have not been reported. In June 2008, the patient received the first dose of GARDASIL batch number, route and site not reported. In July 2008, the patient received the second dose of GARDASIL batch number, route and site not reported. In November 2008, five months after the first dose and four months after the second dose of GARDASIL, the patient underwent a cervical smear test which showed changes suggestive of a wart infection. The patient was referred to a clinic but had no clinical signs of genital warts. Human papilloma virus testing was not carried out. The patient subsequently received the third dose of GARDASIL, batch number, route and site not reported in December 2008. It was not known if the patient had recovered. The adverse events were reported as other important medical events. Additional information has been requested. Other business partner numbers include E2009-03643.

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a registered nurse, for the GARDASIL a Pregnancy Registry, concerning a 17 year old female patient with a history of pelvic inflammatory disease who on 19-Mar-2009 was vaccinated with a dose of GARDASIL (lot# not specified). It was reported that 2 weeks ago the patient was being treated for pelvic inflammatory disease, and that time was given an urine hCG test which was negative. On 19-Mar-2009 the patient was given vaccines (not specified) and afterward was also given another urine hCG pregnancy test which was positive. LMP was not provided. The nurse indicated that the patient has an office visit on 23-Mar-2009 for counseling. The patient will not receive prenatal care there since this is a pediatric office. The nurse will provide whatever health care professional contact information for the patient's prenatal care that she obtains. Follow up information has been received from a health professional and a registered nurse concerning a 17 year old female with oligomenorrhoea and a history of pelvic inflammatory disease who on 19-Mar-2009 was vaccinated with third dose of GARDASIL (dose and route not reported, lot number 661531 / 1311X). The registered nurse reported that the patient's mother had called the clinic on 26-Mar-2009 to report that her daughter had an appointment on 30-Mar-2009. In a subsequent phone call to the clinic on 22-Apr-2009, the mother reported that the pregnancy had been electively terminated. Upon internal review, pregnancy had been electively terminated was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Epilepsy, Loss of consciousness, Muscle spasms

Symptom Text: Information has been received from a health authority (reference no. PEI2009008417) concerning an 18 year old female with a medical history of chronic headaches due to sinusitis that did not improve despite surgery and medication (onset: approx. SEP-2008) and pollen allergy who was vaccinated with the first dose of GARDASIL on 10-DEC-2007(batch# NF58540, LOT# 0253U), the second dose on 21-APR-2008(batch# NF58540, LOT# 0253U), the third dose on 03-NOV-2008(batch# NF58540, LOT# 0253U). On 12-FEB-2009 the patient developed recurrent attacks of unconsciousness with muscle spasms of approximately 30 minutes - similar to epileptic seizures. Despite anticonvulsive treatment with lamotrigine the patient experienced further seizures. The patient had not recovered at the time of reporting. Epilepsy was determined to be an other important medical event. File closed.

MedDRA PT Headache, No reaction on previous exposure to drug, Sinusitis, Surgery

Symptom Text: Information has been received from a health authority under HA reference no. PEI2009008417. This case is linked with serious case E2009-03559 (MSD WAES 0904USA04367) (same patient, same vaccine, but different reactions after the second dose). It was reported that a 17 year old (also reported as 18 year old) female with history of pollen allergy who on 10-DEC-2007 was vaccinated with the first dose of GARDASIL (lot # 0253U and batch # NF58540) that was well tolerated. On 21-APR-2008 the patient was vaccinated with the second dose of GARDASIL (lot # 0253U and batch # NF58540) IM. Since approximately September 2008, the patient experienced chronic headache. The headache was attributed to a sinusitis. Despite sinusitis was treated by surgery and medication (not otherwise specified) headache did not improve. Despite ongoing events the patient was vaccinated with a third dose of GARDASIL (lot # 0253U and batch # NF58540) IM on 03-NOV-2008. The patient has not recovered at the time of reporting. The agency considered sinusitis and chronic headaches to be other important medical events. Other business partner number included E200903721. File closed.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Convulsion, Fatigue, Gaze palsy, Immediate post-injection reaction, Pallor, Stress, Tonic clonic movements

Symptom Text: Information has been received from a physician concerning a 22 year old female who on 23-APR-2009 was vaccinated with the second dose of GARDASIL. The patient received the first vaccination on 13-FEB-2009 (lot # reported as "660825/0423X"). After receiving the second dose on 23-APR-2009 the patient's face turned white, eyes rolled back in her head and she had a seizure. The physician reported that after the patient had a seizure she was sent to her primary care physician for further evaluation. The physician reported that the patient's primary care physician wanted the patient to go and have test done but the patient wanted the patient to go and have test done but the patient refused. The physician reported that the patient was still feeling tired and she was under a lot of stress but she was recovering. Follow-up information was received from a physician. The physician stated that the patient had a seizure that lasted 4-5 min with tonic, clonic posturing. The physician stated that the patient was "completely out". The patient "perked-up and came to with no postictal confusion". The physician stated that the patient had no history of seizures. The seizure occurred immediately after the patient received GARDASIL. The physician stated that he was not sure if the patient had the seizure due to GARDASIL or a drop in blood pressure. The physician did not know if the seizure was due to a neurological disorder. The physician stated that he thought the patient's Primary Care was another physician. Upon internal review, seizure was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy, Haemorrhage, Nausea

Symptom Text: Information has been received from a registered nurse concerning a 19 year old female with no medical history and no known drug allergies who on 05-FEB-2009 was intramuscularly vaccinated with a 0.5 ml dose of GARDASIL (lot #660616/0570X). Concomitant therapy included vitamins (unspecified) (FLINTSTONES MULTIVITAMIN). The patient was pregnant while received GARDASIL. Her LMP was 25-JAN-2009. No adverse effect was reported. Lab diagnostic studies included prenatal screen. The patient had an office visit for medical attention. Follow up information was received from the registered nurse who reported that the 19 year old patient was a smoker with HPV infection. She had one previous pregnancy and pre-term delivery at 35.4 weeks by caesarean section in 2008. The patient was vaccinated with the first dose of GARDASIL on 05-FEB-2009. Concomitant therapy included vitamins (unspecified) (FLINTSTONES MULTIVITAMIN) for prenatal use. The patient experienced nausea during her pregnancy and was prescribed ZOFRAN 8mg every 12 hrs on 23-MAR-2009 for treatment. Her pregnancy was confirmed by sonogram at the first OB appointment on 26-MAR-2009. She was advised to quit smoking. There was no illness during the pregnancy. The patient was seen on 03-APR-2009 with known spotting. The patient also experienced heavy bleeding. She experienced spontaneous abortion complete in an emergency room while on vacation on 04-APR-2009, that was 8.2 weeks from her LMP. The patient was seen in the reporter's office on 08-APR-2009 and confirmed spontaneous abortion and by ultrasound. Upon internal review, spontaneous abortion was determined to be an other important medical event. Additional information is not expected.

Other Meds: FLINTSTONES MULTIVITAMIN

MedDRA PT Asthenia, Convulsion, Dyskinesia, Foaming at mouth, Gaze palsy, Musculoskeletal stiffness, Pallor, Tongue paralysis

Symptom Text: Information has been received from a nurse concerning a her great-niece 13 year old female with no known allergies or medical history reported, who on 28-APR-2009 was vaccinated with her first dose of GARDASIL (dose, route of administration and lot number not reported). There was no concomitant medication. The nurse reported, the patient two seizures soon after receiving her first dose of the vaccine. The first seizure was described as violent jerking, stiffness, frothing at the mouth, tongue deviated to the right and eyes rolled back lasting five minutes. The patient experienced a second seizure within the hour as she was being escorted from the office. The patient was transported home by her mother and was recovering, although still "weak and pale". The patient sought unspecified medical attention. Upon internal review, seizure was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Arthralgia, Myofascitis, Pain, Skin lesion

Symptom Text: Information has been received from a physician who reported that a patient's mother told him that her 24 year old daughter, on an unspecified date was vaccinated with the third dose of GARDASIL (Lot not reported) and "shortly after vaccination" the patient complained of sore body and pain in joints and she was diagnosed with macrophagic myofascitis. It was reported that the patient could not get out of bed. She also developed skin lesions. The patient's muscle biopsy showed that the muscle contain aluminum. The physician also reported that she is no longer his patient. Additional information has been received from the physician, who stated that he "run into the patient's mother and she told him that her daughter was diagnosed with macrophagic myofascitis" at another medical center. The patient's mother stated that aluminum hydroxide was found in the patient's muscle. The physician also stated that the patient did not receive GARDASIL in his office. The physician felt that Macrophagic myofascitis and skin lesions were considered to be disabling. No additional information is expected.

Symptom Text: Information has been received from a physician and a nurse concerning her 13 year old daughter with asthma and no known allergies who on 06-AUG-2008 was vaccinated with the first dose of GARDASIL (lot no. 660620/0571X). Second dose of GARDASIL (lot no. 659184/0843X) was given on 07-OCT-2008 and on 22-APR-2009 was given third dose of GARDASIL 0.5 ml, IM into the left arm (lot no. 661846/1312X). The patient did not have any other vaccines administered that day. The nurse was reporting that her daughter was having ongoing symptoms after getting the third dose of GARDASIL. There was immediate burning and pain during vaccination followed by a tingling and numbness within five minutes (also reported as 10 minutes) to the vaccinated arm (left). The injection site was red, raised, erythemous, warm to touch and the size of a ping pong ball. The nurse reported that, that night the patient's left arm felt numb from the fingers to the shoulder. The swelling at the injection site was the size of a golf ball. There was intense pain with the application of ice to the injection site. She was given ALEVE for pain. The next morning (on 23-APR-2009) she did not feel good. Both hands were puffy. On 23-APR-2009, around 10:00, she was shaking (chills), can't move having joint pain throughout, abdominal tenderness. and fever. She saw her pediatrician around 11:30 for the fever (100.6F), numbness, nausea and abdominal discomfort. The patient was prescribed ZANTAC and ANSAID or TYLENOL. At 19:00 the same day, the patient went to the emergency room (ER). She had a temperature of 103F. All labs came back negative. Lab test performed included C reactive protein ("RCP" for appendicitis), kidney profile, abdominal pelvis exam, contrast CT scan and Liver Function Test (LFT). She was given IV morphine (no relief) IV TORADOL (positive relief) and IV ZOFRAN. The nurse reported that the patient was diagnosed with acute inflammatory response to GARDASIL. Last evening the patient had a temperature of 101.6F, horrible abdominal pain (right sided from

MedDRA PT Drug exposure during pregnancy, Ectopic pregnancy

Symptom Text: Information has been received from a pharmacist concerning a 23 year old female who on 08-FEB-2008 was vaccinated with her second dose of GARDASIL. The pharmacist reported on 12-FEB-2008, that the patient subsequently learned she was pregnant. The patient did not seek medical attention. No adverse reactions were reported. Follow-up information was received from a staff in the office and the registered pharmacist. The staff in the office reported that the patient had a tubal pregnancy in approximately February 2008 and "it had nothing to do with the GARDASIL". The registered pharmacist reported that she had received a request for the office for the third dose of GARDASIL for the patient in April 2008. The request note said that the patient was not pregnant at that time. The registered pharmacist had no any more information about the pregnancy. Upon internal review, tubal pregnancy was determined to be an other important medical event. No further information is available.

MedDRA PT Dizziness, Nausea, Orthostatic intolerance, Syncope

Symptom Text: Information has been received from a physician and a health authority through SPMSD (HA reference number PEI 2009005756) concerning a 15 year old female who on 10-FEB-2009 was vaccinated intramuscularly into deltoid muscle with first dose of GARDASIL (dose not reported) (Batch number NH38400, lot number 1400U). On 20-FEB-2009 the patient developed dizziness and recurrent syncopes. She was repeatedly hospitalized. All investigations (unspecified "internal, neurological") were normal. The patient recovered after two weeks. Follow up information has been received from a health authority (HA reference number PEI 2009005756). The hospital report was sent. The patient had additionally developed nausea. It was reported that all routine laboratories showed normal results. Schellong test, blood pressure (over 24 hours), echocardiography, MRI, (neurocranium) and ENT examination showed normal results, except EEG which showed intermittent retardation (bilateral posterior, with accentuation right). Orthostatic dysregulation was suspected as a possible cause for the syncope. A relation to the vaccine was considered to be possible. The physician's expected a "soon recovery" of the patient and did not recommend any further diagnostics. Other business partner numbers included: E2009-02496. No further information is available. Case is closed.

Other Meds: Unknown

Lab Data: electroencephalography, intermittent retardation (bilateral posterior, with accentuation right); diagnostic laboratory test, SCHELLONG test, normal results; electrocardiogram, normal results; ears, nose, and throat examination, normal resul

MedDRA PT Loss of consciousness

Symptom Text: Information has been received from a Health Authority (reference # ES-AGEMED-514454343) concerning a 14 year old female who between December 2007 and June 2008 was vaccinated intramuscularly with GARDASIL (number of dose/doses not specified). It was reported that between January 2008 and December 2008 the patient presented with several episodes of loss of consciousness with similar characteristics which do not suggest convulsive crisis. Since January 2009 the patient has clearly improved, ECG is normal and neurological exploration is also normal. The patient required hospitalization (admission and discharge dates not reported). The health authority considered this report to be serious, it was an other important medical event. Other business partner numbers include: E2009-03761. Additional information is not available.

MedDRA PT Activities of daily living impaired, Bedridden, Blood test normal, Chest X-ray normal, Chest pain, Computerised tomogram normal, Decreased activity, Electroencephalogram normal, Gastric disorder, Headache, Musculoskeletal stiffness, Mydriasis, Nausea, Pyrexia, Sleep study normal

Symptom Text: Initial and follow-up information has been received from a consumer concerning a 13 year old female with no pertinent medical history and no drug reactions/allergies who on 13-MAR-2008, 23-MAY-2008 and 26-SEP-2008 was vaccinated with the first, second and third dose of GARDASIL respectively (lot # 659182/1757U, 660391/0063X and 659184/0843X), injection. Concomitant therapy included ibuprofen and AMITRIPTYLIN. In September 2008, the mother stated her daughter experienced chest pain, fever, nausea, muscle stiffness, headaches, stomach problem, and when she was not really feeling well in her pupils became "dilated", while on GARDASIL. She did not go to school and was not active because she could not even get out of bed. The patient had had chest X-rays, EEG'S, CAT Scans, sleep studies, and blood work done which all came back negative. The consumer also reported that the patient was an avid dancer before getting GARDASIL and she could not even get out of bed, "I had taken her to specialist and other physicians and no one can figure out what is wrong". The patient's outcome was not recovered. On unspecified date, the patient sought unspecified medical attention. The nurse stated that the patient's mother consented to come to the office to sign the Consent for the Release of Medical Information concerning the patient, and she would call back when the patient's mother signed the Consent Form about if the patient was able to attend school. Upon internal review she doesn't go to school and isn't active because she can't even get out of bed was considered to be disabling. This is one of several reports concerning the same source. A lot check has been initiated. Additional information has been requested.

MedDRA PT Abortion induced, Drug exposure during pregnancy, Foetal disorder

Symptom Text: Information has been received from a registered nurse, for the Pregnancy Registry for GARDASIL, concerning a 21 year old female with CECLOR allergy on 02-OCT-2008 and 01-DEC-2008 was vaccinated with her first (lot number 659184/0843X) and second (lot number 661764/0650X) dose of GARDASIL 0.5ml IM (site not reported) respectively. Subsequently the patient was determined to be pregnant and she established her prenatal care with a physician. The patient's last menstrual period was 01-NOV-2008. The patient's estimated date of delivery was 08-Aug-2009. Testing performed at 15 weeks gestation revealed Trisomy 18 and the patient underwent an elective termination in February 2009. The patient subsequently fully recovered. On 30-APR-2009 the patient was vaccinated with her third dose of GARDASIL 0.5ml IM (lot number 661846/1312X; site not reported). Additional information was received from the registered nurse. The nurse reported that the patient had seen different physicians for obstetrics and for the pregnancy. The patient was not on any other medications during the vaccines, "just the pill". The patient stopped the pill after the first dose and became pregnant after the second dose. A no Cul test revealed a 3.1cm which suggested a congenital anomaly. An amniocentesis was performed on 19-FEB-2009 which revealed Trisomy 18. Elective termination was performed at the end of February 2009. The patient fully recovered and came back in after the pregnancy and finished her third vaccination. Elective termination was considered to be an other important medical event and Trisomy 18 was considered to be a congenital anomaly. Additional information has been requested.

Other Meds: None

MedDRA PT Drug exposure during pregnancy, Foetal disorder

Symptom Text: Information has been received from a nurse practitioner through a pregnancy registry for GARDASIL, concerning a 20-year-old female, with prior history of pregnancy and delivery, who on 31-JUL-2008 received a dose of 0.5 ml GARDASIL (lot # 660557/0072X) via intramuscular route in her deltoid area. Concomitant medication included birth control pill YAZ. It was reported that the patient was pregnant now. She had urine pregnancy test; her last menstrual period was on 12-JUL-2008. Estimated delivery date was 18-APR-2009. The patient sought medical attention at the office. At the time of reporting, no adverse symptom was reported. Follow-up information has been received from a completed questionnaire. The patient had positive PPD skin test as concurrent condition and a history of 1 previous pregnancy with full term delivery. There was neither birth defect nor infant complications in the previous pregnancy. Ultrasounds for pregnancy were performed on 02-OCT-2008 and 11-DEC-2008 with results "12 inch /7 w" and 22" inch/ 17 w", respectively. The patient was on iron TID per day and prenatal vitamins once per day during her pregnancy. On 04-APR-2009, 39 weeks (reported as "2 weeks") from LMP, the patient delivered a normal female infant weighing 7 pounds 8 ounces, with 19.5 inch in length and Apgar score 9/9. The infant had sacral dimple. There were no complications, infections or illnesses during her pregnancy, labor/delivery. The infant had no complications or abnormalities. Upon internal review, sacral dimple was considered to be an event of congenital anomalies. Additional information is not expected.

Symptom Text: Information was obtained on request by the Company from the agency via a Case Line Listing with further follow-up via a Public Case Details form concerning a 14 year old female who on 18-JUN-2007 was vaccinated with GARDASIL (Batch No. J0801, Expiry Date 07-AUG-2009, Lot No. 655742/0138U). On 01-AUG-2007 the patient experienced Guillain-Barre syndrome. The patient developed sensory impairment with weakness of the lower leg and feet. On 12-AUG-2007, the patient developed the weakness in toes, feet and ankles and had unsteady gait. This progressed while the patient was in hospital. On examination during admission, power was 3-4/5 on the toes, feet and ankles with absent ankle jerk. There was sensory loss to light touch and position. At the time of reporting on 11-SEP-2007, the patient's Guillain-Barre syndrome persisted. The agency considered the Guillain-Barre syndrome was related to therapy with GARDASIL. The original reporting source was not provided. Subsequently the patient's experienced was reported in an article. Information was received from the agency in an Expert Panel Report. The Expert Panel was an independent body commissioned by the agency to undertake an evaluation of the safety of GARDASIL. Further follow-up was also obtained upon request by the Company via a Public Case Detail Form from the agency. The patient's neurological symptoms began 6 weeks after the second dose of GARDASIL and consisted of numbness in her feet. Two weeks later, the patient developed a bilateral foot drop. This was diagnosed as Guillain-Barre Syndrome (GBS). It was subsequently reported by the Expert Panel that the diagnosis of Guillain-Barre Syndrome (GBS) had been changed since the time of reporting to Chronic Inflammatory Demyelinating Polyneuropathy (CIDP) on the basis of worsening condition and follow up nerve conduction studies. The patient was found to have experienced a febrile illness 6 weeks prior to the onset of neurological symptoms and had positive Mycoplasma serology with a rise in titre. Since Mycoplasma infec

MedDRA PT Abortion threatened, Caesarean section, Drug exposure during pregnancy, Placenta praevia

Symptom Text: Information has been received from a licensed practical nurse through a Pregnancy registry concerning an 18 year old female who in June 2007 and August 2007 was vaccinated intramuscularly with a 0.5mL first and second dose of GARDASIL. The nurse reported that the patient was possibly pregnant when she was vaccinated with the second dose of GARDASIL. On 24-NOV-2007, a pregnancy test was positive. Follow up information received from a licensed practical nurse revealed that patient received dose one and two of GARDASIL in June 2007 and August 2007. There was no third dose in their system so the patient never received it at this facility. She also reported that there was never a pregnancy test done at this facility until 07-APR-2008. On this date, the patient had a positive test at the office after having two positive tests at home. Her LMP was 05-MAR-2008. On 17-APR-2008, she was seen by OB/GYN group. It was noted at this visit that it was an unplanned pregnancy that occurred on oral contraceptives. On 28-APR-2008, she was seen for a threatened abortion. It was noted that at this visit patient was GRAVIDA 1 Para 0 (G1P0). An ultrasound was done that showed a viable fetus with an EDD of 02-DEC-2008. On 21-MAY-2008, a placenta previa was noted. On 12-NOV-2008, an ultrasound was done for growth and weight. A male baby weighing 6 pounds and 6 ounces was seen. On 10-DEC-2008, she delivered a healthy boy via C-section. She said it looked like the patient was induced but she did not have the exact reason for the C-section. Apgars were 8 and 9 and mom and baby did great. The licensed practical nurse indicated that , since no pregnancy test was done in their office prior to April 2008 and it was noted that she was G1P0 at the visit in April 2008 then the originally reported "possible" pregnancy must not have been a true pregnancy. She stated that if there was a pregnancy that had any problems then it would have been in their system. Upon internal review, threatened abortion and obstetric complication req

MedDRA PT Conversion disorder, Crying, Dizziness, Headache, No reaction on previous exposure to drug, Syncope

Symptom Text: This case was reported by a regulatory authority (# 2009-01768) and described the occurrence of syncope in a 12-year-old female subject who was vaccinated with TWINRIX pediatric(GlaxoSmithKline), GARDASIL (non-GSK). The subject was healthy and had no concomitant medication. She was not using any drugs or alcohol. All the previous vaccinations were well tolerated. On 24 March 2009, the subject received 2nd dose of TWINRIX pediatric (intramuscular, unknown injection site), 2nd dose of GARDASIL (intramuscular, unknown injection site). On 24 March 2009, less than one day after vaccination with GARDASIL and TWINRIX pediatric, the subject experienced syncope for a few seconds. The patient recovered immediately after keeping her legs in elevated position and she left the doctor. 10 minutes later, the subject experienced headache, hysterical excitement, crying abnormal and dizziness. She came back to the doctor. The circulation was stable all the time. The subject was transferred to hospital and stayed at ER under observation for a short time. The symptoms were resolving and the patient was discharged. A physical examination was done without any findings and no further examinations were performed. On 31 March 2009, the subject went to her family doctor, with persisting headache. At the time of reporting, the events were resolved but the outcome of headache was still unspecified. The regulatory authority reported that the events were possibly related to vaccination with TWINRIX pediatric and GARDASIL, Only the event hysterical excitement was probably related to TWINRIX. Due to the temporal relationship the causality between the different symptoms and GARDASIL as well as TWINRIX is evaluated as possible. Besides the syncope could also be a vasovagal reaction to the injection. Finally, however, a psychogenic component cannot be completely excluded as cause as well.

MedDRA PT Conjunctivitis infective, Convulsion, Presyncope, Sinusitis, Tongue biting

Symptom Text: Information has been received from a 21 year old female concerning herself with no medical history or drug allergy who experienced seizures the next day after receiving the second dose of GARDASIL. There was no concomitant therapy. Patient mentioned that she had seizures attacks for 4 consecutive days and then after that she was hospitalized for 5 days. Patient added that her physician told her that she had sinus infection and she was also prescribed KEPPRA for the seizures and she had been taking KEPPRA now for 20 months. The patient described her seizures, she reported that she would have seizures during her sleep because when she woke up, she would see bite marks on her tongue and her mouth. Patient noted that since she took KEPPRA, she would have occasional pre seizures symptoms but it didn't result to seizures attacks. At the time of the report the patient was not recovered. She added that her twin sister received the complete GARDASIL series and she did not have the AE. Follow-up information has been received from a registered nurse concerning the patient. The first GARDASIL dose was given in their office on 08-JAN-2008 (lot #659653/1448U). The second dose was given in their office on 29-MAY-2008 (lot #660389/1968U); no other vaccines were given at the same time as the GARDASIL doses. Concomitant medications included YASMIN for birth control and PYRIDIUM for a UTI. Patient had no medical history or drug allergies. Their records showed that the patient was admitted to the hospital on 09-JUN-2008 and was discharged on 13-JUN-2008. The patient was last seen in their office on 02-JAN-2009 for pink eye. The nurse did not know the name of the physician who was following the patient for her seizures, did not know what diagnostic tests were performed. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Colitis ulcerative, Crohns disease, Erythema, Gastrointestinal inflammation, Intestinal haemorrhage

Symptom Text: Information has been received from a gynaecologist concerning a 17 year old female patient with a medical history of intestinal hemorrhage during a stay in 2008, who was vaccinated with a first dose of GARDASIL (lot 1050U; batch # NH32140, injection route not reported) into the left upper arm on 19-FEB-2009. Concomitant medication included unspecified hormonal contraceptive for systemic use. On 23-MAR-2009 the patient developed intestinal hemorrhage. A doctor's letter from 02-APR-2009 was provided. A colonscopy showed plane redness of the left intestinal flexure and of the rectum with small aphthae (biopsies of the suspect areas were taken) and Crohn's disease was suspected. The histological results showed an inflammation of the left intestinal flexure as well as the rectum. This result was consistent with the suspicion of ulcerative colitis. The physician assumed ulcerative colitis and treated the patient with PENTASA X-TREND. Under this therapy the symptoms improved. Final outcome not reported. Crohn's disease and ulcerative colitis were considered to be an other important medical event by the company. No further information is available. The case is closed.

Other Meds: hormonal contraceptives (unspecified)

Lab Data: colonoscopy, plane redness left intestinal flexure; diagnostic pathological examination, inflammation left intestinal flexure

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Central nervous system inflammation, Hypoaesthesia, Joint range of motion decreased, Muscular weakness, Myelitis, Neuritis, Tendon disorder, Vaccine positive rechallenge, Viral infection

Symptom Text: Information has been received from a healthcare professional on 30-Apr-2009. It was reported by a gynaecologist that a 14-year physician concerning a 14 year old female who on 27-MAY-2008 was vaccinated with GARDASIL (lot #: 1114U, batch #: NH15190) into the deltoid muscle on 27-MAY-2008. A doctor's letter was provided. Two weeks p.v. the patient developed weakness on the right lower leg and the mobility of the knee joint was decreased. She experienced hypaesthesia from the knee downwards. The patient was hospitalized from 04-JUN-2008 until 17-JUN-2008. CSF puncture and cranial MRI on 06-JUN-2008 showed normal results. Electrophysiology on 05-JUN-2008 and 11-JUN-2008 showed a partial affection of the right lumbar plexus and a neurogenic and myogenic impairment with suspicion of inflammatory CNS process. Orthopedic examination on 06-JUN-2008 showed a distortion of semitendinosus tendon. CK was increased to 5840 u/l. The cause of the events could not be clarified. Under intensive physiotherapy the motoric and sensory deficits completely resolved, but the patient has not recovered. The physicians considered the symptoms most likely as viral myelitis without detected agent (plexus neuritis was assumed as differential diagnosis). Despite ongoing events the patient was vaccinated with the second dose of GARDASIL (lot #: 1695U, batch #: NH25730) into the deltoid muscle on 28-APR-2009. One day p.v., hypaesthesia of the right lower leg was seen. The patient has not recovered at the time of reporting. Neurological clarification was planned. Additional information has been requested. Other business partner numbers include E2009-03753.

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a nurse via agency as part of a business agreement (manufacturer control # 20090505JV1) concerning a 22 year old female who was vaccinated with GARDASIL (date and dose not specified) while unknowingly pregnancy. The patient was advised by general practitioner (GP) to have a termination. The pregnancy was terminated (date not specified). It was reported that the patient was partly recovered at the time of this report. The reporter stated that it was unknown if the elective termination of pregnancy was related to GARDASIL. Upon internal review, pregnancy termination was determined to be an other important event. Additional information has been requested.
