MedDRA PT Syncope

Symptom Text: Information has been received from a physician concerning a 13 year old female who on 16-SEP-2008 was vaccinated intramuscularly with the 0.5 ml third dose of GARDASIL. Three hours after the vaccination, the patient fainted and possibly had a seizure. At the time of the report, the patient was recovering from the symptoms. The patient was seen by the physician. Upon internal review, seizure was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Autoimmune hepatitis, Coagulopathy, Encephalopathy, Fluid overload, Hepatic failure, Injection site pain, Jaundice, Ocular icterus, Oedema peripheral, Peripheral vascular disorder, Portal hypertension, Splenomegaly

Symptom Text: Last year in January 2007 my child was given the H.P.V vaccine and after the 1st dose, her legs and feet started swelling up. I took her to the doctor and they said that she had a problem with her Blood Circulating and they gave her a script for some Peg Hoes Stocking to help support her Blood to circulate. She also had pain at the injection site too. Well her legs swelled up a total of three time's last year and I also took her to our physician and they ran blood work and they gave us the same answer as the Emergency Room When took her. My child got all Three doses of the H.P.V Vaccine. Her last Dose was in 08-10-07 and this year in June of 2008 her feet and legs swelled up again and they diagnosed her with Liver Failure caused by a very rare disease called Autoimmune Hepatitis. 10/6/08-records received-presented to liver transplant clinic on 7/15/08-History ESLD and autoimmune hepatitis. Hospitalized 6/24-6/25/08 for coagulopathy and volume overload at which time diagnosed with autoimmune hepatitis type 1, cirrhosis and EBV hepatitis, portal hypertension. Lower extremity edema, jaundice and encephalopathy. Over past year or two has had some lower extremity edema and some significant fatigue. PE: scleral icterus, abdomen obese, splenomegaly.

Other Meds:

Lab Data: 10/6/08-records received-Liver panel elevated.

History: 10/6/08-records received-PMH:end stage liver disease secondary to autoimmune hepatitis and EBV hepatitis. Increasing fatigue and weight gain over last several years, leg swelling and yellowing of eyes.

MedDRA PT Dizziness, Haematoma, Head injury, Immediate post-injection reaction, Nausea, Syncope, Tenderness, Vomiting

Symptom Text: Initial and follow-up information has been received from a physician concerning a 15 year old female who on 11-JUL-2008, was vaccinated with a third dose 0.5ml of GARDASIL (lot# 660393/0067X) intramuscularly in the left arm. On 11-JUL-2008 the physician reported the patient fainted approximately 3 minutes after receiving GARDASIL at the physician's office. The patient hit her head. The patient was also dizzy, nauseous and began vomiting. The patient was sent to the emergency room. On 11-JUL-2008 the patient was recovered. Medical records were received. A 15 year old female who was sent to the emergency room by her pediatrician's office for evaluation of a head injury, status post a brief syncopal event after receiving her third GARDASIL injection in the office. The patient stated she received a third GARDASIL injection in the office and approximately 30 seconds later, she had a witnessed syncopal event for a "couple of seconds". Her mom and her sister were there, as well as the pediatrician staff. The patient struck the back of her head on the floor below and since that time, vomited once and had been extremely dizzy and complained. The patient denied any history of previous head injury or concussion. There was no abrasion or laceration noted to the scalp. The incident occurred approximately 30 minutes to 45 minutes prior to arrival in the emergency department. A physical examination was performed and the vital signs were stable and the patient was afebrile. The patient appeared nontoxic in no extremis. The patient's head revealed a mild posterior scalp hematoma with tenderness to palpation in the occipital region. A CT scan was performed of the head and was negative for acute pathology per the radiologist's interpretation. The emergency room physician reported "given the fact that this did occur directly after an injection this might be vasovagal in nature". This was discussed with the patient and her mother and no further diagnostic work-up was indicated at the time. The patient was discharg

MedDRA PT Immediate post-injection reaction, Loss of consciousness

Symptom Text: Initial and follow-up information has been received from a physician concerning a 16 year old white, 119 pound, 65 inch, female with pertinent medical history reported as none, with no illness at time of vaccination, except complaints of hunger, who on 03-JUL-2008 was vaccinated with the first dose of GARDASIL vaccine (yeast) (lot # 660389/1968U), 0.5 ml. It was reported that immediately when the needle was withdrawn the patient passed out. She was caught by the physician, her feet were elevated, cool compresses were applied, and smelling salts were used. The event lasted 15-30 seconds. After a "T & R" popsicle she was observed for 20 minutes and had no further sequelae. The patient was reported as recovered on 03-JUL-2008. This is one of two patients from the same source. No additional information is expected.

MedDRA PT Ataxia, Dysarthria, Extensor plantar response, Hyperreflexia, Speech disorder

Symptom Text: Information has been received from a physician concerning an 18 year old female with histiocytosis X and severe scoliosis and a history of iron deficiency secondary to dysfunctional uterine bleeding who in August 2007, was vaccinated with a first dose of GARDASIL vaccine (yeast) (lot number, injection site and route not reported). On an unspecified date, the patient was vaccinated with a second dose of GARDASIL vaccine (yeast) (lot number, injection site and route not reported). In March 2008, the patient was vaccinated with a third dose of GARDASIL vaccine (yeast) (lot number, injection site and route not reported). About the time she started the vaccination, the patient was very ataxic. At the time of reporting, the patient's speech was slurred and slow, and was hyper reflexic with present Babinskis bilaterally. The patient was seen by a neurologist, but had no diagnosis. The patient had scheduled for second opinion neurologist. Additional information has been requested.

Other Meds: Unknown

Lab Data: neurological examination - hyper reflexic with Babinskis bilaterally

MedDRA PT Abdominal pain upper, Bronchitis, Injection site pain, Joint sprain, Mononucleosis heterophile test positive, Nausea

Symptom Text: Information has been received from a registered office nurse manager and a consumer concerning her 12 year old daughter who on 19-FEB-2008 was vaccinated with the first dose of GARDASIL vaccine (yeast) (lot # 660387/1967U) intramuscularly in her right deltoid. The patient's mother reported that her medical doctor noted she was in good physical condition at the time the vaccine was administered. She also reported that the patient's vaccine site was extremely tender and sore for a complete week after she received the vaccination. Within a few days of receiving the vaccine, in February 2008, the patient began complaining of persistent stomach cramps and nausea. The nurse office manager reported that the patient developed stomach cramps and nausea after the vaccination. According to the nurse, the patient was treated as the physician's office as follows: on 07-MAR-2008 for a diagnosis of bronchitis (treatment unspecified) on 23-APR-2008, for symptoms of a left ankle sprain (treatment unspecified), on 15-MAY-2008 for symptoms of stomachache. On 16-MAY-2008, an ultrasound of the liver, kidney, pelvis and spleen were performed and the results were within the normal range. On 23-MAY-2008, upper gastrointestinal air contrast, hematology test, routine immunology test, blood chemistry test were performed and the results reported to be within the normal range except for serum Epstein-Barr virus antibody test positive for EBV IgG, EBV IgM and EBV nuclear antigen. Results suggested recovery or reactivation. The provider will recommend a gastrointestinal consult. No other symptoms or treatment noted. The patient's mother reported that the patient's stomach cramps and nausea continued until the time of this report despite a series of medical testing. The outcome of the patient's bronchitis, L ankle sprain and positive mononucleosis test was unknown. The patient sought medical attention.. Additional information has been requested.

MedDRA PT Hypoaesthesia, Immediate post-injection reaction, Pallor

Symptom Text: Information has been received from a physician concerning a 16 year old female who on 10-JUL-2008 was vaccinated with the first 0.5 ml dose of GARDASIL vaccine (yeast) (lot no. 660389/1968U). On the same date the patient also received meningococcal ACYW conj vaccine (dip toxoid) (MENACTRA) and hepatitis A vaccine (inactive) (HAVRIX). After receiving the first dose the patient immediately became pale, lost her color and her arm felt numb at top of the arm. The patient was recovered after 15 minutes. The patient sought unspecified medical attention in office. This is one of two reports received from the same source. Additional information has been request.

MedDRA PT Muscular weakness, Pain in extremity

Symptom Text: Information has been received from a physician concerning an 18 year old female who on 07-MAY-2008 was vaccinated with the first dose of GARDASIL vaccine (yeast) (lot # 659055/1522U) and also with varicella virus vaccine live (Oka/Merck) in her arm. Concomitant therapy included meningococcal ACYW conj vaccine (dip toxoid) (MENACTRA). The physician reported that the patient experienced pain and weakness in her arm after receiving GARDASIL vaccine (yeast) (Lot # 659055/1522U) and varicella virus vaccine live (Oka/Merck). The vaccines were administered in the same arm on the same day and the symptoms are being experienced in the same arm that the vaccines were administered. The patient's pain and weakness in her arm persisted. No further information was provided. The patient sought medical attention, seen by the physician. Additional information has been requested.

MedDRA PT Abdominal pain, Asthenia, Headache, Heart rate normal, Immediate post-injection reaction, Injection site pain, Loss of consciousness, Malaise, Neurological examination normal, Syncope vasovagal

Symptom Text: Information was received from a paediatrician concerning a 14-year-old female patient, with a history of vagal malaise, including one with loss of consciousness, anxiety and pollen allergy who on 03-SEP-2008 was vaccinated with a first dose of GARDASIL (lot # 1524U, batch # NH38000, route unknown) into her deltoid via intramuscular route. Four hours after the injection, the patient experience violent cephalgia, abdominal pain and vagal malaise. She rapidly recovered. The physician thought that the patient was probably emotional and that could have induced her malaise. Additional information was received from local Health Authorities (reference # BR20080309). According to report, on 03-SEP-2008, ten minutes after vaccination, the patient experienced continuous frontal cephalgia. Four hours later she experienced a vasovagal syncope with loss of consciousness, asthenia, abdominal pain and persisting cephalgia. She also had injection site pain immediately after vaccination. Evolution was favorable with recovering of consciousness, persisting cephalgia which resolved in 20 to 30 minutes after corrective treatment with paracetamol. Neurological examination was normal; blood pressure was at 130/70, pulse rate at 60-65/min, apyrexia, supple painless abdomen. Evolution 3 days later: She had persisting asthenia and injection site pain. The patient's experience was considered serious as an other important medical event. Other business partner numbers included: E200808457. No further information is available. The file is closed.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Information has been received from a registered nurse concerning a 14 year old female with a history of excess sweating and no drug reactions/allergies who on 16-Nov-2007 was vaccinated with the first dose of GARDASIL (lot#657617/0384U). Concomitant therapy included a first dose of Tdap and RUBINUL (therapy unspecified). On 22-Feb-2008, the patient was vaccinated intramuscularly with 0.5ml of the second dose of GARDASIL (lot# 657617/0384U) and found out she is pregnant (LMP = 26-JAN-2008). On an unspecified date GC test (gonorrhea and chlamydia test) and PAP test were performed (results pending). Also, on an unspecified date the patient took urine pregnancy test. Unspecified medical attention was sought in the office. Follow-up information was received. On 09-APR-2008 an ultrasound was performed which indicated a 9 weeks 2 days pregnancy. On an unspecified date the female patient experienced spontaneous abortion. The outcome of the spontaneous abortion was unknown. Upon internal review the spontaneous abortion was considered to be an other important medical event. Additional information is not expected.

Other Meds: [therapy unspecified]

MedDRA PT Cervical incompetence, Drug exposure during pregnancy, Gardnerella infection, Premature labour, Tocolysis

Symptom Text: Information has been received from a physician concerning 16 year old female who on 10-AUG-2007 was vaccinated with the first dose of GARDASIL (lot # 1451F; batch NF42160). It was well tolerated. On 11-OCT-2007, she was vaccinated intramuscularly in the deltoid muscle with her second dose of GARDASIL (lot # 1537F; Batch NF42170). After the second dose the reporter diagnosed pregnancy (duration not reported). At the time of reporting pregnancy was normal. Follow-up information was received from a gynaecologist which reported that the patient was hospitalized on 15-JUN-2008 due to premature labour in the 30th week of pregnancy. Incompetence of cervix and gardnerella infection were diagnosed. The gardnerella infection was treated with Ampicillin and a tocolysis (intravenous route) was given. Under this treatment the premature labour ceased. The patient was discharged on 23-JUN-2008. From 27-JUL-2008 to 31-JUL-2008, the patient was hospitalized again due to imminent premature birth in the 36th week of pregnancy. No labour was observed and the patient was discharged on 31-JUL-2008. On 15-AUG-2008, the patient gave birth to a normal newborn boy. His weight at birth was 3.650 grams and height at birth was 54 cm. The Apgar score was 10/10/10. Postnatal examinations of mother and child showed no pathologies. CASE CLOSED. Upon receipt of new information, this case was upgraded because of hospitalization due to premature labour. Other business partner numbers include: E2008-00789. Additional information is not expected.

MedDRA PT Allergy to metals, Bacterial infection, Dyspnoea, Erythema, Rash generalised, Rash pruritic, Skin irritation

Symptom Text: Information has been received from a 26 year old female with an allergy to TYLENOL who in 2007 was vaccinated with the first dose of GARDASIL vaccine (yeast) prior to a spinal fusion surgery in August 2007. Two weeks after the surgery she broke out in a serious rash all over her body that was red, itchy and oozy. She went back to her surgeon who thought she may have caught a bacterial infection while in the hospital. After the treatment for that, the rash did not go away and patient was thought to have a staph infection. The rash was getting worse and she started having difficulty breathing and had to be taken to ER. It was determined she may have an allergic reaction to the nickel hardware that was placed in her spine. After that she was sent to an allergist who performed some tests, however the patient was taking allergy medication at the time and the test came back inconclusive. She did receive a second and third dose of GARDASIL vaccine (yeast) and was also scheduled for a second spinal fusion to replace the hardware with stainless steel. The patient is still experiencing a rash, that comes and goes depending on whether she puts the cream on it or not. She will bring the package insert for GARDASIL vaccine (yeast) with her to the allergist office to look at the ingredients and perform some tests to see if she could be allergic to any of the components. At time of report, the patient had not recovered from her rash. The outcome of the difficulty breathing, bacterial staph infection and allergic reaction to nickel hardware is unknown. No further information is available.

MedDRA PT Injection site irritation, Injection site pain

Symptom Text: Information has been received from a registered nurse concerning female patients of various ages who were vaccinated with GARDASIL. All her patients who received GARDASIL experienced injection site pain and burning immediately upon injection. This has caused some of the patients to not return for their subsequent doses. The patients recovered while they were in the office. These symptoms occurred with any dose of the series. The patients sought unspecified medical attention. Follow up information was received from the nurse stating that, she was not aware of any specific patients but rather a general statement was made regarding patients experiencing injection site pain and burning. With HIPAA, the nurse would not feel comfortable providing any patient information anyway. As this was a general statement, there will be no patient information coming from this office.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Dizziness, Dyspnoea, Dysstasia, Eyelid oedema, Pyrexia, Swelling face

Symptom Text: Fever of 105, extreme dizziness to the point of being unable to stand on own, swelling in eyelids and face, and difficulty breathing. Called family doctor to confirm if this was a reaction to the HPV and they said to go to the ER, which we did. Today is one week after injection, and dizziness still occurs. The other symptoms are no longer visible.

MedDRA PT Fatigue, Infectious mononucleosis, Malaise, Myalgia, Pain in extremity

Symptom Text: Information has been received from a public health nurse concerning her daughter a 19 year old female patient with no known allergies who on last summer (2007), was vaccinated with the first dose of GARDASIL vaccine (yeast). On last fall (2007), was vaccinated with the second dose of GARDASIL vaccine (yeast). In February 2008, was vaccinated with the third dose of GARDASIL vaccine (yeast). In January 2008, the patient was diagnosed with mononucleosis and was treated with (3 MEDROL dose pack). The patient's mononucleosis persisted. Nurse states that her daughter was not on any medication when the third dose of GARDASIL vaccine (yeast) was administered. The patient had muscle aches and pains on both arms and legs, had been tired, fatigued and generally feels unwell. Nurse states she thought these symptoms were lingering due to mononucleosis, but is not sure now. At the time of reporting the patient had not recovered. Additional information has been requested.

MedDRA PT Influenza like illness, Nausea, Pyrexia, Vaccine positive rechallenge

Symptom Text: Information has been received from a registered nurse concerning a 14 year old female patient who 14-DEC-2007 and on 07-MAR-2008 was vaccinated with the first and second dose of GARDASIL vaccine (yeast) respectively. There was no concomitant medication. The registered nurse reported that within 24 hours of vaccination with the first dose of GARDASIL vaccine (yeast) on 14-DEC-2007, the patient developed a fever of 101 degrees F, nausea and flu like symptoms. It was unclear how long the fever, nausea and flu like symptoms lasted. The patient recovered. On 07-MAR-2008, the same night after the second vaccination with GARDASIL vaccine (yeast), the patient developed a fever of 102 degrees F, nausea and flu like symptoms that lasted for "several days". On an unspecified date, the patient recovered. It was not specified if the patient sought for medical attention. There was no product quality complaint. Additional information has been requested.

MedDRA PT Abdominal distension, Amenorrhoea, Anger, Irritability, Mood altered

Symptom Text: Information has been received from a physician concerning a 14 year old white female with menarche in February 2008 and irregular periods. The patient had asthma, acne and mood swings for which she was seen by a counselor prior to vaccination who on 30-MAY-2008 was vaccinated intramuscularly with the first 0.5 ml dose of GARDASIL vaccine (yeast) (lot no. 659182/1757U). Concomitant therapy included albuterol, benzoyl peroxide (TRIAZ) and RETIN-A MICRO GEL. On approximately 01-JUN-2008 (within the first week after the vaccination) the patient experienced anger outbursts, irritability, moodiness and bloating. The patient stated that she did not have a period in June 2008 but experienced bloating, moodiness and anger outburst off and on. She went on to have a menstrual period on 09-JUL-2008. The physician confirmed that the patient was not pregnant. On 16-JUL-2008, the patient was seen by the physician for the symptoms. The patient was asymptomatic at the visit. The patient was in counseling and the counselor stated that she felt mood problems were probably related to her vaccination. The patient's symptoms were noted to occur "on and off". This is one of several reports from the same source. Additional information has been requested.

MedDRA PT Drug exposure during pregnancy

Symptom Text: Information has been received through the Merck Pregnancy Registry from a physician concerning a 24 year old female, with no pertinent medical history, who on 21-JUN-2007 was vaccinated with a first dose of GARDASIL. Subsequently, the patient became pregnant. On an unspecified date the patient was seen in the doctor's office for an obstetrics visit. "The routine obstetrics lab work was taken" (results not reported). Her last menstrual period was 27-MAY-2007 and the estimated date of delivery was 02-MAR-2008. Follow-up information was received via phone call on 22-SEP-2008 from two other health professionals indicating that the baby was born on 28-FEB-2008 by C-section. The baby was born normal and healthy. There were no problems with the mother or the baby. The mother was seen for post partum visit and "everything is just fine". Upon internal review, birth by C-section was determined to be an other important medical event. Additional information is not expected.

MedDRA PT Breech presentation, Caesarean section, Drug exposure during pregnancy, Foetal disorder

Symptom Text: Information has been received from Merck pregnancy registry through a health professional concerning a 16 year old female with a medical history of tonsillectomy 4 years ago, and with no allergies, who on 23-JAN-2008 was vaccinated IM with the first dose of GARDASIL (lot# 659657/1487U). Concomitant therapy included Tdap and MMR II (Enders-Edmonston, Jeryl Lynn, Wistar RA 27/3) (MSD). On 28-Feb-2008 it was determined that the patient was pregnant with a LMP of 09-Dec-2007. The patient will be seeing the physician. The patient's outcome is unknown. Follow up information was received from a physician who reported that the patient was taking prenatal vitamins during her pregnancy. On 02-MAY-2008 the patient had ultrasound test for sex of baby and the result indicated within normal limits. On 01-SEP-2008 due to the baby was breech, the patient underwent c-section and delivered a normal, but small male baby whose weight was 4 pounds and 9 ounces and height was 17 inches. Upon internal review, c-section due to breech presentation was determined to be an other important medical event. Additional information is not expected.

MedDRA PT Amnesia, Asthenia, Convulsion, Fall, Headache, Malaise, Syncope, Vomiting

Symptom Text: Information has been received from a health professional concerning a 22 year old female with a history of migraine who on 22-AUG-2008 was vaccinated with the first dose of GARDASIL, 0.5 ml, IM. Concomitant therapy included JEANINE. On 22-AUG-2008, two minutes after vaccination, patient sat on chair, then felt against the wall and then on floor. After that started short-term "convulses" (5-8 seconds). Then patient opened eyes and did not remember anything, what happened. Five to six hours after vaccination, patient vomited. All day she felt weakness, felt herself ill, had headache. Thee patient recovered from syncope, convulses and vomiting on 22-AUG-2008. Weakness and headache lasted for two more days and resolved on 24-AUG-2008. The reporter felt that syncope, convulses, vomiting and headache, weakness were related to therapy with GARDASIL. Upon internal review, it was determined that "convulses" was serious as an other important medical event. Additional information has been requested.

MedDRA PT Paraplegia, Sensory loss, Syncope

Symptom Text: Information has been received from a physician concerning a 19 year old female with a history of syncope and sensory loss in lower extremities approximately 3.5 years ago after a 2000 meter run who on 25-NOV-2007 was vaccinated with GARDASIL first dose and no adverse event. On 25-JAN-2008 the patient was vaccinated with GARDASIL second dose. Concomitant therapy included MELIANE. On 30-JAN-2008 the patient experienced loss of feeling in lower extremities and syncope and was hospitalized for 5 days. During hospitalization head computed axial tomography and spinal tap were normal. After 20 hours the patient had gradually gained back feeling in lower extremities. Subsequently, the patient recovered from syncope and loss of feeling in lower extremities. Post hospitalization, magnetic resonance imaging, Holter monitoring and echocardiography were normal. One month since the event, the patient had returned to the military service. Three days later, on approximately 01-MAR-2008 the patient experienced syncope, loss of feeling in lower extremities and paraplegia. Subsequently, the patient recovered from syncope. The patient's paraplegia and loss of feeling in lower extremities persisted. Therapy with GARDASIL was discontinued. Paraplegia were considered to be disabling and other important medical event upon internal review. The details for this event were received from the patient's mother who is also a nurse. Additional information is not expected.

MedDRA PT Abdominal pain upper, Alopecia, Asthenia, Blindness, Body temperature increased, Cough, Dizziness, Fatigue, Hair disorder, Headache, Heart rate irregular, Immune system disorder, Infection, Malaise, Nasopharyngitis, Oropharyngeal pain, Rhinorrhoea, Sinus headache, Sinusitis, Vision blurred, Visual disturbance, Vomiting

Symptom Text: Information has been received from a 22 year old female who in December 2006, received the second vaccination of GARDASIL (lot # not provided). Concomitant therapy included unspecified vitamins. The patient reported "constant sickness", her "vision was really screwed up," and hair loss and hair change on her 2nd dose of GARDASIL. She "had no side effects on the 1st dose and chose not to have the 3rd dose". The patient reported she "felt fine" after her 2nd shot but the next morning at work her vision "completely went". She felt "like there was a white veil over" her eyes, "like half of 1 of the eyes was working, the other half was gray". She had to be driven home since she could not see. She said she "had a very bad headache". Her gynecologist, did not know the cause of her symptoms. The patient reported she in general does not get very sick, but from her 2nd dose to June 2007, she was "constantly sick with the same cold and infection". The patient believes GARDASIL "knocked" her immune system. She "could not keep anything down for 6 months and had stool samples done last year after the shot". In June 2007, the patient and her hairdresser noticed her "hair part was so wide" and the patient's "hair looked like it was thinning". She visited a dermatologist. She said now her "hair is not as bad as June 2007, maybe because of popping 8-9 vitamins a day" (manufacturer unspecified), but she does "not see a lot of regrowth". She does "not have baldness spots, but it has fallen out more" than she has ever seen. Dr. ran bloodwork less than a week ago. The patient is also concerned about her fertility, but has not reported fertility problems. The patient had no pertinent medical history. At the time of the report, the patient was recovering. Upon internal review, loss of vision was considered to be an other important medical event. Additional information has been requested. 12/26/2008 MR received from PCP. Reported to PCP on 3/2/07 that since receiving HPV vax pt has been having blurry vision and dizziness. Returned 3/

MedDRA PT Bundle branch block right, Syncope

Symptom Text: Information has been received from a physician, concerning a 13 year old female patient who was vaccinated with 0.5 mL of the first dose of GARDASIL vaccine (yeast) (Lot #659184/0843X). The patient fainted after vaccination. An ambulance was called and the patient was brought to the emergency room where it was determined by electrocardiogram that the patient had a blockage in her right branch. The patient sought medical attention at the office. There was no product quality complaint. Additional information is expected.

MedDRA PT Asthenia, Dizziness, Dyspnoea, Headache, Vision blurred

Symptom Text: Information has been received from a physician assistant concerning a 19 year old with no pertinent medical history or drug reactions or allergies who on 28-JUL-2008 was vaccinated intramuscularly with the first dose of GARDASIL vaccine (yeast) (lot no. 659184/0843X). Concomitant therapy included an unspecified birth control pill (patient had been on for years). On the same day, a few hours after leaving the office the patient had a significant headache. On 29-JUL-2008, "the following day" the patient experienced weakness, headache, blurred vision, dizziness and shortness of breath during a workout. The patient had always regularly worked out before the vaccination. On 30-JUL-2008, "today", the patient was feeling better but not fully recovered. The patient called the office to seek unspecified medical attention. Additional information has been requested.

MedDRA PT Erythema, Fatigue, Pain, Rash

Symptom Text: Information has been received from a physician concerning an 18 year old female with no relevant medical history or allergies who on 28-JUL-2008 was vaccinated with a first dose of GARDASIL vaccine (yeast). There was no concomitant medication. On 29-JUL-2008, also reported as "24 hours after vaccination" the patient developed fatigue and a rash on the palms of the hands and the soles of the feet. On 30-JUL-2008, the patient sought treatment with an urgent care provider rather than the provider who administered the vaccine. The rash was described as "little reddened spots that were almost raised and similar in look to that of a hands foot and mouth disease rash". The rash was painful and did not itch. The physician planed to prescribe unspecified anti-inflammatory pain medication for the symptoms. At the time of reporting, the patient's events persisted. Additional information has been requested.

MedDRA PT Dizziness, Pain in extremity

Symptom Text: Information has been received from an office manager concerning an 18 year old female who on 27-JUL-2007 was vaccinated with the first dose of GARDASIL vaccine (yeast). After receiving the first dose, the patient's arm was sore. On 29-JUL-2008 the patient came back to the office and was vaccinated with the second dose of GARDASIL vaccine (yeast), which was almost a year later. Concomitant therapy included diphtheria toxoid (+) pertussis acellular vaccine (unspecified) (+) tetanus toxoid. On the same day, after receiving the second dose, the patient was a little dizzy so she waited for a while until she felt better. The patient was fully recovered on that day. The patient sought unspecified medical attention. Additional information has been requested.

MedDRA PT Arthralgia, Joint swelling, Rash, Urticaria, Vaccine positive rechallenge

Symptom Text: Information has been received from a nurse concerning a 13 year old female patient who on 04-JAN-2008, was vaccinated with the first dose of GARDASIL vaccine (yeast) (lot # 657006/0188U) IM, on 19-MAR-2008 was vaccinated with the second dose of GARDASIL vaccine (yeast) (lot # 659657/1487U) IM and on 09-JUL-2008, was vaccinated with the third dose GARDASIL vaccine (yeast) (lot # 660553/0070X) IM. The nurse reported the patient developed hives, arthralgia and swollen knees and ankles after administration of her first dose of HPV vaccine in January-2008. The patient experienced the symptoms intermittently through receiving her HPV vaccine series. Medical attention was sought. The laboratory diagnostics studies performed were sedimentation rate, CBC and rheumatoid factor were negative. The patient's hives and arthralgia and swollen knees and ankles persisted. The patient is being treated with ibuprofen (motrin) and cetirizine (Zyrtec). Additional information has been requested. 10/08/2008 PCP office records received. 13 yr WCC 1/4/08. PE WNL except nevus noted on neck, wart on finger. Seen 5/19/08 for worsening joint pain, constant x 2 weeks-5 months duration. Pain ankles, knees, hips and back. One time ankle swelling. Sent for labs. DX: Joint pain-unspecified. Seen 7/9/08 for spreading rash and joint pain. PE (+) for wheal and flare lesion on knee and shoulder. Pediatric Rheumatology consult 8/21/08 with Impression: Arthralgia associated with mild joint hypermobility. Urticaria. Pt reports transient joint swelling as well. Tx with Aleve.

MedDRA PT Dermatitis contact, Injection site erythema, Rash pruritic

Symptom Text: Information has been received from a registered pharmacist concerning her 22 year old daughter with a lobster allergy and a history of a tonsillectomy 5 years ago and chickenpox in childhood who on 20-MAY-2008 was vaccinated with the first dose of GARDASIL vaccine (yeast) 0.5ml IM. Concomitant therapy included YAZ. Subsequently, not long after vaccination, the patient experienced "a little" redness at the injection site which resolved on its own. One week after the vaccination (on approximately 27-MAY-2008) the patient developed a "rash". The patient also developed poison ivy at the time. The "rash" had persisted since that time. The rash looked like tiny hives that itch, no drainage noted. The patient had seen her primary physician and a dermatologist. The patient was prescribed 2 courses of MEDROL dose pack and multiple creams that have been resolved the rash. The rash had completely resolved and then come back again. The location of the rash changed each time it returned. It has been located on her arms, legs, knees, and thighs at different times. The dermatologist stated that it may be caused from a virus or nerves. Additional information has been requested.

MedDRA PT Cervical conisation, Cervix carcinoma stage 0, Cervix carcinoma stage III

Symptom Text: Information has been received from a gynecologist via Sanofi Pasteur as part of a business agreement concerning a 20 year old female with a history of a normal smear test papanicolaou II (Dec-2007) who on 06-Jun-2008 was vaccinated with the third dose of GARDASIL (lot # 1114U, batch # NH010940)) IM in her deltoid. Concomitant therapy included hormonal contraceptives (unspecified). In August 2008, the patient had a check-up cytology smear test (papanicolaou) showed PAP IVa, highly positive for HPV. In September 2008, the patient underwent conisation resulting in CIN III. On 10-Oct-2007, the patient was vaccinated with the first dose of GARDASIL (LOT# 1518F, batch # NF23330), and on 13-Dec-2007, the second dose of GARDASIL (LOT# 0276U, batch # NF58550). Both vaccinations were given in to the deltoid and well tolerated. The reporter pointed out that smear test papanicolaou had been without pathological findings until Aug-2008. Last smear test had been in Dec-07 which was PAP II. Cervical intraepithelial neoplasia III and papanicolaou smear abnormal, class IVa were considered other important medical events. No further information is available.

Other Meds: hormonal contraceptives (unspecified)

Lab Data: Pap test, ??Jul07, Comment: No pathological findings, PAP II; Pap test, ??Aug08, Comment: PAP IV a, highly positive for HPV

History: Papanicolaou smear normal

MedDRA PT Central nervous system lesion, Facial palsy, Multiple sclerosis

Symptom Text: Information has been received from a health care professional concerning a 19 year old female who was vaccinated with the second dose of GARDASIL (route and lot number not reported) by the end of May-2008. On 29-Jun-2008 the patient presented with facial palsy. Symptoms were not observed by the reporter. MRI on 29-Jun-2008 revealed lesions. The specialist performed another MRI with contrast's product (unspecified date) but there was no contrast uptake for lesions. The specialist evoqued past multiple sclerosis. A MRI was scheduled in Dec-2008. At time of reporting the outcome was not specified. She had received the first dose of GARDASIL in Mar-2008. Upon internal review, multiple sclerosis-like syndrome was determined to be other important medical events. Other business partner numbers included: E2008-08715. No further information is available.

MedDRA PT Fall, Fatigue, Syncope, Tooth fracture

Symptom Text: Information has been received from a health professional concerning a 19 year old female who on 11-SEP-2008 at 11 am was vaccinated with the third dose of GARDASIL (batch number and route of administration not reported). Within 3 seconds after injection, the patient experienced very brutal and violent syncope. She fell from the examination table and had fractured her left upper incisor tooth. The event was not a vagal malaise; there was no anticipation sign and it was very sudden. The patient remained distraught for 15 to 20 seconds because of the shock. She was kept under observation for one hour at the physician's office; she was very tired. She could subsequently walk, however she was still very tired. The outcome was not reported. The patient has no adverse effect after 1st and 2nd injections of GARDASIL and no reaction after other vaccines. Patient was rested and coming back from holidays. The reporter considered the adverse events to be other important medical events. Other business partner numbers included: E2008-08537. No further information is available. The case is closed.

MedDRA PT Blood test normal, Cephalo-pelvic disproportion, Culture negative, Delayed delivery, Drug exposure during pregnancy, Laboratory test normal, Umbilical cord around neck

Symptom Text: Information has been received for Pregnancy Registry for GARDASIL from a consumer's mother concerning her 18 year old daughter with no medical history who on 24-JAN-2007 was vaccinated with a first dose of GARDASIL. Concomitant therapy included HEP B (unspecified) and Vitamins (Prenatal DHA). The reporter mentioned that "her daughter received her first injection and found out that she was pregnant 2-3 weeks later." No adverse event reported. It was reported that she had a pregnancy test done. On 27-SEP-2007, the patient delivered a normal, healthy female baby weighing 7 lbs and 6 oz, length 20, apgar score 8/9, head circumference not reported. No congenital anomalies. Complications during pregnancy or labor/delivery included Nuchal cord x 1 and cephalopelvis disproportion (1 CTC/S) failure to progress. Diagnostic test during pregnancy included routine Quad screen, routine labs, culture and biophysical all within normal limits. Upon internal review cephalopelvis disproportion and failure to progress were considered to be an other important medical event. No further information is available.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Computerised tomogram, Convulsion, Dizziness, Drooling, Electroencephalogram, Headache, Pallor

Symptom Text: Information has been received from a physician concerning a 14 year old female who on 03-MAY-2007 was vaccinated with the first dose of GARDASIL, on 17-JUL-2007 was vaccinated with the second dose of GARDASIL and on 25-OCT-2007 was vaccinated with the third dose of GARDASIL (lot#: 658560/1062U). Two or three months after she received the third dose her mother reported that she had been having seizures at night while she was sleeping. She also began experiencing headaches and dizziness. It was not known if this also occurred after the first two doses. The mother told the physician that the patient's sister went into her room a few times and noticed that she was very pale and had white saliva dripping out of her mouth. She was currently seeing a neurologist but it was not known if she had recovered. Electroencephalogram (EEG) and computed axial tomography (CAT) scan was performed (results not reported). Upon internal review the patient's seizures were determined to be an other important medical event. Additional information has been requested.

MedDRA PT Wrong drug administered

Symptom Text: Information has been received from a nurse practitioner and the patient's aunt concerning a 41 month old female, who on 01-OCT-2008, at 11:00Am was inadvertently vaccinated with 1 dose of GARDASIL (lot#660553/0070X), IM, into the left thigh instead of Hepatitis B vaccine (manufacturer unknown) she was supposed to receive. The GARDASIL was intended for the patient's older sister. The nurse accidentally gave the patient GARDASIL rather than switching to Hepatitis B vaccine. This was a case of human error. No adverse event was reported. The patient was seen in the office. Additional information is not expected.

MedDRA PT Abnormal behaviour, Anger, Feeling abnormal, Gaze palsy, Inappropriate schedule of drug administration, Loss of consciousness, Pallor

Symptom Text: Information has been received from a registered nurse concerning a 14 year old white female with attention deficit/hyperactivity disorder and mental illness who on 03-JAN-2007, at 1230, was vaccinated intramuscularly into left deltoid with the first 0.5 ml dose of GARDASIL vaccine (yeast). (Lot number 654741/1208F). On 26-JAN-2007, the patient was vaccinated intramuscularly into left deltoid with the second dose of GARDASIL vaccine (yeast), (Lot number 654741/1208F). There was no illness at the time of vaccination. Concomitant therapy given on 03-JAN-2007 intramuscularly into right deltoid included the first dose of MENACTRA vaccine (dip toxoid) (Lot number U1808AA). Concomitant therapy also included CONCERTA. The patient's mother reported that on 26-JAN-2007 night, the patient "tripped out". The patient threw things, her eyes rolled into back of head and passes out for 3 minutes. The patient had never had anything like that before. The mother reported that the patient was "like a zombie this weekend". The patient was pale on 29-JAN-2007 and continued with anger outbursts over the weekend. There was no fever and no further episodes. The patient was not evaluated by anyone over the weekend. The mother called to seek medical attention on 29-JAN-2007. The doctor advised her to continue to monitor and to call if increased with concerns. No further call came back regarding symptoms. 3 to 4 days post the onset of the events (approximately 30-JAN-2007) the patient recovered. No further information is available.

MedDRA PT Drug exposure during pregnancy

Symptom Text: Initial and follow up information has been received through the Pregnancy Registry for GARDASIL from a physician concerning a 19 year old female who on 11-MAY-2007 was vaccinated in the left deltoid with the first dose of GARDASIL (Lot#655126/0087U). On 22-MAY-2007 the patient found out that she was pregnant. It is not known how many weeks pregnant she is. Patient plans to discontinue the series of injections. On 20-JUN-2007, the patient has an ultrasound for dating purposes which was within normal limits. On-08-AUG-2007, the patient had a normal serum alpha fetoprotein test which was negative. On 13-AUG-2007, the patient had an ultrasound for evaluation of growth which was within normal limits. On 02-JAN-2008, the patient gave birth to a 7 pond, five ounce normal male infant who was 20 1/2 inches long. The baby was born 39 weeks from LMP and stored a 9/9 on the apgar test. There were no congenital anomalies or abnormalities. There were no complications during pregnancy or labor/delivery. Follow-up information has been received in the form of medical records. On 10-JAN-2008 the baby's mother called the pediatrician's office reporting the baby had discharge from his eye. There was no redness and sclera was white. Mother advised to gently massage with warm compress. On 15-JAN-2008 the baby was seen for a routine visit with the pediatrician. Physician noted sacnt discharge from the right eye. Physician felt the baby had a right lacrimal duct stenosis and advised continuing with massage with warm washcloth. Physician examination otherwise normal. On 30-JAN-2008 the physician noted the baby's eye was improving and to continue duct massage. On 11-FEB-2008 mother to pediatrician after noticing a left inguinal lump. Physician noted a firm, non-tender lump approximately 2-3 cm in the left inguinal canal. Patient given referral to Urologist. On 13-FEB-2008, urologist saw the baby and his mom in consultation. The baby was 6 weeks of age. He was born at 7-lb 12 oz. On resent examination he was noted to have a mass in the l

MedDRA PT Drug exposure during pregnancy

Symptom Text: Information and follow up information has been received for Pregnancy Registry for GARDASIL vaccine (yeast) from a 23 year old Caucasian female consumer with asthma and penicillin allergy who on 18-JUL-2007 was vaccinated IM with a first dose of GARDASIL vaccine (yeast) (Lot # 658100/0525U). Concomitant therapy included albuterol. The consumer reported that "I found out today (10-AUG-2007) that I am pregnant". No adverse reaction was reported. She had a "pregnancy test" done. The patient sought unspecified medical attention. The outcome was unknown. On 15-OCT-2007 the patient had a normal ultrasound. Additional information has been requested. Information was received on 07-APR-2008. A normal female infant was born on 21-MAR-2008 (weeks from LMP = 38 5/7). The baby weighed 6lbs. 11 oz. and had an Apgar score of 9/9. There were no congenital anomalies. The baby did develop some jaundice in the first few days of life. This resolved on it's own and was felt to be physiological. No other information was reported concerning this pregnancy. Follow-up information has been received in the form of medical records. On 23-MAR-2008, all state Department of Health tests screen-negative and no follow-up action was requested. On 24-MAR-2008, the newborn's total serum bilirubin test was 15.3 mg/mL (normal range 2.0 to 12.0). On 25-MAR-2008, the newborn's total serum bilirubin test was 18.4 mg/mL (normal range 2.0 to 12.0). On 26-MAR-2008, the newborn's total serum bilirubin test was 18.1 mg/mL (normal range 2.0 to 12.0). On 27-MAR-2008, the newborn's total serum bilirubin test was 16.3 mg/mL (normal range 2.0 to 12.0). On 10-APR-2008, the patient had a 2 week well child visit and all appeared normal. On 21-MAY-2008, the patient presented for a scheduled 2 months well child visit and baby's mother was concerned about the baby spitting up a lot. The baby "seems to be spitty". The physician found that the baby appeared healthy and gaining weight appropriately, so in that point he did not feel that the "spitting" was of any clinical

MedDRA PT Drug exposure during pregnancy, Gestational diabetes

Symptom Text: Initial and follow up information has been received from a nurse practitioner concerning an 18 year old white female patient who on 18-JUL-2007, was vaccinated with a first 0.5ml dose of GARDASIL vaccine (yeast) (Lot# 657737/0522U). On 18-AUG-2007 a month later (4 weeks after her last menstrual period), the patient found out she was pregnant. The date of her last menstrual period was reported to be 17-JUN-2007. Her estimated delivery date was reported as 25-MAR-2008. Her pregnancy was confirmed by lab work and an ultrasound. It was reported that the patient had a total of 4 ultrasounds and al were within normal limits (WNL). Prenatal vitamins were reported to be taken during the pregnancy. The patient has not had any previous pregnancies or previous live births. On approximately 30-DEC-2007, 28 weeks from her last menstrual period, the patient developed gestational diabetes. On 14-MAR-2008, the patient gave birth to a liveborn infant male weighing 7 pounds 15 ounces. The infant was reported to be normal. It was unknown if the infant had any congenital anomalies or if there were any complications. At the time of this report, the patient's outcome was unknown. No product quality complaint was involved. Additional information is not expected.

MedDRA PT Drug exposure during pregnancy, Insomnia, Pain

Symptom Text: Information has been received from a physician's assistant through a pregnancy registry concerning a 21 year old female who on 08-AUG-2007 was vaccinated with the first dose of GARDASIL. The physician's assistant reported that the patient became pregnant after receiving the first dose of GARDASIL. At the time of the report, the patient had a gestational age of 16 weeks, and no adverse reactions were reported. The patient's last menstrual period was approximately 16-SEP-2007 with an estimated due date of 24-JUN-2008. Follow up information received from the physician's assistant stated that on an unspecified dates during the patient's pregnancy she developed pain (NOS) which was treated with TYLENOL 325 mg, PO, PRN and insomnia which was treated with BENADRYL 25 mg, PO, PRN. The patient's unspecified pain and insomnia were considered to be nonserious events. On 22-JUN-2008 at 40 wk 2 days gestation the patient gave birth to a normal female infant. The baby weighed 7 lbs. 6 oz and had a 9/10 Apgar score. It was also reported that there were no complications with the delivery. Additional information has been requested.

MedDRA PT Drug exposure during pregnancy

Symptom Text: Initial and follow-up information has been received for the Pregnancy Registry for GARDASIL from a health professional concerning a 17 year old female with papilloma viral infection diagnosed in December 2007 history of 2 pregnancies, 1 live birth and a history of an elective termination who on an unspecified date was vaccinated with a first dose of GARDASIL. On 14-MAR-2007 the patient was vaccinated with a second dose of GARDASIL (lot#657006/0188U). Concomitant therapy included prenatal vitamins (CB Complete), iron (unspecified), PHENERGAN and ZOFRAN ODT. The patient's (last menstrual period) LMP date was 17-NOV-2007 and the (estimated date of delivery) EDD date is 23AUG-2008. The estimated date of conception was 30-NOV-2007. On 23-JAN-2008 a confirmation ultrasound was performed and was within normal limits. On 19-MAR-2008 a maternal serum alpha-fetoprotein test was performed for sequential screening and was within normal limits. There was no adverse experience was related to this event. Medical attention was sought in the office. The product quality complaint unit was not involved. Follow up information was received which indicated that the patient had one previous pregnancy and on elective termination (6-8 weeks from LMP). The patient had allergy to sulfa and iron deficiency anemia and a history of Papilloma viral infection (biopsies revealed mild to moderate (cervical) dysplasia) and ankle fracture in motor vehicle accident (in MAY of 2007). It was also reported that the patient was group B Strep carrier during pregnancy. On 20-Feb-2008, the patient underwent sequential screen and the result indicated normal. On 19-AUG-2008 (39 3/7 weeks from LMP) the patient delivered a normal male baby who was 8 LB 1oz with an Apgar score 9/9. Additional information is not expected.

MedDRA PT Drug exposure during pregnancy, Wrong drug administered

Symptom Text: Information has been received for the Pregnancy Registry for GARDASIL vaccine (yeast) from a 35 year old female with no pertinent medical history or drug reactions/allergies who on 16-APR-2008 was vaccinated with the "first dose of three doses" of GARDASIL vaccine (yeast) (lot# 0152X) injection. Concomitant therapy included RHOGAM. On 16-APR-2008 the patient was administered GARDASIL vaccine (yeast) instead of another injection the patient was supposed to be receiving. On an unspecified date an ultrasound was performed. No adverse side effects were reported as a result of this. The patient's gestation was 28 weeks. The date of the last menstrual period (LMP) and the estimated date of delivery (EDD) was unknown. Follow-up information was received from a registered nurse RN. The RN reported that the patient should have received RHOGAM injection for Rh negative on 16-APR-2008 but instead received the GARDASIL vaccine (yeast). The RN stated that the nurse who administered the GARDASIL vaccine (yeast) mistakenly did so. There was no product confusion involved. The patient received the RHOGAM injection after the patient received the GARDASIL vaccine (yeast) on 16-APR-2008. On 16-APR=2008, the patient had an ultrasound which was reported as normal. Follow-up information was received. The patient had a history of 2 previous pregnancies with full-term deliveries. The patient had a history of macrosomia in both previous pregnancies. The birth weights were 9 pounds and 12 ounces and 10 pounds and 5 ounces. The patient's date of her last menstrual period was 06-OCT-2007, the estimated conception date was 20-OCT-2007 and the estimated date of delivery was 13-JUL-2008. On 05-MAR-2008 the patient had an ultrasound for AMA and it was within normal limits. On 14-MAY-2008 an ultrasound was within normal limits. On 09-JUL-2008 the patient delivered a normal, healthy male baby weighing 9 pounds and 15 ounces. The baby's length was 21.5 inches with apgar score 9. His head circumference was 38.7cm. There were no congenial anomalies a

Other Meds: RHOGAM

MedDRA PT Drug exposure during pregnancy

Symptom Text: Information has been received from a registered nurse concerning a 25 year old female with atypical squamous cells of undetermined significance and no known drug allergies who on 15-MAR-2007 was vaccinated with her first dose of GARDASIL vaccine (yeast) (Lot# not reported). On 17-May-2007, the patient was vaccinated with her second dose of GARDASIL vaccine (yeast) (Lot# not reported) and delivered a baby in April 2008. Unknown medical attention was sought in a clinic. It was reported that a PAP test, ultrasound, amniocentesis and Maternal Serum Alpha-Petoprotein Screening (MSAFP) were performed (no results provided). Follow-up information was received from the registered nurse. The patient only received vaccination with GARDASIL vaccine (yeast) there, not obstetrician care. Telephone call follow-up information was received from a healthcare professional at the obstetrician's office, who reported that the patient was last seen on 30-MAY-2008 for her 6 week postpartum check up. The patient had a full term elective induction, and delivered a healthy and normal baby, weighing 3135 grams, whose Apgar assessments were 8.9 and 9. No additional information is expected.

MedDRA PT Abdominal pain upper, Gastric disorder, Vaccine positive rechallenge

Symptom Text: Information has been received from an office manager concerning a 16 year old female with irregular menstrual cycles and premenstrual syndrome and no drug reactions or allergies who on 21-MAR-2008 was vaccinated with a first dose of GARDASIL vaccine (yeast). Concomitant therapy included LOESTRIN. "4 weeks post vaccination", on approximately 18-APR-2008 the patient developed severe upper gastric stomach cramps, which lasted for approximately 5 days. The patient had no fever, no vomiting. After that the patient would get some occasional stomach problem. It was reported that the pain was not associated with the patient's menstrual cycle and in fact the patient's menstrual cycle was "better and lighter". On 19-JUN-2008 the patient was vaccinated with her second dose of GARDASIL vaccine (yeast). "Weeks later", the patient developed the same symptoms but worse. The patient played volleyball and the pain was "so bad she could not run". PEPTO_BISMOL seemed to help relieve the symptoms somewhat. At the time of the report, the patient had not recovered from the events yet. Unspecified medical attention was sought. Additional information has been requested.

MedDRA PT Weight increased

Symptom Text: Information has been received from a nurse practitioner concerning a 16 year old female with no known allergies or pertinent medical history who in March 2008, was vaccinated with the first dose of GARDASIL vaccine (yeast). There was no concomitant medication. The nurse practitioner reported that a patient gained weight after she received GARDASIL vaccine (yeast) in March 2008. The patient claimed a weight of 126 lb at the time of administration. (GARDASIL vaccine (yeast) was administered by another provider). The patient was evaluated by the physician in April 2008 and weighed 141 lb. The patient refused the second GARDASIL vaccine (yeast) injection at the 28-JUL-2008 follow up appointment because the weight had increased to 150 lb. No other symptoms. The physician evaluated the patient's blood work including a pregnancy test. The blood work results were unspecified but reported to be within normal range. At the time of the report the patient had not recovered, There was no product quality complaint. Additional information has been requested.

Other Meds: None

MedDRA PT Injection site atrophy, Injection site pain

Symptom Text: Information has been received from a nurse practitioner concerning a 13 year old female with no pertinent medical history or history of drug reactions or drug allergies who on 30-OCT-2007 was vaccinated with the first dose of GARDASIL vaccine (yeast). On approximately 03-MAR-2008, "two days prior to" the second vaccination, the patient had received a steroid injection in the gluteal area, for the treatment of allergies. On 05-MAR-2008 the patient was vaccinated intramuscularly in the left arm with the first 0.5 ml dose of GARDASIL vaccine (yeast) (lot no. 655604/0052X). Concomitant therapy included YAZ, CLARITIN and ADDERALL TABLETS. On the same day, "after her second immunization", the patient developed pain and muscle tissue atrophy at the injection site. On 01-AUG-2008 the patient was vaccinated with the third dose of GARDASIL vaccine (yeast). At the time of this report, the patient was recovering from the symptoms. The patient sought unspecified medical attention via office visit. Additional information has been requested.

MedDRA PT Cervical dysplasia, Drug exposure during pregnancy

Symptom Text: Initial and follow-up information have been received from a nurse for the Pregnancy Registry for GARDASIL vaccine (yeast) concerning a 17 year old white female with allergic reaction to CECLOR and a history of one previous pregnancy, one elective termination and no full-term deliveries who on 08-JAN-2008 was vaccinated with GARDASIL vaccine (yeast) (Lot # 659439/1267U) and is pregnant. The patient had a pap test on 04-MAR-2008 that revealed atypical squamous cell of undetermined significance (ASCUS). An ultrasound test was performed on 12-MAR-2008 to established pregnancy due date of 15-SEP-2008. A colposcopy was performed on 18-APR-2008 and a biopsy from 30-APR-2008 provided a diagnosis of cervical intraepithelial neoplasia 1 (CIN 1). An ultrasound test was performed on 07-JUL-2008 and revealed an estimated fetal weight of 3 pounds and a fetal measurement of 28-30 weeks. A repeat pap test was performed on 21-JUL-2008 that revealed ASCUS. Pregnancy was reported as normal to date. Additional information has been requested.

Other Meds: Unknown

Lab Data: ultrasound - 03/12/08 - 13 weeks - Establish due date WNL, biopsy - 04/30/08 - CINI on Bx, ultrasound - 07/07/08 - EFW 3# measures 28-30 wks, Pap test - 03/04/08 - Abnormal and was positive for HPV type 16

History: Abortion, LMP = 12/15/2007

MedDRA PT Arthralgia, Arthritis, Asthenia, Back pain, Fatigue, Hypokinesia, Joint range of motion decreased, Menstruation irregular, Musculoskeletal pain, Myalgia, Vitamin D deficiency

Symptom Text: Information has been received from a consumer concerning his 14 year old daughter who was vaccinated with GARDASIL vaccine (yeast). The consumer did not remember when his daughter's first and second dose of GARDASIL vaccine (yeast) were administered. On 20-APR-2008 or 25-APR-2008 the patient was vaccinated with the third dose of GARDASIL vaccine (yeast). The patient experienced muscle aches and pain on GARDASIL vaccine (yeast) and the consumer noticed she had slow movements while walking and getting dressed after her 1st and 2nd dose of GARDASIL vaccine (yeast). The doctor referred her to a rheumatologist, who told her to take high amounts of vitamin D. Lab tests showed her "antibodies went up". The doctor thinks patient has "rheumatism". Patient was getting worse everyday and needs help getting out of bed. Additional information has been requested. 11/06/2008 PCP records received. Pt reports developed irregular periods, knee pain, lower back pain and R wrist pain after 2nd HPV vax . Normal exam 5/5/08. Sent for labs and referred to Rheumatology. OV 5/22/08 with DX: Acute Arthritis. OV 8/5/08 with c/o decreased energy and parent noticed movements are slower. DX: Vit D deficiency. Fatigue. Rheum consult 7/8/08 for joint pain/(+) ANA. PE (+) for Wrist limitation. 11/12/2008 Rheumatology consults received dated 7/8 and 10/17/2008 with DX: Polyarthritis, chronic. Vit D deficiency. Anemia NOS. Pt presented with gradual onset of bilateral hand, knee, foot and back pain & morning stiffness. PE (+) for fatigue, generalized weakness, non-productive cough, and wrist limitation. Tx with anti-inflammatory

Other Meds: Unknown

Lab Data: diagnostic laboratory - the test showed antibodies went up. Labs and Diagnostics: LH high at 21.1. FSH 4.5. ANA 174. RF (-). EBV and Lyme (-). Wrist x-ray (-).

MedDRA PT Contusion, Immediate post-injection reaction, Syncope

Symptom Text: Information has been received from a health professional concerning a 25 year old white female teacher with no allergies or medical conditions, who on 29-JUL-2008 at 11:30 am was at the doctors office for an annual exam and was vaccinated intramuscularly into left arm with a second dose of GARDASIL vaccine (yeast) (lot # 0250X). On 29-JUL-2008, approximately 5 minutes after immunization (approximately 11:35 am) the patient experienced fainting and had a head contusion. She was transported to the Emergency department. The patient had no illness at the time of vaccination. Additional information is not expected.

MedDRA PT Injection site pain

Symptom Text: Information has been received from a nurse concerning unknown number patients who were vaccinated with GARDASIL vaccine (yeast). The nurse reported that about 80% of her patients who received GARDASIL vaccine (yeast) experienced injection site pain. The outcome was unknown. It was unknown if the patients sought medical attention or not. Attempts are being made to obtain additional identifying information to distinguish the individual patients mentioned in this report. Additional information will be provided if available.

MedDRA PT Brachial plexus injury, Drug administered at inappropriate site, Hypoaesthesia, Hypoaesthesia facial, Immediate post-injection reaction, Neuralgic amyotrophy, Pain in extremity

Symptom Text: Information has been received from a physician concerning his daughter, a 25 year old female who in February 2008, was vaccinated in the left arm with the second dose of GARDASIL vaccine (yeast). Immediately after the vaccination, the patient experienced pain and numbness in the left hand and numbness on the left side of the face that never went away. The physician reported that the vaccination was not administered in the deltoid but was administered in the biceps and triceps area in the patient's left arm. The patient was referred to neurologists and was diagnosed with brachial plexus and Parsonage E28093 Turner syndrome. Numerous magnetic resonance imaging (MRI) studies and other unspecified tests were performed but no results were provided. The patient's symptoms persisted. Additional information has been requested.

MedDRA PT Convulsion

Symptom Text: Information has been received from a nurse practitioner concerning a female who on an unspecified date was vaccinated with a dose of GARDASIL. Concomitant therapy included VARIVAX (Oka/Merck). It was reported that the patient experienced an adverse reaction following vaccination with GARDASIL. The reporter stated that the patient had an adverse reaction (possible seizure) when VARIVAX (Oka/Merck) was administered concomitantly with GARDASIL. The details of the adverse reaction were not provided, thought it may have been a seizure. On an unspecified date, the patient recovered. It was unknown if the patient sought medical attention or not. Upon internal review, seizure was considered to be other important medical event. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Drug exposure during pregnancy, Intra-uterine death

Symptom Text: Information has been received from a specialist in a foreign country through the Sanofi Pasteur MSD Gardasil Pregnancy Registry. Case linked to serious-case number E2008-08869 (baby's case). A 16-year-old female came to see the reporting gynecologist on 25-Jan-2008 or on 28-Jan-2008 for a 1st prescription of oral contraceptive. The same day she received the first dose of GARDASIL (lot # not provided). The physician had asked her before the injection if there was a possibility that she was pregnant and she had answered with a categorical no. The patient only mentioned afterward (after receiving the injection) her delayed menstrual period which were due on 13-Jan-2008 or on 15-Jan-2008. Consequently the physician prescribed a serum beta HCG test which returned positive 3 days later. An echography at 12 amenorrhea weeks revealed nuchal translucency at 3.3 mm. After this the pregnant woman was followed at hospital and the gynecologist had no news until mid-September 2008: she was contacted by phone by the mother of the pregnant patient and learned that on the 5th month echography performed by the end of May-2008 the baby was found dead (no heart beat). The mother of the patient claimed this had a link with the vaccination with GARDASIL. No more information was provided to the gynecologist. Upon internal review, fetal death in-utero was considered to be an other important medical event. Other business partner number included: E2008-08846 and E2008-08869.

Other Meds: Unknown

Lab Data: Ultrasound, 05?Apr08, foetus presented with nuchal translucency at 3.3 mm; Ultrasound, ??May08, baby was found dead (no heart beat); Serum beta-human chorionic gonadotropin, 25?Jan08, returned positive 3 days later

MedDRA PT Complex partial seizures, Confusional state, Eye movement disorder, Loss of consciousness, Neurological examination abnormal, Partial seizures with secondary generalisation, Tonic clonic movements

Symptom Text: Information has been received from a nurse practitioner concerning a female patient who on an unknown date, was vaccinated with GARDASIL. After receiving the vaccine, the patient experienced seizure. The patient was in the physician's office when the adverse event occurred. An electroencephalography (EEG) was performed (results were not provided). Upon internal review, seizure was considered to be an other important medical event. Additional information has been requested. 10/10/08 Reviewed vax records & office note of 8/4/08 when patient seen for recheck of axillary cyst & states EEG abnormal. No other records available. 10/14/08 Reviewed neuro medical records of 9/9/08. FINAL DX: complex partial seizure disorder w/secondary generalization Records reveal patient experienced seizure symptoms since 7/2007 each lasting appro 5-10 min. Starts w/eye deviation, progressed to LOC & tonic-clonic activity followed by confusion. Tx w/antiseizure meds.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Condition aggravated, Convulsion, Fatigue, Gaze palsy, Loss of consciousness, Malaise, Nausea, Pulse pressure decreased, Tremor, Urinary incontinence, Vomiting

Symptom Text: Information has been received from a registered nurse concerning a 23 year old female who faints easily and with a history of seizures after car accident in 2004, and issues with a shot given in the past, but unknown what drug or vaccine, or unknown what type of reaction who on 23-SEP-2008 was vaccinated with the first dose of GARDASIL (Lot # 661044/0548X), 0.5 ml, intramuscularly, into the left deltoid. There was no concomitant medication. The registered nurse reported that 5 minutes post vaccination the patient experienced an adverse event. The nurse reported that the patient said that she did not feel good. The patient had seizure activity, some shaking, her eyes rolled back into her head, she passed out, and had loss of urine. When the client came to she experienced nausea and vomiting. Her pulse was weak, but her airway was open. The nurse reported that the patient was given oral fluids, crackers and was monitored. One hour later the patient's blood pressure was 110/72. Prior to administering the GARDASIL vaccine a unsuccessful blood draw was attempted on client, but after vaccination another blood drawn was taken. A cat scan was performed with negative results. At the time of the report a EEG was scheduled. The patient sought medical attention at internist office. At the time of the report the registered nurse called the patient and she said that she was "tired but was feeling much better today". Upon internal review, seizure was considered to be an other important medical event. Additional information is expected.

MedDRA PT Convulsion, Loss of consciousness, Muscle twitching, Tonic convulsion, Visual acuity reduced transiently

Symptom Text: Information was obtained on request by the Company from the agency via a Case Line Listing concerning an 18 year old female who was vaccinated with GARDASIL. Subsequently after vaccination with GARDASIL, the patient experienced convulsion, loss of consciousness, muscle twitching, tonic convulsion and visual acuity reduced transiently. At the time of reporting to the agency on 07-APR-2008, the patient had recovered from the convulsion, loss of consciousness, muscle twitching, tonic convulsion and visual acuity reduced transiently. The agency considered that convulsion, loss of consciousness, muscle twitching, tonic convulsion and visual acuity reduced transiently were related to therapy with GARDASIL. The original reporting source was not provided. Upon internal medical review the adverse event of convulsion and tonic convulsion were considered to be an other important medical event. Additional information is not expected.

MedDRA PT Rash, Rash macular

Symptom Text: Information has been received from a nurse concerning a 24 year old female with sulfonamide allergy and a history or rosacea who on 28-JUL-2008 was vaccinated intramuscularly with the first dose of GARDASIL vaccine (yeast) into the left deltoid. There was no concomitant medication. On approximately 29-JUL-2008, "one to two days after the first vaccination"' the patient developed rashes and blotches on her face and neck. The rashes and blotches were still present at the time of this report, but were improving. The patient sought unspecified medical attention. No further information is available.

MedDRA PT Bladder disorder, Gastric disorder, Injection site erythema, Injection site pruritus, Morphoea, Rash macular, Skin discolouration, Vaccine positive rechallenge, Weight decreased

Symptom Text: Information has been received from a consumer concerning her 21 year old daughter with penicillin allergy and allergy to codeine who in March 2008, was vaccinated with the first dose of GARDASIL vaccine (yeast). Concomitant therapy included YAZ. After receiving the first dose, she had itching and redness at the injection site and developed patches on her back and hips that were the size of a baseball and were purple on the outside and white on the inside, and her skin is very hard. The consumer reported that her daughter saw the physician at school for about two months and they could not figure out what it was so they had then sent her to a dermatologist, in which they did a biopsy and could not figure out what the patches were. In June 2008 the patient was vaccinated with the second dose of GARDASIL vaccine (yeast). About two weeks later she had developed about eleven new patches on her breast, back, hips and other spots as well. The consumer reported that her daughter then came home from school and saw her own primary care physician who sent her to a dermatologist. The dermatologist as soon as she saw her daughter diagnosed her on site with localized morphea acleroderma, which is a build up of collagen that attacks the skin. The dermatologist also did a blood test, and first prescribed a topical steroid, name and manufacturer unspecified, which made some difference, but then was put up on prednisone for a month which had helped, and her daughter stated that "you can hardly see the patches but they are still there." The consumer also reported that "While taking prednisone, she lost about 5 pounds, even though she was eating normally, and she was having problems with her stomach and bladder. The patient has seen a physician about this and was tested for diabetes and bladder issues, but she did not have any and the physician feels it is from the prednisone. No further information is available.

Other Meds: YAZ

Lab Data: biopsy - 03?/??/08, diagnostic laboratory - 06?/??/08 - blood test, diagnostic laboratory - 06?/??/08 - bladder issues test - negative, blood glucose - 06?/??/08 - negative

MedDRA PT Dizziness, Feeling cold, Headache, Influenza like illness, Presyncope

Symptom Text: Information has been receiving from a physician's office manager and her co-worker concerning a 26 year old white female positive for high risk papilloma viral infection and no known allergies who on 11-JUN-2008 at approximately 12:00PM was vaccinated in her left deltoid with the first dose of GARDASIL (LOT# 660393/0067X). Concomitant therapy included DEPO-PROVERA. After the vaccination, the patient sat for about 10-15 minutes in the waiting room to make sure that she did not have an reaction to the injection. the patient "was absolutely fine" when she left the physician's office. About 1/2 hour after leaving the office, she went to pick up her kids and she started to experience flu-like symptoms. she felt to then cold. She got a headache and felt dizzy. She almost fainted and almost had a wreck in her car on her way home. She got home and slept for 4 hours. when she woke up, she took some aspirin and drank tea to help her feel better. She did not feel better until the next day. The patient did not seek medical treatment at a hospital or from any other doctor for these symptoms, nor did she call the physician's office. The other vaccines within a month before or after getting GARDASIL. No tests were ordered by any doctor or medical facility to try to determine her ailment at this time. On 08-AUG-2008, the patient called the physician's office. She wanted to cancel her scheduled appointment for her second vaccination. additional information is not expected.

MedDRA PT Accidental exposure, Eye burns, Medical device complication, Paranasal sinus discomfort

Symptom Text: Information has been received from a medical assistant concerning a female medical assistant. On 12-AUG-2008 the medical assistant was preparing to attach a needle to prefilled GARDASIL syringe (Lot # 0250X) when the vaccine splashed into her left eye. She was going administer the injection, so before she attached the needle, she was trying to take off the gray colored syringe tip cap, when the plunger popped out through the back end and the vaccine splashed into her eyes. The safety device did not activate. The needle was not attached. The syringe was empty and there in no vaccine left. the syringe was the first one on the right side of the tray, when they took it out for use. There was no damage to the package or the tray. The medical assistant has been administered GARASIL vaccine for a long time. When the vaccine splashed into her left eye, she immediately flushed her eye. The eye was irrigated but still "Burns a little." There was no redness or pain. There was slight burning sensation and irritation in her sinuses. No visual problems are noted. At the time or the report the patient had not recovered. Information has been received from a medical assistant regarding GARDASIL in a prefilled syringe (lot number: 0250X). It was reported that the plunger of the vaccine prefilled syringe "came out the wrong way" as the tip cap was being removed. SR Number: 1-3088949518. Additional information has been requested.

MedDRA PT Mobility decreased, Myalgia, Off label use, Pain in extremity

Symptom Text: Subject reported the following to this study RN today. He had been experiencing muscle pain equally in both arms and had been seeing his PCP for this problem. The pain is worse in the mornings upon rising to where it is painful to raise his arms up. He is able to continue with his ADLs and does not take pain meds. He stated that the pain began over a month after his first GARDASIL injection (Day 1=3/12/2008) and after his doctor had changed his ARV regimen, and before his second GARDASIL injection. He started new HIV medication regimen on 3/25/08. His doctor (PCP) told him that his arm pain was a side effect of one of his new HIV medications such as TRUVADA and did not think it was caused by the GARDASIL vaccine. The pain did not subside so his physician switched the TRUVADA out for INTELENCE one month ago to see if his arm pain will subside. The arm pain continues, so one of the other HIV medications will be switched out to see if the symptoms improve. The subject states that he is otherwise well and that it is "not a big deal," yet agrees that it will be good to be rid of the arm pain. (The subject never reported this arm muscle pain on his report cards and stated that he tolerated the injections well without problem.)

Seriousness: LIFE THREATENING, PERMANENT DISABILITY, SERIOUS

MedDRA PT Abdominal distension, Abdominal pain lower, Abdominal pain upper, Activities of daily living impaired, Anorexia, Anxiety, Arthralgia, Arthropathy, Chest pain, Chills, Depression, Dyspepsia, Ear pain, Erythema, Eye pain, Fatigue, Gastrooesophageal reflux disease, Headache, Immunisation reaction, Influenza like illness, Joint stiffness, Joint swelling, Leukoplakia oesophageal, Malaise, Menstruation irregular, Myalgia, Nasal congestion, Nausea, Oral intake reduced, Oropharyngeal pain, Ovarian cyst, Pain in extremity, Pelvic pain, Pyrexia, Rhinorrhoea, Sinusitis, Sleep disorder, Vomiting, Weight decreased

Symptom Text: My daughter had the first GARDASIL shot on 7/7/08. 7 to 10 days later she began having severe pains and cramping in her pelvic area along with redness, fever, vomiting, and joint pains. Her doctor said it was just a reaction to the shot and after examining her told her to go home and take TYLENOL for headaches, pains, etc because she was the first case he had seen this severe and didn't know what to do other than to examine her once a month. Every week she has experienced severe joint pains, cramps, not feeling well enough to eat, etc. She lost 10 lbs. Since she is 17 years old and only weighed 105 lbs that didn't set well with me. She is naturally skinny. The gynecologist still doesn't know what to do with my daughter's pains. He did an EKG, ultrasound, urine test and they all came back ok. The ultrasound showed an enlarged cyst on one of her ovaries. This is getting ridiculous in the fact that she can no longer lead a normal life due to weekly pains and not feeling well. Isn't there anything she can take to reverse the medicine's side effects as I see this as being a lifetime adventure for her. PLEASE ADVISE on what I as a parent can do next. I feel this is all the medicine's fault because my daughter Never had anything wrong with her until after having this shot. I don't like reading all the articles about this shot and seeing that the company tries to blame every day life events or happenings for causing the bad things to happen to these girls. It is definitely the GARDASIL Shot that has caused the adverse health of these young girls having problems. 12/29/2008 PCP records received for several OVs between 9/29/08 and 11/10/2008. Pt initially presented with c/o painful joints, cramping chest pain. ROS (+) for fever, chills, fatigue, 10 lb weight loss, abdominal pain, nausea, vomiting, H/A, eye pain, ear pain, sore throat, congestion, runny nose and Flu-like sx since Gardasil vax in July. Pt also reports sleep disturbance, joint pain and swelling, morning stiffness, myalgias, anxiety and depres

MedDRA PT Abdominal pain, Abdominal pain upper, Abdominal tenderness, Adrenal disorder, Anorexia, Arthralgia, Asthenia, Back pain, Dehydration, Diarrhoea, Diet refusal, Dizziness, Fall, Fatigue, Gait disturbance, Headache, Hypoaesthesia, Influenza like illness, Mouth ulceration, Muscular weakness, Nausea, Pain, Paraesthesia, Sensation of heaviness, Urinary tract infection, Vomiting, Weight decreased

Symptom Text: About 2 weeks post vaccine my daughter had flu like symptoms- severe nausea, stomach pain, back pain, headache. All persisted for about 3 weeks. At that point stomach and back pain lessened but nausea has continued 24/7 until the present date. 2 pediatric gastroentrologists could find nothing wrong despite numerous diagnostic tests and blood work. Hospitalized overnight once and to ER 3x for dehydration, refusal to eat, etc. She has lost 14 pounds. At about 8 weeks post injection she began complaining of severe joint pain all over, then tingling and numbness from her knees down-began walking strangely and fell twice per she couldn't feel lower legs. Doctor advised to go the ER. She was admitted overnight and had spinal MRI and full nuerological check that showed nothing wrong. Released - still cannot walk correctly, still has severe nausea and headache. On Zofran for 10 weeks. Has now been referred to infectious disease doctor...My daughter was the picture of health before this injection and no one has been able to find any reason for her illness. 10/13/2008 MR received for 3 ER visits 7/17, 7/19, and 7/27/2008 and Admission 9/29-30/2008. Final D/C DX: Subjective LE paresthsias and weakness. L Adrenal fullness on MRI. Initially presented to ER with 4 day hx of nausea, Had vomiting and diarrhea which have resolved. Lightheaded upon standing, mild H/A. PE (+) for epigastric tenderness and an ulceration of the lip. UA c/w UTI. Final DX: Urinary Tract Infection. Mild dehydration. Nausea. Tx with IVF, abx and Zofran. Returned to ER 2 days later with persistant nausea. Now with LLQ gnawing pain. DX: Nausea, NOS. Abdominal Pain, undifferentiated. 3rd ER visit to 2nd hospital 7/27/08 with DX: Undifferentiat abdominal pain. Pt still with persistant nausea. Refusing to eat/drink 2' to lost appetite and post-prandial nausea and abdominal pain. D/c with outpt UGI planned. UGI WNL. Returned again 9/29/08 with c/o bilateral leg weakness x 4-5 days. Began with aches, joint soreness, numbness and tingling of the t

MedDRA PT No reaction on previous exposure to drug, Rash generalised, Urticaria

Symptom Text: Information has been received form a pharmacist concerning his 21 year old daughter with no known allergies/ reactions who in early June 2008, was vaccinated with the first dose of GARDASIL. On 13-AUG-2008, the patient was vaccinated with the second dose of GARDASIL. Concomitant therapy included YASMIN. On 13-AUG-2008, after the second dose was given, the patient experienced rashes and hives throughout the body (from the trunk to elbow and shoulder of both arms). There were occasional hives and rashes on the front of the hips also. The pharmacist has been treating his daughter with BENADRYL and an unspecified topical steroid. The patient did not have a reaction after receiving the first dose of GARDASIL. The patient sought medical attention with the pharmacist. Additional information has been requested.

MedDRA PT Tooth discolouration, Weight decreased

Symptom Text: Information has been received from a registered nurse (R.N.) concerning a 21 year old female with significant mitral regurgitation and an allergy to VERSED and a history of miscarriage (at age 18), gallbladder surgery and appendicectomy (in 2000) who on 02-AUG-2007, 30-OCT-2007 and 19-FEB-2008 was vaccinated intramuscularly with 0.5 ml first, second and third dose of GARDASIL (lot #658556/1060U, 659437/1266U and 659653/1448U), respectively. Concomitant therapy included NUVARING and VALTREX. On 30-OCT-2007 and the patient weighed 144 lbs. "After her third dose", the patient stated that she lost 25 pounds after receiving GARDASIL. Colonoscopy was performed and the result indicated negative. The nurse did not have the current weight of the patient. The nurse also mentioned that recently she observed that the patient's teeth were brown and white which resembled someone who had anorexia or bulimia. The patient initially called her primary care physician and was told to contact the nurse's office. At the time of this report, the events persisted. Additional information has been requested.

MedDRA PT Arthralgia, Hypoaesthesia, Joint instability, Musculoskeletal pain

Symptom Text: Information has been received from a licensed practical nurse concerning a 25 year old female with no medical history and no known allergies, who on 25-OCT-2007 was vaccinated with a first dose of GARDASIL (lot and site unspecified). On 10-JAN-2008 was vaccinated intramuscularly into the right deltoid with a second dose of GARDASIL (lot # 658560/1062U) and on 09-MAY-2008 was vaccinated intramuscularly into the left deltoid with a third dose of GARDASIL (lot # 659962/1740U). Concomitant therapy included DEPO-PROVERA. The patient reported that she developed shoulder and knee pain with numbness in her feet with an onset in April 2008. The pain and numbness were described as "off and on". The pain was described as worsening with increased intensity and frequency. On 11-AUG-2008 the pain was described as becoming more constant. The patient saw an orthopedic physician and her primary care physician. The orthopedic physician diagnosed the pain as "joint instability" and no treatment was given. The nurse noted that the patient started exercising in April 2008. At the time of reporting the patient had not recovered. The patient sought for medical attention: office call. There was no product quality complaint. Additional information has been requested. 12/19/2008 Patient does not recall having ortho consult & no f/u done w/PCP. Has recovered completely w/o residual.

MedDRA PT Amyotrophic lateral sclerosis

Symptom Text: Information has been received from a pharmacist via her brother who was told by a neurologist that a female patient who received a dose of GARDASIL developed amyotrophic lateral sclerosis (ALS). The patient was seen by a neurologist. The outcome of the event was unknown. Upon international review, amyotrophic lateral sclerosis was considered to be an other important medical event. Additional information has been requested.

MedDRA PT Abdominal pain, Drug exposure during pregnancy, Evacuation of retained products of conception, Intra-uterine death, Premature rupture of membranes, Premature separation of placenta, Retained products of conception, Umbilical cord abnormality, Vaginal haemorrhage

Symptom Text: Information has been received from a 20 year old female consumer, for the Pregnancy Registry for GARDASIL, concerning herself, who in October 2007, was vaccinated with a dose of GARDASIL, injection. In April 2008 the patient received a third dose of GARDASIL. Concomitant therapy included vitamins (unspecified). Subsequently, she became pregnant, and the last menstrual period is 11-MAY-2008. The patient had blood work performed several times during her pregnancy, results not reported. On 17-SEP-2008, the patient's placenta ruptured. The patient experienced a blood clot between her uterus and placenta, a tear in her placenta and her umbilical cord was partially attached on the side. The baby was delivered, was too small and died. The patient was hospitalized for a day after giving birth. Additional information has been requested. 3/10/09 MR received for DOS 9/17-18/2008 with D/C DX: Premature ROM. Previable fetus. Marginal abruption. SVD. Pt presented at 19 wks of pregnancy with cramping, vaginal bleeding and rupture of membranes. Non-viable fetus delivered. Pt had retained products of conception tx with D&C. Unremarkable post-op course.

Other Meds: vitamins (unspecified)

Lab Data: hematology. Labs and Diagnostics: surgical pathology report for markedly disrupted placenta. Fibrinogen (H) 653. CBC with WBC 27.0. Hgb 11.9. Hct 33.9 down slightly after delivery. UC (-). GC and Chlamydia (-).

MedDRA PT Autonomic nervous system imbalance, Feeling cold, Feeling hot, Hyperaesthesia, Hypoaesthesia, Inflammation, Neck pain, Pain in extremity

Symptom Text: Information has been received from a Health Authority (reference number TS20080315) concerning a 16 year old female with no previous medical history reported who on 10-NOV-2007 was vaccinated with the first dose of GARDASIL in right deltoid, via intramuscular route. On 07-JAN-2008 was vaccinated with the second dose of the same vaccine. Ten to twelve days after the first dose, on approximately 22-NOV-2007, and during an abduction (due to an important effort of the arm), the patient experienced pain in the base of the right thumb. One to two weeks after the second dose, on approximately 14-JAN-2008, occurred pains in right arm and forearm. Three weeks after i.e at a consultation dated on 08-FEB-2008, it was observed in right arm, inflammatory pains irradiating, hyperesthesia poorly systematized, vasomotor disorders i.e. cold and white or erythrosic bands associated with low and right cervical pains with hypoesthesia of C6 and trapezalgy. There was no adenopathy or axillary inflammation. Two neurological consultations with cervical radiographies, scan, cerebral MRI, neck Doppler arterial vessels, right axillary ultrasound performed in February - March 2008 and electromyography performed in June 2008, did not found any anomaly. Treatment with analgesics and corticosteroids were given and disorders partially regressed. In June 2008, persisted a pain in the base of the thumb, hypoesthesia of first and second fingers and vasomotor disorders. The whole picture evoked an algodystrophy. Kinesitherapy sessions were started. Two months later, the patient still experienced vasomotors disorders. Bone scan was planned on an unspecified date. The events were reported as medically significant. Other business partner numbers included: E2008-08929. Additional information has been requested.

MedDRA PT Presyncope, Vision blurred, Vomiting

Symptom Text: Information has been received from a nurse practitioner concerning a 24 year old female with a history of cerebrovascular accident perinatal and mental disorder who on 05-MAR-2008 was vaccinated intramuscularly with the first dose of GARDASIL. On 05-MAR-2008 evening, the patient experienced vomiting, blurred vision and near syncope. The nurse practitioner reported that they thought the patient might had a TIA (mini stroke). However, this has not been proven. The patient was referred to a neurologist for further evaluation. The patient was hospitalized, but the length of hospitalization was unspecified. The patient's last seizure happened in June 2008. The patient's outcome were unknown. Upon internal review, seizure was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Abdominal pain, Abdominal pain upper, Pancreatitis necrotising, Parenteral nutrition

Symptom Text: Information has been received from a specialist concerning a female patient who on an unspecified date was vaccinated with the third dose of GARDASIL (batch number not reported). Within the week following the vaccination the patient experienced severe abdominal pain. She was hospitalized. She presented with lipase increased at 20000 and amylase increased at 15000. Gamma glutamyl transferases and transaminases were normal. There was no other associated symptom (neither fever, nor nausea). Auto antibodies were negative and biological tests were normal. There was no associated risk factor. CT scan revealed a diagnosis of pancreatitis necrotizing with Balthazar CT score at D. There was no treatment prescribed besides parenteral feeding. on 27 or 28-SEP-2008 analysis revealed increased transaminases twice normal ranges and increased phosphatases leading to suspect biliar microlithiases. At time of reporting the patient had not recovered and remained in intensive care services at hospital. As to her medical history the patient experienced abdominal epigastric pain 5 to 6 days after first and second doses of GARDASIL (unspecified dates). Other business partner numbers included E200809018. Additional information has been requested.

Other Meds: Unknown

Symptom Text: Information has been received from a pharmacy technician concerning her 14 year old female daughter with no previous medical history reported who in May 2007, was vaccinated with the first dose of GARDASIL and in July 2007 was vaccinated with the second dose of GARDASIL. There was no concomitant medication. The patient received the second dose of GARDASIL and about one week later she woke in the middle of the night. The patient's lips and ears were swollen and her whole body was red. The patient then developed diarrhea and projectile vomiting followed by chills that caused her whole body to shake. The whole episode lasted for about one hour to one and one half hour. The patient has had 6 similar "bad" reactions, the worst was in January 2008. The patient has had numerous "moderate" reactions (at least 6 in 2008) which involved diarrhea, vomiting or nausea. The patient has also sought treatment for continual menstrual bleeding since September 2007 that was treated with hormones (birth control). The patient was hospitalized in September 2007 for dehydration. The patient experienced nausea and felt like she was going to pass out on 22-Sep-2008. She has also experienced breathing difficulty (EPI PEN) and was starting to be emotionally effected (wanted to be by herself). The patient never received the third dose of GARDASIL. Numerous blood tests and unspecified tests were performed (resulted were not provided). There was no product quality complaint. As of 29-SEP-2008; the patient was not recovered. Lips and ear swelling; whole body red, diarrhea, vomiting, chills, nausea, going to pass out, continual menstrual bleeding, breathing difficulty and emotionally affected were considered to be disabling by the pharmacy technician. Breathing difficulty requiring EPI-PEN was considered to be an other important medical event by the pharmacy technician. Additional information has been requested. 10/10/08 Reviewed ER records of 8/9-8/10/2007. FINAL DX: acute allergic reaction, vomiting & diarrhea Records reveal patient exp

MedDRA PT Drug exposure during pregnancy, Foetal disorder, Premature labour

Symptom Text: Information has been received from a physician for the pregnancy registry for GARDASIL, concerning a female patient who on an unspecified date, was vaccinated with first dose of GARDASIL. The physician reported that the patient became pregnant after receiving her first dose of GARDASIL. At the time of the report the patient had already given birth. On follow-up information it was reported that the patient was a 18 year old female patient with a history of low platelet count and no previous pregnancies, who on 17-OCT-2007, was vaccinated with the first dose of GARDASIL (lot# 654510/0962F). Concomitant medication included prenatal vitamins. On 08-NOV-2007, the patient had an ultrasound which results were an intrauterine pregnancy of 6 weeks and 2 days. On an unspecified date, during pregnancy, the patient had repeat CBC to follow PLT count which dropped to 109,000. On 20-MAY-2008, the patient went to preterm labor and had a normal male liveborn infant. There were no congenital anomalies. The baby's weight was 4 pounds 2 ounces, length 18.5 inches, head circumference 13 inches and apgar score 8/9. It was 33 weeks from LMP. Because of prematurity the baby was treated in the new born nursery for 3 days with ampicillin and gentamycin. Baby's weight at discharge was 4 pounds 8 ounces. On 05-JUN-2008, the patient was vaccinated with the second dose of GARDASIL (lot# 660387/1967U) and on 23-JUL-2008, the patient was vaccinated with the third dose of GARDASIL (lot#660393/0067X). No further information is available.

MedDRA PT Alopecia, Aphthous stomatitis, Contusion, Hyperhidrosis, Liver function test abnormal, Malaise, Pain, Syncope, Tremor, Vomiting

Symptom Text: Information has been received from a office manager, concerning an 17 year old female patient with mononucleosis diagnosed in the beginning of April 2008. On 14-APR-2008, the patient had a recheck for the mononucleosis. On 16-APR-2008, the patient was vaccinated with the first dose of GARDASIL (Lot #14870) and MENACTRA. The patient experienced feeling sick and fainted immediately after the vaccinations. The patient also experienced a lot of bruising on an unspecified arm within 24 hours of the vaccinations and her hair was falling out (unspecified date). The patient recovered on an unknown date. The patient sought medical attention in the office and called the office. There was no product quality complaint. Follow up information was received from the physician's office and laboratory records concerning a 17 year old white female with infectious mononucleosis (recovering; last day re-checked on 14-APR-2008 and "she was ok") and an allergy to sulfa who on 16-APR-2008 was vaccinated with a first dose of GARDASIL into the right arm and with a first dose of MENACTRA (Lot # U2542AA) into the left arm. In between 16-APR-2008 and 31-JUL-2008, the patient complained about sweating, shaking, vomiting and being extremely sore all over. On 14-APR-2008 the patient underwent a hepatic panel and complete blood count which revealed an elevated liver enzymes which were noted to be "improving." (refer to lab data field). On 31-JUL-2008 the patient had a thyroid stimulating hormone and free thyroxine level and CBC. The TSH was low at 0.30 uIU/mL (nl 0.50 - 5.20) and the FT4 was normal 1.1 ng/dL (nl 0.8 - 1.8). The MCH and MCHC were low. (refer to lab fields). On 08-MAY-2008 patient developed canker sores treated with FAMVIR. On 31-JUL-2008 the patient developed hair loss (checked with Blood work) and was bruising easily. The patient had recovered on an unknown date. Additional information is expected.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Chest discomfort, Dizziness, Dyspnoea

Symptom Text: Information has been received from a registered nurse concerning a 19 year old female with asthma who on an unspecified date was vaccinated with a first dose of GARDASIL. "5 days after vaccination", the patient experienced faintness, shortness of breath and chest tightening in the morning. She went to the Emergency room and was given an unspecified inhaler but it did not relieve her symptoms. She had some labs done, which came back negative. The emergency physician believed that this could be a late response from GARDASIL. The patient was sent home and recovered next day. Additional information has been requested.

MedDRA PT Hypoaesthesia, Muscular weakness, Paraesthesia

Symptom Text: Information has been received from a nurse practitioner concerning a 17 year old female who in June 2008 (date discrepant), was vaccinated with the first dose of GARDASIL. On 07-DEC-2007 the patient vaccinated intramuscularly with the third 0.5 ml dose of GARDASIL. On 10-AUG-2008 the patient returned to the physician's office with numbness, tingling and weakness in her arms and fingers after receiving her third dose of GARDASIL. At the time of this report, the patient's symptoms persisted. The physician felt that the patient's condition was not a result of GARDASIL. Additional information has been requested.

MedDRA PT Condition aggravated, Headache

Symptom Text: Information has been received from a consumer concerning her 19 year old daughter with allergic reaction to Tdap (the patient was starting into space and constantly crying) and a history of shingles (onset when she was five years old) who "about three weeks ago", on approximately 24-JUL-2008, was vaccinated with a first dose of GARDASIL. "About 6 weeks ago", on approximately 03-JUL-2008, the patient had a neurological episode where she losing her vision, muscle spasms and had severe headaches. It was reported that the patient was seen by a neurologist who did blood work, spinal tap and at first they thought she was having a brain amorism, and then they ruled that out with everything else and diagnosed her with having a full blown migraine episode. The reporter stated that the patient was hospitalized for a short time for blood patches because her spinal fluid was leaking for three days, and she was having severe spinal headaches. It was reported that at hospital the patient was given VICODIN and other medications, which were unspecified. The reporter stated that it took her sometime for the headaches to go away. But "about three weeks later", on approximately 24-JUL-2008, the patient went to her pediatrician and was given a dose of GARDASIL. After the vaccination, the patient was "still having mild headaches", but the patient had been given medication, which the name and manufacturer was unspecified, to treat her migraines. It was reported that the patient needed hospitalization or prolonged hospitalized. At the time of the report, the patient was recovering from the event. No further information is available.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Aphthous stomatitis, Dysuria, Fungal infection, Incorrect route of drug administration, Oral contraception, Polydipsia, Polyuria, Type 1 diabetes mellitus, Vision blurred, Weight decreased

Symptom Text: Information has been received from a health authority (HA ref # ST20080864) concerning a 17 year old female who in approximately June 2008 (three months ago), was vaccinated with GARDASIL (lot no. not reported) via intradermal route instead of intramuscular. On an unspecified date, the patient presented with small aphtha and white stains which were diagnosed as mycosis by the attending physician. Since three weeks, she complained of burning urine associated with polyuria and polydipsia. Approximately in Aug 2008 (the last month), the patient experienced loss of weight of 7 Kg. The physician observed glycaemia at 5.9 g/dl and visual disorder described as blurred. She was diagnosed with type 1 diabetes. The patient had a concomitant therapy of oral contraceptives. At the time of the report, the outcome was considered as resolved with sequelae. The patient had a medical family history of autoimmune diathesis and her sister had Berger's disease. Follow-up information received from the health authorities (HA ref #ST20080864) which reported that patient's height was 56 Kg and height was 164 cm. Other business partner numbers included: E2008-08919. No further information is available.

MedDRA PT Asthenia, Musculoskeletal pain, Pain, Pyrexia

Symptom Text: Information has been received from a health authority (HA ref # DJ20080746) concerning an adult female with major depressant syndrome treated with ZOLOFT for several years and hirsutism treated with PROMAVES and ANDROCUR for at least 10 years. On 01-DEC-2007 the patient was vaccinated with the first dose of GARDASIL IM. In February 2008, the patient received the second dose of GARDASIL IM and on 16-JUN-2008 received the third dose of GARDASIL IM. Approximately since 20-JUN-2008, the patient was subfebrile at 37.8 C and 38 C, had asthenia and generalised pains especially at shoulder girdle punctually treated with EFFERALGAN. Clinical examination did not find any particularity. There was no evidence for focus infection. On biological standpoint, red and white blood cell count was normal, erythrocyte sedimentation rate was at 13 at first hour, hepatic check-up and thyrotropin were normal, cytomegalovirus and Epstein-Barr virus serologies were negative. Sinus scan and pelvic abdominal ultrasound did not find any particularity. At office visit date on 30-JUL-2008, it was observed that the patient was still febrile at 38 C and still presented pains. Symptoms did not regressed or worsened. The reporter considered the events to be other important medical events. Other business partner numbers included: E2008-08953. Additional information has been requested.

Other Meds: ANDROCUR, unk, unk; Estradiol, unk, unk

Lab Data: Diagnostic laboratory test, hepatic check up - normal; Sinus probe, normal; Abdominal ultrasound, normal; Pelvic ultrasound, normal; Epstein-Barr virus antibodies, negative; WBC count, normal; Serum TSH, normal; Red blood cell count, normal

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Inflammation, Retinal vasculitis, Visual disturbance

Symptom Text: Information has been received from a physician concerning a 23 year old female who on unspecified dates was vaccinated with the first and the second dose of GARDASIL which were well tolerated. In the end of February 2008, was vaccinated with the third dose of GARDASIL IM into the upper arm. In May 2008, the patient experienced retinal vasculitis at both eyes. The patient was treated at an outpatient department of a hospital. At the time of the reporting, the outcome of the patient was not reported. Follow-up information was reported by the physician who sent the report from the outpatient neurological department of a hospital: since beginning of May-2008 the patient presented with visual disturbance ("dot shaped") of the right eye. CSF on 15-MAY-2008 showed inflammatory CSF syndrome with intrathecal igAa and IgM synthesis, but without detection of oligoclonal bands in the CSF. Borreliosis was ruled out by serology (serum and CSF). Serology for systemic vasculitis showed normal results. Cranial MRI with contrast medium showed no inflammatory foci with affinity to contrast medium. Neurological examination was normal. Immunosuppressive therapy was not indicated. The final outcome was not reported. A follow-up examination was planned. Retinal vasculitis and visual disturbance were considered to be other important medical events. Other business partner number included: E2008-08878. Additional information has been requested.

Other Meds: Unknown

Lab Data: Diagnostic laboratory test, 15May08, diagnosis of CSF: inflammatory CSF syndrome with intrathecal IgA and IgM synthesis; Diagnostic laboratory test, 15May08, borrelia in CSF and in serum: no indication for neuriborreliosis; Diagnostic labor

History: Unknown

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy, Haemorrhage, Muscle spasms

Symptom Text: Information has been received from a registered nurse, for the pregnancy registry for GARDASIL concerning a 26 year old female with drug hypersensitivity to AMOXIL who on 26-JUL-2007 was vaccinated with the first dose of GARDASIL (lot n. 657868/0523U), 0.5 mL, intramuscularly. On 30-JUL-2008, the patient was vaccinated with the second dose of GARDASIL (lot n. 0250X) 0.5 mL, intramuscularly. On 12-SEP-2008, the patient experienced cramping and bleeding. The nurse reported that the patient had a miscarriage after receiving GARDASIL. LMP occurred on 08-JUL-2008. On 17-SEP-2008, an ultrasound was done with no fetal heart beats. She "passed" the fetus on her own. The patient saw the physician. A pregnancy blood work was done but the results were not provided. Subsequently, the patient recovered on an unspecified date. Upon internal review miscarriage was considered to be an other important medical event. Additional information has been requested.

MedDRA PT Areflexia, Back pain, Demyelination, Gait disturbance, Hypoaesthesia, Neck pain, Pallanaesthesia, Paresis, Pleocytosis, Sensory disturbance, Spinal osteoarthritis, Visual acuity reduced, Visual disturbance

Symptom Text: Information has been received from a gynecologist and a hospital report concerning a 24 year old female who on 19-FEB-2008 was vaccinated with the first dose of GARDASIL (lot # 0467U; batch NG14290) IM into her left upper arm which was well tolerated. On 17-APR-2008, the patient received the second dose of GARDASIL (lot # 0513U; batch NG34780) IM into her left arm. Concomitant therapy included hormonal contraceptives for systemic use. The patient was hospitalized on 23-MAY-2008 due to pain of the nape and back as well as sensory disturbance in the jaw region, face and the whole trunk and extremities (exact date of events not reported). Suspicion of postvaccinal polyradiculitis was diagnosed in hospital. The patient was treated with methylprednisolone 500 mg IV for 5 days. The patient additionally complained of visual disturbance, impaired accomodation of the eyes with an initial visual acuity of 50% (bilateral) and 80 to 90% in the further course. Neurological examination revealed absent tendon reflexes of the lower limbs slight paresis of hip flexion and foot and toe extension on the left side, unsteady gait, subjective feeling of numbness in the area of the palate and the cheeks, "patchy" hypoasthesia in face, both arms trunk and legs and pallhypaesthesia (malleolus 5/8). In cranial Magnetic Resonance Imaging (MRI), two small demyelinating foci in the ventral corpus callosum were detected. Cervical MRI was normal except small spondylosis. CSF showed slight pleocytosis and increased protein. Extensive serology was negative (hepatitis A, B and C virus, HIV 1 and 2, measles virus, rubella virus, varicella virus and borrelia), CMV-IgG >250 IE/mL, CMV-IgM negative. ANA 1:5120. ENA, c-ANCA, p-ANCA, ANCA were negative. AMA, lupus antibodies and campylobacter antibodies were not yet available at the time of reporting. The symptoms improved but the final outcome was not reported. The patient was discharged on 02-JUN-2008. Other business partner numbers included: E2008-08924. Additional information has been requested.

Other Meds: hormonal contraceptives (unspecified), Unk - Unk

Lab Data: Visual evoked potential, 26May08, normal; Somatosensory evoked potential, 26May08, normal; Neurological examination, 26May08, see narrative; Electroneurography, 28May08, consistent with polyradiculitis; Magnetic resonance imaging, Cranial M

MedDRA PT Bone pain, Nausea

Symptom Text: Information has been received from a nurse concerning her 16 year old daughter who on 01-AUG-2008 was vaccinated with the second dose of GARDASIL. Concomitant therapy included an unspecified birth control medication. On approximately 01-AUG-2008 the patient experienced nausea and bone pain for about 2 weeks. The nurse noted that the only new factor between the first dose and the second dose was an initiation of an unspecified birth control medication. The patient recovered without any intervention. Additional information has been requested.

MedDRA PT Pyrexia

Symptom Text: Initial and follow-up information has been received from a physician concerning a 17 year old female with no relevant medical history or allergies who in spring of 2007, was vaccinated with a first dose of GARDASIL (lot number ,injection site and route not reported). About two weeks after the vaccination, the patient developed intermittent fevers. The physician also reported that the patient completed the series of GARDASIL (the vaccine was given on a 0, 2, 6 month schedule) without any pattern of injection-related fever or associated symptoms. The patient has had three episodes of unexplained fever as high as 103-104 degrees F with no other localizing signs since her first dose. These episodes lasted up to several weeks and then resolved spontaneously. Medical work-up was negative except for a markedly elevated C-reactive protein. At the time of this report, the patient's event persisted. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Facial palsy, Hypoaesthesia, Paraesthesia

Symptom Text: Information has been received from a clinical director/ registered nurse, concerning a 25 year old female patient, who on 11-JUN-2007 was vaccinated with the first dose of GARDASIL 0.5mL IM, the second dose of GARDASIL (Lot #658094/0524U) on 13-AUG-2007 and the third dose of GARDASIL (Lot #659439/1267U) on 02-JAN-2008. The patient experienced facial paralysis and numbness and tingling of the hands and feet one and a half months (approximately in July 2007) after get the first dose of GARDASIL. The patient had been seen by the primary care physician and a neurologist for the symptoms. All laboratories and diagnostic studies came back negative (computed tomography scan, spinal tap and magnetic resonance imaging) for cause and GARDASIL is now the primary suspect. At the time of reporting the patient did not recovered. There was no product quality complaint. Additional information has been requested.

MedDRA PT Drug exposure during pregnancy, Loss of consciousness

Symptom Text: Information has been received from a consumer concerning her 13 year old daughter with no relevant medical history or allergies who in February 2008, was vaccinated with a first dose of GARDASIL (lot number, injection site and route not reported). On 15-JUN-2008 the patient was vaccinated with a second dose of GARDASIL (lot number, injection site and route not reported). There was no concomitant medication. According to the reporter, the patient became sexually active on "April 2008". And the patient's mother was not sure if the clinical conducted a pregnancy test prior to giving the second dose of vaccine. On 15-JUN-2008 the patient passed out and was brought to emergency room and on that day, pregnancy was confirmed after blood and urine was taken for tests. The patient was not admitted to the hospital. The patient's mother noted that the patient was fine at time of this report and her due date was on 28-JAN-2009. At time of this report, the patient was 19 weeks pregnancy. Additional information has been requested.

MedDRA PT Rash generalised, Rash pruritic

Symptom Text: Information has been received from a physician concerning a 22 year old female with no pertinent medical history who in June 2008, was vaccinated intramuscularly with a first 0.5 ml dose of GARDASIL. Concomitant therapy included oral contraceptive. "One week after administration of her first dose of GARDASIL", the patient developed generalized pruritic rash on her body. The patient took BENADRYL and then symptoms resolved when the patient woke up "the next morning". "One week later", the rash reappeared for the second time and resolved the next day after taking BENADRYL. The rash reappeared for the third time "one week later" and again symptoms resolved after taking BENADRYL. The patient was seen in office. These events were also reported as a "head to toe rash" that developed one week post vaccination which resolved the next morning after OTC BENADRYL use. The rash returned a second time about one week after the first rash appeared which again resolved after using OTC BENADRYL. Follow-up information was received from the physician via phone call on 08-SEP-2008 indicating that the patient received the first dose of GARDASIL on 27-JUN-2008. The patient went to bed one night and woke up the next day with a total body rash one week after the injection. The patient took BENADRYL and the rash resolved. "One week later", the same total body rash reappeared. After taking hydrochloride BENADRYL, the rash resolved. "One week later", the same total body rash reappeared for the third time. After taking BENADRYL, the rash resolved. So the patient had 3 episodes of total body rash that resolved with BENADRYL. On 27-AUG-2008 the patient returned for her second dose of GARDASIL and reported her experiences to the physician. As far as the physician knows, no further episodes had occurred. Additional information has been requested.

MedDRA PT Fatigue, Hyperhidrosis, Malaise, Pallor

Symptom Text: Information has been received from a physician concerning a 17 year old female with no pertinent medical history or drug allergies who on 24-JUL-2008 was vaccinated intramuscularly with the first 0.5 ml dose of GARDASIL (lot # 660553/0070X). Concomitant therapy included ALLEGRA. It was reported that the patient was not feeling well, looked pale, and complained of fatigue and diaphoresis when she came in to get her GARDASIL. Labs done that day after she got GARDASIL came back that she is anemic and the mom was blaming the GARDASIL. On an unspecified date, the patient recovered. The patient was seen by doctor. No product quality complaint was involved. Additional information has been requested.

MedDRA PT Gaze palsy, Loss of consciousness, Syncope, Tremor

Symptom Text: Information has been received from a physician concerning a 13 year old female with sulfonamide allergy who on 26-AUG-2008 was vaccinated with a first dose of GARDASIL (lot number 660557/0072X) intramuscularly (injection site not reported). After the vaccination, the patient "passed out, her arms were shaking, and her eyes rolled back". The patient was sent to the emergency room but was not admitted. The patient was diagnosed with syncope and released. The physician also reported that the patient came to the physician's office for a "sick visit" and had symptoms of "not feeling well for one month, right knee pain, sore throat, and out of breath when running or in the pool." During the visit it was decided to give her the GARDASIL. The physician reports that "the father requested to start GARDASIL series." Subsequently on 26-AUG-2008, also reported as "yesterday", the patient recovered from syncope. Additional information has been requested.

MedDRA PT Anogenital warts

Symptom Text: Information has been received from a physician concerning a female who on an unspecified date was vaccinated with the second dose of GARDASIL. A few weeks after receiving the second dose, the patient had broken out in genital warts. The patient had come into the office about the experience and the physician referred her to an Obstetrician/Gynecologist. The physician did not know at the time when the patient received the first dose because she received it in Texas. At the time of this report, the outcome was unknown. Additional information has been requested.

MedDRA PT Bronchitis, Chest discomfort, Condition aggravated, Dyspnoea, Epstein-Barr virus infection, Fatigue

Symptom Text: Information has been received from a physician concerning a 16 year old female who on 31-MAR-2008 was vaccinated with a first dose of GARDASIL (route and administration site not reported). The patient was healthy prior to her second dose of GARDASIL. On 05-JUN-2008 the patient was vaccinated with a second dose of GARDASIL (route and administration site not reported). On 05-JUN-2008 the patient experienced severe fatigue, shortness of breath and chest discomfort. She was seen in urgent care sometime between June 5th and 9th. She was treated with an inhaler. On 09-JUN-2008 she followed-up with her physician. Her chest X-ray showed bronchitis. She was prescribed MEDROL DOSEPAK and albuterol as needed. The patient was referred to a pulmonologist and an allergist. She saw the allergist on 11-JUN-2008, the allergist agreed that the patient had bronchitis. He treated her with Z-PAK and albuterol, then added CLARINEX, "Cymbicort" and prednisone (manufacturer unknown) 40 mg. The patient was followed-up on 17-JUN-2008 with her primary care physician and she diagnosed her with dyspnea. Another follow up visit was made on 05-AUG-2008, her shortness of breath was resolved, but she still complained of severe fatigue. Her blood work showed reactivation of Epstein-Barr Virus. A follow up visit was made on 25-AUG-2008 she still complained of chronic fatigue. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Drug exposure during pregnancy, Foetal disorder, Premature labour

Symptom Text: Information has been received from a licensed practical nurse concerning a 20 year old female, with asthma and an allergy to shellfish and iodine, who on approximately 08-JAN-2008 was vaccinated with her first dose of GARDASIL. There was no concomitant medication. The patient was 4 weeks and 3 days pregnant when vaccinated. The patient sought medical attention. As of 01-FEB-2008, the patient was 7 weeks 6 days gestation. In follow-up, the nurse reported that the patient delivered a preterm, where the baby had some sort of "loss of amniotic fluid" and that had needed surgery. Subsequently, the patient whose estimated delivery date was 15-SEP-2008, delivered a vaginally on 06-AUG-2008 at 34 week estimated gestational age. The nurse reported that the patient was last seen in the office at her 32 week prenatal visit on 23-JUL-2008. The nurse was able to access the patient's chart information. On 05-AUG-2008, the patient had called the practice to report a significant decrease in fetal movement. She was sent to the hospital for a non-stress test (NST) and a biophysical profile (BPP) by ultrasound. The result of the BPP were that the patient scored only a 4 out of 8 and had amniotic fluid index (AFI) of 3.6, which is the diagnostic for oligohydramnios, and subsequently needed to be induced. She did not specify the results of the NST. It was also noted on the ultrasound at that time that the baby had a distended bladder with bilateral hydronephrosis and had an obstructed bladder outlet. And would require surgery after delivery. The patient was then sent to a major medical center where she delivered on 06-AUG-2008 and the baby had subsequent surgery (exact date of surgery not specified). According to the nurse, the mother was seen last week (week of 23-SEP-2008) and she was doing quite well at her postpartum visit and the baby was doing well and was at home with her. The nurse reported that she would offer the patient the informed consent sheet at her next visit. Upon internal review, premature baby, distended bladder, o

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Convulsion, Gaze palsy, Immediate post-injection reaction, Tremor, Unresponsive to stimuli

Symptom Text: Information has been received from a registered nurse concerning a 12 year old female with no pertinent medical history and no drug reactions/allergies who on 02-OCT-2008 was vaccinated with the first dose of GARDASIL (Lot# reported as 660557/0072X), 0.5 milliliter intramuscular in left deltoid. Concomitant therapy included DTaP, varicella virus vaccine (MSD), hepatitis A vaccine (inactive) and MENACTRA, all these vaccines were received at the same office visit as GARDASIL. The patient developed a seizure within 3 minutes of receiving the first dose of GARDASIL on 02-OCT-2008. The seizure was described as follows: "The patient's limbs shook, the eyes rolled back, and the patient was unresponsive for about one minute". Subsequently the patient recovered from the seizure. The patient sought medical attention at physician's office. No other symptoms or treatment was reported. Upon internal review, seizure was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Balance disorder, Encephalitis viral, Epstein-Barr virus infection, Pyrexia

Symptom Text: Information has been received from a health authority (reference no. PA20080269 and PA0800294) concerning a 20-year-old female patient with no known infections medical history who received an injection of GARDASIL in May-2008. 2 weeks later on 01-Jun-2008 the patient experienced viral encephalitis. On 06-Jun-2008 she was hospitalized for physical and equilibrium troubles in a febrile context. Diagnosis was Epstein Barr virus viral encephalitis. There was a progressive amelioration until regression of troubles in 2 months. The patient had recovered without any sequelae. Other business partner numbers included: E2008-09118. No additional information is available.

MedDRA PT Urticaria, Vaccine positive rechallenge

Symptom Text: Information has been received from a physician concerning a 14 year old female patient with obesity who on 23-JUN-2008, was vaccinated with the first dose of GARDASIL (lot # 660389/1968U), 0.5 ml intramuscularly. There was no concomitant medication. The physician reported that on 15-JUL-2008, the patient developed widespread urticaria. The patient was treated with a course of prednisone and completely recovered. On 21-AUG-2008, the patient was administered the second dose of GARDASIL (lot # 660612/0229X), 0.5 ml intramuscularly, and on 26-AUG-2008, she developed urticaria of the upper chest and upper extremities. On 29-AUG-2008, the patient was prescribed a MEDROL dose pack. At the time of the report, the patient had not recovered. The patient sought medical attention at the physician's office. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Lymphadenopathy, Vaccination complication

Symptom Text: It was reported in a published article, titled as above. A 26 year old woman came to a family practice clinic to receive the first of three doses of GARDASIL. She returned 5 days later with swollen lymph nodes in the left side of her neck. The patient noticed enlarging lymph nodes 3 days after receiving the GARDASIL, which had been injected intramuscularly into her left deltoid muscle. At this visit and all sequent clinic visits, the patient denied any recent upper respiratory infection, pharyngitis, cough, fever, or left upper extremity skin infections or rashes. She also denied any significant medical or surgical history. Her drug therapy only consisted of a daily oral contraceptive, and she denied recent antibiotic and nonsteroidal antiinfammatory treatment. She had received no other immunizations recently and reported no previous vaccine-related lymphadenopathy. The patient also denied any drug or seasonal allergies, asthma, or eczema. Physical examination revealed normal vital signs and several palpable anterior cervical and supraclavicular subcentimeter lymph nodes on the left side of the patient's neck. These were soft and fully mobile, without matting. The remainder of her physical examination was normal with no other regional lymphadenopathy. Due to the patient's lack of systemic symptoms, laboratory evaluation, pharmacologic therapy, and lymph node biopsy were not indicated. The patient remained afebrile and exhibited no signs or symptoms of systemic infection over the next several days. She was reevaluated at the family practice office 17 days after her initial vaccination. The lymphadenopathy had completely resolved. The patient received her second dose of GARDASIL 2 months after the initial immunization and experienced no associated lymphadenopathy. This patient's lymphadenopathy was spatially and temporally related to administration of GARDASIL, given that it developed in the left side of her neck, ipsilateral to the vaccination site, within 3 days of immunization. Her history and

Seriousness: ER VISIT, HOSPITALIZED, SERIOUS

MedDRA PT Abdominal pain upper, Activities of daily living impaired, Back pain, Conversion disorder, Convulsion, Cyanosis, Emotional disorder, Eye disorder, Fatigue, Grand mal convulsion, Headache, Injury, Kidney infection, Pain, Respiratory arrest, Urinary tract infection

Symptom Text: Within a day or two after the first shot on 03/25/08 she developed severe back pain. On 04/27/08 she had a seizure and went to the ER. She had the second shot on 05/06/08 and had another seizure. She had two more seizures between then and 06/20/08 when she had three seizures at work and was admitted to the hospital. She had daily seizures throughout the summer, was diagnosed with epilepsy and put on anti-seizure meds. After a cluster of 4 seizures when she turned blue and stopped breathing she was admitted to the hospital and a Video EEG done. Epilepsy was ruled out and psuedoseizures diagnosed and meds stopped. She continued to have seizures and saw a psychiatrist as suggested. The psychiatrist said the seizures were not psychological and were medical. Put back on anti-seizure meds until she became toxic from the meds and was admitted to the hospital through the ER where she was given charcoal. After discharge she began to start feeling better and has been seizure free now for 30 days. Also from March until now she suffered from severe stomach aches, eye problems, headaches, one kidney infection and one urinary infection (never had any in her life before this), severe fatigue (this is a very hyper kid)and body aches. She is not currently on seizure meds and is slowly gaining her strength and getting back to her independent life as before the shot. She lost the ability to drive, to be left alone, was injured repeatedly from the drop seizures, lost her job and her confidence with the way the medical community threw her back and forth between treatments and diagnosis and labeled her as emotionally disturbed. This was a very happy, Dean's list, independent college kid before this shot. Thankfully, she appears to be coming back to us but still has fatigue and stomach issues which we are treating with diet and vitamins. 10/27/08-records received for DOS 6/20-6/21/08-DC DX: Generalized tonic clonic seizures. First seizure 4/26/08 a partial seizure and two additional ones. Did not begin her anti-seizure medication unt

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Abdominal pain upper, Back pain, Blood test normal, Convulsion, Electroencephalogram normal, Fatigue, Headache, Pain, Smear cervix abnormal, Urinary tract infection, Visual impairment

Symptom Text: My daughter received her first GARDASIL vaccine in March 2008. Within 24 hours she began experiencing a horrible backache that did not go away for a couple of weeks. she had her first seizure at the end of April. She received her second shot at the beginning of May. She had three more seizures and in June began having daily seizures. She also experienced severe stomach aches, headaches, vision problems, UTI's, body aches and extreme fatigue. She also had an abnormal pap after this vaccine. She was hospitalized multiple times and had to have paramedics come multiple times as well. Fortunately, we figured this out before the third shot or I'm not sure she would have survived. She was perfectly healthy, none of these symptoms prior to the GARDASIL. She is getting better now and the seizures are less frequent though she just had one on January 8, 2009. She is still experiencing stomach aches and body aches and fights the fatigue. I know GARDASIL Caused this. She was a very athletic, active, healthy girl before that vaccine and now she is not. I can't believe anyone is still endorsing giving this vaccine. It makes me furious, especially when I've discovered there have been nearly 15,000 adverse reactions to this vaccine. All EEGS, bloodwork, etc. have been normal and the Neurologist cannot explain the seizures and other health problems. In addition, the doctor that gave her this vaccine gave her no information and just told her she needed to have the vaccine.

MedDRA PT Alopecia, Back pain, Contusion, Convulsion, Dysplasia, Headache, Hypovitaminosis, Immediate post-injection reaction, Kidney infection, Urinary tract infection

Symptom Text: Information has been received from a consumer concerning her 19 year old daughter with penicillin and sulfa allergy who on 25-MAR-2008 was vaccinated with the first dose of GARDASIL. Immediately after getting the vaccine her daughter had a severe backache, severe headaches, a urinary tract infection, a kidney infection, seizures, hair loss and bruising. On 6-MAY-2008 the patient received the second dose of GARDASIL and then had seizures everyday. It was also reported that the patient tested positive for dysplasia after being vaccinated with the GARDASIL vaccine. The reporter stated her daughter almost died from the seizure. On an unspecified date the patient was hospitalized. A complete blood work was performed and everything was normal other than a vitamin deficiency. The patient did not receive the third dose of GARDASIL vaccine and she continues to get seizures about every six weeks. Additional information has been requested.

MedDRA PT Caesarean section, Drug exposure during pregnancy, Gestational diabetes

Symptom Text: Information has been received from a health professional concerning a 24 year old female with no medical history who in July 2007, was vaccinated with a second dose of GARDASIL. After the vaccination the patient found to be pregnant. Medical attention was sought. No product quality complaint was involved. On 06-MAR-2008, the patient delivered a normal, healthy male baby weighing 8 lb and 4.75 onz, length not reported, apgar score 8/9, head circumference not reported. No congenital anomalies. Complications during pregnancy included gestational diabetes. Complications during labor/delivery included labor stalled at 9cm and the patient subsequently underwent a Caesarian section. Upon internal review stalled at 9 cm was considered to be an other important medical event. No further information is available.

MedDRA PT Back pain, Chest pain, Impaired work ability, Pyrexia

Symptom Text: Information has been received from a general practitioner concerning a 14 year old female who in January 2008, was vaccinated with the first dose of GARDASIL, on 13-MAR-2008 was vaccinated with the second dose of GARDASIL and on 22-JUN-2008 was vaccinated with the third dose of GARDASIL (batch number not reported). On an unspecified date the patient experienced dorsal pain and thoracic pain. At time of reporting the outcome was not specified. Follow-up information was received. Case initially reported as non serious was upgraded. It was specified that the patient received the third dose of GARDASIL (Lot No. 1208U; Batch No: NH13360) in the left arm via subcutaneous route on 22-JUL-2008 instead of 22-JUN-2008 as initially reported. On approximately 23-JUL-2008, twenty hours after vaccination, the patient experienced moderate fever for two days. Twenty four hours after vaccination and during 4 days, the patient also experienced severe and serious lumbar pain with disabling of both lower limbs leading to 4 days temporary interruption of work. Thoracic pain was no more reported. Corrective treatment with paracetamol and ibuprofen were given. Lumbar pain, thoracic pain and fever were considered to be an other important medical events. Other business partner numbers included: E2008-07180. Additional information has been requested.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy, Uterine dilation and curettage

Symptom Text: Information has been received from a physician concerning a female who in 2008 was vaccinated with GARDASIL. At the time of the report the patient has received two doses to GARDASIL. On 25-AUG-2008 the patient informed to the physician to be pregnant. HPV vaccine dose 3 was not administered. Pregnancy outcome is unknown. After several attempts no further details could be obtained. On 29-SEP-2008 additional and clarification information was received from the physician who confirmed that the patient is a 23 year old female with a history of 0 pregnancies and 0 live births who on 07-JUL-2008 was vaccinated with GARDASIL (only first dose of vaccine received). No concomitant therapy. Last menstrual period occurred on 04-JUL-2008. On 28-AUG-2008 pregnancy was confirmed through agency that reported pregnancy with 6 weeks live embryo. On 18-SEP-2008 the patient experienced abortion spontaneous and was hospitalized to perform curettage. The patient was discharged on 19-SEP-2008 recovered and without complications. The physician stated that he could not define if abortion spontaneous was related or no with GARDASIL. Additional information is not expected.

MedDRA PT Autoimmune thrombocytopenia, Contusion, Ecchymosis, Menorrhagia

Symptom Text: Information has been received from a health authority (reference numbers NT20080403 and NT0800407), concerning a 19 year old female patient with no relevant medical history reported who on 15-JAN-2008 was vaccinated with the first dose of GARDASIL (Batch #NS37380) IM, on 14-MAR-2008 with the second dose of GARDASIL (Lot #1201U and Batch #NH0090) IM and on 17-JUN-2008 with the third dose of GARDASIL IM (Lot # 1208U and Batch #NH13370). On 05-SEP-2008, the patient had post traumatic ecchymoses on her lower limbs. The patient also mentioned the notion of spontaneous bruises since one month and the notion of menstrual flow very important (beginning of August 2008). A numeration was performed on 05-SEP-2008 revealed a severe thrombocytopenia (19G/L) isolated. After analysis of marrow the conclusion was thrombocytopenia of peripheral origin. On 06-SEP-2008, a treatment with corticosteroids was begun. A complete aetiologic work up was performed: hepatic, renal and ionic results were normal, viral serologies (hepatitis, cytomegalovirus, EBV) were negative or revealed past infections. Rheumatismal serologies were negative. Antiplatelets antibodies were highly positive (anti GPIIb/IIIa and GPIbIX). Diagnosis was auto immune thrombocytopenia of unknown origin. Evolution was favourable with 99 giga of corticotherapy from 10-SEP-2008. The patient had recovered without any sequelae. The patient had been hospitalized (unspecified dates). Other business partner numbers included: E2008-09133. No further information is available.

Other Meds: Unknown

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received through the Merck Pregnancy Registry through a physician concerning a female who was intramuscularly vaccinated with her first dose of GARDASIL and found out she was pregnant. No adverse events were reported. Follow up information was received from the physician who reported that the 24 year old female with a history of two previous pregnancies (1 spontaneous abortion and 1 elective termination) who on 18-OCT-2008 was vaccinated with a first dose of GARDASIL. On 21-JAN-2008 the patient underwent elective termination. Upon internal review, elective termination was determined to be an other important medical event. Additional information is not expected.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Drug exposure during pregnancy, Foetal disorder, Pre-eclampsia, Premature baby

Symptom Text: Information has been received through the Merck pregnancy registry from a consumer concerning her 14 year old daughter with a sulfonamide allergy who on 27-JUL-2007 was vaccinated with the second dose of GARDASIL and then found out she was pregnant on 31-JUL-2007. There was no concomitant medication. As of 03-AUG-2007, the patient was approximately 13 weeks pregnant with an estimated delivery date of 07-FEB-2008. No medical attention was sought. Telephone follow-up information was received from a nurse who reported that the 14 year old patient did deliver her baby and that mom and baby were both doing well now. The mother experienced severe pre-eclampsia resulting in the baby being born early at 28 weeks "probably by c-section" weighing 836 grams in November 2007. The nurse indicated that the baby was on oxygen for some time while in the Neonatal Intensive Care Unit (NICU) post delivery and that the baby was normal with no congenital anomalies. This was the mother's first pregnancy. Upon internal review pre-eclampsia requiring baby to be born early at 28 weeks "probably by C-section" were determined to be an other important medical events. No further information is available.

MedDRA PT Arthralgia, Erythema, Insomnia, Joint swelling, Musculoskeletal stiffness, Rheumatoid arthritis, Skin nodule, Tenosynovitis

Symptom Text: Three injections in HPV4 (Human papillomavirus, quadrivalent) series provided on 01/07/2008, 08/08/2007, 05/11/2007. Began to experience gradually increasing joint pain in June 2007, with nodule formation (on right wrist) by August 2007. Joint pain, swelling, redness increased until diagnosed with rheumatoid arthritis in September 2008. 12/22/08 Reviewed PCP clinic records. FINAL DX:Rheumatoid arthritis; right wrist tenosynovitis. Records reveal patient experienced right wrist pain since 2/07. PRogressed to include multiple joints w/AM stiffness, difficulty sleeping due to pain. Seen by PCP, PT & ortho. Failed conservative treatment. Referred to Rheum & seen 8/08 & second opinion 9/08. Tx w/steroids & antiarthritis meds. Responded well to steroids & continued arthritis meds w/intermittent use of steroids.

MedDRA PT Alopecia, Cystitis, Fatigue, Gastrooesophageal reflux disease, Lymphadenopathy, Pharyngitis, Seasonal allergy, Sensorimotor disorder, Sinusitis, Thyroid function test abnormal, Tonsillar hypertrophy, Urinary tract infection, Vaginal disorder, Viral infection, Vulvovaginal candidiasis

Symptom Text: My daughter became very sick after the second shot. Her glands swelled up and also her tonsils. She experienced exhaustion and a number of vaginal, female problems. We spent a lot of money on the Dr. and tests to find out what was wrong. I took her to a specialist who said he thought she had mono, but all tests were negative. After the third shot her hair began to fall out. Another doctor visit and specialist visit. Apparently her thyroid (of which we have no history) was not functioning properly. Eventually her thyroid began to function, but she still suffers from various female problems and swollen glands and tonsil issues. We NEVER had these problems before. I want to sue this company for making my daughter SICK! 1/9/09 Reviewed PCP medical records of 1/31/08-12/12/08. FINAL DX: none provided Records reveal that on following office visits patient experienced: 1/31/08 - UTI, vaginal yeast infection, seasonal allergies, GERD 2/14/08- acute pharyngitis 7/11/08 - acute cystitis 7/30/08 - alopecia x several months, fatigue, focal motor & sensory deficits & resolved viral syndrome. 12/12/08 - acute sinusitis

Seriousness: ER VISIT, HOSPITALIZED, SERIOUS

MedDRA PT Abasia, Amnesia, Aphasia, Arnold-Chiari malformation, Complicated migraine, Condition aggravated, Convulsion, Disorientation, Drooling, Fall, Gaze palsy, Hemiplegia, Migraine, Neurological examination abnormal, Posturing, Pregnancy test, Syncope, Unresponsive to stimuli

Symptom Text: Information has been received from a consumer concerning her daughter a 14 year old female with migraine who on 07-SEP-2007, 14-NOV-2008 and 19-MAR-2008 was administered her first, second and third doses with GARDASIL. Concomitant therapy included propranolol HCL. On 19-MAY-2008 the patient experienced seizure. On 20-MAY 2008 the patient "had another seizure in her sleep. Her eyes rolled back into her head", subsequently she was hospitalized for 5 days. On 23-AUG-2008 the patient came into the house "disoriented" after falling outside. Her mother suspected she had a seizure. The hospital did an X-ray which came out fine. Patient's right arm could not move, she did not remember the falling incident, and she was not herself at all. One of her eyes would go off to the side and her other eye to the other side, her mouth was twisted, her right side paralyzed, and she could not walk or talk or feel her right side. Even though her vision was checked and was 20/20, the patient's eyes still "kind of go off to the side when being talked to." Lab diagnostics studies performed included: MRI, MRA, EKG, EEG, X-ray, tests for drugs, heart problems diabetes, STD's, and pregnancy (results not reported). The patient will see a neurologist 09-OCT-2008. The patient present status was unknown. No more information reported. Upon internal review, right side paralysis was considered to be an other important event. Additional information has been requested. 12/2/08 Reviewed hospital medical records of 5/20-5/24/2008. FINAL DX: right-sided weakness; possible seizures Records reveal patient experienced episodes of weakness & unresponsiveness. Had been picked up from school w/migraine HA. Had posturing movements, was unresponsive, & collapsed in restaurant. Taken to ER & released. Next AM had recurrent symptoms. Taken to peds clinic & admitted. Neuro consult done. 11/18/08 Reviewed neuro medical records of 06/12/2008. FINAL DX: Spell, seizure vs complex migraines vs non-epileptic/functional; HA migraines vs stress vs function

Other Meds: propranolol hydrochloride

Lab Data: X-ray, "fine"; Ophthalmological exam, 20/20 LABS: video EEG abnormal. MRI revealed Chiari I. MRA WNL. CT scan of neck WNL.

History: PMH: migraine HAs s/p MVA x 3, last on 6/9/08 w/o injury but severe HA. Family hx: migraine HAs, seizures, CVA.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Anaemia, Disturbance in attention, Fatigue, Loss of consciousness, Malaise, Myoclonus, Syncope

Symptom Text: Information has been received from a neurologist, via a health authority, concerning an 18 year old female who on an unspecified date was vaccinated with a dose of GARDASIL, (Lot number, route and injection site not reported). The patient developed malaise and fatigue at the end of vaccination. Admittedly an anaemia was diagnosed and lab findings revealed also a raised ESR without evidence of an inflammatory focus. These symptoms persisted for some weeks. Finally she experienced loss of consciousness with myoclonic jerks. Differential diagnosis was conclusive syncope but EEG showed rhythmic potentials which looked like deformed SW-complexes. In the further course an epilepsia was not confirmed but the patient experienced once again a myoclonus-like tremor syndrome of the upper right extremity. Other loss of consciousness did not occur but impaired concentration with feeling of short mental blackouts. A second and a third EEG showed again rhythmic potentials, whereas the symptoms improved within 2 to 3 months. Cranial MRI was normal. CSF was not examined. The final outcome was not reported. The patient's experiences were considered to be other important medical events. File closed. Other business partner numbers included: E2008-08982 and PEI2008014831. No further information is available.

Other Meds: Unknown

Lab Data: electroencephalography, rhythmic potentials which looked like deformed SW-complexes; magnetic resonance imaging, cranial MRI: normal; erythrocyte sedimentation rate, Without evidence of an inflammatory focus

MedDRA PT Drug exposure during pregnancy, Intra-uterine death, Umbilical cord abnormality

Symptom Text: Initial and follow-up information has been received from a medical assistant, for the Pregnancy Registry for GARDASIL, concerning a 21 year old female with no known drug allergies and a history of chickenpox and depression in past who on 12-OCT-2007 was vaccinated with the first dose of GARDASIL (lot no. 658556/1060U). On 12-DEC-2007 the patient was vaccinated with the second dose of GARDASIL (lot no. 659435/1265U). On 12-JUN-2008 the patient was vaccinated with the third dose of GARDASIL (lot no. 659964/1978U). The patient is now pregnant. As of 22-JUL-2008, it was reported that the pregnancy was normal to date. The patient was seen in the office to seek unspecified medical attention. Follow-up information was received which reported in September 2004 the patient had one previous pregnancy and delivered a baby boy at 39 week gestation. The previous live born child was healthy and well. On 05-AUG-08, the initial physical examination was performed. The pregnancy was essentially unremarkable. On 02-SEP-2008, the follow-up physical examination was performed. No fetal heart tones were detected. On the same day, ultrasound confirmed the intrauterine fetal demise. On 08-SEP-2008 the baby was delivered in the evening at approximately 18:00. The mother denied use of tobacco and alcohol in excess during the pregnancy. Her only medications include prenatal vitamins, some Omega-3 fatty acids over-the-counter and acetaminophen over-the-counter. On 08-SEP-2008, the parents reported the baby was active until approximately a week ago. The physical examination of the baby was performed. The infant weighted 85 grams. Cranium was intact. Ears were normally formed and positioned for a 17 week gestation. Palpebral opening were horizontal with very slight fusion still present. Nose, cheeks and philtrum appeared to be normal. Palate is intact. Tongue appeared to be normal. Mandible is only slightly recessed. Cervical area was unremarkable. Thorax was normally developed. Abdomen was negative palpably. There was a very small narrowing a

MedDRA PT Blood pressure decreased, Cold sweat, Convulsion, Heart rate decreased, Hypoaesthesia, Musculoskeletal chest pain, Pallor, Sensation of heaviness, Syncope, Tremor

Symptom Text: Information has been received from a registered nurse concerning a 16 year old female patient with no previous medical history and no illness at time of vaccination reported who on an unknown date was vaccinated with the first dose of GARDASIL IM, 0.5 mL. After the first dose, the patient reported that her arm was numb for about 24 hours and then it resolved. On 06-OCT-2008 at 16:30, the patient was vaccinated with the second dose of GARDASIL (Lot # 659184/0843X) IM in the left deltoid, 0.5 mL, and within 10 minutes after became white (pale) and experienced syncope. The patient felt clammy and her heart rate decreased. She appeared to had seizure, shook for 3 to 5 seconds and her blood pressure decreased for 88/50 to 90/52. When she came to, she said she felt numbness in her arms, a heavy feeling in her feet (dull/numb), a sharp pain in her ribs and was shakey. The patient's blood pressure remained low during an hour of monitoring and her heart rate resolved to within normal limits. The patient also complained that the other arm and feet felt "numb/dull". On 07-OCT-2008, the patient recovered. No treatment was noted. The patient not had any laboratory test done. The patient sought medical attention at the office. Upon internal review, seizure (shook 3-5 seconds) was determined to be an other important medical event. Additional information is not expected.

Seriousness: ER VISIT, EXTENDED HOSPITAL STAY, HOSPITALIZED, SERIOUS

MedDRA PT Abnormal behaviour, Bipolar I disorder, Confusional state, Crying, Delusion, Feeling abnormal, Headache, Impaired work ability, Mania, Mental status changes, Metal poisoning, Mood swings, Obsessive thoughts, Speech disorder, Stress

Symptom Text: My daughter was given the 3 Gardasil vaccinations. They were given over a 6 month time, beginning in October of 2007. Shortly after receiving the first injection, she complained of feeling "thick-headed" and had difficulty comprehending things. She had started a new job, that was similar to a previous one, but couldn't seem to grasp what was being told. Following the second injection, she began having frequent crying spells, continued feelings of confusion, and she broke up with a then boyfriend, and quit her job. This was the first time she hadn't worked since she was 15 years old. She began a new job in March, after taking a couple months off. Things were going OK, until she received the third injection in April. By July, she was exhibiting confusion and mania. She was taken to see her family physician, who advised seeing a psychiatrist. She was told that she was having a "manic episode and was possibly bipolar." By the end of Aug. it was necessary to hospitalize her for treatment. In the interim, she was diagnosed with having high mercury levels in her blood and adipose tissue. A decision was made to treat her for an acute immune response, due to the combination of the reaction to the Gardasil injections, mercury levels and stress. Every physician who had seen her asked the same questions about her past medical history, and every one of them, consisting of MD's, a DO, and 2 Naturopaths felt that her illness was due to an acute reaction, or a combination of "things" that overwhelmed her body. She is now on psychiatric drugs, and is receiving supportive care from the Naturopaths. The hope is to detoxify her body. She has not had any previous issues with mental instability. 11/21/2008 MR received for DOS 8/29-9/01/2008 with D/C DX: Bipolar Disorder with Manic and Delusion, resolved. Pt presented to ER after escalating bizzare behaviors, mania and delusions. Neurology consult reports changes in mental status and behavior began in Oct 2007 following receipt of HPV vaccine. Impression: Acute mani

MedDRA PT Anorexia, Asthenia, Back pain, Blood product transfusion, Bone pain, Coagulation factor V level, Ecchymosis, Eosinophil count normal, Eosinophilia, Hepatic vein thrombosis, Hepatosplenomegaly, Lymphocyte count abnormal, Mesenteric vein thrombosis, Pain in extremity, Petechiae, Portal vein thrombosis, Pulmonary embolism, Pyrexia, Splenic vein thrombosis

Symptom Text: Information has been received from a health authority (reference #'s AN20080564 and LA200810580) concerning a 13 year old female who was vaccinated with the first dose of GARDASIL (lot #, route and site not reported) and the third dose of RECOMBIVAX HB (manufacturer unknown) on 28-AUG-2008. Concomitant therapy included Ibuprofen on 05-SEP-2008. The patient was hospitalized on 06-SEP-2008 for multiple ecchymoses. There was a notion of asthenia and of loss of appetite since 1 week. The patient had fever at 38.5 centigrade by the evening of 05-SEP-2008. At clinical examination the patient presented with multiple ecchymoses: back of left hand, 2 on her elbows, 2 on her knees and on her posterior side of left calf. The patient also presented with petechiae on lower limbs, on abdomen and on her palate. There was no hemorrhagic bubbles and no epistaxis. She had pain of vertebral column and lower limbs. Biological and complementary tests indicated schistocyte was negative. On 09-SEP-2008 B12 vit was 1064 ng/l. Analysis of lymphocyte with flow cytometry indicated that there was no argument in favour of an underlying clonal lymphoproliferation. Rheumatoid factor was normal (below 8 UI/ml). Frank medullar hypereosinophilia was 34%, no excess of blasts. On 10-SEP-2008 an abdominal echography showed hepatosplenomegaly, partial portal thrombosis extending to left and right portal branch. On 11-SEP-2008 antithrombin activity was of 63%. CT scan thorax abdomino-pelvian revealed a total thrombosis of veinous affluents of right subhepatic vein and of portal trunk; partial thrombosis of superior mesenteric vein and of splenic vein. Pulmonary embolism of left basal lateral and posterior segmental artery. There was no tumourous lesion. Concerning the evolution and symptomatic treatment: 2 fresh blood plasma were frozen on 07-SEP-2008 at 2h 30 and at 3h 20. There was a platelets blood transfusion on 07-SEP-2008 at 1h 15. The patient was treated with curative dose of heparin. On 12-SEP-2008 platelets reincreased at 95G/l. Eosinophilia

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Erythema, Feeling of body temperature change, Headache, Hypoaesthesia facial, Paraesthesia, Paraesthesia oral, Swelling face

Symptom Text: Initial report was received 18 September 2008 from a health care professional. A 12-year-old female patient had received a left deltoid intramuscular injection of MENACTRA, lot number U2636AA and a first dose right deltoid intramuscular injection of GARDASIL, lot number 0843X (manufacturer Merck) on 11 September 2008, and on the evening of vaccination, she developed numbness in her face. By the following morning, the numbness had worsened and she complained of a prickly feeling in her cheeks and around her lips, and her face felt hot and cold. The patient's face also appeared pink and puffy. By the afternoon, her lips became tingly. The patient's mother called their health care provided to report the symptoms and stated the patient complained that her head was hurting (onset time and date not reported). The patient had not experienced any fever and no other symptoms occurred. The patient received corrective treatment with BENADRYL. By the following morning (date not reported), all symptoms had resolved. The patient had also received an injection of ADACEL (lot number not reported) within four weeks prior to receipt of MENACTRA and GARDASIL. No further information was provided.

Other Meds: FLONASE

Lab Data: None

History: The patient had no illness at the time of vaccination. Her past medical history included chronic rhinitis and she had known allergies to AMOXIL, AUGMENTIN, CEFZIL, dustmites, and cats. Concomitant medications included FLONASE. The patient had also received ADACEL (date not reported) within four weeks prior to receiving MENACTRA and GARDASIL.

MedDRA PT Bed rest, Blood test, Drug exposure during pregnancy, Premature labour, Ultrasound foetal

Symptom Text: Information has been received from a Registered Nurse for the Pregnancy registry for GARDASIL concerning a female with a history of obesity who in September 2007, was vaccinated with the first dose of GARDASIL (lot 658556/1060U). The patient became pregnant at the end of November 2007. The patient's estimated date of confinement was 03-SEP-2008, and the patient delivered on 20-AUG-2008. At some unspecified point in the pregnancy, the patient experienced premature contractions and was treated with bed rest. Unspecified blood tests and fetal ultrasounds were performed. No other information was available at this time. Upon internal review, premature contractions which required bedrest was considered disabling. Additional information has been requested.

MedDRA PT Abdominal pain, Amenorrhoea, Anxiety, Constipation, Depression, Dizziness, Dysuria, Ear pain, Erythema, Fatigue, Gastrooesophageal reflux disease, Hypoaesthesia, Intestinal functional disorder, Malaise, Nausea, Pain, Paraesthesia, Throat tightness, Viral infection

Symptom Text: Red soreness at time of vaccine, extreme fatigue, numbness tingling in hands & feet, severe nausea still to this date, lightheadedness, lack of premenstruation. Bowel issues possible blockage in March/2008. Healthy child is now so very ill!! 12/02/2008 Reviewed PCP office records which consisted only of lab reports & vaccine records w/o lot #s. 12/23/08 Reviewed additional PCP office records which are difficult to read but reveal patient experienced feeling unwell & being fatigued since 1/08. Started w/possible GERD, abdominal pain & throat tightness in 6/08. GI viral illness, ear pain, anxiety, dysuria. GI clinic eval of 7/08 included Endoscopy 9/08 for GI issues. Seeing counselor for anxiety & depression. Per follow-up: October 8, 2008. To Whom It May Concern: I have enclosed the adverse reporting form with a copy of my daughters shot records. I am Very concerned about the HPV shots that she received this past year. She has always been a very healthy child until the first shot of HPV. I mean healthy!!! WE have been to several gastroenteritis's, counselors, specialists as well as frequently to our pediatrician looking for answers. I had asked my pediatrician months ago if it could be the HPV shots and always got "not possible" as an answer. I am very frustrated with all that my child is still going through and curious if there is anything else I should be doing or could be doing, or persons I should be in contact with. I am at a loss of what to do to help my daughter with these horrible side effects. Please contact me with any suggestions small or large. Thanking you in advance!!

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received through the Merck pregnancy registry from a physician concerning a 15 year old female with a history of dysmenorrhoea and bee sting who on 03-DEC-2007 was vaccinated intramuscularly with her first dose of GARDASIL (lot# 656372/0243U). Concomitant therapy included MENACTRA, NAPROSYN, PAMPRIN and TUMS. On 05-FEB-2007 the parents of the patient called the office to report the patient was pregnant. Her LMP was 25-DEC-2007 with an expected due date of 30-SEP-2008. The patient had 2 positive pregnancy tests via urine and blood through another office. On 15-FEB-2008, the patient experienced an elective termination of her pregnancy at 11 weeks from LMP. It is unknown if the products of conception were examined and if the fetus was normal. Physician reported that the patient was not actually exposed to GARDASIL during pregnancy since her first dose was given during LMP and the second dose after threatened abortion (TAB). The patient did not use any medication during her pregnancy. Upon internal review elective termination was considered to be an other important medical event. Additional information is not expected.

Other Meds: PAMPRIN; TUMS; NAPROSYN

MedDRA PT Inappropriate schedule of drug administration, Pallor, Syncope vasovagal, Unresponsive to stimuli, Vision blurred

Symptom Text: This case was reported by a health professional on 04 October 2007. An 11-year-old female patient with no reported history received an intramuscular right deltoid injection of TRIPEDIA (lot number U1813BA) and an intramuscular left deltoid injection of GARDASIL (Merck, lot number 10606) on 03 October 2007. Within 15 minutes, the patient had blurred vision, and subsequently became pale and unresponsive. She slid to the floor, and was responsive within one minute. No respiratory distress was noted, and no EMS was required. The patient recovered. Additional information received 05 November 2007. An 11-year-old female patient received TRIPEDIA (Per product insert, indicated through six years of age). The reporter verified that the patient had not received any concomitant medications at the time of vaccination and had no prior history of fainting. Diagnostic and laboratory testing had not been performed. The reporter stated that this event was felt to be a vasovagal response. No further information was provided. Additional information received from a health car professional on 04 January 2008. The reporter confirmed that the patient was 11-years-old and that the product administered with TRIPEDIA (TDAP was the intended vaccine). 17/Sep/2008: A corrective version with the same latest received date as the previous version (04/Jan/2008) was created to add the event of vasovagal response.

Other Meds:

Lab Data: None

History: Reported a "none". The patient had not been taking any concomitant medications and had no history of fainting.

MedDRA PT Drug exposure during pregnancy, Mastitis

Symptom Text: Initial and follow up information has been received from two registered nurses for the Pregnancy Registry for GARDASIL concerning a 22 year old female, with no relevant medical history, no known drug allergies and no previous pregnancies, who on 12-MAR-2007 was vaccinated IM with 0.5 ml of the first dose of GARDASIL (Lot #656049/0187U). There was no concomitant medication. The patient was currently pregnant with a LMP of 15-FEB-2007. All prenatal labs were normal. It was reported that on an unspecified date, the patient began taking prenatal vitamins. Medical attention was sought. On 17-JUL-2007, the patient had a routine ultrasound which was normal (not further specified). On 21-NOV-2007, the patient gave birth to a healthy baby girl (3510 gm; 20 in), with Apgar scores of 9 and 9. There were no congenital anomalies, complications or abnormalities. There were no complications during the pregnancy or during labor and delivery. Follow-up information was received indicated that in approximately December 2007, the patient experienced mastitis and was treated recently (unspecified). The outcome was unknown. Pediatric medical records were received, refer WAES # 0810USA00111. No further information is available.

MedDRA PT Drug exposure during pregnancy, Immotile cilia syndrome, Lung infection

Symptom Text: Initial and follow-up information has been received through the Merck Pregnancy Registry from a physician concerning a 20 year old female with bronchitis, Kartagener's syndrome, pregnancy and lung infection with a history of 1 pregnancy, 1 live birth and no birth defects in previous pregnancies who on 05-APR-2007 was vaccinated with GARDASIL (lot # 654535/0950F). Concomitant therapy included albuterol 6.7 gm. QID as needed, salmeterol 50 mcg BID, and fluticasone propionate 10mcg BID for chronic bronchitis. Prenatal vitamins, iron (unspecified) and calcium (unspecified) taken once to twice daily for pregnancy and amoxicillin TID for lung infection. On 12-JUL-2007 the patient was vaccinated with a second dose of GARDASIL (lot# unknown). On 12-JUL-2007 the patient was found to be pregnant, in the first trimester. The patient's last date of menstrual period was 01-JUN-2007 and the estimated date of delivery is 10-MAR-2008. Unspecified medical attention was sought. An ultrasound was performed for dates and surveillance on 10-SEP-2007 and 25-OCT-2007 and was within normal limits: growth as expected. It was reported pregnancy was normal to date. Follow-up information was received from the physician. The physician reported that the patient delivered an 11 pound male on 11-MAR-2008 via vaginal delivery. The mother was formula feeding. There was no additional information on the baby at the time of reporting. Follow-up information was received via medical records. On 16-MAR-2008 the baby had neonatal physiologic jaundice in face only. On 16-MAR-2008 the baby's body temperature measurement was 99.2, respiratory rate measurement was 36, pulse oximetry was 94 and total heartbeat count was 142. Follow-up visit was scheduled for 2 weeks. On 27-MAR-2008 the baby had his 2 week old well child visit. The baby lost weight, was down to 5% from 10%. The baby had thrush and constipation issues, and changed formula to try to improve constipation and treat thrush. Try to increase daily formula amount to about 30 oz. day. Plan was to rec

MedDRA PT Drug exposure during pregnancy, Foetal disorder

Symptom Text: Initial and follow up information has been received for the Pregnancy Registry for GARDASIL from a health professional concerning a 25 year old female patient with allergic reaction to codeine, allergic reaction to antibiotics, genital herpes (onset 2006) and a history of d pelvic inflammatory disease (2005) who on 18-MAY-2007 was vaccinated IM with a first dose of GARDASIL (lot #657621/0387U). Concomitant therapy included VALTREX. The reporter mentioned that they found out that patient was pregnant one day before her second injection was due (LMP= 14-JUN-2007). The second dose of GARDASIL was not administered. Patient had cervical smear test and enzyme immunoassay HIV antibody screen laboratory tests were done. On 11-OCT-2007 the patient had a normal serum alpha fetal protein and on 26-NOV-2007 the patient had a normal ultrasound. On 09-APR-2008 (41 weeks from LMP) the patient delivered a normal male infant (weight 9 pounds, 0 ounces). Apgar score were 8 and 9. There were no congenital anomalies, complications or abnormalities. Follow-up information was received via medical records. The baby developed jaundice on 14-APR-2008. On 23-APR-2008 bilirubin test was performed the result was 14.7. On 02-MAY-2008 the baby's skin looked good. On 27-MAY-20087 the baby vomited twice. There was no fever, cough etc. The patient subsequently recovered from the jaundice and vomiting. No further information is expected.

Other Meds: VALTREX

MedDRA PT Drug exposure during pregnancy, Hypertension, Inappropriate schedule of drug administration

Symptom Text: Information has been received from a registered nurse concerning a 27 year old female with no drug allergies, who on 04-DEC-2007 was vaccinated intramuscularly with a 0.5mL first dose of GARDASIL (Lot# 655619/1427F). There were no concomitant medications. Subsequently, the patient was 21 weeks pregnant at the time of this first dose. The patient was not experiencing any known symptoms. The patient was seen in our office. At the time of the report, the outcome of the patient was unknown. No product quality complaint was involved. This was the patient's first pregnancy. Follow up information was received from a nurse practitioner that the LMP of the patient was 08-JUL-2007; EDD was 15-APR-2008. Ultrasounds were done on 30-NOV-2007 and 30-JAN-2008 for size/date and review of systems which were born within normal limits. The patient took prenatal vitamins during pregnancy. She was diagnosed with hypertension later in pregnancy, she was prescribed no medications. On 09-APR-2008 (41 weeks 3 day from LMP) the patient delivered a normal, healthy female baby weighing 6lb. 4oz., length was 31.5 cm, head circumference was "49 cm". The infant was considered normal; no congenital anomalies or complications were noted. APGAR score was 8/9. The pregnancy and delivery were considered as having no complications. Additional information is not expected.

MedDRA PT Cervical dysplasia, Drug exposure during pregnancy, Papilloma viral infection, Pre-eclampsia, Premature labour, Smear cervix abnormal

Symptom Text: Information has been received through the pregnancy registry for GARDASIL from a health professional concerning a 16 year old adopted female who in November 2007 was vaccinated with the second dose of GARDASIL. Per the reporter, the patient may have been pregnant when she was given her second dose of GARDASIL (LMP=01-NOV-2007). No adverse events were reported and no further information was available. Follow up information was received which reported that the routine obstetric labs were normal and the first and second trimester metabolic panel screens were within normal limits. On 25-FEB-2008 the patient's PAP smear was abnormal: "epithelial cell, abnormality squamous: low grade squamous intraepithelial lesions. HPV changes, possible CIN1." Repeat Pap smear will be performed in 6 months. During pregnancy and labor, the patient had preeclampsia. The patient was treated with magnesium sulfate. On 16-JUl-2008 the patient delivered a baby boy at 36.4 weeks gestation. The infant's weight was 5lb 10oz. The infant was normal and no congenital abnormalities. Additional information is not expected.

MedDRA PT Drug exposure during pregnancy

Symptom Text: Information has been received from a licensed practical nurse (L.P.N.), for the pregnancy registry for GARDASIL concerning a 21 year old female with a history of anemia, Crohn's disease and abnormal papanicolaou smears who on 28-JUN-2007 was vaccinated intramuscularly with her first dose of GARDASIL. Concomitant therapy included ORTHO-NOVUM. On 22-AUG-2007 the patient was vaccinated intramuscularly with her second dose of GARDASIL. On 12-DEC-2007 the patient was vaccinated intramuscularly with her third dose of GARDASIL. On 17-DEC-2007 the patient found out she was pregnant with a positive home pregnancy test the patient's LMP was 10-NOV-2007 (also reported as 06-NOV-2007) (due date = 13-AUG-2007). The patient was seen on 03-JAN-2008 for her first prenatal visit and an ultrasound was preformed; results showed a viable pregnancy. The patient was placed on daily prenatal vitamins. The patient has not experienced any difficulties with the pregnancy at this time. Follow-up information was received on 02-SEP-2008 from a L.P.N. indicating that on 01-JUL-2008 the patient delivered a normal female baby weighing 5 pounds, 1.1 ounces. There was no congenital abnormalities. There was no infections or illness during pregnancy. There was no complication during delivery. Other medications used during pregnancy included Celestone and Procardia. Additional information is not expected.

Other Meds: Celestone, Ortho-Novum, Procardia, Vitamins

MedDRA PT Cough, Drug exposure during pregnancy, Nasopharyngitis, Premature labour

Symptom Text: Information has been received through the Merck pregnancy registry from a health professional concerning a 16 year old female who on 09-OCT-2007 was vaccinated with the first dose of GARDASIL (lot #not provided). On an unknown date, "the patient received the second dose of GARDASIL (658554/0928U). * Concomitant suspect therapy included varicella virus vaccine live. Per the reporter, the patient came back into the office because she was having a cough and cold, which turned out to be prenatal symptoms. The physician did a pregnancy test on the patient which came back positive. Per the reporter, the patient received the first dose of varicella virus on 06-DEC-2006. The lot # for varicella virus vaccine live was 659692/1767U, unspecified which dose. Additional information received from pregnancy questionnaire (31-MAR-2008): The lot# for the first dose of GARDASIL was provided as 658094/0524U and the date of the second was listed as 06-FEB-2008. Follow up information was received which reported that on 16-JUN-2008 the patient delivered a female infant. The infant's weight was 12.3 (unit not reported), length was 23.25 inches. The infant was normal, there were no congenital anomalies and no other complications or abnormalities. Additional information is not expected.

MedDRA PT Drug exposure during pregnancy, Hydronephrosis, Ureteric obstruction, Uterine contractions during pregnancy

Symptom Text: Information has been received from the Merck Pregnancy Registry for GARDASIL via a medical assistant concerning a 26 year old white female with "kidney problems" who on 08-JAN-2008 was vaccinated IM with a first 0.5ml dose of GARDASIL vaccine (Lot # 659437/1266U) and was " 4 weeks pregnant at the time of the vaccine." Last menstrual period was approximately 10-DEC-2007. Estimated date of delivery is 15-SEP-2008. There were no concomitant medications. No adverse event occurred. Laboratory studies performed were "blood work" and an "OB profile" (results not reported). The patient sought unspecified medical attention. At the time of the report the outcome was unknown. Follow-up information was received indicating that on 30-AUG-2008, the patient delivered a normal baby. During pregnancy, the patient had hydronephrosis and obstructed right ureter. She also received terbutaline sulfate 2.5 mg every 4 hours on 04-AUG-2008 for contractions. The patient took prenatal vitamins during pregnancy. No diagnostic tests during pregnancy. There were no complications during labor/delivery. Additional information has been requested.

Other Meds: vitamins (unspecified)

MedDRA PT Medical device complication

Symptom Text: information has been received from a woman's clinic regarding GARDISAL in a pre filled syringe. It was reported that the syringe was leaking. No adverse event was reported. In follow up it was reported that the patient received the dose of HPV Vaccine the same day using a different syringe. The problem was identified before patient was injected so patient never received any of the faulty dose, therefore this reports being deleted from our files, and a healthcare professional did not come into direct contact with the vaccine as a result of the complication . No further information is available.

MedDRA PT Drug exposure during pregnancy

Symptom Text: Information has been received from a Caucasian registered nurse for the pregnancy registry for HPV vaccine, concerning a 23 year old female with sulfonamide allergy who on 28-JUL-2008 was vaccinated with the first dose of GARDASIL vaccine (yeast) (lot # 660553/0070X, exp: 22-OCT-2010) 0.5ml, intramuscularly. There was no concomitant medication. The nurse reported that the patient received her first dose of HPV vaccine and then discovered that she was pregnant. On 28-JUL-2008, the patient had a urine pregnancy test that was negative, and on 06-AUG-2008 she had another pregnancy test that was positive. The patient's LMP was on 25-JUN-2008 and the EDD is on 01-Apr-2009. No adverse event was reported. The patient sought medical attention at the physician's office. Follow up information was received on 27-AUG-2008 from a registered nurse which reported that the patient's LMP was on 27-JUN-2008. Additional information has been requested.

MedDRA PT Asthenia, Feeling abnormal, Heart rate normal, Pallor

Symptom Text: Client received HPV #1 vaccine on right upper arm approximately at 5:15pm in company of her mother. Mother during assessment stated she had eaten "goodies" prior to vaccine and was ready to receive her "shot" although she appeared nervous. After informing patient/parent of the benefits of the vaccine and comfort measures, she stated she was ready for "shot". Approximately 2 minutes after administration, patient stated she didn't feel good and sat on her mother's lap. She leaned towards her mother resting her head on mother's chest. "I'll be alright, I just need some time" she added that she felt weak and needed to sit down on chair. She stood up and with my assistance she proceeded to sit in chair. I questioned mother on her pale color, to which she answered that it was her "normal color", she was always pale. Vital signs taken excluding temperature. P-66, R-12, B/P 108/80. Patient called on cell phone initiating a conversation. Mother stated she was fine and they needed to go, signing Vaers form that she could no longer stay. Patient left ambulating in company of mother and sister at approximately at 6:00 pm.

MedDRA PT Drug exposure during pregnancy, Nausea

Symptom Text: Information has been received from a medical assistant for pregnancy registry for GARDASIL, concerning an 18 year old female with allergy to amoxicillin who on 17-JUN-2008 was vaccinated with her first and only dose of GARDASIL intramuscularly while pregnant. Concomitant therapy included meningoccoccal ANYN conj vaccine (dip toxoid) (MENACTRA). LMP was 22-MAY-2008. No adverse effect was reported. The patient sought medical attention. Follow up information has been received from a physician concerning the "healthy teenage female on ORTHO EVRA (enter generic name) patch" which was discontinued on 01-JUL-2008. The patient took B6 50 mg TID from June 2008 to July 2008 for nausea. She was also started on prenatal vitamins, 1 daily. An ultrasound was performed on 12-AUG-2008 for viability and dates and was normal. A maternal serum alph-fetoprotein (MSAFP) was done on 25-SEP-2008 and was normal. Another ultrasound was performed on 07-OCT-2008 for fetal survey and was normal. The patient had no other previous pregnancies. Additional information has been requested.

Other Meds: ORTHO EVRA

MedDRA PT Cough, Dyspnoea, Lip swelling, Oedema peripheral, Rash pruritic

Symptom Text: Information has been received from a nurse practitioner concerning a 17 year old white female who at 9 am on 29-JUL-2008 was vaccinated with a first dose of GARDASIL vaccine (yeast) (lot# 660557/0072X) 0.5 ml IM in her left deltoid. Concomitant therapy included (DESOGEN). At 8 am on 12-AUG-2008 (also reported as 13 to 14th August) the patient noted a pruritic rash beginning on her trunk and extending down her legs and arms. Within 24 hours, her plantar surfaces were swollen and she developed a pruritic rash. Then the patient developed swollen lips and a dry cough with shortness of breath within 48 hours. The patient was prescribed 3 weeks course of Prednisone oral, an unspecified "antihistamine" and an Albuterol inhaler. The patient had a chest x-ray on an unspecified date which was negative. A pulmonary function test was performed on an unspecified date with a normal result. A Lyme disease enzyme-linked immunosorbent assay for "pulmonary edema" and her events were confirmed as an allergic reaction. The patient was recovered from the allergic reaction. The patient sought medical attention in the office. Additional information is not expected.

Other Meds: DESOGEN

MedDRA PT Lymphadenopathy

Symptom Text: Information has been received from a physician concerning a female with a history of thyroid cyst who on 17-JUN-2008 was vaccinated with the first dose of GARDASIL. On approximately 24-JUN-2008, "a week after receiving" the vaccine, the patient developed symptoms of "receding small reactive lymph node in her lower LAC section". Per physician patient will hold off in getting the succeeding GARDASIL. The patient sought medical attention. On an unspecified date, the patient recovered. Additional information has been requested. MedDRA PT Loss of consciousness

Symptom Text: Information has been received from a physician and the patient's mother concerning a 15 year old female with no pertinent medical history who in approximately 03-AUG-2007, was vaccinated with her first dose of GARDASIL. Concomitant therapy included unspecified birth control. On 03-SEP-2007 (1 month after 1st dose) the patient began experiencing episodes of passing out. These episodes occurred just about every other day. There were "tons of episodes" which lasted until November 2007. In approximately 02-OCT-2007, she received her second dose of GARDASIL. In November 2007, therapy with birth control was discontinued. There were no other known reactions to the birth control, but it was discontinued since they did not know reason for repeated episodes of passing out. On 23-NOV-2007, the frequent episodes stopped. Since November of 2007, the patient has had 5 episodes of passing out. Patient was due for her third dose of GARDASIL in February, but did not receive it. The patient has had other test done, however, no cardiac abnormalities, or other causes noted. Additional information has been requested.

MedDRA PT Drug administered at inappropriate site

Symptom Text: Initial and follow-up information has been received from an official concerning a female who was vaccinated with GARDASIL vaccine (yeast) at the gluteal region. It was stated that the girl was vaccinated this way because there was not enough muscle mass to vaccinate the intended way. No symptoms were noted. It was not specified if the patient sought medical attention or not. This is one of several reports received from the same source. Additional information has been requested.

MedDRA PT Injected limb mobility decreased, Injection site pain

Symptom Text: Information has been received from a medical assistant concerning a 15 year old female patient with no known drug allergies or pertinent medical history who on 07-AUG-2008 was vaccinated with the first dose of GARDASIL vaccine (yeast), Lot # 654540/1161F, 0.5 mL, intramuscularly in her left deltoid. Other concomitant medication included unspecified allergy medication. It was reported that the patient developed arm pain at the injection site, after receiving the first injection. The patient took Ibuprofen and applied ice and heat; however, the patient's arm pain worsened and the patient could not lift the arm to use a hair brush. On 21-AUG-2008 the patient was reported to have less pain. No other symptoms or treatment reported. At the time of the report the patient was recovering. The patient sought medical attention at physician's office. Additional information has been requested.

MedDRA PT Alopecia, Arthralgia, Inappropriate schedule of drug administration, Menstruation irregular, Pain in extremity

Symptom Text: Information has been received from a 32 year old female patient with no pertinent medical history or drug reactions/allergies who on 18-JAN-2007, was vaccinated with the first dose of GARDASIL vaccine (yeast), on 19-MAR-2007 was vaccinated with the second dose of GARDASIL vaccine (yeast) and on 19-JUL-2007 was vaccinated with the third dose of GARDASIL vaccine (yeast) into her buttocks. There was no concomitant medication. In May or June-2007, the patient reported that her hair fell out in clumps, she experienced pain in the lower legs and sore joints (though not constant), after she was getting her second dose of HPV vaccine. Also she stated that her periods have gone from a steady every 28 days to between 28 and 50 days. She has not been on birth control for years. She has had no family history of female hair loss. The patient had also consulted a nutritionist and dermatologists. The blood work performed showed no vitamin or mineral deficiency. The patient's hair fell out in clumps, sore joints, pain in the lower legs and irregular menstrual cycle persisted. Additional information has been requested.

MedDRA PT Erythema, Oedema peripheral, Paraesthesia, Pruritus, Urticaria

Symptom Text: Information has been received from a physician concerning a 19 year old female patient who in June 2008, received the first dose of GARDASIL vaccine (yeast) IM. On 23-AUG-2008, the patient received the second dose of GARDASIL vaccine (yeast) IM. There was no concomitant medication. The patient experienced the following symptoms within 2 hours after receiving the second dose of GARDASIL vaccine (yeast): hives, swelling of the hands and redness of the hands, itching, tingling along nail and toe nail beds. Given BENADRYL which helped within 1/2 hour. Then put on CLARITAN for maintenance for 10-15 days. Had been off CLARITIN for 36 hours and all of the symptoms recurred. Symptoms are not severe, but hives and itching, swelling of the hands and redness recurred. Took another CLARITIN and BENADRYL. At time of reporting, the patient's adverse experiences were still being treated. No additional information is expected.

MedDRA PT Pruritus, Rash generalised, Urticaria

Symptom Text: Information has been received from a physician concerning an 18 year old female who on 25-JUN-2008 was vaccinated with the first dose of GARDASIL vaccine (yeast) and she had no reaction after her initial GARDASIL vaccine (yeast). On 03-SEP-2008, the patient was vaccinated with the second dose of GARDASIL vaccine (yeast). Four days post vaccination, on 07-SEP-2008, the patient developed what she described as a "hives". At the time of the report, the patient was "still itching with the hive/rash covering for whole body". She had been prescribed unspecified steroids to treat the reaction. Additional information has been requested.

MedDRA PT Immediate post-injection reaction, Injection site erythema, Injection site mass, Injection site swelling

Symptom Text: Information has been received from a nurse practitioner concerning a 19 year old female who on 05-AUG-2008 was vaccinated with the first dose of GARDASIL vaccine (yeast) (therapy route and lot number not reported). Concomitant therapy included oral hormonal contraceptives (unspecified). On 05-AUG-2008 the patient experienced a lump, redness and swelling at the injection site after she received her first dose of GARDASIL vaccine (yeast). The patient's symptoms began immediately after she received the dose. The patient sought unspecified medical attention. The swelling and redness subsided but the lump has persisted and as of 05-SEP-2008 has become larger. Additional information has been requested.

MedDRA PT Rash generalised

Symptom Text: Information has been received from a licensed practical nurse (LPN) concerning a 20 year old female with no pertinent medical history or known drug allergies who on 08-JAN-2008, 11-MAR-2008 and 11-JUL-2008 was vaccinated intramuscularly with her 0.5 ml first, second and third doses of GARDASIL vaccine (yeast) (all the lot numbers are 659180/1758U). Concomitant therapy included Ibuprofen, codeine and penicillin (unspecified). After administration of her third dose of GARDASIL vaccine (yeast), the patient developed a generalized rash intermittently on different parts of her body. The patient sought medical attention via telephone. No laboratory or diagnostics tests were performed. At the time of this report, the event persisted. Additional information has been requested.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy, Uterine dilation and curettage, Vaccine positive rechallenge

Symptom Text: Information has been received from a physician for the pregnancy registry for GARDASIL concerning a 26 year old female who on an unspecified date was inadvertently vaccinated with GARDASIL while pregnant. After the patient received GARDASIL, she had a spontaneous termination at 6 weeks and 5 days from the last menstrual period. The patient had FYA antibodies (noted to be abnormal antibodies indicative of an autoimmune disorder). She was antinuclear antibodies test (ANA) negative with this second termination. the patient was not hospitalized. Subsequently the patient recovered. She had dilation and curettage (D & C) following the spontaneous termination. The reporter didn't necessarily think it was linked but she could not understand the connection to GARDASIL, and she could not find any other reason for the termination. Upon internal review the patient's spontaneous termination was determined to be an other important medical event. The patient also had a first spontaneous termination after the vaccination at 13 weeks from the last menstrual period. (WAES# 0810USA01794) Additional information has been requested.

Other Meds: Unknown

Lab Data: diagnostic laboratory, FYA antibodies; serum ANA, positive, first termination; serum ANA, negative, second termination

MedDRA PT Drug exposure during pregnancy, Wrong drug administered

Symptom Text: Information has been received from a physician concerning a 29 year old white female with hypothyroidism and migraine headache and no previous pregnancy. In April-2007, the first ultrasound was performed for fetal survey. On 20-APR-2007, serum alpha-fetoprotein test was performed for screening and the result was normal. On 04-JUN-2007, the second ultrasound was performed for fetal survey. On 06-AUG-2007 the patient was vaccinated with a dose of GARDASIL when she was 29 weeks pregnant. The patient received the vaccine in error and was supposed to receive RHOGAM. Concomitant therapy included SYNTHROID and prenatal vitamins. On 16-AUG-2007 and 27-SEP-2007, separate ultrasound was performed. On 01-NOV-2007 the patient delivered a health normal baby boy at 41.2 weeks gestation. The weight of the baby was 8.0 pounds; the length was 21 inches; the Apgar score was 9/9. There was no congenital anomaly or complication with the baby. Additional information is not expected.

Other Meds: SYNTHROID; vitamins (unspecified)

MedDRA PT Drug exposure during pregnancy, Foetal disorder

Symptom Text: Initial and follow-up information has been received from Merck pregnancy registry from a health professional and a 25 year old female with 1 previous pregnancy with full term delivery who on 27-JUL-2007 was vaccinated with a first dose of GARDASIL. There was no concomitant medications at the time of vaccination. Subsequently, she learned she was pregnant. The patient's last menstrual period was 20-JUL-2007 and estimated of delivery was 25-APR-2008. Ultrasound on 17-SEP-2007 and 18-DEC-2007 were within normal limits. Unspecified medical attention was sought. On 09-APR-2008, 37 weeks from LMP, the patient delivered vaginally a normal female (weight 7 pounds 15 ounces and length 20.5 inches). Follow up information reported that on 12-APR-2008, the newborn was seen in the office for jaundice. The physician reported that the newborn female was a healthy appearing, alert, normally nourished, developmentally normal, well hydrated child in no acute distress. The infant had skin symptoms of jaundice. Bilirubin levels were ordered and were as follows: Neonatal bilirubin was high at 12.3 and indirect bilirubin was high at 12. On 13-APR-2008 the physician reported that the patient had jaundice to the hips. Bilirubin levels were ordered and were as follows: Neonatal Bilirubin was high at 13.3 and Indirect Bilirubin was high at 12.9. On 14-APR-2008 the patient was evaluated at the office, and the child's mother stated "she looks less yellow today." The physician reported the patients status as improved. The child was to return to the clinic to follow-up in 2 weeks. The newborn was vaccinated with hepatitis B virus vaccine rHBsAg (yeast) on 09-APR-2008 at birth. (WAES0809USA03006). Other medication used during this pregnancy included pre-natal vitamins from 13-SEP-2008 to 09-APR-2008. Additional information is not expected.

Other Meds: None

Lab Data: ultrasound, 9/17/07, within normal limits; ultrasound, 12/18/07, within normal limits

MedDRA PT Chlamydial infection, Drug exposure during pregnancy, Foetal disorder, Papilloma viral infection

Symptom Text: Initial and follow-up information has been received from a certified medical assistant, for the Pregnancy Registry for GARDASIL concerning a 19 year old female with a history of heart murmur and 1 previous pregnancy and 1 full term delivery who on 04-SEP-2007 was vaccinated intramuscularly with the first dose of GARDASIL during the first trimester of pregnancy. Concomitant therapy included prenatal vitamins and iron tablets. The patient sought unspecified medical attention in the physician's office. On 13-SEP-2007 routine ultrasound was performed and the result was normal. Follow-up information was received that during pregnancy, the patient developed papilloma viral infection and Chlamydia infection. On 27-January-2008, the patient was placed on ZITHROMAX, 1 gram, 1 dose for the treatment of Chlamydia infection. The outcome was unknown. During labor/delivery, the baby developed umbilical cord around neck. On 05-MAR-2008 the patient delivered a full-term, normal and healthy baby boy with no congenital anomalies. The weight of the baby was 7.4 pounds and the Apgar score was 9/9. Additional information is not expected.

Other Meds: iron (unspecified); vitamins (unspecified)

Lab Data: ultrasound, 09/13/07, normal; beta-human chorionic, positive

History: Cardiac murmur

MedDRA PT Drug exposure during pregnancy, Foetal disorder

Symptom Text: Information has been received through the Merck Pregnancy Registry through a health professional concerning an 18 year old female with a history of attention deficit disorder, and mood swings, who on 27-NOV-2007 was intramuscularly vaccinated with her first dose of GARDASIL (Lot # 659437/1266U) and was subsequently determined to be pregnant (LMP=12Nov2007). Urine pregnancy test was positive. Concomitant therapy included CONCERTA, NORDETTE, LEVORA, and LEXAPRO. The patient sought medical attention during an exam in the office. No problems were reported. Follow-up information was received on 22-SEP-2008 from a registered nurse concerning an 18 year old white female who smoked daily before pregnancy and quit tobacco use when pregnant. Other medications used during pregnancy included LEXAPRO, 20 mg, once a day for the treatment of mood swings (stopped a 5 weeks pregnant), CONCERTA, 72 mg, once a day for the treatment of Attention deficit disorder (stopped at 5 weeks pregnant) and prenatal vitamin daily PO. On 22-AUG-2008, at 39 weeks from her LMP, the patient delivered a normal female baby weighting 7 pounds, 12 ounces. The baby's length was 19 inches and head circumference was 34 cm. The baby developed an elevated white blood cell count at birth and was treated intravenously with antibiotics for 10 days. The outcome of the baby was not reported. Additional information is not expected.

Other Meds: LEXAPRO 20 mg; NORDETTE; LEVORA; CONCERTA 72 mg; vitamins (unspecified)

MedDRA PT Chlamydial infection, Drug exposure during pregnancy

Symptom Text: Initial and follow-up information has been received from a mother and a licensed practical nurse for the Merck Pregnancy Registry for GARDASIL concerning her 17 year old daughter with no previous pregnancies who on approximately 07-JAN-2008 was vaccinated intramuscularly with a 0.5 mL dose of GARDASIL. The mother was calling to report that her daughter was pregnant after receiving the vaccine. Therapy was discontinued. The patient's mother reported that "they had no physician information because they have not found an OB/GYN in their area." The patient's mother advised that "once a doctor has been found they would call with the information." Medical attention was not sought. The patient's mother requested prescribing information. No product quality complaint was involved. On 29-JAN-2008 the patient was placed on therapy with ZITHROMAX (250mg once) for the treatment of chlamydia. Other medications taken during pregnancy included ZOFRAN and pre-natal vitamins. On 29-MAY-2008, the ultrasound was performed for rule out abruption and the result was normal. On 05-MAR-2008 the serum alpha fetoprotein test was performed as routine screen with negative result. On 09-AUG-2008 the patient delivered a normal female baby weighing 7 pounds 6 ounces at 38.5 weeks. There were no complications during pregnancy and labor/delivery. There were no congenital anomalies, other complications or abnormalities. Additional information has been requested.

Other Meds: Unknown

MedDRA PT Antepartum haemorrhage, Drug exposure during pregnancy

Symptom Text: Information has been received through the Merck pregnancy registry from a health professional concerning a 21 year old female who was vaccinated with her first dose of GARDASIL and it was subsequently discovered that the patient was pregnant. The patient's LMP=16-Nov-2007. Follow-up information has been received from a registered nurse. The patient experienced early pregnancy bleeding. The reporter was not aware of any other information that would inform the outcome of this pregnancy. Medications used during pregnancy included pre-natal vitamins (unspecified). There were no other complaints during pregnancy and labor/delivery. The prenatal labs, obstetrical procedure, serum alpha-fetoprotein test and ultrasound were performed. On 12-AUG-2008 the patient delivered a normal, health male baby weighing 7 pounds 6 ounces length 19.5 inch at 38 weeks with Apgar score "4/9/9." There were no congenital anomalies and no other complaints or abnormalities. Additional information is not expected.

MedDRA PT Drug exposure during pregnancy, Foetal disorder, Premature labour, Ultrasound scan, Vaginitis gardnerella

Symptom Text: Initial information has been received from a health professional and follow-up information was received from a physician, for the Pregnancy Registry for GARDASIL, concerning a 20 year old white female with depression, sciatica, drug hypersensitivity to PHENERGAN and amoxicillin and a history of 1 previous pregnancy (1 full-term delivery), cervical dysplasia, right ovarian cystectomy (2006), and loop electrosurgical excision of transformation zone procedure (LEETZ, in 2007). On 07-FEB-2008 the patient was vaccinated with the first dose GARDASIL (lot# not provided). On 13-FEB-2008 the patient had a positive blood test for pregnancy (LMP 15-JAN-2008) and an ultrasound on 27-FEB-2008 (IUP 8w5d). On approximately March 2008, the patient developed GARDNERELLA vaginitis. On 25-MAR-2008 the patient was placed on therapy with PROZAC, 20 mg, once a day, orally, for the treatment of depression and FLAGYL, 500 mg, twice a day, orally, for the treatment of GARDNERELLA vaginitis. On 30-JUN-2008 therapy with PROZAC was discontinued. On 01-JUL-2008 therapy with FLAGYL was discontinued. The outcome of GARDNERELLA vaginitis was unknown. On approximately 28-JUL-2008, the patient developed preterm labor at 30 weeks gestation. On 28-JUL-2008 the patient was placed on CELESTONE, 12 mg, every 12 hours, intramuscularly and magnesium sulfate, 2 gram every hour for the treatment of preterm labor. On 29-JUL-2008 therapy with CELESTONE was discontinued. On 30-JUL-2008 therapy with magnesium sulfate was discontinued and the patient was placed on terbutaline sulfate, 2.5 mg, every 4 hours, orally, for the treatment of preterm labor. On 11-AUG-2008 therapy with terbutaline sulfate was discontinued and the patient was placed on an unspecified medication, 10 mg, every 6 hours, orally, for the treatment of preterm labor. On the same day, the unspecified medication was discontinued. On 09-SEP-2008 the patient delivered a 7 pounds 6 ounces normal boy. The baby was diagnosed with sleep apnea and gastric reflux. Additional information is not expecte

MedDRA PT Drug exposure during pregnancy, Premature labour

Symptom Text: Information has been received from a physician and a medical assistant for the Pregnancy Registry for GARDASIL concerning a 16 year old Hispanic female with anemia and a history of 0 pregnancies who in June 2007, was IM vaccinated with GARDASIL. Medications taken during pregnancy included pre-natal vitamins (unspecified). The patient became pregnant sometime during the vaccination series. On 06-MAR-2008 the maternal serum alpha-fetoprotein test (MSAFP) was performed with the negative result. A positive ultrasound for pregnancy was performed on 13-Mar-2008. It is suspected that the patient's LMP is 23-Oct-2007. The patient sought unspecified medical treatment with an office visit. On 30-May-2008, the patient threatened premature labor. On that same day, she was placed on therapy with terbutaline sulfate (5 mg Q4H until 36 weeks) and KEFLEX (500 MG QID). On 10-JUL-2008 the patient delivered a normal female baby with apgar score 8/9. There were no complications during labor/delivery. There were no congenital anomalies abnormalities or complications. Additional information is not expected.

MedDRA PT Drug exposure during pregnancy, Vomiting in pregnancy

Symptom Text: Initial and follow-up information has been received from a physician, for the Pregnancy Registry for GARDASIL, concerning a 21 year old black female with a history of 2 previous pregnancies, 1 full term delivery in 2005, and 1 elective termination, and no defects or complications in previous pregnancies, who on approximately 23-JAN-2007 was vaccinated with GARDASIL (lot # not reported) 0.5 mL IM. There was no concomitant medication. On 20-MAR-2008 the patient was vaccinated with a second dose of GARDASIL (Lot# 659962/1740U). The patient's last menstrual period was 08-MAR-2008, her estimated conception date was 22-MAR-2008, and her estimated delivery date was 13-DEC-2008. In follow up information was reported that on an unspecified date, the patient started prenatal vitamins, 1 dose, every day for pregnancy. On 12-MAY-2008, the patient started TERAZOL at bed time, 3 doses, for morning sickness. It was also reported that on 22-JUN-2008, a maternal serum alpha-fetoprotein test performed for routine, revealed negative results. On 30-JUN-2008 an ultrasound performed, to rule out any anomaly, with result 16 5/7 weeks. On 25-JUL-2008, the patient started PROMETHAZINE, 25 mg, every six hours, as needed, for morning sickness. Follow-up information indicated that the patient had left the practice and was being cared for by another health care professional office. Follow-up information was received which reported that the patient was no longer followed in physician's office. This is one of two reports from the same source. Follow-up information was received which reported that the patient was no longer followed in physician's office. This is one of two reports from the same source. MedDRA PT Headache, Pain, Pain in extremity, Pyrexia, Rash

Symptom Text: Information has been received from a anesthesiologist, concerning an 13 year old female who on 17-APR-2008 was vaccinated with the first dose of GARDASIL, (Lot #, route and injection site not reported). 2 days post vaccination, the patient developed fever up to 39 degrees. On 26-MAY-2008 and 27-MAY-2008, the patient presented to a pediatrician due to fever up to 39.9 degrees. The pediatrician prescribed antibiotics due to presumed sinusitis. Antibiotics were discontinued after 5 days due to a rash. On 04-JUN-2008 the patient developed fever up to 39.9 degrees again, now with pain on the whole body. Physical examination was without any pathological findings. On 04-JUN-2008 leukocytes cell count revealed 15000 and serum C-reactive protein test (CRP) 115. On the same day, on 04-JUN-2008, the patient was hospitalized until 13-JUN-2008. Discharge diagnosis was fever of unknown genesis. Due to recurrent fever, pain in limb and headache the patient was hospitalised again from 14-AUG-2008 to 20-AUG-2008. Suspicion of Juvenile idiopathic arthritis (Morbus Still) was established. At the time of reporting the patient had not recovered and still complained about fever (in the mornings), pain and changing rashes. Due to the unclear diagnosis, further diagnosis were initiated (no otherwise specified), the results were pending at the time of reporting. The reporter considered that a causal relation to the vaccine can not be excluded. Other business partner numbers included: E2008-09494. Additional information has been requested.

Other Meds: Unknown

Lab Data: Physical examination, 04Jun08, without any pathological findings; Body temp, 19Apr08, 39.0 C; Body temp, 27May08, 39.9 C; WBC count, 04Jun08, 15000; Body temp, 04Jun08, 39.9 C; Serum C-reactive protein, 04Jun08, 115

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Hypoaesthesia, Multiple sclerosis, Sensory disturbance, Somatosensory evoked potentials, Visual evoked potentials

Symptom Text: Information has been received from a health professional on 10-OCT-2008. A 17-year old female patient with no relevant familial or personal medical history reported received the first dose of GARDASIL (Lot # was not reported, site of injection and dose unknown) approximately on 15-AUG-2008. By the end of AUG-2008, approximately on 26-AUG-2008 the patient experienced numbness in her first right toe which resolved in 24 hours. Then by the end of SEP-2008-beginning of OCT-2008 she consulted at hospital for anomaly of sensation of left hemicorpus during 24 to 48 hours. Clinical examination was not detailed. A work-up was performed: cerebral MRI showed 2 hypersignals of T2 localized at frontal level. Result of visual evoked potential and somatosensory evoked potential were not available but visual evoked potential were long. The neurologist has not considered of performing a lumbar puncture. Another MRI was scheduled in 3 months. Evoked diagnosis was multiple sclerosis. At time of reporting the patient had not recovered. The reporter felt that the adverse event was an other important medical event. Other business partner numbers included: E2008-09472. No further information is available.

Other Meds: Unknown

Lab Data: magnetic resonance imaging, 2 hypersignals of T2 localized at frontal level

MedDRA PT Injection site discolouration, Injection site scab, Skin discolouration

Symptom Text: Patient received two doses of Gardasil at the appropriate intervals on 3/12/08 and 5/14/08. On 9/10/08 she refused the third dose and showed us her right arm. She stated that the vaccine had "bleached her skin white". The patient is darker skinned. Her arm displayed a circular area at what would have been the site of injection that was the size of a quarter and was very light in color, markedly lighter than the surrounding skin. She denied pain at the site. She also stated that the injection site on the opposite arm did not "heal" well and displayed a 1-2 mm scabbed area at what would have been an injection site. This was several months after the injection was given. No treatment was initiated.

MedDRA PT Depression, Drug exposure during pregnancy

Symptom Text: Information has been received from a licensed practical nurse, for the Pregnancy Registry of GARDASIL, concerning a 21 year old white female with factor V Leiden and a tobacco user with a history of 2 pregnancies and 1 live birth (one full-term delivery with deep venous thrombosis post delivery; and a tubal pregnancy with a miscarriage and oophorectomy) who on 19-NOV-2007 was vaccinated intramuscularly with 0.5 ml of GARDASIL. Concomitant therapy included prenatal vitamins with folate (manufacturer unspecified) and aspirin 81 mg daily for factor V Leiden. After the vaccination on the same office visit, a pregnancy test was performed and the result was positive. No other symptoms reported. On 21-NOV-2007, and ultrasound was performed and confirmed a yolk sac was present. The date of last menstrual period was 17-OCT-2007 and the estimated delivery date was 24-JUL-2008. During the pregnancy, the other medications included LOVENOX 40 mg daily from 26-FEB-2008 until delivery for factor V Leiden and WELLBUTRIN XL 300mg daily from 14-JAN-2008 until delivery for depression. On 04-FEB-2008, serum alpha-fetoprotein test (MSAFP) was performed and the result was negative. On 18-FEB-2008, an ultrasound was done with the normal result. On 22-JUL-2008, at 40 weeks the patient delivered a normal, healthy female baby weighting 7 pounds 7 ounces. The apgar scores were 8/8. There were no congenital anomalies and no other complications/abnormalities. Additional information is not expected.

Other Meds: aspirin 81 mg vitamins (unspecified)

Lab Data: Ultrasound 11/21/2007 yolk present Ultrasound 02/18/2008 normal beta-human chorionic 11/19/07 positive serum alph-fetoprotein 02/04/08 negative

History: Tubal pregnancy, Miscarriage; Oophorectomy; Deep vein thrombosis; Clot blood; Blood transfusion

MedDRA PT Chills, Feeling hot, No reaction on previous exposure to drug, Pain

Symptom Text: Information has been received from a physician concerning a 25 year old female who on 03-APR-2008 was vaccinated with the first dose of GARDASIL well tolerated. On 03-JUN-2008, the patient was vaccinated with the second dose of GARDASIL well tolerate. On 09-SEP-2008 the patient was vaccinated with the third dose of GARDASIL. Approximately 6 to 8 hours after the third dose the patient developed chills, aches and felt warm but never really took her temperature. The patient was advised how to self-medicate for the chills and aches and there had been no other adverse events reported. Additional information has been requested.

MedDRA PT Dizziness, Immediate post-injection reaction, Pallor, Syncope

Symptom Text: Information has been received from a nurse concerning a 11 year old female who on 15-SEP-2008 at about 1530 was vaccinated with the first dose of GARDASIL (lot # 660553/0070X). Concomitant therapy included meningococcal vaccine (unspecified) and diphtheria toxoid (+) pertussis acellular vaccine (unspecified) (+) tetanus toxoid. About 2 min after vaccination, the patient said she felt dizzy, became pale , and fainted into mother's arms. The patient was placed on exam table with feet elevated and she spontaneously revived. The events lasted only minutes. The patient was given water to drink. No hospitalization required. The reporter spoke with mother at home and patient remained fine at this time. Additional information has been requested.

MedDRA PT Abdominal pain, Rash

Symptom Text: Information has been received from a physician concerning a 15 year old female patient who in the Spring of 2008 was vaccinated with the third dose of GARDASIL. The physician reported that about one and a half months after the 3rd dose of GARDASIL, the patient had a severe abdominal pain. The patient also developed a mild rash on one side of the hips that radiated to the knees. The patient was seen by both her primary physician and gynecologist. On an unspecified date, the patient had a CT scan that was negative. The symptoms were diagnosed as idiopathic. Outcome was not reported. Additional information has been requested.

MedDRA PT Infectious mononucleosis, Lymphadenopathy

Symptom Text: Information has been received from a physician concerning an 18 year old female who in May 2008, was vaccinated with her first dose of GARDASIL 0.5 mL, IM. In approximately May 2008, after receiving the vaccination, the patient experienced lymphadenopathy. The patient called the physician in August 2008, about 10 days before her schedule appointment to say her lymph nodes were swollen. The physician said to wait the 10 days and then come in for her second dose. She come in 10 days after her call but was still sick so the second dose was not given. The physician "ran a bunch of testing, including bloodwork, and ruled out mononucleosis." Patient came on 02-SEP-2008 for a follow-up, but the physician still has to send her for a biopsy. Additional information has been requested. On 03-Nov-2008, Dr reported that the patient was seen by Infectious Disease specialist, and was diagnosed with mononucleosis. The patient's status was reported as recovered.

MedDRA PT Amenorrhoea

Symptom Text: Information has been received from a patient's mother, an employee at the physician's office, concerning her 20 year old daughter who on 07-APR-2008, last day of her menstrual period, was first vaccinated with GARDASIL (dose was unspecified and route was injection). Concomitant therapy included NUVARING for birth control. When NUVARING was discontinued the patient still continued to have her menstrual periods. Subsequently the patient experienced amenorrhea since then. The following dose of GARDASIL (MSD) was not reintroduced. On an unspecified date the patient took pregnancy test via blood and urine and all tests were negative. The patient sought medical attention. At the time of report the patient's amenorrhea persisted. Patient didn't have medical history and drug allergies. Additional information has been requested.

Other Meds: NUVARING

MedDRA PT Abdominal pain, Back pain, Dizziness, Injection site coldness, Injection site pain, Pain in extremity

Symptom Text: Information has been received from a certified medical assistant concerning a 21 year old female with no pertinent medical history reported who on 18-SEP-2008 was vaccinated with the first dose of GARDASIL 0.5 mL, intramuscularly in the left deltoid. Secondary suspect therapy included RECOMBIVAX HB. Concomitant therapy included ADACEL. The certified medical assistant reported that the patient got lightheaded following vaccination with GARDASIL and then developed back, abdominal and arm pain. After 10 to 15 minutes of vaccination the patient felt light headed. The patient was given a cracker and instructed to sit down. The patient then developed lower back pain then wrapped around the abdominal area. The patient was then instructed to lie down. The patient then complained that her arm (injection site arm) was cold and sore. The patient recovered in a few minutes with the exception of the sore arm. Additional information has been requested.

MedDRA PT Drug exposure during pregnancy, Vaginal haemorrhage

Symptom Text: Information has been received from a physician assistant, for the Pregnancy Registry for GARDASIL, concerning a 24 year old black healthy female with a history of 6 pregnancies and 3 live births and a history of spontaneous abortion and stillbirth at 17 weeks for fetal anomalies who on 28-AUG-2008 was vaccinated with her first dose of GARASIL (Lot number 659964/1978U). There was no concomitant medication. The patient was pregnant. She had a menstrual period in Jun 2008 and then had vaginal bleeding on 28-AUG-2008 which was assumed to be a menstrual period. The patient sought medical attention and had been seen in the emergency room. The pregnancy test was performed there and the result was positive. On 04-SEP-2008, an ultrasound was performed for vaginal bleeding and the result showed as live intrauterine pregnancy at 6 weeks 3 days. The date of last menstrual period was unknown and the estimated delivery date was 26-APR-2009. Additional information has been requested.

MedDRA PT Genital herpes, Vaccine positive rechallenge

Symptom Text: Information has been received from a registered nurse concerning a 26 year old female with an amoxicillin allergy and a history of genital herpes who on 19-DEC-2007 was intramuscularly vaccinated with the first 0.5 mL dose of GARADSIL (lot # 659439/1267U), on 11-MAR-2008 was intramuscularly vaccinated with the second 0.5 mL dose of GARDASIL (lot # 659182/1757U) and on 21-AUG-2008 was intramuscularly vaccinated with the third 0.5 mL dose of GARDASIL (lot # 66012/0229X). There was no concomitant medication. The patient developed a mild outbreak of her genital herpes about one day after being vaccinated with doses one and two of GARDASIL. About two weeks after her third dose of the series, the patient had a more severe outbreak that required treatment with VALTREX. The patient was seen in the office. At the time of reporting, the patient was recovering. No product quality complaint was involved. Additional information has been requested.

MedDRA PT Contusion, Loss of consciousness

Symptom Text: Initial and follow-up information has been received from a physician and a registered nurse concerning an 9 year old female, also reported as 11 year old, with no relevant medical history or allergies, who on 04-SEP-2008 was vaccinated with dose of GARDASIL intramuscularly in the right deltoid. Concomitant therapy included MENACTRA and ADACEL (UF452AA) intramuscularly in the left deltoid. On 04-SEP-2008 3-5 minutes after the vaccination, the patient passed out at the front desk. The patient was unconscious for a few seconds. Her vital signs were stable. The patient bruised her chin and cheek. The patient was sent home with an icepack with her mother. It was unknown if the patient sought any medical attention. On 04-SEP-2008, the patient recovered from the events. Additional information is not expected.

MedDRA PT Abdominal pain, Dizziness, Hyperhidrosis, Hypotension, Immediate post-injection reaction, Loss of consciousness, Nausea, Vision blurred

Symptom Text: Information has been received from a health professional concerning an 18 year old female, with no medical history reported, who was administered on 15-SEP-2008 the third dose of GARDASIL (Batch # NG39340/ lot #0569U), (site and route not reported). After vaccine administration the patient suffered hypotension, dizziness, blurry vision, sweating, abdominal pain and nausea. The patient recovered. It was reported the patient had no adverse event with the previous doses of GARDASIL. The patient suffered a loss of consciousness immediately after vaccine administration, that persisted for 10 seconds. The patient recovered from hypotension, dizziness, blurry vision, sweating, abdominal pain and nausea 10 minutes after symptoms' onset. The first and second doses of GARDASIL (batch #'s not reported) were administered on 14-MAR-2008 and 15-MAY-2008 respectively, both of them by intramuscular route on the deltoid. This case was considered as serious with other medically important condition as criteria. This is a group of 4 linked cases (E2008-9562 to E2008-9565). The case is closed.

Other Meds: Unknown

Lab Data: Unknown

History: It was reported the patient had no adverse event with the previous doses of GARDASIL.

MedDRA PT Condition aggravated, Dyspnoea, Gait disturbance, Hyperventilation, Muscular weakness, Myalgia, Pain in extremity, Paraesthesia, Respiratory disorder

Symptom Text: Information has been received from the foreign health authority - ref NY20080646 (local reference BGAR 2008/113), concerning a 13 year old female with allergy to Alternaria tenuis and sensibilisation to this mold, who on 05-MAR-2008 was vaccinated with the first dose of GARDASIL, by intramuscular route. On 07-MAY-2008, the patient was vaccinated with the second dose of GARDASIL (Lot # unknown) by intramuscular route. On 03-JUN-2008 the patient experienced dyspnea and tingling in hands and feet. Auscultation was normal. On 04-JUN-2008 she experienced an aggravation of the dyspnea. Clinical examination: hyperventilation without functional anomaly or clinical provocation of asthma: EFR normal. She was symptomatically treated with corticoid, antihistaminica and bronchodilatator. On 05-JUN-2008 she experienced a sudden sensation of weakness and pain of the lower limbs. Clinical examination showed a disorder gait, a painful palpation of the muscles. No pyramidal or cerebellar syndrome, no sphincter dysfunction. Normal tendon reflexe. EMG showed no sign of neuropathy or myositis. F-wave latency delayed. On 09-JUN-2008, there was a favourable evolution concerning the respiratory problems. On 13-JUN-2008 persistence of difficulty of walking due to a weakness of the muscles. Since then favourable evolution. She recovered fully. According to the serious criteria the patient has been hospitalised but no further information received. Other business partner numbers included: E2008-09498. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Demyelination, Diplopia, Multiple sclerosis, Optic neuritis retrobulbar, Visual acuity reduced, Visual disturbance

Symptom Text: Information has been received from a physician concerning a 16 year old female who on 13-DEC-2007 was vaccinated with the first dose of GARDASIL (batch no. NF58150; lot no. 0278U) (route and site not reported). In January 2008 (two to three weeks post vaccination) the patient experienced visual disturbance, double vision and vision decreased. The patient was seen by an ophthalmologist, but not confirmed by diagnosis. Despite the events, the patient was given a second dose of GARDASIL (batch no. NG34890; lot no. 0466U) (route and site not reported) on 13-FEB-2008 and a third dose of GARDASIL (batch no. NH15200; lot no. 1114U) (route and site not reported) on 25-JUN-2008. In September 2008 the patient consulted a neurologist and retrobulbar neuritis was diagnosed. The patient was not hospitalized. A magnetic resonance imaging was performed that showed multiple demyelinating foci, and a cerebrospinal fluid puncture showed increased IgG synthesis. The diagnosis of multiple sclerosis was established. Treatment with interferon had not been given at the time of the reporting, but it was intended. The patient had not recovered. Multiple sclerosis, retrobulbar neuritis, visual disturbance, double vision and vision decreased were considered to be another important medical event. Other business company numbers included: E2008-09508. Additional information has been requested.

MedDRA PT Glossopharyngeal neuralgia

Symptom Text: Information has been received from a health authority (ref. # ES-AGEMED-517630344) concerning a 25 year old female who on 30-AUG-2008 was vaccinated with a dose of GARDASIL IM. It was reported that on 10-SEP-2008 the patient suffered a glossopharyngeal neuralgia that was still ongoing. The patient was treated with carbamazepine, (details regarding this treatment not reported). In September 2008 an ultrasound, a magnetic resonance imaging and a computed axial tomography were performed and showed normal results. According to the reporter, the patient has been checked by both the otorhinolaryngologist and the maxillofacial doctor; they have discarded any other pathologies. Other business partner numbers included: E2008-09537. Additional information has been requested.

MedDRA PT Loss of consciousness

Symptom Text: Information has been received from a health professional concerning a 14 year old female with no reported medical history, who was administered on 17-MAY-2008 the third dose of GARDASIL (Batch No NG30400), intramuscularly into the deltoid. After vaccine administration the patient experienced loss of consciousness. The event lasted for a few seconds. The patient recovered. Additional information was received through telephone contact with the healthcare professional: GARDASIL was administered on the deltoid by intramuscular route (Batch # confirmed NG 30400). It has also been reported that the patient received the second dose of GARDASIL (Batch # not reported) by intramuscular route on her deltoid. The patient didn't receive any treatment for the adverse event. No other information has been reported. The case was reported by the Health Authority as serious with other medically important condition as criteria. This is a case of 4 linked cases (E2008-09562 and E2008-09565). The case is closed. Other business partner numbers included: E2008-09562. No further information is expected.

MedDRA PT Complication of pregnancy, Drug exposure during pregnancy, Premature labour

Symptom Text: Information has been received from a consumer for the pregnancy registry for GARDASIL, concerning her 17 year old daughter with no medical history and no drug allergies reported, who on 09-JUL-2007 was vaccinated with the first dose of GARDASIL and on 21-SEP-2007 was vaccinated with the second dose of GARDASIL while she was pregnant. The patient did not know at the time of vaccination that she was pregnant. The patient gave birth two months early on 14-DEC-2007. The patient was hospitalized twice during the pregnancy due to unspecified complications. The patient received the third dose of GARDASIL after giving birth but it was unknown if the vaccine was given late. There was no concomitant medication. The patient's LMP was unknown. Additional information has been requested.

MedDRA PT Fatigue, Infectious mononucleosis, Splenomegaly

Symptom Text: Information has been received from a consumer concerning her approximately 14 year old grandaughter with no pertinent medical history of drug reactions/allergies, who "about two years ago" in approximately 2006 received the three doses of GARDASIL 0.5 mL. There was no concomitant medication. The reporter stated that the patient either a month after receiving her first or third dose, experienced mononucleosis as well as an enlarged spleen. Caller knew that patient received all three doses of the series, however it was unknown after which one the symptoms occurred. Patient also experienced fatigue. Last blood test was "about 6 months ago" in approximately March 2008. The patient sought unspecified medical attention. At time of report, the patient had not recovered. Additional information is not expected.

MedDRA PT Dermatitis contact

Symptom Text: Information has been received from a physician concerning a patient who was vaccinated with GARDASIL (route, site and lot number not reported). Subsequently the patient experienced contact dermatitis from the GARDASIL band-aids. The skin affected was the shape of the band-aids. The patient came in the day after the band-aid was applied to report the reaction. There was no additional information at that time. Further information was received from the office manager. It was reported that "several girls" mentioned that the band aids "should not be used." The patient information was not recorded at the time, and therefore, the office had no way of knowing "who made the comments."

MedDRA PT Inappropriate schedule of drug administration, Injection site nodule

Symptom Text: Information has been received from a emergency medical technician and a patient's mother concerning an 18 year old female with KEFLEX allergy who on 24-SEP-2007 (previously reported as "6 months ago") was vaccinated with the first dose of GARDASIL (lot# 658558/1061U). On 13-FEB-2008, she was vaccinated with a second dose of GARDASIL (lot # 659439/1267U). On 19-AUG-2008 (previously reported as "week of 11-AUG-2008") the patient was vaccinated with a third dose of GARDASIL (lot #660612/0229X), 0.5, I.M. Shortly, after receiving her third dose, on 19-AUG-2008, the patient experienced a 30 mm nodule at the injection site (previously reported as a lump at the injection site, the size of a "half dollar"). The patient sought medical attention calling the practice. The nodule persisted for 7-10 days, then resolved. The nodule returned at the same area in September 2008. At the time of reporting, the patient had not recovered from the nodule at the injection site. Additional information has been requested.

MedDRA PT Rash erythematous

Symptom Text: Information has been received from a mother and a certified medical assistant concerning the development of a rash by a twin sister following vaccination. A 18 year old female who on 20-JUN-2008, was vaccinated with the first dose of GARDASIL. On 19-AUG-2008, was vaccinated with the second dose of GARDASIL. On 20-JUN-2008, the patient experienced rash after the first vaccination, but development or resolution was not available at the time of the report. The patient reported on 25-AUG-2008, that she developed a rash that started 10 days prior (4 days prior to the second vaccination). On 15-AUG-2008, the patient experienced 10 point erythematous rash all over her torso. At the time of reporting, the outcome was unknown. Her rash was described as similar to her twin sister's (WAES0809USA02661). Additional information has been requested. This one of several reports received from the same source.

MedDRA PT Alopecia

Symptom Text: Information has been received from a consumer concerning her 14 year old daughter who had no pertinent medical history or allergies who in November 2007, was vaccinated with the first dose of GARDASIL and in May 2008, was vaccinated with the second dose of GARDASIL . Concomitant therapy included ALLEGRA. In June 2008, the mother reported that her daughter started losing her hair, where her hair was thinning and she had bald spots on the front of her head and in other specific areas. The mother's patient also reported that the patient had seen her physician and was diagnosed with alopecia. It was reported that the physician did full blood work which were negative. The mother stated that her daughter looked like a man balding with hair plugs. It was reported that physician gave her a medicated shampoo, just in case of fungus on her scalp, which she was almost finished and she was starting to see some regrowth, but her hair was still thin. The mother also reported that in November 2007 the patient had stopped therapy with fexofenadine hydrochloride when she received her first dose of GARDASIL. The patient was also received routine vaccines (names and manufactures unspecified), before going back to school. The HPV vaccine series was discontinued (last dose May 2008). Additional information has been requested.

Other Meds: ALLEGRA

Lab Data: Diagnostic laboratory, blood work which was negative.

MedDRA PT Loss of consciousness, Road traffic accident

Symptom Text: Information has been received from a physician concerning a 17 year old female with low blood pressure who on 11-MAR-2008, 12-MAY-2008 and 13-SEP-2008 was vaccinated with a first, second and third dose of GARDASIL. Respectively, no concomitant medication was reported. The physician mentioned that after the first dose on 11-MAR-2008 the patient passed out in the office. No injuries were sustained and the patient was discharged home. The physician reported that three hours after receiving the second dose on 12-MAY-2008 the patient passed out while driving and hit another vehicle. No injuries were sustained. The physician reported that there were no adverse effects after the third dose. The outcome of the patient was not reported. The patient sought medical attention: in the office. There was no product quality complaint. Additional information has been requested.

MedDRA PT Arthralgia

Symptom Text: Information has been received from a physician (also reported as medical assistant) concerning a 16 year old female with no known allergies or medical history, who on 28-JUL-2008 was vaccinated with a first, 0.5 mL dose of GARDASIL (LOT# 659964/1978U), intramuscular. There was no concomitant medication. Five or four days later the patient experienced joint pain. The patient is a golfer and indicated that her joints are so painful at the end of a golf game that she has to rest for the reminder of the time. At the time of the report, the patient had not recovered. She mentioned that she tried ice and BIO-FREE, but only ADVIL made it tolerable. The patient sought medical attention, she was seen. The patient's joint pain was considered to be disabling. Additional information has been requested.

MedDRA PT Feeling of body temperature change, Flushing, Headache, Hypoaesthesia facial, Paraesthesia, Paraesthesia oral, Swelling face

Symptom Text: Information has been received from a registered nurse concerning a 12 year old female with allergic rhinitis, allergies to amoxicillin, AUGMENTIN, CEFZIL and dust mites allergies, who on 11-SEP-2008 was vaccinated with the first dose of GARDASIL (Lot # 659184/0843X), 0.5 mL, I.M. Concomitant therapy include MENACTRA. About 5 hours after the receiving vaccination, the patient developed a "prickly feeling" and numbness on her face. She also experienced sensations of hot and cold on her face. The numbness increased the next day and included a "tingling" sensation of her lips. The patient's mother reported to the nurse that her daughter's cheeks looked puffy and "flushed." The patient also developed a headache. The patient was treated with BENADRYL and on 13-SEP-2008 recovered. The patient sought unspecified medical attention. Additional information has been requested.

MedDRA PT Asthenia, Dyspepsia, Eating disorder, Gallbladder disorder, Intestinal functional disorder, Pyrexia, Vaccine positive rechallenge, Weight decreased

Symptom Text: Information has been received from a 19 year old female patient with allergy to codeine and no other medical history, who in August 2007, was vaccinated with GARDASIL 0.5mL. There was no concomitant therapy. On February 2008, the patient received the third dose of GARDASIL. After each shot her condition worsened. Since the beginning therapy, the patient experienced difficulty digesting food, loss of weight and energy, fever, problems with bowel movements, and at one time could not eat for 1.5 week. Her gall bladder is now not functioning and may have to be removed. The patient's mother, a registered nurse, stated that her daughter was sick almost most of summer especially with everything that contains fat. She was then eating a low fat diet. Ultrasound of the gallbladder was implemented and the results was negative for gall stones. At the time of report, the adverse events were ongoing. The patient sought medical attention. Additional information has been requested.

MedDRA PT Oedema peripheral

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under freedom of information Act. A patient with no pertinent medical history or allergies who on 28-AUG-2008, was vaccinated with GARDASIL (lot# 659441/1446U) IM into the right arm and MENACTRA (lot# U2621AA) IM, into the left arm. There was no concomitant medication. On 28-AUG-2008 the patient complained of feet swelling, about double sizes after receiving the vaccine. The patient's mother stated that the patient had no pain in her feet. It was reported that her feet started swelling about 45 minutes after receiving the vaccines and the swelling went away 90 minutes. She denied another problem. No laboratory tests were performed. The original reporting source was not provided. The VAERS ID # is 324371-1. No further information is available.

MedDRA PT Nausea, Pyrexia, Rash, Vomiting

Symptom Text: Information has been received from a mother concerning her 22 year old female daughter with colitis and allergies to Ceclor, who on 20-SEP-2008 was vaccinated with the second dose of GARDASIL. Concomitant therapy included hormonal contraceptives (unspecified) and ASACOL. The mother reported that her daughter developed a fever, nausea, vomiting and a rash on her chest about 8 hours after receiving her second dose of GARDASIL. The patient sought medical attention by a phone call. At the time of report the patient had not recovered. Additional information has been expected.

MedDRA PT Arthralgia, Drug administered at inappropriate site, Injection site haematoma, Injection site necrosis, Injection site scar

Symptom Text: Information has been received from the mother patient concerning a 16 year old female with a knee operation who in "Fall 2007" approximately in September 2007, was vaccinated with her first dose of GARDASIL 0.5mL in her hip, closer to the waist than the thigh. Concomitant therapy included hormonal contraceptives (unspecified). About two weeks after the first shot, at the injection site she developed a scar that is indented and bruised, and the physician said it was dead tissue. She had her second and third dose of HPV vaccine(yeast) in the same spot so that it would not scar her arm too. She had also experienced joint pain. The patient's adverse experience persisted. The patient sought medical attention. Additional information has been requested.

MedDRA PT Dizziness, Dyspnoea, Fatigue, Malaise

Symptom Text: Information has been received from a physician concerning a female who on 17-Jun-2008 was vaccinated intramuscularly with the second dose of GARDASIL (lot# 659180/1758U). Her first dose was on 31-Mar-2008. The patient has no concomitant conditions and medical history. She has no drug reactions or allergies either. Subsequently the patient experienced shortness of breath, dyspnea, malaise and fatigue. The patient has been several times at an urgent care center. She was last seen by physician on 04-Sep-2008 and the physician wrote in her notes "symptoms resolving, possible GARDASIL reaction". At this appointment the patient stated that she is experiencing transient dizziness that last for 1 minute. At the time of the report the patient had not recovered. No additional information is available. Additional information has been requested.

MedDRA PT Rash

Symptom Text: Information has been received from a physician concerning a 26 year old female with no medical history who on 19-Sep-2008 was vaccinated with second dose of GARDASIL (Lot number reported as 0152X). The patient received her first dose of GARDASIL in JUL (year unspecified). On 22-Sep-2008 the patient experienced rash. No lab diagnostics studies were performed for the patient. It was unspecified if the patient received any concomitant therapy. However, the patient did not experience any rash after the 1st dose. The physician told the patient to take BENADRYL for the rash. The patient informed the physician that once the BENADRYL wears off the rash come back. The patient did not recover from the rash. Additional information has been requested.

MedDRA PT Injection site vesicles

Symptom Text: Information has been received from a nurse concerning a 15 year old female who was intramuscularly vaccinated with a dose of GARDASIL (MSD) on 04-FEB-2208. Concomitant vaccination on 04-SEP-2008 included MENACTRA (manufacture unspecified) in the same arm at the same time. Approximately on 19-SEP-2008 ("about 3 days ago") the patient experienced blisters around the injection site after she received GARDASIL (MSD) and MENACTRA (manufacture unspecified). On 22-Sep-2008, the patient was schedule to come into the physician's office for a check-up. The patient was recovering at the time of report. No further adverse event information reported. The patient called the doctor to seek medical attention. Additional information has been requested.

MedDRA PT Syncope

Symptom Text: Information has been received from a vaccine nurse who noticed that children that are on attention deficit disorder (ADD) or attention deficit/hyperactivity disorder (ADHD) medication or with psychological needs experience syncope more often after receiving GARDASIL (lot# not provided). The patients sought unspecified medical attention. Follow-up information was received from the nurse. She said that the office had 3 or 4 patients faint after receiving GARDASIL. When they looked into it the patients were all on ADHD medicine of Psych medicine. The office decided to lay all the patients down after they received the vaccine to hopefully prevent the syncope. None of the patients were hospitalized. She did not have any patient identifiers because all of this happened over a year ago. Since they started laying patients down after the vaccinations over a year ago they have had no problems. Attempts are being made to obtain identifying information to distinguish the individual patients mentioned in this report. Additional information will be provided if available.

MedDRA PT Drug exposure during pregnancy, Foetal disorder

Symptom Text: Information has been received from a licensed practical nurse through the pregnancy registry for GARDASIL concerning a 17 year old female with penicillin allergy who on 11-OCT-2007 was vaccinated intramuscularly in the left arm with her first dose of GARDASIL (Lot # 655620/0171U). There was no concomitant medication. On 19-NOV-2007, the patient had a blood work drawn in the office for a pregnancy test which was positive (LMP approximately 22-OCT-2007). It was reported that the patient was 3 to 4 weeks pregnant. The patient sought unspecified medical attention in the office. Follow-up information received indicated that on 25-JUN-2008 the patient vaginally delivered a "normal" infant. Upon a skeletal joint exam in the hospital the baby was found to have pes adductus (club feet). The baby's club feet were considered a congenital anomaly. No further information is available.

Other Meds: None

Lab Data: physical examination, a skeletaljoint exam, the baby had pes adductus; serum beta-human, 11/19/07, positive

MedDRA PT Loss of consciousness, Rash

Symptom Text: Information has been received from a Health Authority (case n. 90326) concerning a 11 year old girl with no medical history reported who on 08-OCT-2008 was vaccinated intramuscularly with the first dose of GARDASIL (Lot# 1881U, Batch# NJ03030). Concomitant therapy was unspecified. On 08-OCT-2008, the same day, about 10 minutes post vaccination, she presented with a severe reaction with loss of consciousness for a few seconds followed by the onset of a cutaneous rash. The child was laid in a supine position with her lower limbs raised, her blood pressure was taken (NOS) and she quickly recovered in a few minutes. The outcome is recovered on 08-Oct-2008. The loss of consciousness and rash were reported as other important medical events. The case is closed. Other business partner numbers included E2008-09486. No further information is available.

MedDRA PT Acute tonsillitis, Condition aggravated, Pruritus, Psoriasis, Rash, Rash erythematous, Rash generalised, Skin exfoliation, Skin plaque, Stress

Symptom Text: Information has been received from a gynecologist concerning a 16 year old female with psoriasis vulgaris (known for 12 years) in stable condition who 04-OCT-2007 was vaccinated with a second dose of GARDASIL (lot # 0251U/batch # NF43780) site and route not reported. In November 2007, exact onset not reported, the psoriasis exacerbated with generalized extensive disseminated efflorescences including the scalp. The patient suffered from severe pruritus. Therapy was started with CALCIPORTRIL, corticosteroids and TAGEVIL. As symptoms remained, the patient was hospitalized from 07-MAR-2007 til 18-MAR-2008. Serum antistreptolysin O antigen test (ASL) and serum C-reactive protein test (CRP) were normal, no focus was found. According to the hospital physicians potential triggering factor could be severe psychic stress with mobbing at school. At the time of hospitalisation, disseminated multiple erythematous plaques (palm-sized) with desquamation spread over the whole body. The rima ani, the axillae and the scalp were strongly affected. Laboratory findings included on 08-MAR-2008 ALT/P/37 degrees: 26 P+ (<23) u/l and AST/P/37 degrees: 31 P+ (<21) u/l. On 11-MAR-2008 serum immunoglobulin E test (IgE) was normal. On 12-MAR-2008 HLA antigen test standardization (HLA-Cw6) was positive. Routine diagnostic laboratory test showed normal results. The patient received balneophtotherapy. Additionally the patient was treated with 8% dithranolsalicylic petroleum jelly with liquor carbonis detergens and 5% salicylic acid. The face was treated with CURATODERM and FUMADERM. At that time an acute tonsillitis was diagnosed by the ENT physician. Antibiotic therapy with erythromycin was initiated and the symptoms quickly improved. On 16-MAR-2008 the condition of the skin had improved significantly and the patient was discharged. Since 19-MAR-2008 the patient was further treated with on a day care basis. In the course, she recovered completely, exact duration was not reported. On 05-JUL-2008 the patient was vaccinated with a third dose of G

MedDRA PT Abdominal pain, General physical health deterioration, Haematemesis, Headache, Myalgia, Pyrexia, Vomiting

Symptom Text: Information has been received from a general practitioner concerning a 17 year old female patient with medical history of migraine and painful menstrual periods who received the first dose of GARDASIL (batch number not reported) and an injection of REPEVAX on 03-APR-2008. On 06-APR-2008 the patient was hospitalized for cephalgia, fever at 39 degrees C, vomiting and haematemesis. Hospital report mentioned facts described by the patient to the physicians: since 05-APR-2008 the patient had myalgia and haematemesis with black blood. Clinical examination found the patient with mediocre general condition, pulse rate at 115, abdominal pain without resisting at palpation. There was no (deglobulinisation). There was no other infectious point. Conclusion of hospital was a reaction post vaccination with GARDASIL. Lumbar puncture was normal. CT scan was normal. The patient had recovered and was discharged on 07-APR-2008 with treatment with paracetamol. Vaccine with GARDASIL stopped. As to her medical history the patient had ANTADYS for painful menstrual periods in DEC-2007, NSAID'S and VIDORA on 21-FEB-2008 during 5 days, antibiotics on 25-FEB-2008 for 5 days. Other business partner number include E2008-09727.

MedDRA PT Epilepsy

Symptom Text: Information has been received from a general practitioner concerning a 22 year old female with no medical history of epileptic seizure who in 2008 was vaccinated with the first dose of GARDASIL (batch number not reported). 15 days later the patient experienced an epileptic seizure. At time of reporting a work-up was no-going and the patient had recovered. As of today the reporter did not see a relationship between adverse effect and vaccination. Upon internal review the event was considered medically significant. Other business partner numbers included: E2008-09678. Additional information has been requested. MedDRA PT Iris hypopigmentation

Symptom Text: Information has been received from a optometrist concerning a female patient who in November 2007, was vaccinated with her first dose of GARDASIL, 0.5mL, IM. In January 2008, was vaccinated with her second dose of GARDASIL in May 2008, was vaccinated with her third dose of GARDASIL in November 2007. Since receiving the vaccine the patient experienced a depigmentation of the lower half of the iris of the right eye which has been progressive with each. A gonioscopy was performed which results normal. The patient had not recovered. The patient sought medical attention at the physician's office. The timing of the depigmentation was unknown. Additional information has been requested.

MedDRA PT Dizziness, Headache, Nausea, Vomiting

Symptom Text: Patient feeling dizzy and nauseous - doctor spoke to mom 1st day close observation. Day 2 advised rest/push fluids/use Motrin for HA, if worsening to call back. Telephone call received from mother with the following information: 10/15 7 pm: feeling dizzy and nauseous a few hours after getting GARDASIL. Advised close observation and fluids tonight. Call in am to speak with PCP if persists. 10/16 9 am: spoke with mom this am to check on patient and she was not so great last night - woke up in middle of the night and vomited. This am had headache and went to school. Advised to follow up with PCP re future shots. Discussed that this is likely an intercurrent illness, not related to GARDASIL, but no way to know.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Initial and follow-up information has been received from the Merck Pregnancy Registry via a registered nurse and a physician concerning a 26 year old female with anxiety and hay fever who on 06-AUG-2007 was vaccinated intramuscularly with a 0.5 ml first dose of GARDASIL (lot # 658282/0929U). There was no concomitant medication. On 24-AUG-2007 the patient was seen in the office for pregnancy. The patient's last menstrual period was on 29-JUN-2007 (previously reported as 15-JUN-2008) and the estimated date of delivery on 21-MAR-2008. The physician reported that the patient had a miscarriage at 8 weeks and 6 days, on 29-AUG-2007. An ultrasound was done at 10 weeks, approximately on 13-Sep-2007, which showed demise from 2 weeks prior. Upon internal review, miscarriage was considered an other important medical event. Additional information is not expected.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Autoimmune disorder, Body temperature increased, Dizziness, Fear, Hallucination, visual, Injection site pain, Mental disorder, Presyncope

Symptom Text: Paige had her HPV shot on 1/14/08 at 3pm. Paige had started back on Adderall 10mg in January after taking a 6 month break. She got very light headed 1 hour after her shot and almost fell in the bathroom at home. A couple of days later, she had a temp of 104 degrees for 2 day. Tylanol was given every 4 hours with no real aid in dropping the fever. The 2nd night of the high temp, she had a vision of a boy standing by her bed in the middle of the night. The boy was not real. The temp broke that night. In March, Paige saw the vision of the boy by her bed in the middle of the night again. This continued to happen on an inconsistant bases, but by April she was seeing different visions of people during the day and night all of the time. She saw Dr. Dvorak (pediatrician) on April 15, 2008. She was told to stopped taking the Adderall. Paige was set up with an appointment with Dr.Jillian Brown(psychiatry) on April 23. Paige began Siraqual for her visions and numerous psychiatry appointments. After trying different doses, she continued on 1/2 pill per day until the end of May 2008. The visions went away after the second day of Siraqual. Paige also has a major fear of having any thing injected into her or taken out of her (example. immunizations and blood draws). She said the HPV shot hurt and you could feel the medicine go into your body. She had sessions to desensitizer her to have a blood draw done. The blood draw did show that her Auto-immune numbers were at 40. We have not followed up on this yet.

Other Meds: Adderall XR 10mg

Lab Data: 5/7/2008 EEG -(Showed spikes) 5/9/2008 MRI - ok After being off Seriqual for 1 month 7/9/2008 EEG - (no spikes) 7/23/2008 MRI - ok

Seriousness: ER VISIT, EXTENDED HOSPITAL STAY, HOSPITALIZED, PERMANENT DISABILITY, SERIOUS

MedDRA PT Dizziness, Dysstasia, Fall, Headache

Symptom Text: Information has been received from a physician concerning a 17 year old female with benign cyst in the breast, fungal infection behind the ears and no allergies who on 16-SEP-2008 was vaccinated intramuscularly with a first dose of GARDASIL (lot number 655604/0052X) (injection site not reported). There was no concomitant medication. On 17-OCT-2008 the patient experienced severe dizziness and headache and went to the emergency room. The ER found no factors relating to the symptoms. The patient continued to have severe dizziness and could not stand. Standing caused falling and so the patient was seen on 20-OCT-2008 by her primary physician. The patient was admitted to the hospital that day for 2 days. MRI, CT scan and blood work came back negative. The patient was seen by both a neurologist and cardiologist. The patient was then admitted to a hospital since 22-OCT-2008. The patient was given intravenous fluid because the physician did not find the cause for her symptoms. At time of this report, the patient's symptoms persisted. The patient's severe dizziness, headache, could not standing and standing which caused falling were considered to be disabling. Additional information has been requested.

MedDRA PT Inappropriate schedule of drug administration, Injection site pain

Symptom Text: Information has been received from a consumer concerning her daughter a 17 year old female with no known drug allergies/reactions and no pertinent medical history reported who on unspecified dates was vaccinated with the first and second doses of GARDASIL vaccine (yeast). On 18-AUG-2008, the patient was vaccinated with a third dose of GARDASIL vaccine (yeast) and experienced soreness at the injection site after receiving the vaccine. On 23-SEP-2008 the patient was vaccinated with a fourth dose of GARDASIL vaccine (yeast) 0.5 mL intramuscularly, and the patient's mother stated that the doctor's nurse accidentally administered the fourth dose. On 23-SEP-2008, soreness at the injection site reappeared after the 4th dose of GARDASIL vaccine (yeast). The patient sought unspecified medical attention. The patient recovered from soreness at the injection site on 23-SEP-2008. Additional information is not expected.

MedDRA PT Dizziness, Visual impairment

Symptom Text: Information has been received from a physician concerning a 23 year old health female who on 26-AUG-2008 was vaccinated with the first dose of GARDASIL (lot# 660555/0279X). Concomitant therapy included DEPO-PROVERA (not administered with GARDASIL). Later that day, on 26-AUG-2008, the patient had dizzy spells and vision changes lasting for 2 weeks. She had no headache. The patient's blood sugar was normal. She reported these symptoms to the physician after they had already resolved. Additional information has been requested.

Other Meds: DEPO-PROVERA

Lab Data: blood glucose, normal

MedDRA PT Injection site pain, Musculoskeletal pain, Pain in extremity

Symptom Text: Information has been received from a registered nurse concerning a female with a history of hernia and no drug allergies reported who on 08-Sep-2008 was vaccinated with the first dose of GARDASIL (lot # 0573X), 0.5 mL, IM. There was no concomitant medication. On 08-Sep-2008, after vaccination, the patient experienced pain at injection site. On around 12-Sep-2008, the patient developed shoulder pain. At the time of the report, on 26-Sep-2008, the patient was having constant pain on right arm. The patient sought unspecified medical attention. Additional information has been requested.

MedDRA PT Bronchial hyperreactivity, Constipation, Croup infectious, Cytomegalovirus infection, Fatigue, Hot flush, Leukopenia, Lymphadenopathy, Malaise, Myalgia, Petechiae, Pyrexia, Splenomegaly, Urticaria, Viral infection

Symptom Text: Information has been received from a physician concerning a 14 year old female who on 14-APR-2008 was vaccinated with the first dose of GARDASIL. On 16-JUN-2008, the patient was vaccinated with a second dose of GARDASIL. Patient then went to the emergency room on 19JUN-2008. It was unspecified if the patient was hospitalized that day. The next day, on 20-JUN-2008, the patient came in the physician's office with petechial rash, hot flashes and muscle pain. The office did a complete blood count, high mono, and esosithil count, and a high alcoholine phosphate count. The next visit was on 21-JUN-2008; the patient had no bleeding but had a low white count and petechial rash on legs. On 23-JUN-2008, the patient's spleen tip was enlarged. The patient physician gave the patient a possible diagnosis of Ehrlichiosis. The patient was ordered a complete blood count(CBC), serum antinuclear antibodies test (ANA) and anti- DNA testing. The patient was tested for cytomegalovirus, rheumatoid factor, and Rocky Mountain spotted fever. A complete blood count showed low white count, negative serum antinuclear antibodies test (ANA) and normal rheumatoid factor (RF). Cytomegalovirus test (CMV) came back low white count; negative serum antinuclear antibodies test (ANA), and normal rheumatoid factor. Cytomegalovirus test (CMV) came back high, erichias, West Nile and Rocky Mountain spotted fever came back negative. Epstein-Barr came back high at 5.31. On 09-JUL-2008, the patient's rash was still present. On 14-JUL-2008, the patient had hives on her arms, constipation, and positive cytomegalovirus test. At this point the patient was referred to the infectious disease specialist. On 23-JUL-2008, the infectious disease physician ordered the patient not to receive the third dose of GARDASIL. The patient's history of persistent malaise, fatigue, and low platelet count had resolved by 09-JUL-2008. Additional information has been requested. 11/4/08 Reviewed PCP medical records of 6/16-7/29/2008. FINAL DX: none provided Records reveal patien

MedDRA PT Cough, Nasal congestion, Nasopharyngitis, Pain, Pain in extremity, Pyrexia

Symptom Text: Information has been received from a 22 year old female patient with allergy reaction from to antibiotic, who on 30-JUN-2008 was vaccinated with the first dose of GARDASIL. On approximately 24-SEP-2008, the patient received her second dose of GARDASIL. There was no concomitant medications. On 28-SEP-2008, the patient woke up with stuffy nose, cough, fever, and general body aches. The patient did mention that her family recently had suffered from cold symptoms as well and she may have picked it from them. She did not had a similar reaction after the first dose of GARDASIL. The patient also stated that her arm was still a little sore. The patient sought unspecified medical attention. At the time of the report the patient had not recovered. No further information is expected.

MedDRA PT Arthralgia, Joint effusion, Muscular weakness, Myalgia

Symptom Text: Information has been received from a mother of a 14 year old female patient with no known medical history and no known drug allergies, who on 16-Sep-2008 was vaccinated with the first dose of GARDASIL . Concomitant therapy included HEP A vaccine and Lisdexamfetamine Dimesylate. The mother reported that on the night of 28-Sep-2008, her daughter's knees felt very weak. The mother also reported that on 29-Sep-2008, her daughter went to school, then around 12:30 pm she had came home from school because the weakness moved from knees to her thighs and she felt like she didn't have knees and she was going to fall over. The mother reported that on 29-Sep-2008 her daughter went to her pediatrician who did strength test on her legs but her strength was fine, and she did say she had some fluid in her right knee but her knee was not hot. The mother reported that the physician was not sure what was causing the symptoms since the patients activities did not change, but stated to give it 72 hours and if nothing had changed the patient had come back and get blood work done. The mother also reported that on 29-Sep-2008 her daughter did stay home from school. The patient sought medical attention. At the time of the report the patient had not recovered. Additional information has been requested. 11/4/2008 PCP records received. Healthy with no problems noted at WCC 9/16/08. Vax given. Returned 9/29/08 with c/o joint/muscle pain and weakness. Tx ibuprofen and rest. Pt has recovered.

MedDRA PT Condition aggravated, Convulsion

Symptom Text: Information has been received from a physician concerning a 20 year old female with seizures and a history of brain surgery within the past few months who on about 1 & 1/2 month ago (approximately 09-Sep-2008) was vaccinated intramuscularly with the first dose of GARDASIL (0.5 mL, lot# and injection site not reported). The patient informed office that she had an increased frequency of seizures post-GARDASIL. No information is available about any single occurrences. The patient informed the office of the seizures during a follow-up visit, when she may have received the 2nd dose of GARDASIL. Physician believes that the seizures are not related to GARDASIL. At the time of the report (24-Oct-2008) the symptom of seizures is stable. Upon internal review, seizures determined to be other important medical events. Additional information has been requested.

MedDRA PT Activities of daily living impaired, Arthralgia, Fatigue, Musculoskeletal chest pain, Pruritus, Skin lesion, Syncope, Vaccine positive rechallenge, Vomiting

Symptom Text: Information has been received from a general practitioner concerning a 15 year old female who received the first dose of GARDASIL (batch number not reported) in February 2008. Twenty four hours after the injection the patient experienced syncope, arthralgia, vomiting, fatigue, intercostal pain and pruritus which turned into scratching lesions. Afterward, she presented with syncope or dizziness exercise induced. The patient partially recovered and on 06-MAY-2008 she received the second dose of GARDASIL (batch number not reported). She had the same symptoms 24 hours after the second dose of GARDASIL (on 07-MAY-2008). At the time of reporting the patient was recovering besides persisting intercostal pain. To be mentioned that the patient had to miss school to stay confined to bed to recover from fatigue. Cardiological, rheumatological and neurological work-up were negative. There was no prescribed treatment. The case was considered as serious by the reporter due to other medically important condition. Other business partner included: E2008-09832. Additional information has been requested.

MedDRA PT Abortion spontaneous, Conjunctivitis, Drug exposure during pregnancy

Symptom Text: Information has been received, for the Pregnancy Registry for GARDASIL (lot number #660393/0067X), from a 15 year old female with a history of anxiety attacks and latent tuberculosis infection (+PPD, negative chest X-ray) and concurrent medical condition of cold who was vaccinated with the second dose of GARDASIL on 30-SEP-2008. Other medication used during this pregnancy included MOTRIN, POLYTRIM, ZOLOFT, SUDAFED and prenatal vitamins (unspecified). It was subsequently learned that the patient was pregnant at the time. Her LMP was 02-SEP-2008. A pregnancy test was performed. On 28-JUL-2008, urine HCG test was negative. On 17-OCT-2008 urine HCG was faint positive and serum HCG was positive (126.7). The patient experienced spontaneous abortion on 22-OCT-2008. The duration from LMP to abortion was more than 7 weeks. The patient sought unspecified medical attention. Follow-up information has been received from a physician who reported that the patient received the second dose of GARDASIL On 30-SEP-2008. It was reported that the patient had history of latent tuberculosis infection and concurrent medical condition of cold. The patient took isoniazid for the treatment of tuberculosis. During this pregnancy the patient took MOTRIN, POLYTRIM drops for the treatment of conjunctivitis, ZOLOFT for the treatment of depression, SUDAFED for the treatment of cold and prenatal vitamins (unspecified). On 22-OCT-2008 the patient experienced spontaneous abortion. Upon internal review, spontaneous abortion was considered to be a other important medical event. Additional information has been requested.

Other Meds: MOTRIN; POLYTRIM; ZOLOFT; SUDAFED; Prenatal Vitamins (unspecified)

MedDRA PT Drug exposure during pregnancy

Symptom Text: Information has been received from a physician, for the Pregnancy Registry for GARDASIL, concerning a 26 year old female with mild asthma, cervical dysplasia and migraine and no history of pervious pregnancies who on 10-SEP-2007 was vaccinated with the first dose of GARDASIL (lot# 657868/05230). On 07-DEC-2007, the patient was vaccinated with a second dose of GARDASIL. Concomitant therapy included prenatal vitamins (unspecified) daily for routine health maintenance. Subsequently, she became pregnant on approximately 20-NOV-2008 (LMP: 06-NOV-2007, estimated delivery date: 12-AUG-2008). On 05-FEB-2008, as routine screening a serum alpha-fetoprotein test (MSAFP) was performed at first trimester and the results showed low risk pregnancy. On 06-MAR-2008, as routine screening a modified serum MSAFP was performed and the result was negative. On 10-Mar-2008, was performed to the patient an ultrasound as routine screening which showed normal anatomy. On 29-JUL-2008, the patient delivered a normal, healthy female baby at 38 weeks from LMP. The baby had a face presentation at time of delivery (mal presentation). The baby's weight was 2977 grams, with a length of 18 inches, apgar score was 9/9 and a head circumference of 34. Additional information has been requested.

MedDRA PT Dysplasia

Symptom Text: Information has been received from a consumer concerning her 26 year old daughter who in 2007 was vaccinated with the three doses of GARDASIL third dose was in August 2007. There was no concomitant medication. On approximately 09-Sep-2008, the patient had a Papanicolaou test positive and revealed mild dysplasia. As of 30-Sep-2008, the patient had not recovered. The patient sought unspecified medical attention. No additional information is expected.

Other Meds: unknown

MedDRA PT Arthralgia, Arthritis, Asthenia, Back pain, Chest pain, Contusion, Depressed mood, Discomfort, Fatigue, Hypokinesia, Mood altered, Musculoskeletal stiffness, Nausea, Oropharyngeal pain, Pain, Polyarthritis, Pyrexia, Sleep disorder, Stomach discomfort

Symptom Text: In September of 2007, one month after receiving the third installment of the Gardasil vaccine, I began to have joint pain and body aches. The pain increased through October and November. The joints throughout my body were inflamed, I had a fever, disruption of sleep due to pain and discomfort, and severe restriction in movement. Tests revealed that I had severe inflammation. I was treated with Prednisone and Methotrexate as a preventative measure for arthritis. The inflammation decreased following medication treatment. However, when the medicines are reduced the inflammation of joints returns. There was also calcification in my wrist joints following the inflammation, causing restriction in joint flexibility. 1/16/2009 MR received from Rheumatologist. DX: Polyarthritis. Pt initially presented 11/26/07 with c/o abrupt onset of pain-joint pain: hands, knees, PIP, MCP, wrists, feet, hips, shoulders, lumbosacral spine and cervical spine, morning stiffness x 2 hrs, sleep disturbance, low energy and feeling moody and depressed. Initially thought to be RA with (-) markers. C/o sore throats, H/As and mild upset stomach 12/6/07. Tx with anti-inflammatories, Pred and Methotrexate with some improvement, however worsening with reduced doses. Reported chest pain, nausea and bruising 1/8/08. Increased H/A, neck pain and knee tightness 3/08. Increased fatigue despite sleeping well 11/08. Pain improved.

Other Meds: Kariva Birth Control, Fexofenadine

Lab Data: High levels of inflammation throughout the body. Labs and Diagnostics: CRP 10.7 (H). MRI L wrist (+) for mild flexor tenosynovitis and synovitis, no erosions. R wrist US (-). RF (-). ANA (-). CCP IgG Ab (-). ESR 1.0.

History: Allergies (pollen, dust, mold, cat and dog dander), eczema. PMH: HPV.

MedDRA PT Abdominal pain, Abdominal pain upper, Activities of daily living impaired, Anorexia, Asthenia, Disturbance in attention, Epistaxis, Gastrooesophageal reflux disease, Hiatus hernia, Migraine, Nausea, Pain in extremity, Rash generalised, Thirst decreased, Vaccine positive rechallenge, Visual impairment, Vomiting

Symptom Text: My daughter became ill on April 9th, 2008, 4 months after her second vaccine of GARDICIL vaccine, with a rash all over her body. The following week, she began vomiting multiple times per day for over four weeks. From April 9th through June 28, 2008 she experiences severe migraines, bloody noses, complete lack of energy, loss of appetite, nausea, acid reflux, weak and ache legs, constant stomach pain, trouble with vision. She has has chest x-ray, abdominal ultrasound, CT of abdomen with contract, MRI of brain with contrast, upper GI, endoscope, BRAVO, EEG and colonoscopy. She was in the ER department due to nausea and unable to eat and drink. She was sent home after numerous tests that showed nothing. She was unable to attend school from April 21, 2008 through June 20, 2008 due to her is and was home schooled. She is currently under the care of a pediatric neurologist, pediatric gastrointestinal physician and an immunologist who are truing to elevate her symptoms with various medications. All medical tests have come back normal except for her having a small hiatal hernia. As quickly as her symptoms came on, they stopped on June 28th. She received her third GARDASIL vaccine on July 29th, 2008. A week later on August 6, 2008, her symptoms returned again, severe pain in the abdomen, nausea, loss of appetite, difficulty with vision and concentration. I will begin the paperwork again this week with her doctor to have her home schooled as she hasn't been able to attend school for the past two weeks. I have also included copies of her physician reports for your review. Medicine she has taken or is currently taking: REGLAN, CARAFATE, TOPAMAX, PREVACID.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Abdominal pain upper, Pancreatitis

Symptom Text: Information was obtained on request by the Company from the agency, via a tabulation and Public Case Details Form, concerning a 13 year old female who on 09-APR-2008 was vaccinated with her third dose of GARDASIL as prophylactic vaccination. On 10-APR-2008, one day post-vaccination, the patient experienced persistent epigastric pain without vomiting, anorexia or fevers. Epigastric pain worsened after two weeks at which time the patient's serum lipase level was found to be elevated at 1272 U/L, later peaking at 5920 U/L. The patient's liver function tests were normal and an abdominal ultrasound was normal. Subsequently, in April 2008 the patient was hospitalised for 10 days and treated with nil by mouth and nasojejunal feeding. The patient was discharged on oral fluids and NJ feeds. In May 2008, three weeks later, the patient was readmitted to hospital with 3 to 4 days of worsening abdominal pain. Her serum lipase level was elevated at 7944 U/L. A diagnosis of acute-on-chronic pancreatitis was made and the patient was hospitalised for eight weeks. Treatment was NJ feeding and then a low-fat diet. On 14-JUL-2008 the patient recovered from upper abdominal pain and pancreatitis. All investigations for the cause of the patient's pancreatitis have been normal. The agency considered that upper abdominal pain and pancreatitis were possibly related to therapy with GARDASIL. The original reporting source was not provided. Additional information is not expected.

Other Meds: Unknown

Lab Data: Abdominal ultrasound, ??Apr08, normal; Diagnostic pathological examination, ??May?08, all investigations for cause of pancreatitis were normal; Hepatic function tests, ??Apr08, normal; Serum lipase test, 24?Apr08, 1272 U/L, elevated; Serum

MedDRA PT Abdominal pain, Back pain, Hyperhidrosis, Pancreatitis, Pyrexia

Symptom Text: Information was obtained on request by the Company from the agency via a tabulation and a Public Case Details Form, concerning a 19 year old female, with normal alcohol use, who in May 2008, was vaccinated with her first dose of GARDASIL as prophylactic vaccination. On 15-JUL-2008 the patient was vaccinated with her second dose of GARDASIL, intramuscularly. Subsequently, in July 2008 "after injection" with GARDASIL, the patient developed a fever and sweating, followed a week later by back and abdominal pain. Subsequently, the patient was hospitalised for four days, with a final diagnosis of pancreatitis. In July 2008 a computed tomography (CT) scan showed no organic cause for the patient's pancreatitis. On 07-AUG-2008 the patient recovered from pancreatitis. The agency considered that pancreatitis was possibly related to therapy with GARDASIL. Vaccination with GARDASIL was discontinued. The original reporting source was not provided. Additional information is not expected.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Abdominal pain, Biliary colic, Chest pain, Cholelithiasis, Gastroenteritis viral, Pancreatitis

Symptom Text: Information was obtained on request by the Company from the agency, via a table and Public Case Details form, concerning a 26 year old female who on 04-AUG-2007 was vaccinated with her first dose of GARDASIL as prophylactic vaccination. Concomitant long-term therapy included multivitamins (unspecified). On 06-OCT-2007 the patient was vaccinated with her second dose of GARDASIL. Subsequently, on 15-OCT-2007, the patient experienced abdominal pain and chest pain. The patient's general physician diagnosed viral gastroenteritis and the patient was treated symptomatically. In January 2008 the patient started therapy with MARVELON as oral contraception. In February 2008, (125 days post-vaccination with GARDASIL), the patient experienced severe abdominal pain and chest pain and was hospitalised. There was a reported diagnosis of pancreatitis - no test results are available. The patient's abdominal and chest pain settled with analgesics and IV fluids. On 17-APR-2008 the patient was vaccinated with her third dose of GARDASIL. Subsequently, on 20-APR-2008, three days post-vaccination with GARDASIL, the patient again experienced severe abdominal and chest pain. She was found to have an elevated serum amylase of 792 U/L. The patient was hospitalised and diagnosed with pancreatitis. An ultrasound showed no gallstones. The patient saw a gastroenterologist post-discharge who diagnosed biliary colic with pancreatitis. In May 2008 a computed tomography (CT) cholangiogram showed normal biliary system with layering in gallbladder consistent with very small calculi. In May 2008 a limited viral screen showed hepatitis C negative; Hepatitis BsAg negative and hepatitis A Ab positive. In September 2008 the patient's serum calcium and lipids were normal. In October 2008 a magnetic resonance cholangiopancreatography (MRCP) was completely normal, showing no pancreatic parenchymal or ductal abnormality and intrahepatic and extrahepatic biliary tree normal. The patient had no prior history of illness, abdominal pains, gallstones or pancreati

MedDRA PT Autonomic nervous system imbalance, Bradycardia, Cardiac murmur, Chest pain, Convulsion, Dizziness, Dyskinesia, Gait disturbance, Gaze palsy, Hypoaesthesia, Hypotension, Loss of consciousness, Malaise, Night sweats, Orthostatic hypertension, Orthostatic hypotension, Palpitations, Phonophobia, Photophobia, Pleuritic pain, Somnolence, Speech disorder, Syncope, Unresponsive to stimuli, Urinary tract infection

Symptom Text: Information has been received from a nurse concerning a 19 year old female with a history of penicillin allergy who on 22-JAN-2008 was vaccinated with the first dose of GARDASIL (lot # 659653/1448U) via IM route. On 03-APR-2008 she receive the second dose (lot # 659964/1978U) and on 23-SEP-2008 received the third dose (lot #661044/0548X), both via IM route. Concomitant therapy included hormonal contraceptives (unspecified). The patient was hospitalized for possible cardiac problems after administration of 3 doses of GARDASIL. On 18-OCT-2008 the patient started to stagger and her speech became "funny" and 30 minutes later she passed out. The patient was transported to the hospital. Emergency medical technician determined patient developed bradycardia. She was admitted to hospital on 18-OCT-2008. As of the reporting time, she was still in the hospital. She was experiencing complex seizures and severe orthostatic hypertension. She was diagnosed with possible cardiac arrest and may need an implantable cardioverter defibrillator. On an unspecified date, the magnetic resonance imaging (MRI) showed normal results, electrocardiogram showed normal slow and toxicology screen was negative. The patient had not recovered. The reporter considered the events to be disabling, immediately life-threatening and to be other important medical events. A lot check has been requested. Additional information has been requested. 1/27/09 PCP records received including multiple diagnsotic studies from 10/2008 for syncope/unresponsiveness/bradycardia. In for annual exam 11/5/08. ROS note states "Drs think the problems she had were from a blood vessel in brain and reaction to meds" Not sure if Gardasil started the whole thing off. Exam WNL. 2/11/09 Tag2 received. 2/20/09 MR received for DOS 10/20-26/2008 with no definitive DX as pt was transferred to higher level of care for further w/u. Had been admitted with admission dx of syncopal episode with orthostatic hypotension and bradycardia. ER visit 12/2/08 with dx: seizure. Pt presente

Seriousness: ER VISIT, EXTENDED HOSPITAL STAY, HOSPITALIZED, LIFE THREATENING, PERMANENT DISABILITY, SERIOUS

MedDRA PT Anorexia, Aphasia, Convulsion, Deafness, Dizziness, Dyspnoea, Eye disorder, Fatigue, Headache, Heart rate decreased, Hypersomnia, Hypotension, Loss of consciousness, Malaise, Pain, Pain in extremity, Syncope, Trismus, Unresponsive to stimuli

Symptom Text: Right after she recieved her last Gardasil shot patient felt sick, severe headaches, dizzy, ached all over, not hungry, extremely tired her arm hurt. This lasted for 2-3 weeks. She thought she felt better and tried to go to work. Patient collapsed at work, found unresponsive, extremely low blood pressure, low heart rate, unable to start IV. Once in Ambo. they were able to start IV on the way to hospital they had to give more medicine to keep heart rate going. Rushed to Medical Center. In ER they cut off clothes called for crash cart were able to start central line. They did all tox screens nothing found in blood work up. Heart rate at 37 she was transferred to Progressive Cardiac Care unit. They started her on 2 medications. She started having seizures that lasted 3-5 minutes she had at least 12 in one day.When she stood up her heart rate would go to 180 and she would pass out or have seizure. She had multiple EEG's and EKG's and a few other test towards the end of the week her seizures went to 25-55 minutes in length. She was transfered to clinic by a Medivac ambulance. Once there she went thru a battery of test they found that the seizures were none epilectic in nature. Her seizure state was glassy eyes, trouble breathing, couldn't hear, mouth would lock, unable to talk throat would move rapidly. When the seizure was done she would sleep for a long time. The only thing patient had was the Gardasil HPV shot. She still has difficulty with her left arm. She was a healthy 19 year old girl until she had the shot.

MedDRA PT Systemic lupus erythematosus

Symptom Text: Information has been received from a Health Authority on 23-OCT-2008 under reference 2008-02178. It was reported by a obstetrician-gynaecologist on 09-MAY-2008 that a female patient (initials and age unknown) with no past medical history or concomitant condition reported received a dose of GARDASIL, lot number, site and route of administration not reported) on an unspecified date. On an unknown date she experienced a systemic lupus erythematous. Concomitant medication included YASMIN (batch number not reported). The patient was taking YASMIN for a relatively short time of period (not further specified). At the time of reporting, the outcome was unknown. This case was considered as serious with other medically important condition as criteria. Other business partner numbers included: E2008-09878. Additional information has been requested.

MedDRA PT Arthralgia, Encephalitis, Headache, Insomnia, Mental status changes, Muscular weakness, Nausea, Retrograde amnesia, Systemic lupus erythematosus, Vision blurred

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. On 01-JUL-2008 a 16 year old female with no relevant medical history was vaccinated intramuscularly with a first dose of GARDASIL (lot number 660553/0070X) in the right arm. Concomitant therapy included oral contraceptive pills (unspecified). On 01-OCT-2008 the patient developed arthralgias, change in mental status. The patient was diagnosed with Systemic Lupus Erythematosus on 23-OCT-2008, based on antinuclear antibodies test positive and deoxyribonucleic acid antibodies test positive. It was reported that "last week" the patient was on prednisone. The patient was admitted to the hospital for changes in mental status, which was thought to be from lupus cerebritis. Medical records received on 14-DEC-2008 which showed that the patient was presented to the emergency department on 28-Oct-2008, and complained of short term retrograde amnesia. The patient also had intermittent blurry vision, complained of joint pain, headache and nausea for 4 weeks. The patient had left hand weakness. One and half months prior, the patient complained of pain in hands and feet and isolated papules. The patient had difficulty in sleeping. On 06-NOV-2008, the patient was diagnosed with lupus cerebritis, change in mental status. Laboratory tests showed antinuclear antibodies test positive, CT sinusitis, MRI consistent with lupus cerebritis, echocardiogram normal, white blood cell count 22.4, absolute neutrophil count increased 18.82, ESR increased 87, CSF glucose low 59, oligo band albumin, serum 3330. The listing indicated that one or more of the events required hospitalisation, was considered to be immediately life-threatening. No further information is available. The original reporting source was not provided. The VAERS ID # is 331142. A standard lot check investigation was performed. All in-process quality checks for the lot number in question were satisfactory. In addition, an expanded lot check investi

MedDRA PT Drug exposure during pregnancy, Intra-uterine death, Uterine dilation and curettage

Symptom Text: Information has been received from a physician through the Sanofi Pasteur MSD GARDASIL Pregnancy Registry, concerning a 16 year old female who on 15-MAY-2008 was vaccinated with the first dose of GARDASIL and on 17-JUL-2008 was vaccinated with the second dose of GARDASIL. The patient started a spontaneous pregnancy approximately 3 weeks before receiving the second dose of GARDASIL (batch number not reported). The starting date of her last menstrual period was 13-JUN-2008. No adverse event reported. Estimated date of delivery 20-MAR-2009. Follow-up information received through the initial pregnancy questionnaire: Case upgraded to serious. Administration dates of vaccine were modified from 15-MAY-2008 into 16-MAY-2008 for the first dose of GARDASIL. Estimated date of conception was on 27-JUN-2008 and estimated date of delivery was 27-MAR-2008. On 08-SEP-2008 an echography revealed a foetal death and the patient had a curettage on 10-SEP-2008. At the time of reporting the outcome was not specified. To be mentioned that patient consent was provided. Foetal death and endometrial curettage were considered to be an other important medical event. Other business partner included: E2008-07519. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Convulsion, Syncope

Symptom Text: Information has been received from a physician concerning an "approximately 18-20 years old" female who on unspecified date was vaccinated with the first dose of GARDASIL. Immediately after receiving vaccination, the patient had a convulsive seizure for 2 seconds and then fainted. The patient has recovered but the physician does not plan to administer the second or third doses to the patient. The patient sought unspecified medical attention. Upon internal review, convulsive seizure was considered to be an other important event. Additional information has been requested.

MedDRA PT Convulsion, Hypotonia, Presyncope

Symptom Text: Information has been received from a consumer concerning her 17 year old grand-daughter with allergy to penicillin and no pertinent medical history reported who on 28-OCT-2008 was vaccinated with the first dose of GARDASIL. Concomitant therapy included NUVARING, flu vaccine (unspecified) (also given on 28-OCT-2008) and unspecified antibiotic. After receiving her first dose of GARDASIL, on 28-OCT-2008, in the physician's office, the patient almost fainted and her head was flopping around. The consumer stated that she thought it looked like a seizure. At the time of reporting, the patient was recovering. Upon internal review, seizure was considered to be other important medical event. Additional information has been requested.

MedDRA PT Convulsion

Symptom Text: Information has been received from a health care worker who reported that one of their patient's mother stated that her niece, on an unknown date was vaccinated with the third dose of GARDASIL. The health care worker reported that the patient didn't go to their office. The patient's aunt reported that her niece shortly after received her third dose of GARDASIL had a seizure. The patient's aunt reported that the seizure happened different times of day and they still happening. She also reported that the patient did see her physician who said that the seizures could be due to GARDASIL. At the time of the report the patient had not recovered. Upon internal review seizure is considered to be an other important medical event. Additional information has been requested.

MedDRA PT Asthenia, Condition aggravated, Crying, Disturbance in attention, Feeling abnormal, Major depression, Overdose, Pharyngitis, Suicidal ideation, Suicide attempt, Syncope

Symptom Text: Kate was a perfectly healthy young woman prior to these events. The day after receiving the first shot of Gardasil on 10/24/2007, Kate experienced frequent fainting and crying spells. The possible connection to the vacine shot was not considered. Her pediatrician recommended a psychiatrist for an evaluation. The psychaitrist diagnosed severe depression and prescribed lexapro. 17 days later, Kate overdoses and is transported to the hospital. She is hospitalized for 4 days. She continues to be seen over the next 9 months for depression. Meds are frequently changed. She was plagued by various side effects. Her life ruined. 01/19/09 Reviewed hospital medical recods of 11/25-11/29/2007. FINAL DX: major depression, recurrent, severe, w/o psychotic features; pharyngitis on antibiotics; GAF on admit 25, on d/c 60. Records reveal patient had suicide attempt by overdose after worsening depression, decreased energy, decreased concentration, feelings of hopeless & worthless. No history of prior suicide attempts or prior psych hospitalizaations although had long history of depression. Had been started on Lexapro approx 2 wks prior to suicide attempt. Slowly improved & d/c to home with continued outpatient psych program. 1/19/09 Reviewed ER medical records of 11/25/2007. FINAL DX: overdose suicide attempt Records reveal patient took multiple drugs in suicide attempt. Had increased depression & suicidal thoughts lately. Under psych treatment & transferred to inpatient psych hospital.

MedDRA PT Abortion induced, Drug exposure during pregnancy, Nausea, Vomiting

Symptom Text: Information has been received from a physician, through the Pregnancy Registry for GARDASIL, concerning a 15 year old female who on 17-MAR-2008 was inadvertently vaccinated intramuscularly with GARDASIL (Lot # 659437/1266U). The patient has not experienced a menstrual cycle for 2 months and is experiencing nausea and vomiting. The physician suspected she was pregnant and performed a pregnancy test. On 18-MAR-2008, the serum pregnancy test results were positive. The patient sought unspecified medical attention in the office. No additional information is available. Follow up information was received from the physician who reported that the patient had termination of pregnancy (TOP) few days after she was given GARDASIL, approximately 19-Mar-2008. This was unwanted teenage pregnancy and the TOP was an already planned before she was given GARDASIL. Upon internal review, elective termination was determined to be an other important medical event. Additional information is not expected.

MedDRA PT Convulsion

Symptom Text: Information has been received from a nurse concerning a 18 year old female who on 28-OCT-2008 was vaccinated with the first dose of GARDASIL (lot# 0947X). Concomitant therapy included multivitamins VI and calcium (unspecified). The patient had a seizure after vaccination and received medical attention while in the physician's office. Subsequently, the patient recovered from seizure. Upon internal review, seizure was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Amenorrhoea, Drug administered at inappropriate site, Dysmenorrhoea, Menstruation irregular, No reaction on previous exposure to drug

Symptom Text: Information has been received from a general practitioner on 03-OCT-2008. A 17 year old female patient who was a sportswoman in good health and non smoking received the third dose of GARDASIL (lot number not reported) on an unspecified date. Since the summer in 2008 the patient experienced irregular period and altered menstrual flows. No aetiology was found. The patient had no nutritional disturbance, there was no risk of pregnancy and she had no sexual activity. At the time of reporting the outcome was not specified. The patient had no adverse effect after first and second dose of GARDASIL in 2007. Follow-up information received through the pharmacovigilance form on 28-OCT-2008: Case upgraded to serious by the reporter who assessed the events as medically significant because of functional prognosis. Case of misuse. Patient's date of birth was completed. The patient received the three doses via intramuscular route in her back which was an inappropriate injection site. She experienced dysmenorrhoea followed by amenorrhoea of moderate intensity since the beginning of 2008. At time of reporting the patient had not recovered. Other business partner numbers include E2008-09209. No further information is available.

MedDRA PT Caesarean section, Drug exposure during pregnancy, Pre-eclampsia

Symptom Text: This case was received from a health professional on 18 April 2008. Seriousness Criteria: Other-Medically Significant. A 15-year-old female patient, with a history of type I diabetes and sulfa allergy, received an intramuscular left arm injection of MENACTRA (lot number U2548AA) and an intramuscular right arm injection of GARDASIL (Merck, lot number 1757U) on 04 March 2008. The patient was pregnant at the time of vaccination, and date of last menstrual period was 07 December 2007. At the time of the report, the patient had not experienced any adverse effects. Follow-up information received on 27 May 2008 from a clinic. Per the reporter, the patient was not seen at their facility. The name of the facility where the patient was evaluated was provided. No other medical information was received. Follow-up information received on 08 September 2008 from a healthcare professional. It was confirmed that the patient had no adverse effects following vaccination and that the date of her last menstrual period was 07 December 2007. The patient's estimated date of delivery was reported to be 18 September 2008. Her obstetrical history included no previous pregnancies. The patient's health during pregnancy and risk factors were not known. Follow-up information was received from the health professional on 27 October 2008. Based on new information received, the case was determined to meet serious criteria. Seriousness Criteria: Other-Medically Significant. The patient underwent an ultrasound on 18 August 2008 and a fetal stress test on 28 August 2008; results of both tests were reported as normal. Pregnancy complications included pre-eclampsia, failure to descend, and non-reassuring fetal status. A male infant was born on 29 August 2008 via C-section at 37 weeks gestation. Birth weight was 7 pounds 12 ounces, and birth length was 21.75 inches. Apgar scores were 8/10 at one minute and 9/10 at five minutes, and the infant had no congenital anomalies. He was subsequently adopted, and no information regarding the infant or adoptive pa

MedDRA PT Injection site pruritus, Pruritus

Symptom Text: Pt. has had an adverse reaction the hepatitis B shot in the past that consisted of a rash with an onset of 10 minutes after administration. Pt. received HPV shot and meningoccal today. I waited 15 minutes between adminstration of each vaccine to check for reactions. The meningococcal vaccine was adminstered first with no reaction. After 15 minutes the HPV vaccine was adminstered and patient had some localized itching at the injection site and some slight itching on her face but did not report any problems swallowing or breathing. After 15 minutes the patient left the office with instructions to call if itching increased. After one hour the patient's mother called in complaining of increased itching by the patient. The patient was informed to come in and per Dr. a 4mg/ml 1 ml dose of dexamethasone sodium phospate was injected in the gluteus muscle. The patient was held at the office for one hour and reported feeling better with less itching. The patient was sent home with instructions to go to the ER if any signs of trouble breathing or swallowing were found.

MedDRA PT Drug exposure during pregnancy

Symptom Text: Information has been received from a nurse for the Merck pregnancy registry for GARDASIL concerning a 16 year old female smoker with attention deficit/hyperactivity disorder and a history of a functional murmur and febrile seizure as a child who on 25-APR-2007 was vaccinated intramuscularly with the first dose of GARDASIL (655205/1426F). On 28-JUN-2007, the patient received the second dose intramuscularly of GARDASIL (657868/0523U). Following the second dose, the patient was confirmed to be pregnant by ultrasound with a conception date of 12-JUL-2007. Concomitant therapy included prenatal vitamins. The patient had been taking SEROQUEL, METADATE, and TOPAMAX for ADHD but had stopped medications prior to conception. Gestation on 28-SEP-2007 was 11 weeks and 1 day. The patient sought unspecified medical attention. Additional information received from telephone call (09-JUN-2008): The physician reported that the patient delivered a healthy, normal male baby on 21-APR-2008 at 40 weeks gestation. Apgar scores were 8 at 1 minutes and 9 at 5 minutes. Birthweight was 8 pounds, 5 ounces, length 20 3/4 inches, head circumference was 14 1/4 inches and he was blood type O positive. On 29-APR-2008 the baby was seen for a one week well child visit. The baby is a healthy appearing infant, well nourished, bottle feeding and alert. Weight is within normal range for stated age. No known drug allergies. On 02-JUN-2008 the baby was seen for congestion, crying for no reason, vomiting yellow x 2, coughing and fever for a few days. Acute otitis media was suspected and the parents were instructed to take the baby to the emergency room for a septic work up and he was admitted to the hospital. On 24-JUN-2008 the baby was seen for a 2 month well child visit. The parents had no concerns. The baby's ear, nose and throat exam was normal. Additional information is not expected. All medical records are available upon request.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Information has been received from a nurse for the Pregnancy Registry for GARDASIL concerning an 18 year old female who on 13-DEC-2007 was intramuscularly vaccinated with her first dose of GARDASIL (lot # 658554/0928U) and later found out she was pregnant. On 27-Dec-2007, the patient sought unspecified medical treatment with an office visit. A pregnancy test was performed and determined she was about 5-6 weeks pregnant (LMP approximately 11/17/07). No adverse events were reported. Follow-up information was received on 03-NOV-2008 from a physician indicating that the patient is a female with 0 previous pregnancies. The patient had no significant past medical history or concurrent medical conditions. In early January 2008, 7-8 weeks from her LMP, the patient had an spontaneous abortion. The products of conception were not examined. It was unknown if the fetus was normal. Upon internal review, the spontaneous abortion was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Drug administered at inappropriate site, Mobility decreased, Pain, Rash erythematous, Rash papular, Rash pruritic

Symptom Text: Information has been received from a physician concerning a 26 year old female with penicillin allergy and no relevant medical history who on 25-AUG-2008 was vaccinated intramuscularly with a first dose of GARDASIL in the left arm (lot number not reported). At time of administration, the patient experienced pain. The pain became severe and impaired lifting the arm. The patient self-treated with unspecified non-steroidal anti-inflammatory medications and the pain resolved in 3 weeks. On 27-OCT-2008, the patient was vaccinated intramuscularly with a second dose of GARDASIL in the gluteus muscle (lot number not reported). Concomitant therapy included YASMIN. Within a few hours, the patient developed a red, raised, itchy rash on her torso and both arms. The patient self-treated with BENADRYL. The patient contacted the physician's office by phone the next day to inform them of the reaction and at that time, the rash was improved. According to the physician, the patient's events were considered to be disabling. Additional information has been requested.

MedDRA PT Convulsion, Dizziness, Gaze palsy, Syncope vasovagal

Symptom Text: Information has been received regarding a case in litigation from a administrative assistant concerning a 26 year old female with no relevant medical history or allergies who on 15-APR-2008 was vaccinated intramuscularly with a first 0.5 ml dose of GARDASIL (lot number and injection site not reported). On 17-JUN-2008, the patient was vaccinated intramuscularly with a second 0.5 ml dose of GARDASIL (lot number 660553/0070X) (injection site not reported). Concomitant therapy included birth control pills (unspecified brand). After the vaccination, the patient became lightheaded. Her eye rolled back and she seemed to have a severe vasovagal response. According to the reporter, it seemed like the patient was going to have a seizure. The patient was sent to the emergency room. The patient was observed there and released on the same day fully recovered. Upon internal review, seizure was considered to be an other important medical event. Additional information has been requested.

MedDRA PT Abortion induced, Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Information has been received from a nurse practitioner through a Merck pregnancy registry concerning a 24 year old female with a history of 3 live births prior to vaccination of GARDASIL, who in February 2007 (according to the patient) was vaccinated with the first dose of GARDASIL (lot number, route and injection site unknown) at a different facility, when she was 5 weeks pregnant. The patient had sought unspecified medical attention. On an unknown date she terminated her pregnancy. Subsequently, during 2007 the same patient became pregnant 3 more times and each pregnancy ended with spontaneous abortions (miscarriages) (WAES # 0811USA00647, WAES # 0811USA00648 and WAES # 0811USA00649). The patient became pregnant again and gave birth to a child in September 2008 (WAES # 0811USA00650). On 30-OCT-2008, the patient received the second dose of GARDASIL (lot number, route and injection site unknown). Upon internal review, elective abortion was considered to be other important medical event. Additional information has been requested.

MedDRA PT Dizziness, Hypoaesthesia

Symptom Text: Information has been received from a physician concerning a 15 year old female who in approximately June 2008, was vaccinated with first dose of GARDASIL (lot # not provided). In approximately June 2008, the patient experienced feeling faint and numbness in left arm (site of injection) following first dose of GARDASIL. The physician reported that the reaction was within 10-30 minutes following injection and lasted approximately an hour following. No intervention was taken and symptoms disappeared. Subsequently, the patient recovered from feeling faint and numbness in left arm. Upon internal review numbness in left arm (site of injection) was considered other important medical event. No further information is available.

MedDRA PT Depression

Symptom Text: Information has been received from a general practitioner concerning a 16 year old female who on 13-NOV-2007 was vaccinated with the first dose of GARDASIL (LOT# NF58550, Lot # 0276U). Subsequently, on an unknown date the patient developed severe depression. She presented in the physician's practice on 08-Jan-08. It was noted in the patient's record that the patient "was still depressive". Despite ongoing symptoms the patient was vaccinated with a second dose of GARDASIL (Lot# not reported) on 14-Jan-2008. The reporter assessed the case as serious. Outcome was not reported. Depression was considered to be an other important medical event. Other business partner numbers included: E2008-10074. Additional information has been requested.

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received, for the Pregnancy Registry for GARDASIL, from a nurse concerning a 24 year old female who on 05-OCT-2007 was vaccinated intramuscularly with her first dose of GARDASIL. Subsequently, the patient found out she was pregnant (LMP = 15-SEP-2007). According to the reporter, it is believed that the patient was about 5 to 8 days pregnant at the time of vaccination. The patient sought unspecified medical attention. No further information was provided. Follow-up information was received on 04-NOV-2008 via phone call from a person of a doctor's office indicating that the patient was given the vaccine elsewhere and she came in for one prenatal visit and returned stating she had terminated the pregnancy elsewhere. The reporter could not confirm the gestational age at the time of the pregnancy termination. The patient later moved to another state and they have no further information to provide. Upon internal review, pregnancy termination was determined to be an other important medical event. Additional information is not expected.

MedDRA PT Caesarean section, Drug exposure during pregnancy, Failed trial of labour, Premature labour

Symptom Text: Initial and follow up information has been received from a physician and nurse for the Pregnancy Registry for GARDASIL regarding a 19 year old female who on 12-APR-2007 was vaccinated intramuscularly with her first dose of GARDASIL (lot #655165/1425F). On 12-JUN-2007, the patient was vaccinated intramuscularly with her second dose of GARDASIL (lot #655165/1425F). There was no concomitant medication. On an unspecified date, the patient took an over-the-counter pregnancy test and the results were positive (date unspecified). The patient sought medical attention via telephone. As of 04-JUN-2008, the patient is 38 weeks + 1 day pregnant, her estimated due date is reported as 17-JUN-2008 (LMP estimated as 09-SEP-2007). Follow-up information was received on 05-NOV-2008 via phone call from a nurse indicating that the patient had an estimated delivery date of 16-JUN-2008 and went into spontaneous labor on 22-JUN-2008. She progressed well through the first stage and reached full dilatation, pushed for one and a half hours and had a cesarean section for a diagnosis of failure to descend. The patient delivered a healthy and normal baby girl, weighing 8.2 pounds, at 40 and 5/7 weeks RGA. The patient had a normal post-operation recovery and was doing well. Upon internal review, "failure to descend" was determined to be an other important medical event. Additional information is not expected.

MedDRA PT Drug exposure during pregnancy, Foetal disorder

Symptom Text: Initial and follow up information has been received from a physician and a licensed visiting nurse through the Pregnancy Registry for GARDASIL concerning an 18 year old female, with no previous pregnancies and no reported medical history who on 02-MAY-2007 was vaccinated intramuscularly with the first dose of GARDASIL (Lot # and site not provided). On 27-JUN-2007, the patient was vaccinated intramuscularly with the second dose of GARDASIL (Lot # and site not provided). Subsequently, it was reported that the patient was pregnant (LMP = 10-JUL-2007). On 31-AUG-2007, the patient had an ultrasound to confirm gestational age and the results were normal. Concomitant medications during pregnancy were prenatal vitamins (unspecified) and TYLENOL. On 10-APR-2008, the patient gave birth to a normal baby girl (8 lbs 10oz; 21.5 inches in length, and head circumference 13 inches). The infant's apgar scores were 9 and 9. There were no complications during pregnancy, or labor and delivery, and the infant had no congenital anomalies. Follow-up information indicated that the infant was seen on 14-APR-2008 and there was a concern that her feet were "turned in." The infant was assessed with bilateral feet inversion most likely from inutero positioning. The plan was to observe the infant over the next couple months and it was reported that it may take 6 to 12 months to fully correct. A orthopedic referral, evaluation, and possible splinting for this problem were all considered. The physician reported that there were no congenital anomalies. However, upon internal review bilateral feet inversion was considered to be a minor congenital anomaly. Additional information is not expected. Medical records are available upon request.

MedDRA PT Chest pain, Dizziness, Dyspnoea, Hodgkins disease stage II

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. A 17 year old female with no known allergy who on 01-JUL-2008 was vaccinated in the left arm with the third dose of GARDASIL (lot# 659180/1758U) (route of administration not reported). The patient was vaccinated with the first and the second dose of GARDASIL on 04-DEC-2007 and 29-FEB-2008 respectively. On 28-AUG-2008 the patient experienced chest pain, shortness of breath, lightheadedness and dizziness. The patient was accepted by emergency room. Chest X-ray test indicated a "fullness" by the heart. On 30-AUG-2008 a computerized axial tomography (CAT) scan was performed and early Stage 2 Hodgkin's lymphoma was the official diagnosis received on 24-SEP-2008. The patient was hospitalized. Patient is currently undergoing treatment at the clinic. Prior to the beginning of the 3 shot series of GARDASIL, the patient had a chest X-ray, and the chest X-ray showed no signs of Hodgkin's Lymphoma. Other lab tests also included positron emission tomography (PET) scan, lymph node biopsy, bone marrow biopsy and blood work. A standard lot check investigation was performed. All in-process quality checks for the lot number in question were satisfactory. In addition, an expanded lot check investigation was performed. The testing performed on the batch prior to release met all release specifications. The lot met the requirements of the Center for Biologics Evaluation and Research and was released. The reporter considered the adverse experiences to be life threatening. The original reporting source was not provided. The VAERS ID# is 332094. No further information is available.

Seriousness: ER VISIT, EXTENDED HOSPITAL STAY, HOSPITALIZED, LIFE THREATENING, PERMANENT DISABILITY, SERIOUS

MedDRA PT Autoimmune disorder, Back pain, Eye haemorrhage, Headache, Hypertension, Takayasus arteritis, Tuberculin test

Symptom Text: Information has been received from a physician concerning a 19 year old female patient, with allergic reaction to antibiotics, who on 16-JUL-2007 was vaccinated with a first dose of GARDASIL (lot # 658094/0524U, on 20-SEP-2007 she received the second dose of GARDASIL (lot # 657736/0389U), and on 18-MAR-2008 she received the third dose of GARDASIL (lot # 659964/1978U). The physician reported that the patient experienced "back pain" from the GARDASIL, and on approximately 19-JUL-2007 the patient experienced blood dripping from both eyes (just for one day) and she has been having bad headaches since then. The physician reported that the patient was diagnosed with high blood pressure and an autoimmune disease affecting the large arteries called "TAKAYASU". The physician reported that the patient had been hospitalized for about a week as a result of the condition. Physician recommended Ibuprofen for treatment. The back pain, blood dripping from both eyes, bad headaches, high blood pressure and autoimmune disease affecting the large arteries called "TAKAYASU" were considered immediately life-threatening. On 27-May-2008 a "TB test" was done as a laboratory diagnostic studied (results not provided). The patient had not recovered. According to the physician, the patient has been released from the hospital. The physician is concerned about the "weird" things that she heard are happening to patients around the time of the GARDASIL vaccination. According to the reporting physician, "complications resulting from chronic use of steroids" was considered to be disabling. This is one of two reports from the same source. Additional information has been requested.

MedDRA PT Dizziness, Musculoskeletal stiffness, Myalgia, Pain in extremity

Symptom Text: Information has been received from a consumer concerning her 15 year old sister who was vaccinated with a first dose of GARDASIL (lot #, site and route not reported) in OCT-2008. Two hours after vaccination the patient developed dizziness, stiffness of hands and feet and pain in limb. The patient was hospitalized on an unspecified date. She has not recovered at the time of reporting. The physicians do not see a causal relationship with GARDASIL vaccination. Further information was received from the hospital physician on 05-Nov-2008: The patient was vaccinated with a first dose of GARDASIL on 22-OCT-2008. One to two days after vaccination, the patient developed severe muscle ache in both thighs. The patient was hospitalized for a day (exact dates not reported) in a department of internal medicine. After two days at home she was admitted to a neurological department where she is still staying at the moment. Neurological examination was normal as well as lab findings including CK and electrolytes. Also MRI of lumbar spine, electroneurography and electromyography were normal. No diagnosis was established to date. Other business partner number include: E2008-10182. No further information is available.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Asthenia, Eczema, Lymphadenopathy, Malaise, Pyrexia, Spleen palpable

Symptom Text: Information has been received from a Health Authority (HA reference # PEI2008016765) concerning a 17 year old female patient with no medical history reported who on 06-MAY-2008 was vaccinated with GARDASIL (Lot # and site not reported) IM. Two to three days post vaccination, the patient developed slight malaise. Six days p.v., the patient developed fever up to 40 C. The patient was treated with antibiotics. Additionally, she developed eczema on the legs and the fever persisted for 6 days. After short convalescence she experienced again fever up to 40 C with asthenia. The patient was hospitalized on an unspecified date. Upon hospitalization the cervical lymph nodes were partly enlarged, the spleen was palpable. Laboratory findings: Hemoglobin, reticulocytes, leukocytes decreased. Triglycerides: 368 mg/dl and C-reactive protein: 54.3mg/l. Abdomen sonography showed enlarge liver and spleen. Due to indication to possible Epstein-Barr virus infection the patient was treated with cefuroxime (manufacturer unknown) and trobamycin (manufacturer unknown) as well as doxycycline (manufacturer unknown). Due to suspicion of haemophagocytic lymphohistiocytosis treatment with dexamethasone IV (manufacturer unknown) was administered. After the symptoms had improved the dose was gradually reduced and treatment with amphocerin B (manufacturer unknown), trimethoprim (manufacturer unknown) and sulfamethoxazole (manufacturer unknown) was initiated. Diagnosis: Suspicion of haemophagocytic lymphohistiocytosis post vaccination or in consequence of an Epstein-Barr virus infection respectively. File Closed. Other business partner numbers include E2008-10243. No further information is available.

MedDRA PT Anogenital warts, Anorexia, Cervical dysplasia, Colposcopy, Fungal infection, Genital lesion, Malaise, Papilloma viral infection

Symptom Text: Information has been received from a mother and aunt concerning a 16 year old female patient with no known medical history, who was vaccinated with all three doses of GARDASIL by June 2008. Concomitant suspect vaccination included influenza virus vaccine (unspecified) (name and manufacturer unspecified). The consumer reported that her niece was HPV (unknown type) positive after getting all three doses of GARDASIL. The mother subsequently reported that about one month after receiving all three doses of GARDASIL her daughter had a yeast infection and then two weeks later had another infection. The patient was the due for her yearly checkup and so she went and had a pap test done and the test showed the patient had genital warts and a "large lesion on her insides". The mother stated that her daughter is going to a specialist and will have to get "some work done on her" for the lesions. The mother reported that the patient does not feel well and has a loss of appetite. It also reported that the patient received the flu vaccine and "wound up in the hospital" (specifics not provided). The patient sought unspecified medical attention. At the time of the report it was reported that the patient was not recovered. No further information is available. 1/28/2009 MR received for GYN visit 12/5/08 for colposcopy for (+) PAP smear. Final DX: Mild to moderate dysplasia with HPV.

Other Meds: Unknown

Lab Data: gynecological, the patient had genital warts and large lesion on her insides; Pap test, the patient had genital warts and large lesion on her insides. Labs: Pap smear (+) for low grade sqaumous intraepithelial lesion. HPV (+). Cervical

Seriousness: ER VISIT, PERMANENT DISABILITY, SERIOUS

MedDRA PT Abdominal pain upper, Activities of daily living impaired, Chest pain, Dizziness, Fatigue, Headache, Hypersomnia, Inappropriate schedule of drug administration, Nausea

Symptom Text: Information has been received from a registered nurse concerning her 17 year old daughter with an allergy to antibiotics and no other pertinent medical history, who on 22-APR-2008 was vaccinated with a 0.5 mL first dose of GARDASIL intramuscularly. On 20-JUN-2008 the patient received the second dose of GARDASIL. Concomitant therapy included hormone contraceptives (manufacturer unspecified). On 22-SEP-2008 the patient experienced headache, dizziness, nausea, fatigue, chest pain and stomach pains. The patient had her first CT Scan of the abdomen and blood work that were negative. On 09-OCT-2008 the patient had another CT Scan of the abdomen and the pelvis due to increased pain; the results were negative. On 22-OCT-2008 the patient received the third dose of GARDASIL. Then on 03-NOV-2008, the patient had an upper GI that was negative. On 04-NOV-2008 the patient had gastric emptying studies that were negative. On 05-NOV-2008 the patient had X-rays and blood work that were negative. The mother reported that her daughter was now "incapacitated", sleeping most of the day and was unable to get out the bed. The pain in the patient's stomach and chest had persisted and continued to worsen. The mother stated that "she continues to go down every day". The patient had been out of school for the past week and was not able to participate in after school activities (the patient was a cheerleader). At the time of this report, the patient had not recovered. The patient's headache, dizziness, nausea, fatigue, "sleeping most of the day/unable to get out of bed", "out of school for the past week and not able to participate in after school activities", "continues to go down every day", chest pain and stomach pains were considered to be disabling. Additional information has been requested.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Dizziness, Hypoaesthesia, Hypoaesthesia facial, Hypothyroidism, No reaction on previous exposure to drug, Post lumbar puncture syndrome

Symptom Text: Information has been received from a gynaecologist concerning a 25 year old female patient who was vaccinated with a second dose of GARDASIL (Lot #, site and route not reported) on 07-APR-2008. Concomitant medication included unspecified hormonal contraceptives. On 29-APR-2008, she was hospitalized for numbness of the left arm and face (left half) for 6 days. Additionally, she complained of dizziness. Neurological findings showed hypoesthesia of the left half of the face and the left arm. Overall clinical examination was normal. Lab findings revealed TSH: 6.26 uIE/ml. Routine laboratory findings showed normal results. Thyroid sonography was normal. Diagnosis of latent hypothyroidism was established. CSF puncture on 30-APR-2008: cell count: 1/3, glucose 63 mg/dL, protein: 21 mg/dL, lactate: 1.7 mmol/L. Albumin and IgG/IgA/IgM (CSF and serum) showed normal values. TPHA screening procedure was negative, specific IgG and IgM antibodies to borrelia (CSF and serum) were negative. No oligoclonal bands detectable. No CSF-blood barrier disorder. ECG showed normal results. Cranial MRI on 29-APR-2008: Normal NMR tomography of the cranium, no indication of lesions typical for multiple sclerosis. Electrophysiology on 02-MAY-2008, SEP of median nerve (bilateral): normal findings. VEP on 05-MAY-2008: normal findings. MEP (arms) on 05-MAY-2008: normal findings. MEP (legs) on 05-MAY-2008: normal findings. On 01-MAY-2008, the patient experienced headache caused by lumbar puncture. The patient's condition improved under treatment with infusions, Ibuprofen and caffeine tablets and at discharge on 05-MAY-2008 she had completely recovered from headache. Outcome from hemihypaesthesia was not reported. The first dose of GARDASIL (Lot # not reported) was administered on an unspecified date and was well tolerated. Other business partner numbers included: E2008-10187. Additional information has been requested.

Other Meds: hormonal contraceptives (unspecified)

MedDRA PT Burning sensation, Intervertebral disc protrusion, Muscle spasms, Musculoskeletal pain, Neck pain, Pain in extremity, Rash, Sensation of heaviness, Sleep disorder, Soft tissue disorder, Tenderness

Symptom Text: CLIENT STATED THAT THE FIRST TWO DAYS AFTER THE FLU SHOT, SHE HAD "A RASH AND MY ARM FELT HEAVY. THERE WAS SOME PAIN, BUT NOT ALOT." SHE THEN GOES ON TO SAY THAT THE THIRD DAY AFTER THE FLU SHOT SHE HAD A SHARP BURNING PAIN THAT RADIATED UP HER RIGHT NECK AND DOWN HER RIGHT ARM. SHE SAID THAT SHE TOOK TYLENOL, USED THE COLD COMPRESSES, TOOK HOT SHOWERS, BUT DID NOT GET ANY RELIEF AND CANNOT SLEEP. SHE DID NOT TAKE HER TEMPERATURE SO SHE IS NOT AWARE OF A FEVER. SHE CALLED OUR OFFICE BEFORE GOING TO SEE A DOCTOR. ENCOURAGED HER TO SEE HER PRIMARY CARE PHYSICIAN. SHE SAID THAT SHE DOES NOT HAVE ONE SHE WOULD HAVE TO GO TO THE ER. 2/5/09 Received ER medical records of 11/21/2008. FINAL DX: cervicalgia; pain in limb Records reveal patient experienced right side neck & shoulder pain x several weeks. Exam noted sever muscle spasm of right posterior neck & severe soft tissue tenderness of right upper neck. Tx w/steroids & pain meds. Phone f/u revealed patient improved on 11/24/08.

MedDRA PT Foetal disorder

Symptom Text: Initial information has been received from an investigator concerning a 0 day old neonate (birth weight: 3432 g) who was born from a mother who entered a clinical trial. Concomitant therapy included "ALIMAN" and "ZALUCS". On 06-JUl-2006, the subject received the first inoculation of GARDASIL or placebo, 0.5 ml, IM. as prophylaxis against HPV infection. On 05-SEP-2006, the subject received the second inoculation of GARDASIL or placebo, 0.5 ml IM, as prophylaxis against HPV infection. On 06-DEC-2006, the subject received the third inoculation of GARDASIL or placebo, 0.5 ml IM, as prophylaxis against HPV infection. On 23-JAN-2008, it was the date of the subject's last menstrual period. On 28-OCT-2008, the subject gave birth to a neonate. Congenital clubfoot developed. at the time of the report, outcome of congenital clubfoot was "ongoing". The investigator felt that the neonates congenital clubfoot was possibly related to the study drug. The investigator considered the neonates congenital clubfoot to be serious due to congenital anomaly. Additional information has been requested. Reporter's comment: Regarding the causal relationship to the study drug, it was assessed as "possibly related", as there were no grounds to deny the relation.

MedDRA PT Depressed level of consciousness, Dissociation, Fall, Pallor, Urticaria

Symptom Text: Information has been received from an agency concerning a 15 year old female who on 15-OCT-2008 was vaccinated with a first dose of GARDASIL intramuscularly in her left back. The patient was lying during the vaccination and for 1 minute after vaccination. One minute after vaccination, the patient felt fine and went to the general practitioner's waiting room where she sat for observation. Five minutes after vaccination, the patient became pale in face, on hands and feet. The patient was feeling remote and fell off the chair. While lying on the floor, the patient was conscious, but responded with latency when latency when replying to questions. Rash urticaria-like was observed on the patient's neck and right shoulder. Adrenalin (dose not reported) was given to the patient and an ambulance was called. On arrival to hospital, the patient had recovered from all symptoms. The patient was admitted to hospital for observation. No rash was observed. The patient was discharged on the same day. Other business partner numbers included E2008-10403. Additional information has been requested.

MedDRA PT Abdominal pain upper, Activities of daily living impaired, Anorexia, Bacterial infection, Burning sensation, Cellulitis, Contusion, Crying, Dizziness, Erythema, Genital pain, Headache, Pallor, Pruritus genital, Rash, Skin discolouration, Swelling, Vulvovaginal discomfort

Symptom Text: 10/22/08 after my daughter received the vaccinations at a little after 10:00 AM, my daughter started to tell me that she was itching around her pelvic/vaginal area and on the same day as the shot early morning she had just got her PMS before going to the Dr.'s office. I did not think it was serious because I thought that it might of been the pad that was making her feel uncomfortable. I remembered seeing my daughter's face was very pale, but again I did not think of anything serious nor read the allergic reactions vaccination handouts that was provided to me from the Medical Assistant GRA 93777-initials. And after the appointment, she also had a dentist appointment on the same day and she had two fillings done & 2 sealants. It finally got my attention after hearing my daughter acting abnormal, like constantly scratching and crying because her itching was burning and I asked her describe to me what they look like. She told me it was red and color purple around her vagina and that it was bruising and swollen, also it was spreading all over her bottom everywhere, between her legs. I was very scared to look at it but I told her that I would make a Dr's appointment and I also asked her if she would like to be taken into the emergency room and she refused to because she could not handled the pain anymore. I called her Dr.'s office on 10/27/08 and asked for the earliest appointment available in the later afternoon so I can have her stepfather take her to see the Dr. I even mentioned to the gentlemen that it was very weird that she has all these rashes right after she received the vaccinations. So the appointment was scheduled on 10/30/08 4:45 p.m. to see the doctor and she diagnosed her as rash & nonspecific skin eruption and on the same day they offered her a flu shot which she agreed to have. The Dr. provided a rash cream for antifungal bacterial infection around the vagina. At the same time I've been so worried and feel very helpless to see my daughter having to go through this pain, especially having her to tell me

MedDRA PT Caesarean section, Drug exposure during pregnancy

Symptom Text: Information has been received from a physician, for the Pregnancy Registry for GARDASIL concerning a 26 year old female with a history of polycystic ovaries, irregular periods, absence of menstruation (August 2007), Papanicolaou smear abnormal (low grade 2007) and biopsy (July 2007, showed no dysplasia) who on 07-NOV-2007 was vaccinated intramuscularly with a first dose of GARDASIL (Lot # 658282/0929U) and on 04-FEB-2008 was vaccinated intramuscularly with a second dose of GARDASIL (Lot # 659653/1448U). There was no concomitant medication. The physician reported that the patient received 2 doses of the vaccine and is pregnant. The patient had a negative pregnancy test on 02-FEB-2008. On 05-FEB-2008 she had a positive qualitative HCG test (LMP 26-DEC-2007). The patient was seen in the office for unspecified medical attention. The patient was given a slip on 25-FEB-2008 to have routine OB panel. On 25-FEB-2008 the ultrasound showed the fetus to be 7 weeks and 6 days. No product quality complaint was involved. Outcome unknown. Follow-up information has been received from the physician on 10-NOV-2008. It was reported that this was the patient's first pregnancy. Medication taken during pregnancy included duet DHA prenatal vitamin, daily and Fe supplement, daily, for 9 months of pregnancy. Prenatal testing included MSAFP for Down's syndrome, screen negative, on 24-APR-2008. Subsequently, a healthy female infant was delivered at 38.5 weeks from LMP by cesarean section due to compound presentation on 26-SEP-2008. Birth weight was 7 pound 12 ounce, length 21.5 inch. The cesarean section was recommended due to non-vertex presentation. The infant was normal and with no congenital anomalies; there were no complications during pregnancy. The patient's concurrent medical condition included obesity. No further information is available.

Other Meds:

Lab Data: biopsy, 07/??/07, showed no dysplasia; ultrasound, 02/25/08, fetus, 7 weeks 6 days; Pap test, ?/?/07, low, abnormal; serum alpha-fetoprotein, 04/24/08, screen negative; beta-human chorionic, 02/02/08, negative; beta-human chorionic, 02/05/0

History: Polycystic ovaries; Irregular periods; Absence of menstruation; Papanicolaou smear abnormal

MedDRA PT Bradycardia, Liver function test abnormal, Syncope, Thrombocytopenia

Symptom Text: Information was received from a physician concerning a 17-year-old female patient who on 25-AUG-2008 was vaccinated with a first dose of GARDASIL (lot # 1427U, batch # NH15200, route unknown) into her left upper arm. On 27-AUG-2008, the patient experienced syncope and bradycardia. On 30-AUG-2008, she experienced thrombocytopenia; on 01-SEP-2008, she experienced increased liver value. ECG, blood sample and blood pressure measurement were performed without results reported. At the time of reporting, the patient had not recovered. Further information was reported by HA (HA reference no. PEI2008013687). On 28-AUG-2008 the patient presented to an outpatient department. Syncope had lasted for two minutes. The patient had a history of arterial hypotension. She was told to present to her general practitioner for a long ECG (electrocardiogram) and clarification of the thrombocytopenia. Laboratory results were sent. Routine laboratory on 29-AUG-2008 without pathological findings, except for decreased thrombocytes. Liver value was not sent. Outcome was not reported. Follow up information was reported by the physician on the phone: The patient had not recovered. She was still treated in a hospital (outpatient or inpatient department is not known). Other business partner numbers included: E200808294. No further information is available.

Other Meds: Unknown

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Abdominal pain, Back pain, Chest pain, Disturbance in attention, Dizziness, Fatigue, Menstruation irregular, Migraine, Neck pain, Paraesthesia, Photophobia, Rash

Symptom Text: Information has been received from a consumer concerning her 15 year old daughter, with no known drug reactions/allergies and with a history of migraine headaches, who on an unspecified date was vaccinated with the first dose of GARDASIL (Lot # 653735/0688F), intramuscularly and in July 2008, was vaccinated with the second dose of GARDASIL (Lot reported # 659776/0022X was valid for MMRII (HSA, not GARDASIL). There was no concomitant medication. The consumer reported that her daughter had experienced persistent migraine headaches since receiving her first dose of GARDASIL. The patient had also experienced back pain, abdominal pain, neck pain, chest pains, dizziness, fatigue, rash on her head and neck, photophobia, irregular menstrual cycle, difficulty concentrating and her hands and feet frequently "fell asleep". It was noted that these symptoms all began after receiving the first dose of GARDASIL vaccine and intensified after receiving the second dose. At the time of the report, the patient had not recovered. The patient sought medical attention and was seen by the physician. Additional information has been requested.

MedDRA PT Arthralgia, Arthropathy, Finger deformity, Headache

Symptom Text: Case reported by Health Authority (HA reference no. PEI2008016273) on 05-NOV-2008. It was reported that a 13 year old female patient, with a medical history of headache and general discomfort, was vaccinated with a second dose of GARDASIL (lot#, route, injection site not reported) on 26-NOV-2007. After vaccination (onset date not reported), the patient developed aggravation of headache and general discomfort. In addition, the patient experienced joint disorder and pain without swelling, and finger deformity ("deviation of axis of finger of the distal phalanx"). There were no signs of rheumatism of similar diseases. MRT revealed no pathological findings. The patient was treated with analgesics. ON 08-APR-2008, the patient received GARDASIL (lot#, route, injection site not reported). The symptoms were ongoing. The physician did not see a causal relation to the vaccine. The mother wanted to report the case. The patient recovered with sequelae within an unspecified time. GARDASIL on 24-SEP-2008, toleration not reported. The reporter considered the adverse events to be other important medical events. Other business partner number included: E2008-10327. No further information is available. Case closed.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Chest discomfort, Chest pain, Cough, Nasopharyngitis, Oropharyngeal pain, Painful respiration, Pyrexia

Symptom Text: Information has been received from a health authority (H.A Ref. 083471) concerning a woman who on 17-AUG-2008 was vaccinated with GARDASIL, (route unknown, batch number and site of administration not reported). Health authority reported chest pain with onset 10-SEP-2008. Concomitant medication was oral contraceptives (manufacturer unknown). In the beginning of September 2008 the woman had fever, sore throat and a cold. During an episode she was feeling better and started to work out. On 10-SEP-2008 she had chest pains and sore throat and was investigated at a care center which revealed a normal EKG. On 13-SEP-2008 she went for care in another part of the country due to worsened chest pains. She was hospitalized for further investigations and termination of the oral contraceptives was ordered. The woman had symptoms of dry cough and pain at deep breathing. Investigations revealed increased D-dimer 1.12 mg/L (ref 0.25 mg/L), a CT thorax performed on 14 September did not indicate any lung emboli or other noticeable. A lung scintigraphy showed a minimal segmental perfusion defect basal dorsal of left lung. No other perfusion defects were observed. During hospitalization the patient received INNOHEP, which terminated on 15-SEP-2008 after the arrival of X-ray results. The chest pain decreased after discharged. On 16-SEP-2008, she was out walking about 3 km and the following night she woke up with a pressure on the chest. Here after she had a constant mild pressure over the sternum and spine. There was no clear correlation to breathing or to movement. Saturation was 100%, no fever, no tachycardia, normal EKG. The woman was hospitalized due to suspected lung emboli. But an X-ray of the lungs did not show any parenchyma changes. A CT-pulmonary did not indicate any signs of lung emboli. She received a dose INNOHEP before the x-ray results arrived. PK, D-dimer, CRP were all normal as well as the heart enzymes CK, CKMB and troponin T. The chest pains were considered to be without any cardiac genesis and to be muscle-skeletal

Other Meds: hormonal contraceptives (unspecified), Unk - Unk

Lab Data: chest computed axial tomography, 14Sep08, normal; electrocardiogram, Normal; arterial blood O2 saturation, 100%; serum C-reactive protein, Normal; serum TnT, normal; serum creatine kinase, Normal; serum creatine kinase isoenzyme MB, normal;

MedDRA PT Hodgkins disease

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. On 17-SEP-2007, a 15 year old female with penicillin allergy was vaccinated with the third dose of GARDASIL (lot#: 656371/0181U) in the right arm. Concomitant therapy included SEASONIQUE oral for contraception. On 11-AUG-2008, core biopsy was performed. On 17-AUG-2008 the patient was diagnosed with Hodgkins Lymphoma. Hodgkins Lymphoma was considered to be immediately life-threatening. It was also reported that the patient had a previous vaccine illness of Hodgkins Lymphoma in the patient. The original reporting source was not provided. The VAERS ID # is 332906. A standard lot check investigation was performed. All in-process quality checks for the lot number in question were satisfactory. In addition, an expanded lot check investigation was performed. The testing performed on the batch prior to release met all release specifications. The lot met the requirements of the center and was released. No further information is available.

Seriousness: ER VISIT, PERMANENT DISABILITY, SERIOUS

MedDRA PT Activities of daily living impaired, Arthralgia, Arthritis, Discomfort, Muscular weakness, Musculoskeletal stiffness, Pain, Swelling

Symptom Text: Information has been received from a physician concerning a 14 year old female with acne and no known drug allergies who on 29-SEP-2008 was vaccinated with the first dose of GARDASIL, 0.5ml IM on the left arm. Concomitant therapy included minocycline, FINACEA, fexofenadine hydrochloride (manufacturer unknown) and unspecified face wash. Subsequently the patient experienced pain on the arm of the injection since vaccination. In the middle of October 2008 the patient has swelling of the fingers, legs, toes, both arms, stiffness of the body and difficulty moving. The patient also had arthralgias of her arms, legs and back. The patient has been missing school because of the discomfort. The patient couldn't close her hands. Every part of her body was aching. Minocycline (unspecified manufacturer) was discontinued on 14-NOV-2008 and the patient has been able to move since 17-NOV-2008. The patient still has pain, swelling, and arthritis-like symptoms. The patient's work-up revealed normal RF, CBC, CRP, SED rate, ESR, but increased ALT (341) and AST (224). The patient sought medical attention. At the time of the report the patient was recovering. Pain on the arm of the injection, swelling of the fingers, legs, toes, both arms, stiffness of the body and difficulty moving. Every part of her body is aching and arthritis-like symptoms were considered to be disabling. Additional information has been requested.

Other Meds: [therapy unspecified]; FINACEA; fexofenadine hydrochloride; minocycline

Lab Data: serum rheumatoid factor, normal; complete blood cell, normal; serum C-reactive, normal; plasma parathyroid, normal; erythrocyte, normal; plasma aspartate, 224, increased; plasma alanine, 341, increased

MedDRA PT Dizziness, Hyperhidrosis, Pallor, Presyncope, Sensation of heaviness

Symptom Text: Patient left the exam room and after leaving the lobby, felt very dizzy while she was standing by the elevator. Told mother her vision was going "white". Mother supported her upright and called for assistance. RN's from the unit brought her into an exam room and helped her lie down on the exam table. She was reportedly pale and sweaty.RN's checked vital signs; teen was stable. They had MD come to check her. Over course of 10-15' she felt well enough to leave. I called mother later in evening. She said that patient was still a little pale but was much better. mostly embarassed about almsot fainting.She was saying that her arm felt heavy all the way down. She had full motion and pink fingers. Reviewed on-call availability with mother.

MedDRA PT Breech presentation, Caesarean section, Drug exposure during pregnancy

Symptom Text: Initial and follow up information has been received from Merck pregnancy registry through a Nurse concerning a 21 year old female with no previous medical history, who on 14-SEP-2007 was vaccinated IM with a first 0.5 ml dose of GARDASIL. Concomitant medication included FOCALIN 15 mg QD intermittently just until pregnancy known for ADHD and ZOFRAN 4 mg TID PRN for nausea/vomiting. It was reported that the patient received the vaccination while she was pregnant. Medical attention was sought. In follow up the nurse stated that on 28-May-2008, the patient delivered a normal live born female infant weighing 8 lbs and 9 Oz with an apgar score 9/9. There were no complications or abnormalities and no congenital anomalies. There were no infections or illnesses during pregnancy. It was reported that patient had a caesarean section since the baby was in breech presentation. Pediatric medical records were received and reviewed and the following experience was identified. On 02-JUN-2008 baby came to doctor's office and was found to have jaundice. Baby's bilirubin was 16.7 mg/dL and she needed photo therapy. She was seen on 03-JUN-2008 and it was reported as physiologic jaundice and was admitted to the hospital. On 06-JUN-2008 the baby was seen in the doctor's office for follow up hospitalization for jaundice. It was reported that on examination baby had "?questionable hip dysplasia". A follow up phone call was made to the doctor's office and information was received that the baby was referred to an orthopedist. The nurse reported that as per the doctor's note the baby had an examination with the doctor. It was reported that "physical examination showed the hip to be slightly lax, but there was no evidence of any dislocation and it appeared the hip was tightening". The mother cancelled the follow up visit for the baby with the doctor but reported that the baby was doing well. On 11-JUN-2008 the baby went to the doctor's visit. In the record it was reported that the baby had eye drainage and diarrhea after amoxicillin. The bab

MedDRA PT Caesarean section, Drug exposure during pregnancy

Symptom Text: Information has been received from a health professional concerning a female who was vaccinated with a dose of GARDASIL (lot#, injection route and site not reported) on an unspecified date. There was no concomitant medication. At the time of vaccination, the patient was already pregnant. The last menstrual period and due date were unknown. Follow-up information received on 21-APR-2008 indicated that the patient was vaccinated IM into the upper arm on 10-JAN-2008. Follow-up information received on 12-NOV-2008 indicated that upon internal review this case was upgraded due to cesarean section as an other medically important event. It was reported by the gynaecologist that the patient gave birth to a normal newborn via cesarean section on 08-OCT-2008. The Apgar score of the child was 10/10. The postnatal of mother and child showed no pathologies. The patient recovered. Case closed. Other business partner numbers include: E2008-01757. No further information is available.

MedDRA PT Chest pain, Coordination abnormal, Dyspnoea, Fatigue, Hypertension, Hypoaesthesia, Inappropriate schedule of drug administration, Malaise, Muscle twitching, Speech disorder

Symptom Text: Information has been received from a physician concerning a 32 year old female who on 05-APR-2008 was vaccinated with GARDASIL (dose and lot number not provided). The patient had no allergies and there was no concomitant medication. ON 07-APR-2008, two days following vaccination with GARDASIL the patient became ill. The physician reported that the patient had problems breathing due to pain in the left hemi thorax. She also suffered from muscle twitches, numbness in the fingers and toes, extreme fatigue, difficulty in speaking and difficulty with coordination. It was reported that the patient went to the emergency room and while there they discovered that her blood pressure was high. The patient underwent various tests while in the emergency room, but no diagnosis was made. The patient was not hospitalized. The physician reported that the patient is still suffering from problems breathing due to pain in the left hemi thorax, muscle twitches, numbness in the fingers and toes, extreme fatigue, difficulty in speaking and difficulty with coordination and her blood pressure was high. Numbness in the fingers and toes was determined to be an important medical event based on foreign agency requirements. No further information is expected.

MedDRA PT Headache, Nausea, Pyrexia, Syncope, Vertigo

Symptom Text: Information has been received from a med agency from a physician concerning an adolescent female (6th level of education) who on 20-OCT-2008 was vaccinated with GARDASIL (lot #, site and route of vaccination not reported). The patient collapsed 10 minutes post vaccination and developed fever and headache. Latency for fever and headache was not reported. The outcome was not reported. Follow up information was received on 13-NOV-2008 from a foreign healthy authority, documentation # 29185. An 11 year old female patient was vaccinated with a GARDASIL vaccine (lot # 0467U; batch # NG14300, intramuscular, site not reported) on 20-OCT-2008. 10 minutes after vaccination she collapsed. 1 day later she developed fever up to 38.00C, headache, nausea and vertigo. 4 days later (it was not reported if after vaccination or onset of AEs) she recovered. The case was upgraded to serious as it was considered to be medically significant per reporter. The case is closed. This is one of several reports received from the same source. Other business partner numbers include E2008-09891. No further information is available.

MedDRA PT Alopecia, Aphthous stomatitis, Dermatologic examination, Erythema, Exfoliative rash, Herpes simplex, Immune system disorder, Mouth ulceration, Psoriasis, Seborrhoeic dermatitis, Tinea versicolour, Vaccination complication

Symptom Text: Information has been received from a physician concerning a 23 year old female who on 17-OCT-2007, was vaccinated with the first 0.5 ml dose of GARDASIL (lot # 659435/1265U) in the left deltoid, on 19-DEC-2007, was vaccinated with the second 0.5 ml dose of GARDASIL (lot # 659439/1267U) in the left deltoid and on 15-APR-2008, was vaccinated with the third 0.5 ml dose of GARDASIL (lot # 659182/1757U) in the left deltoid. Concomitant therapy included LO OVRAL. In December 2007, the patient experienced severe psoriasis over face, neck, hands, feet and entire scalp causing hair loss. On an unspecified date, the patient was seen by a Dermatologist who performed a "work up". AT the time of reporting, the patient did not recover. Follow-up information on 19-NOV-2008 was received from a physician who reported that she was not able to add much more to her initial report. She stated that the patient's chart did not reflect when the adverse event occurred in December 2007. It was unknown if the onset was before or after the second GARDASIL dose on 19-DEC-2007. The doctor did report that there was no pertinent medical history and no concurrent conditions. She confirmed that the events were disabling and important medical events. The patient was currently taking HUMIRA and using a special shampoo. Dermatology reported that the events were an immune response to the vaccine. Current outcome was not recovered. The physician would not be seeing this patient again until October 2009. The physician considered severe psoriasis and hair loss to be disabling and other important medical event. Additional information has been requested. 12/3/08 Dermatology consults received beginning 6/5/08 with DX: Sebopsoriasis. Pt presented with 6-8 month hx of facial, scalp and hand scaly patches. F/u 7/7/08 with Dx: Seborrheic dermatitis. Psoriasis. Tinea versicolor. PE (+) for erythematous scaly patches on face, extremities and scalp. Started on Humira. Reported severe sores in mouth. Dx: aphthous ulcers. Herpes simplex virus. Humira d/c.

MedDRA PT Syncope

Symptom Text: This case is linked E2008-09891, E2008-09892, E2008-10185 and E2008-10191 (same reporter, vaccine and date of vaccination). Up to now this case is poorly documented but more information from Health Authority is expected. Information has been initially received from a physician on 21-OCT-2008 via health authority. A female adolescent patient (6th level of education) was vaccinated with a dose of GARDASIL (lot number, site and route of vaccination not reported) on 20-OCT-2008. The patient collapsed 2 hours post vaccination. No medical history reported. Follow up information received from a Health Authority (docu#29182) on 13-NOV-2008. The female was an 11 year old child. GARDASIL lot #0467U, #NG14300. The female recovered on an unspecified date. The case was upgraded to serious as it was considered to be medically significant per reporter. Other business partner numbers include E2008-09893. The case is closed.

MedDRA PT Abnormal labour, Caesarean section, Drug exposure during pregnancy

Symptom Text: Initial and follow-up information has been received from a physician concerning a 16 year old female with no medical history, who on 10-OCT-2007 was vaccinated with a first dose of GARDASIL (Lot# 658282/1263U). Concomitant vaccinations included MENACTRA. Concomitant therapies started on 16-OCT-2007 included ceftriaxone sodium 125mg used to treat Gonorrhoea and azithromycin 1gm used to treat a Chlamydial infection. Subsequently, the patient was pregnant. The patient's last menstrual period was 26-SEP-2007 and her estimated delivery date was 02-JUL-2008. It was reported to be unknown if the patient had an ultrasound performed. The patient had no previous pregnancies and no full term deliveries. At the time of the report, the outcome of the patient was unknown. Follow-up information was received from the physician who reported that on 13-APR-2008 the patient had a emergency c-section for failure to progress and repetitive severed deceleration. The patient delivered a male baby, birth weight 6 lb 12 oz. length 481/2 inch, Apgar score 9/9. It was reported that the baby did not have any congenital abnormalities or other complications or abnormalities. Upon internal review, failure to progress and repetitive severed deceleration which resulted in an emergency cesarean section were considered to be other important medical events. Additional information is not expected.

MedDRA PT Bone marrow oedema, Injected limb mobility decreased, Oedema peripheral, Pain in extremity, Sickle cell anaemia

Symptom Text: Information has been received from a physician concerning a 16 year old female with sickle cell disease who on 09-SEP-2008 was vaccinated in her right arm with PNEUMOVAX 23 (lot #657525/0554U). On 09-SEP-2008 the patient was also vaccinated in her left arm with MENACTRA and GARDASIL (lot # 660555/0279X). Shortly after the vaccinations, the patient developed pain and swelling on the right arm where she received the PNEUMOVAX 23. Unspecified medical attention was sought. The physician also reported that on 23-SEP-2008 the patient was hospitalized and at the time of reporting was still in the hospital. It was unknown if the cause of the hospitalization was the swelling on her arm. No further information was provided. Follow-up information was received from the physician. It was reported that the patient was vaccinated with the first dose of PNEUMOVAX 23 vaccine in her right deltoid at 10:53 am. The patient had no illness at time of vaccination. On 23-SEP-2008 the patient experienced bone marrow edema and pain crisis. Subsequently, the patient was hospitalized for 7 days. Laboratory tests included: X-ray and MRI of humerus. The patient recovered from bone marrow edema and pain crisis on an unspecified date. No further information is available. 12/29/2008 MR including hospital records received from PCP for DOS 9/23-10/1/2008 with DX: Sickle Cell Disease and R arm pain. Pt presented with hx of R arm pain following several vaccinations. Pain area includes R shoulder, upper arm, elbow, forearm, wrist and hand. Pt unable to move hand. MRI c/w sickle cell crisis.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy, Pregnancy test positive

Symptom Text: Information has been received from a nurse concerning a 23 year old female who on 02-OCT-2008 was vaccinated with the first dose of GARDASIL, lot # not available. The patient's last menstrual period was on 01-SEP-2008. On 23-SEP-2008 the patient had a pregnancy test done which showed a weak positive result. The nurse reported that the medical student who asked her to give the vaccine was not aware of the previous result. The nurse reported that the patient indicated that on 02-OCT-2008 she had not known she was pregnant for sure. On 20-OCT-2008 the nurse reported that another blood test would be done to confirm/re-confirm pregnancy. The estimated date of delivery is 08-JUN-2009. Additional information has been received from the nurse on 12-NOV-2008. It was reported that the patient was 10 weeks pregnant. Additional information has been received from the nurse on 14-NOV-2008. The patient informed her that she had a spontaneous abortion (no further details available). The patient recovered from pregnancy test done which showed a weak positive result and spontaneous abortion. Upon internal review, spontaneous abortion was considered to be an other important medical event. No further information is available.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Eye pain, Vaccine positive rechallenge, Visual acuity reduced, Visual field defect

Symptom Text: Information has been received from a female patient (age not reported) that she was vaccinated with a third dose of GARDASIL (lot # not reported) on an unspecified date in November 2008 (some days prior to reporting). Few days p.v. (exact latency not reported), she developed "problems with the eyes" (eye pain, decreased vision, visual field defect). She reported that she had experienced the same symptoms after the first and second dose of GARDASIL (lot #, route, site, and vaccination dates and latencies not reported). She had been hospitalized in an ophthalmologic clinic for some days (date not reported). As a possible etiology, toxoplasmosis was evoked by the treating physicians. The patient had treatment with unspecified tablets and infusions as well as antibiotics and "cortisone". The company was contacted to inquire whether the symptoms could have been caused by the GARDASIL vaccines, as the patient was watching a TV programmed in this regard. The final outcome of the events was not reported. Additional information has been requested. Other business partner numbers include E2008-10656.

MedDRA PT Asthenia, Hyporeflexia, Pain, Somnolence

Symptom Text: Case initially received through medical sales representative on 12-Oct-2008 and then reported by foreign health authority (case n. 91589) and (local case n. IT44208) on 14-NOV-2008. An 11 year old female who was vaccinated on 23-OCT-2008 with the first dose of GARDASIL (batch#NJ04480). On the same day, in the evening, she presented with marked hyposthenia of the lower limbs successively extending to the upper limbs with pain and somnolence. Suspected (but not confirmed) Guillain-Barre Syndrome. The patient was hospitalized and kept under observation from 23-OCT-2008 to 25-OCT-2008. On 12-NOV-2008 the patient underwent a neurological consultation that showed hyposthenia of the limbs, weak ostheo-tendineal reflexes almost absent in the lower limb. Admission was advised in an appropriate facility for further investigation. Other business partner numbers include E200810607. No further information is available.

MedDRA PT Bronchitis, Eye swelling, Food allergy, Urticaria

Symptom Text: Information has been received from a patient's mother on 13-NOV-2008, concerning a 15 year old female patient with medical history of allergy to acarus during childhood, who received the first dose of GARDASIL (batch# NH53750) on an unspecified date. 15 days later the patient developed urticaria. In spite of a corrective treatment with corticosteroids and antihistamines the patient's condition aggravated with impairment of her face described as swelling eyes. She also received on VENTOLINE and was hospitalized. Then due to important dosage of corticosteroids the patient developed bronchitis. In the following days (unspecified date), the patient was seen by an allergologist who diagnosed an allergy to sulfites. At time of reporting the outcome was not specified. She had no concomitant treatment. Other business partner numbers include E2008-10637.

Seriousness: ER VISIT, HOSPITALIZED, LIFE THREATENING, SERIOUS

MedDRA PT Chest pain, Cough, Deep vein thrombosis, Hypercoagulation

Symptom Text: Information has been received from a physician concerning a 20 year old female with respiratory allergies who on 21-FEB-2008, 24-APR-2008 and 16-SEP-2008 was vaccinated with the first, second and third dose of GARDASIL respectively (first and second dose lot # unspecified, lot # third dose 660612/0229X). Concomitant therapy included MENACTRA (administered on 21-FEB-2008), ZYRTEC and ALLEGRA. On 04-NOV-2008 the patient went to the physician's office with chest pain and coughing. On 07-NOV-2008 and 14-NOV-2008 the patient came back to the physician's office because the symptoms were still persisting. On 14-NOV-2008 the physician suggested to the patient to go to the hospital. The patient was hospitalized on 15-NOV-2008, a lot of different unspecified tests were done, and the patient was diagnosed with hypercoagulable state and deep venous thrombosis. On an unspecified date the patient was released from the hospital, but the physician did not mention how long the patient was in the hospital for. The physician stated he feels that hypercoaguable state and DVT are life threatening, he was unsure if GARDASIL caused the experience. The patient is still recovering. Additional information has been requested.

MedDRA PT Activities of daily living impaired, Asthenia, Chills, Condition aggravated, Decreased appetite, Fatigue, Headache, Immediate post-injection reaction, Lethargy, Loss of consciousness, Nausea, Neurological examination normal, Presyncope, Rhinorrhoea, Upper respiratory tract infection, Vaccination complication, Vomiting

Symptom Text: My 16 year old daughter was given GARDASIL injection #1 on 9/24/08 along with MENACTRA and TdaP. Immediately she was nauseated. One week later she developed a headache that would not go away for seven weeks. We went to a doctor after hours and received a shot of TORADOL which did not stop the pain, they began orders for MRI of the head. Two days later she almost passed out in the shower and was so weak she could not walk up the stairs at home. I took her to the ER where they did blood tests ruling out diabetes, mono, infection, virus etc. 11/5/08. They did a head CT which showed nothing. They gave IMITEX which made the headache worse. We were referred to a neurologist and would need an MRI which we could not get done because of insurance problems, but ultimately the neurologist eluded to problems with the HPV virus and that this should go away and did not need to get MRI. She spent seven weeks straight with a headache and weakness that is unparalleled. She missed a minimum of six days of school due to exhaustion and headache. During those seven weeks she had constant headache, weakness, severe lethargy, nausea and vomiting. She almost missed making her basketball team that she had been working out for every day of the months because she could not even function on the lowest level. 12/2/08 Reviewed ER medical records of 11/05/2008. FINAL DX: chronic HA & fatigue. Records reveal patient experienced HA x 6 weeks & had developed chills, nasal drainage, nausea, decreased appetite. Had completed antibiotic course recently for sinusitis. Had been seen in urgent care & referred to ER for MRI of brain. Phone consult w/neuro who recommended CT scan instead & outpatient f/u. 12/5/08 Reviewed PCP & neuro medical records. FINAL DX: protracted HA related to immunizations or URI. Records reveal patient experienced usual state of good health on day of vaccination. Neuro consult done 11/18/08 for protracted HA. Had HA, fatigue, intermittent weakness & nausea day starting day after vaccination. Also experienced

Other Meds:

Lab Data: Treated over the phone by our doctor for a presumed sinus infection because headache with LEVAQUIN antibiotic. 11/1/08 Mono test - date approximate- 11/3/08 Doctor's visit #2 where she received TORADOL shot for pain and they started orders

History: She has reactive airways disease and an allergy to Sulfa and CEFZIL, that is it. PMH: Migraines since age 6 w/visual aura.

MedDRA PT Abdominal pain, Headache

Symptom Text: Information has been received from a general practitioner concerning a 17 year old female patient with no relevant medical history reported received the first dose of GARDASIL (batch number not reported) in December 2007 (also reported as December 2008). Less than 1 week later, the patient experienced abdominal pain and cephalgia. Since that first dose symptoms were persisting without any regression. At time of reporting, the patient had not recovered. She received the second dose of GARDASIL in February 2008 and the third dose on 20-JUN-2008. There was hospitalization in order to perform a workup (unspecified date). Abdominal CT scan, cerebral CT scan, blood analysis were normal. Up today she was followed by a pediatrician. She also had been followed by a psychologist and nothing was found. All performed work-ups were negative. Bacteriological, virology and serologies tests were negative. Gynecology and ophthalmology tests were normal. The patient consulted a re-educator of vertebral column and all was normal. endocrinology tests were normal. The patient was treated with antispasmodic, with DOLIPRANE, with codeine, with ADVIL. All corrective treatment were without any amelioration. Other business partner numbers included: E2008-10710. No further information is available.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Fibroadenoma of breast, Hyperplasia, Incorrect route of drug administration, Inflammation, Lymphadenopathy, Surgery

Symptom Text: Information has been received from a general practitioner on 10-OCT-2008, concerning a 17 year old female with a history of left breast nodule with no axillary adenopathy at medical examination in Jan-2008, who on 21-MAR-2008 was vaccinated with the first dose of GARDASIL (batch number not reported) via intramuscular route in right deltoid, and on 23-MAY-2008 the second dose of GARDASIL (batch number not reported) via intramuscular route in right deltoid. One to two days, on approximately 22-MAR-2008 after the first dose the patient developed right axillary adenopathy which persisted at the time of administration of the second dose. To be noted that sites of administration of the first and second dose of GARDASIL were the same. A breast ultrasound performed in JUL-2008 revealed a fibroadenoma for her right breast and 2 adenopathies of 11-12mm in concave axillar. A new breast ultrasound performed on 07-OCT-2008 showed several adenopathies, 1of 27mm and others of 13-15mm for the most significant ones. At time of reporting the patient had not recovered and there still were huge eye perceptible tumefactions in concave axillar. To be mentioned that in JAN-2008 there was no axillary adenopathy at medical examination. Follow-up information received through the pharmacovigilance form on 18-NOV-2008: Batch number of first dose was NH00400 and second dose was NG41880. Both doses had been administered via subcutaneous route in her right deltoid. Right axillary adenopathy of moderate intensity persisting at the time of administration of the second dose and worsened to severe were confirmed. The patient had a painful inflammatory reaction after first dose that worsened after second dose. Surgery was necessary. There was anatomopathology analysis of 9 adenopathies. The smallest one sized 0.5cm and the biggest one sized 5cmx3cmx1cm. Conclusion was right axillary adenopathies showing reactional hyperplasia lymph nodes. At time of reporting the patient had not recovered. Other business partner's# includes E200809471. Case of misu

Other Meds: Unknown

Lab Data: ultrasound, ??Jul08, right breast 2 adenopathies of 11-12mm in concave axillar; ultrasound, 07Oct08, several adenopathies, 1 of 27mm and others of 13-15mm for the most significant ones

MedDRA PT Acute polyneuropathy, Amenorrhoea, Arthralgia, Cerebellar ataxia, Chest wall mass, Guillain-Barre syndrome, Hypoaesthesia, Inflammation, Muscular weakness, Non-cardiac chest pain, Pain, Paraesthesia, Swelling, Tenderness, Vaccination complication

Symptom Text: Information has been received from a office manager concerning a 12 year old female with no known pertinent medical history, and no known drug reactions/allergies, who on 15-AUG-2008 was vaccinated with the first dose of GARDASIL (Lot no 658558/1061U) in her right arm. Concomitant vaccine included VARIVAX. The office manager reported that on 24-AUG-2008 the patient called the office because she was having tingling and numbness in both of her legs. On 28-AUG-2008, the patient went to the doctor's office in which he ordered blood work, a urine test and he did a heavy metal screening and the patient was referred to the neurologist. On 11-SEP-2008, the test all came back normal. On 26-SEP-2008, the patient saw the neurologist whose impression was that the patient had paresthesia to the vaccine injection and he prescribed the patient NEURONTIN (Manufactured unknown) 100 mg twice daily and the patient was scheduled to see the doctor again in a month follow up. On 03-OCT-2008, the patient called the doctor because she was still having the tingling and numbness in both legs and he had diagnosed her with TA paresthesia and added ATAXIA CEREBELAR. On the same day, 03-OCT-2008, the patient had a MRI done of her brain and again was referred to see a neurologist for a second opinion and if it gets worse she may start LYRICA. The office manager stated that the end results of MRI seemed to be normal. The office manager reported that on 24-OCT-2008, the patient left a message which stated that she was now also having pain in her knee. On 27-OCT-2008, the patient saw the doctor again and he was diagnosed her with paresthesia. Then on 03-NOV-2008, the patient received her second opinion with a neurologist and said that she had a mild form of acute polyneuropathy (Guillain Barre) post vaccinating improving. Then on 17-NOV-2008, the patient saw the doctor again because she was stilled having tingling and numbness in both legs but now had worse symptoms in her feet and hand symptoms, and when the patient saw the physician on 17-OCT-2

MedDRA PT Myoclonic epilepsy

Symptom Text: Information has been received from a physician concerning a 15 year old female patient who on unspecified date was vaccinated with a dose of GARDASIL. After three hours of GARDASIL vaccination, the patient developed myoclonic seizures. The patient sought medical attention at the office and emergency room. Upon internal review, myoclonic seizures were determined to be an other important medical event. At the time of reporting, 20-NOV-2008, the outcome of the patient was unknown. Additional information has been requested.

MedDRA PT Convulsion

Symptom Text: Information has been received from a nurse who reported that a patient reported that her "16 or 17 year old" female friend was vaccinated with a second dose of GARDASIL (Lot # not provided). Subsequently, she developed seizures and had to be taken to the hospital. Nurse reported that her patient reported that her friend also claimed that tests were performed in the hospital and the hospital physician felt her seizures were a result of GARDASIL and treated her with unspecified medications. The patient outcome was not provided. Upon internal review seizure was determined to be another important medical event. Attempts are being made to verify the existence of an identifiable patient and reporter. Additional information has been requested.

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received, for the Pregnancy Registry for GARDASIL, from a physician and a registered nurse (R.N.) concerning a 15 year old female with no previous pregnancies, asthma, dysmenorrhoea, attention deficit/hyperactivity disorder and learning disability who on 25-SEP-2007 was vaccinated IM with a first 0.5 mL dose of GARDASIL (Lot# 657737/0522U). Concomitant therapy included albuterol. On 10-NOV-2007 the patient was vaccinated with a second dose of GARDASIL (Lot# 658563/1063U). On 27-MAR-2008, the patient was vaccinated with a third dose of GARDASIL (Lot# 657145/1226U). It was reported by a registered nurse that the patient had a positive pregnancy test on 23-MAR-2008. At the time of the report, the outcome was unknown. Follow-up information was received on 24-NOV-2008 from the physician and the R.N. indicating that "approximately 3-4 weeks before 17-APR-2008", on approximately 27-MAR-2008, the patient had an elective termination. It was unknown if the products of conception were examined. It was unknown if the fetus was normal. The outcome of the patient was not reported. Upon internal review, elective termination was determined to be an other important medical event. No further information is available.

Seriousness: HOSPITALIZED, LIFE THREATENING, SERIOUS

MedDRA PT Acute disseminated encephalomyelitis, Gait disturbance, Herpes simplex serology positive, Incontinence, Mycoplasma serology positive, Nervous system disorder, Pleocytosis, Visual acuity reduced

Symptom Text: Information has been received from health authorities under reference number ST20080920, concerning a 15-year-old female patient who received an injection of GARDASIL (batch number not reported) in JUN-2008. In JUL-2008 the patient suffered from acute disseminated encephalomyelitis and was hospitalized from 25-JUL-2008 to 05-AUG-2008. On 23-JUL-2008 she had a complete visual acuity decreased of her left eye. On 24-JUL-2008 she had walking troubles associated to sphincter troubles in relation with a medullar syndrome. Analysis of CSF put in relief pleocytosis with 280 leukocytes/mm3 with lymphocytic predominance and cervicospinal fluid proteins at 0.54g/l. Findings for herpes simplex virus with polymerase chain reaction, for enteroviruses, rubella and interferon gamma were negative. Biological work-up: leukocytes at 19300/mm3 with 17700/mm3 of PNN. ESR at 80mm at first hour, fibrinogen at 7.48 g/l, CRP at 64mg/l. Findings for anti nuclear antibodies were positive at 1/320, stained which course had to be followed without any antigenic specificity. Pneumoniae mycoplasma serodiagnosis was positive with IgM at 193U and which course had to be followed. Conclusion was an episode of acute disseminated encephalomyelitis probably post-infectious after infection with mycoplasma pneumoniae or herpes simplex virus type I or type II due to those both serologies were positive with IgM. Evolution was rapidly favourable under corticotherapy and in favour of a dysimmunitary event more than an infectious one. Aetiologic work-up put in relief presence of anti nuclear antibodies at 1/320 to control. At time of reporting the patient was recovering from acute disseminated encephalomyelitis. Other business partner numbers included: E2008-10680. Additional information has been requested.

Other Meds: Unknown

Lab Data: CSF volume, lymphocytic predominance and cervicospinal fluid proteins at 0.54g/l; CSF white cell count, 280 leukocytes/mm3; DNA Ab immunoprecipitation, 1/320; WBC count, 19300/mm3 with 17700/mm3 of PNN; Serum C-reactive protein, 64 mg/l; Er

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Gait disturbance, Headache, Muscular weakness, Myalgia, Mydriasis, Paraesthesia, Vertigo

Symptom Text: Information has been received from 2 health care professionals concerning a 15 year old female received the 3rd dose of was vaccinated with GARDASIL on 21-OCt-2008 intramuscularly injection in deltoid. Batch number unknown. On 22-OCT-2008 she was experienced cephalgia, vertigo and difficulty in walking and due to these events she has been hospitalized for several days (admission date unknown). Neurological examination: normal. Biological examination: WBC increased, CRP normal. Lumbar puncture: normal. She has been discharged from the hospital (date unknown) with persisting difficulty in walking. Clinical examination on 18-NOV-2008: muscular weakness and disturbance of deep sensibility of upper limbs and lower limbs (more severe in lower than in upper limbs), severe myalgia, difficulty in walking (subject is not able to stand on her toes, nor on her heels), bilateral pupil dilatation with good photo-motor reflex. Electromyogram: normal. Guillain-Barre syndrome is excluded (the lumbar puncture did not show a dissociation between increased protein level and cell count in CSF; no abnormalities at peripheral nerves shown by EMG; no pyramidal symptoms). No relevant previous personal medical history, no relevant familial history; allergies not known. She has received GARDASIL D1 injection on 22-MAR-2008 and D2 injection on 24-JUN-2008; no adverse events were associated with these injections. According to 1 of the reporters, all events are related to GARDASIL, "no other explanation for events". Other business partner numbers included: E200810774. No further information is available.

Other Meds: None

Lab Data: electromyography, 18Nov08, normal, no abnormalities at peripheral nerves; neurological examination, normal; spinal tap, normal, dissociation between increased protein level and cell count in CSF; WBC count, increased; serum C-reactive prote

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Anxiety, Hyperhidrosis, No reaction on previous exposure to drug, Pallor, Pulse pressure decreased, Syncope

Symptom Text: Client had Hep A vaccine in Left deltoid. I then gave her HPV vaccine in her right deltoid. Her mother, who was sitting in the room, noticed that the client was becoming pale and suggested she needed some "sugar" because she had not eaten in the last few hours. Client then fainted in the chair. With the assistance of another nurse, I was able to lower the client to the floor and elevate her feet without any injury. Her pulse was weak, and she was pale and diaphoretic. Blood Pressure was 118/68. Ammonia inhalant was used and client was responsive within seconds. Client had shown some anxiety over vaccinations but denied any previous reactions. Mother recalled that client had also had a fainting episode after a dental procedure in the past when the dentist was injecting novocaine.

Seriousness: HOSPITALIZED, LIFE THREATENING, SERIOUS

MedDRA PT Acute disseminated encephalomyelitis, Complex regional pain syndrome

Symptom Text: Information has been received from a health authority (HA reference no. PEI2008017247) concerning a 11 year old (also reported as 16 year old) female patient who was vaccinated with a second dose of GARDASIL (lot # 1340F Batch # NF14740), IM into the left arm on 21-MAY-2007. On 28-MAY-2007 the patient developed a "pain syndrome" concerning head and abdomen. CT, spinal MRI, examination of the eyes and teeth and "orthopedic examinations" showed normal results. The patient was hospitalized on an unspecified date. The situation was considered to be life-threatening. The reporter assumed an acute disseminated encephalomyelitis. Despite ongoing SAEs the patient was vaccinated with the third dose of GARDASIL (Batch # NG01520, Lot# 1536F), IM into the left arm on 04-OCT-2007. The patient had not recovered at the time of reporting. The first dose of GARDASIL (lot # not reported) on 23-FEB-2007 was well tolerated. Other business partner numbers include: E2008-10694. Additional information has been requested.

Other Meds: Unknown

Lab Data: Computed axial tomography, normal; Magnetic resonance imaging, normal; Ophthalmological exam, normal; Dental examination, normal; Orthopedic examination, normal

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Dizziness, Fatigue, General physical health deterioration, Headache, Myopathy, Pain in extremity, Paraesthesia, Presyncope, Sinus arrhythmia, Sinus bradycardia, Somnolence, Syncope, Syncope vasovagal

Symptom Text: Information has been received from a health authority (HA reference no. PEI2008006872) through a foreign agency, concerning a 17 year old female patient, who was vaccinated with the second dose of GARDASIL (lot#, route and site of administration not reported) on 25-Sep-07. The patient developed dizziness already during the vaccination and fainted a few minutes later at the elevator. A called physician treated her with a remedy (no name reporter) for improving the circulation and recommended her to take calcium. She recovered from fainting. A few days later, in Sept-07 she complained of headache and pain in limb (arms and legs). She felt exhausted. At the time of reporting symptoms were still ongoing. P1 with GARDASIL in Jul-07 was well tolerated. Follow up information was received on 19-NOV-2008 by the mother of the patient, the case has to be upgraded (hospitalization). Medical letters and hospital report were sent. On 13-NOV-2007 echocardiography and ergometry showed normal findings, vasovagal syncopes were rather suspected. Long term ECG and ECG under rest showed sinus bradycardia and sinus arrhythmia disposition which was interpreted as a normal variant. On 31-MAR-2008 the patient's general condition worsened and she developed paraesthesia of the hands and feet with an increased need to sleep and exhaustion. Detailed diagnosis in terms of an inflammatory rheumatic or cardiological disease was performed. Tarsal tunnel syndrome was suspected. Upon medical letter dated 31-MAR-2008 the reporter assessed a possible relationship to GARDASIL vaccination. On 25-AUG-2008, the patient was admitted to an outpatient department of a hospital. Inflammatory rheumatoid disease was excluded. Significant generalized tendomyopathy was diagnosed. Previous cardiological, neurological and rheumatological examinations showed normal findings. Upon medical letter dated 29-AUG-2008 the clinical picture of generalized tendomyopathy might be caused by a functional genesis of the complaints. The patient was hospitalized from 29-SEP-2008

Other Meds: Unknown

Lab Data: echocardiography, 12-Nov-07, normal findings; cardiac exercise tolerance test, 13-Nov-07, normal findings; electrocardiogram, 13-Nov-07, ECE and ECG under rest showed sinusbradycardia and sinus arrhythmia disposition, normal variant; physic

MedDRA PT Dizziness, Feeling abnormal, Muscle contractions involuntary

Symptom Text: Information has been received from a health agency (HA reference # 083884). It was reported that a 14 year old female was vaccinated with the second dose of GARDASIL (route and site of administration not reported) on 13-OCT-2008. She received the first dose of GARDASIL on 12-AUG-2008 (batch # NG31280, lot # 0513U). HA reported muscle contractions involuntary, preceded by dizziness, with onset on 19-OCT-2008. Afterwards, the patient has had 5 more similar episodes with contractions that lasted for 3 hours at the most. She was conscious during the episodes but she did not feel as normal. She had difficulties explain the feeling. The only event reported by the HA was muscle contractions involuntary. EEG inclusive sleep EEG was normal. Concomitant medications were ATARAX and TETRALYSAL capsule (indications not reported). The outcome was at the time of reporting not yet recovered. Case is closed. Other business partner numbers include E200810719.

MedDRA PT Anaemia, Caesarean section, Cephalo-pelvic disproportion, Drug exposure during pregnancy

Symptom Text: Information has been received from a 24 year old female consumer for the Pregnancy Registry for GARDASIL concerning herself with a history of methicillin-resistant staphylococcal aureus infection in August 2007 who on 24-DEC-2007 was vaccinated with her first dose of GARDASIL (lot# not reported). On 03-MAR-2008 the patient was vaccinated with her second dose of GARDASIL (lot# not reported). There was no concomitant medication. On 10-MAR-2008 the patient found out she was pregnant with 3 positive home pregnancy tests. She also had an examine with the nurse practitioner to confirm she was 9 weeks pregnant. Her estimated LMP was 05-JAN-2008 and her outcome was not reported. Follow-up information was received from a physician concerning the 24 year old female patient with a history of eczema, carpal tunnel and anemia. No previous pregnancies. On 15-APR-2008, ultrasound was performed with result within normal limits. On an unspecified date, the patient developed anemia during pregnancy. On 13-NOV-2008, the patient delivered a liveborn male infant by cesearean section due to cephalo-pelvic disproportion. Infant weighed 9 pounds 11 ounces. The infant's apgar score was 9/9. The infant was normal, with no congenital anomalies. There was no infection or illness during pregnancy. The infant's delivery by cesearean section due to cephalo-pelvic disproportion was considered an other important medical event. Additional information is not expected.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Information has been received from a health professional for the Pregnancy Registry for GARDASIL concerning a 24 year old female who on 26-AUG-2008 was vaccinated with a first dose of GARDASIL (lot # 660620/0571X). There was no concomitant medication. On an unspecified date, she became pregnant. The date of last menstrual period was 09-SEP-2008. On 05-NOV-2008, approximately 7 weeks from the date of last menstrual period, the patient experienced spontaneous abortion. No product of conception was examined. Additional information has been requested.

MedDRA PT Chills, Convulsion, Dyspnoea, Grand mal convulsion, Intensive care, Loss of consciousness, Malaise, Postictal state, Pyrexia, Rash generalised, Sinusitis, Syncope, Tongue biting, Vaccine positive rechallenge

Symptom Text: Information has been received from a certified medical assistant concerning a 20 year old female patient with polycystic ovarian syndrome, depression, asthma and insulin resistance, and no known drug reactions or allergies who on 16-SEP-2008 was vaccinated intramuscularly into the left deltoid with the first 0.5 ml dose of GARDASIL (lot# 660618/0572X). Concomitant therapy included ZOVIA, GLUCOPHAGE, spironolactone, XANAX, PROZAC, trazodone HCl and METADATE. The medical assistant reported that the patient experienced rash all over her body a week after getting vaccinated (approximately 23-SEP-2008). On 11-NOV-2008 the patient received the second dose of GARDASIL (lot# 661044/0548X) and reported the rash. On the night of 11-NOV-2008 the patient had trouble breathing and fainted. On 12-NOV-2008 the patient experienced 2 seizures at school and went to the emergency room and was hospitalized. During her hospitalization, the patient had 8 to 10 seizures and was transferred to the intensive care unit. On 18-NOV-2008 the patient was released because she was seizure-free. On the weekend of 22-NOV-2008 the patient was admitted to the hospital because of more seizures. She was still in the care of the hospital. Rash all over her body, trouble breathing, fainted, and seizures were considered to be other important medical events. Additional information has been requested. 12/31/08 Reviewed hospital medical records of 11/12-11/14/2008 FINAL DX: possible pseudoseizures vx seizure disorder Records reveal patient experienced fever, chills, felt unwell after HPV#2, 0548X, received 11/11/2008. Had cold sore on day of vaccination. Had witnessed tonic-clonic seizure activity w/tongue biting, loss of consciousness, & postictal confusion. Neuro consult done & tx w/antiseizure meds. ICU stay. D/C to home w/neuro & psych f/u.

Other Meds: XANAX; ZOVIA; PROZAC; GLUCOPHAGE; METADATE; spironolactone; temazepam; trazodone hydrochloride

MedDRA PT Papilloma viral infection

Symptom Text: Information has been received from a certified nurse midwife (C.N.M.) concerning a 21 year old female who on 18-SEP-2007 (lot # 658558/1061U), 13-NOV-2007 (lot # 659435/1265U) and 25-MAR-2008 (660387/1967U) was vaccinated with the first, second and third dose of GARDASIL in the deltoid respectively. The patient had 3 negative pap smears results since 2006. She was determined to HPV high risk on 03-NOV-2008 with a positive result. The patient underwent a colposcopy procedure related to abnormal paps. The patient had been sexually active prior to GARDASIL and described "occl" condom use. The C.N.M. considered the positive HPV to be disabling. Additional information has been requested.

Other Meds: Unknown

Lab Data: colposcopy, abnormal paps

History: Sexually active

MedDRA PT Asthenia, Convulsion, Fatigue, Hypersomnia, Malaise, Pain in extremity, Syncope

Symptom Text: This case was reported by a physician, via a sales representative and described the occurrence of convulsive seizure in a female subject of unspecified age who was vaccinated with TWINRIX (GlaxoSmithKline). Co-suspect vaccination included GARDASIL (Sanofi Pasteur MSD). In November 2008 the subject received 3rd dose of TWINRIX and GARDASIL (unknown route and application site). In November 2008, less than one month after co-administered vaccination with GARDASIL and TWINRIX, the subject was very tired and slept over a period of 16 hours. Few days after vaccination the subject felt sick, collapsed and experienced convulsive seizure with obstetrician's hand. This case was assessed as medically serious by GSK. At the time of reporting the subject still felt weak and suffered from pain in hands. Follow-up information has been requested.

MedDRA PT Amnesia, Confusional state, Cyanosis, Drooling, Electroencephalogram, Fall, Gaze palsy, Loss of consciousness, Tremor

Symptom Text: Information has been received from a health authority (case #91860), through a foreign agency (local case # IT465/08), concerning a 11 year old female patient who on 11-NOV-2008 was vaccinated with the first dose of GARDASIL (Batch # NJ14750, Lot #1864U). On 13-NOV-2008, about 36 hours post-vaccination, at night she fell out of bed presenting with loss of consciousness, drooling, lip cyanosis, revulsion of eye balls, tremors of the upper limbs that lasted 4-5 minutes. She was taken to the ER in a confusional state and with amnesia regarding what happened. The patient was admitted to the hospital. A CT brain, cardiac exam and blood work were performed and resulted within normal limits. An EEG sleep and wake was also performed (results not reported). The patient was discharged on 17-NOV-2008 with the diagnosis "single critical episode". The child did not present with any further symptoms after 13-NOV-2008. The outcome is recovered. Other business partner numbers include (E2008-10895). No further information is available. Case is closed.

MedDRA PT Nervous system disorder

Symptom Text: Information has been received from a gynecologist concerning a 17 year old female patient who was vaccinated with a third dose of GARDASIL (lot number, route and injection site not reported) in August 2008. In November 2008 the patient developed neurological failures described as "failures of fingers and hands down to elbows, both sides". Since symptoms were ongoing at reporting time, a neurological check up in a specialized hospital was planned. Concomitant medication included hormonal contraceptives (unspecified). P1 and P2 GARDASIL were given on unknown dates, toleration was not reported. The gynecologist considered the "failures of fingers and hands down to the elbows, both sides" to be an Other Important Medical Event". Other business partner numbers include E2008-10840. No further information is available.

MedDRA PT Impaired work ability, Inflammation, Injection site haematoma, Injection site induration, Muscle atrophy, Muscular weakness, Myositis, Pain in extremity, Vaccine positive rechallenge

Symptom Text: Information has been received from a general practitioner concerning a 19 year old female patient who had hematoma, inflammatory reaction and persisting induration after the first dose of GARDASIL (WAES #0812USA00321), and received the second dose of GARDASIL vaccine in her right deltoid in October 2008. By the following night the patient presented with injection site hematoma and injection site induration of moderate intensity. About 10 days later the patient experienced pain in vaccinated arm with muscular strength decreased and loss of muscular mass (=10cm) of severe intensity. At the time of reporting the patient had not recovered. To be noted, since the first dose of GARDASIL the patient had a persisting induration at the injection site. Blood samples were normal. There was no inflammatory syndrome. Diagnosis of myositis was confirmed by a rheumatologist. Another consultation with a rheumatologist was scheduled in 15 days and complementary investigations will be performed if necessary: electromyogram and auto-antibodies. The patient was on sick leave since 6 weeks. She had just started to recover. She was followed by a kinesitherapist. The events were reported as other important medical events. Other business partner numbers include E200810970. No further information is available.

MedDRA PT Drug exposure during pregnancy, Foetal disorder

Symptom Text: Initial and follow up information has been received from a 14 year old female for the Pregnancy Registry for GARDASIL with an allergy to KEFLEX who on 27-DEC-2006 was vaccinated with a first dose of GARDASIL 0.5 ml IM. Subsequently she received the second dose of vaccine and on 27-SEP-2007 received the third dose of GARDASIL. Concomitant medication included vitamins (PNV). The patient's last menstrual period was 7 weeks ago (approximately 13-AUG-2007). She sought medical attention. On 29-SEP-2007, she found out that she was pregnant. A pregnancy test was performed. At the time of reporting, she had not experienced any adverse reactions. The estimated date of delivery is 19-MAY-2008. Follow-up information was received, concerning a 14 year old female patient with no previous medical history reported. On 18-MAY-2008, the patient delivered a normal, healthy female baby weighing 7-9 lbs, length 21, Apgar score 8/9 and head circumference 14.5. No complication during pregnancy, labor/delivery, infections or illness during pregnancy were reported. On 23-MAY-2008 the baby had a 5 day well child visit and was doing well. Weight was 7.45 pounds. Bilirubin was 10.8 mg/dL. On 02-JUN-2008 a newborn screening for congenital hypothyroidism, congenital adrenal hyperplasia, hemoglobinopathy, galactosemia, fatty acid disorders, organic acid disorders, amino acid disorders and cystic fibrosis were all normal. On 21-JUL-2008 a 2-3 month old well child visit was performed and the baby was doing well. Her parents reported some nasal congestion and constipation. Otherwise she has a bowel movement every 24 hours. The outcome of the congestion and constipation were not reported. No additional information is expected.

Other Meds: Vitamins (unspecified)

Lab Data: Ultrasound, 10/22/07, normal; Ultrasound, 04/23/08, normal; Diagnostic laboratory, 06/02/08, newborn screening: see narrative; Beta-human chorionic, pregnant; Total serum bilirubin, 05/23/08, 10.8 mg/d, 0.0 - 1.0 (normal)

MedDRA PT Drug exposure during pregnancy, Meconium in amniotic fluid

Symptom Text: Information has been received from a physician for the pregnancy registry for GARDASIL concerning a 24 year old female with no known allergies who on 18-SEP-2007 was vaccinated IM with her first dose of GARDASIL (Lot # 658560/1062U). concomitant therapy included (ASTELIN) and Albuterol. Subsequently the patient is pregnant which was confirmed via pregnancy test (LMP = 28-AUG-2007). No further information is available. Follow up information was received from a nurse who reported that on 12-JUN-2008, the patient went into labor spontaneously at 41+ 3/7 weeks with SROM with a moderate amount of meconium in the amniotic fluid. The patient had a vaginally delivered at a healthy female. The baby weight was 8 Lb, 7 oz, and had apgars of 9 and 9. The nurse reported that the patient's EDD was on 03-JUN-2007. The nurse also reported that the baby and the mother were doing well. No further information is expected.

MedDRA PT Drug exposure during pregnancy, Foetal disorder

Symptom Text: Information has been received from a health professional concerning a 16 year old female with a history of madelung's deformity who, on 01-SEP-2006, was vaccinated with her first dose of GARDASIL, IM. On 10-NOV-2006, the patient was vaccinated with her second dose of GARDASIL, IM. On 28-SEP-2007, the patient was vaccinated with her third dose of GARDASIL, IM, and a urine test in the office was negative. On 11-OCT-2007, a home pregnancy test was positive, and 2 repeated home pregnancy tests on a later date were also positive. The patient sought unspecified medical attention in the office and her outcome is unknown. Follow-up information was received on 29-OCT-2008 via phone call from a nurse indicating that, on 14-JUN-2008, the patient spontaneously delivered a healthy and normal male baby. Weighing 7 pounds, 7 ounces, 52 cm long with a head circumference of 32 cm at 40 and 3/7 weeks estimated gestational age. Apgars were 8/9. The baby was being watched for mild jaundice due to his mother's blood type. The mother was O negative and the baby was RH positive. The baby was discharged home with his adaptive parents on 16-JUN-2008, bottlefeeding and with routine care instructions. The mother did return to the office and saw a certified nurse midwife for her postpartum visit and physiologically was recovering well. Additional information is not expected.

MedDRA PT Drug exposure during pregnancy

Symptom Text: Initial and follow up information has been received from a mother and 16 year old female patient for the Pregnancy Registry for GARDASIL. On 21-AUG-2007, the patient was vaccinated with her first dose of GARDASIL (Lot # 658222/0927U; site and route not reported). On 23-OCT-2007 (previously reported as approximately 26-OCT-2007), the patient was vaccinated with her second dose of GARDASIL (Lot #657737/0522U; site and route not reported). There was no concomitant medication. Subsequently, the patient found out she was pregnant (LMP approximately 15-SEP-2007).The patient sought unspecified medical attention. On 24-JUN-2008, The patient gave birth to a normal female infant (6 Lb, 2 oz; 18.5 in). There were no congenital anomalies, complications or abnormalities. There were no complications during the pregnancy or labor and delivery. Additional information was provided from the patients physician. Laboratory work from 25-JUN-2008 revealed a CAH (17 Hydroxy Progesterone) level of 75.8 ng/ml. The analysis revealed unsatisfactory specimen. Repeat levels were done on 29-JUL-2008 that were within normal range. At the time of this report mother and baby were reported to be doing well. Additional information is not expected.

MedDRA PT Drug exposure during pregnancy

Symptom Text: Information has been received through the pregnancy registry from a health care worker concerning a 17 year old female with an allergy to cefaclor (CECLOR) and no concomitant medications (lab diagnostics included a pregnancy test). The patient received three single doses of GARDASIL via injection and became pregnant sometime before she received her third dose. The patient was approximately 8 weeks pregnant at the time she received her third dose. The patient did not have any adverse experience. The first dose of GARDASIL (Lot #0211U) was receiving on 5-APR-2007, the second dose (Lot #0210U) was received on 05-JUN-2007 and the third dose (Lot #65454C/1209U) was received on 9-OCT-2007. Follow up information was received from a health care professional who reported that the patient delivered a full term baby on 04-JUL-2008. The health care professional reported that the baby was normal and healthy with no anomalies. Follow up information was received from a health care professional who reported that the patient delivered a full term baby on 04-JUL-2008. The health care professional reported that the baby was normal and healthy with no anomalies. Follow up information was received from a health care worker who reported that the patient delivered a normal female baby, with no complications during pregnancy, or no known complications during labor/ delivery. The mother's LMP was 40 3/7 weeks. The baby's weight was 6o ponds with 13 oz, and Apgar score was 9/9. There were no concurrent medical conditions reported. Other medications used during the patients pregnancy were reanitidine (ZANTAC) for heartburn, budesonide for allergies, and Zolpidem as needed or PRN for sleep aid. On 23-JAN-2008 a serum alph-fetoprotein test was performed with negative results. On 07-FEB-2008 an ultrasound was performed with normal results. No further information is expected.

MedDRA PT Drug exposure during pregnancy, Premature labour, Premature rupture of membranes, Rash papular, Skin hypopigmentation, Tobacco user

Symptom Text: Initial and follow-up information has been received from the pregnancy registry for GARDASIL via a registered nurse concerning an 23 year old female smoker with "dermatological problems" and a history of cervical cancer with no documented HPV(2007), abnormal pap and loop electrosurgical excision procedure(14-JUN-2006) who on 20-NOV-2007 was vaccinated IM, with a 0.5 ml first dose of GARDASIL (LOT 657872/0515U). Concomitant therapy included DEPO-PROVERA and dermatologic (unspecified). Subsequently the patient became pregnant. On 04-DEC-2007 she had a positive pregnancy test. On 07-DEC-2007, ultrasound revealed gestational age was 7 weeks and 4 days. Last menstrual period was 12-OCT-2007 and estimated date of delivery was 20-JUL-2008. The patient was seen in the physician's office on 09-JAN-2008. Follow up information was received which reported that on 09-JUL-2008 the patient had spontaneous rupture of membranes and delivered a female infant at 38 weeks gestational via spontaneous pitocin augmented delivery. The baby's weight 6lb 12oz. The infant was normal. No congenital anomalies or other complications or abnormalities were noted, head moulding/cone was noted to be resolved. It was also reported that the patient had no complications during the pregnancy and labor. The patient continued to smoke throughout her pregnancy. On 11-JUL-2008 the infant was vaccinated with HEP B virus vaccine (manufacturer unknown), (WAES #0811USA00563). On 11-SEP-2008 it was reported that the patient had a papular rash with mild hypopigmentation to her antecubital crease. Additional information is not expected.

Other Meds: dermatologic (unspecified) DEPO-PROVERA

Lab Data: cervical smear - "current pap test is fine"; ultrasound, 12/07/07 - 7 weeks and 4 days; ultrasound 03/20/07 - normal OB ultrasound; urine beta-human, 12/04/07 - positive

History: Cervical cancer; Loop electrosurgical excision procedure; papanicolaou smear, abnormal

MedDRA PT Chlamydial infection, Drug exposure during pregnancy

Symptom Text: Information has been received from a licensed practical nurse (L.P.N) for the Pregnancy Registry for GARDASIL concerning an 18 year old female with no known allergies and no reported medical history who received two doses of 0.5ml GARDASIL (unknown lot numbers) intramuscularly at another facility, possible in September and November of 2007. The patient is currently taking prenatal vitamins (unspecified brand) and iron supplements (unspecified brand). At 30 weeks pregnancy was discovered during an ultrasound on 23-JAN-2008. The patients LMP is approximately 25-JUN-2007. The ultrasound was performed since the patient said that she had a tumor which was kicking and biting her. No symptoms have been reported. Estimated date of delivery is 03-APR-2008. Follow up information was received on 17-OCT-2008 from the L.P.N indicating that the patient is a female with no previous pregnancies. On 25-NOV-2007 and 26-DEC-2007 the patient was vaccinated with her first and second 0.5 ml doses, respectively, of GARDASIL (lot # of the two doses was probably 657006/0188U). An ultrasound performed on 23-JAN-2008 confirmed her pregnancy and the results were within normal limits. It was reported that the patient confirmed her pregnancy and the results were within normal limits. It was reported that the patient was late for prenatal care (30 weeks) because she wasn't aware of her pregnancy. Other medication used during pregnancy included prenatal vitamins, once daily from January 2008 to April 2008 and iron supplement, 325 mg daily from February 2008 to April 2008. During pregnancy, the patient developed chlyamdial infection and on 01-FEB-2008, was treated with ZITHROMAX, 1 gram once. The outcome of the chlamdial infection was not reported. On 10-APR-2008 the patient delivered a normal female baby, weighing 7 pounds, 2 ounces. The baby's length was 20, headache circumference was 13.5 and apgar score was 8/9. There were no congenital anomalies. There were no other complications or abnormalities. The patient had no complication during pre

MedDRA PT Drug exposure during pregnancy, Vaginal examination abnormal, Vulvovaginitis trichomonal

Symptom Text: Information has been received from a nurse practitioner concerning a 17 year old female with a history of allergic reaction to antibiotics (Ceclor) who on 25-MAR-2008 was vaccinated IM with the first 0.5 mL dose of GARDASIL (lot # 659653/1448U). Concomitant therapy included a dose of HAVRIX (inactive) (GlaxoSmithKline) and a dose of MENACTRA (Sanofi Pasteur). On 25-MAR-2008 the patient intially came in for family planning (to get birth control pills)/ The patient said she had normal periods and no skipped period from 28-FEB-2008 to 06-MAR-2008. The patient denied unprotected sex and was using condoms. During a vaginal exam (part of family planning) by the nurse practioner, it was found the patient had "Trichomonas." The nurse practioner wanted to treat the patient with Metronidazole and did a pregnancy test to make sure it was okay to give this medication. The pregnancy test was positive. Other lad diagnosic studies performed included: hemoglobin (results not provided) and dip stick urine for glucose and protein (results not provided.) The patient's outcome was not reported. There was not product quality control involved. Follow-up information has been received through the pregnancy registry which reported that the pregnancy test was performed on 25-MAR-2008. An ultrasound was performed on 30-APR-2008 and was normal and on 26-JUN-2008 a serum alpha fetoprotein test which was normal. The patient was prescribed promethazine hydrochloride (PHENERGAN) for nausea. Additional information has been requested.

Other Meds: PHENERGAN (PROMETHAZINE) Mg

Lab Data: gynecological, 03/25/08 - patient had Trichomonas; ultrasound 04/30/08 - normal; beta-human chorionic, 03/25/08 - positive; hemoglobin, 03/25/08 - results not provided; serum alpha fetoprotein, 06/25/08 - normal; urine glucose, 03/25/08 - d

History: Allergic reaction to antibiotics

Prex Illness: Vaginitis trichomonal; Pregnancy NOS (LMP = 2/29/2008) vaginitis trichomoinal

MedDRA PT Drug exposure during pregnancy, Placental disorder, Urinary tract infection

Symptom Text: Information has been received through the pregnancy registry for GARDASIL from a physician concerning a 18 year old female with a history of smoking (quit when she had a positive pregnancy test) and no known drug allergies, who on 27-JUL-2007, was vaccinated in the right arm with the first dose of GARDASIL (lot#65822/0927U). On 15-Nov-2007, the patient received the second dose in the left arm (lot# 659437/1266U). On 05-Apr-2008, the patient received IM in the right arm a 0.5 ml third dose (lot#659964/1978U). Other medications included prenatal vitamins from 03-APR-2008 to present, once daily. The physician reports that the patient is 15 weeks pregnant. The patient's LMP was 24-DEC-2007, the estimated delivery date is 29-SEP-2008. The patient sought unknown medical attention with her OB/GYN. Follow up information was received which reported that on 08-APR-2008 and 12-MAY-2008, ultrasound indicated low lying placenta. From 16-JUN-2008 to 21-JUN-2008, the patient was treated with ampicillin, 500mg, q8h, for urinary tract infection. From 13-AUG-2008 to 20- AUG-2008, the patient was treated with amoxicillin, 500 mg, q8h, for urinary tract infection. On 03-SEP-2008, the patient delivered a female infant at 36+ weeks from The infant's weight is 6 lb 11 oz with apgar scores of 7/9. The infant was normal, without congenital anomalies and other complications or abnormalities. There was no medical condition after the delivery. Additional information is not expected.

Other Meds: Vitamins (unspecified)

Lab Data: Ultrasound, 04/08/08, low lying placenta; ultrasound, 05/12/08, low lying placenta

MedDRA PT Condition aggravated, Drug exposure during pregnancy, Lice infestation, Pyrexia

Symptom Text: Initial and follow-up information has been received from a 16 year old Hispanic female consumer with head lice and no previous pregnancies, who on 08-APR-2008, was vaccinated with a third dose of GARDASIL vaccine (Lot # 659964/1978U) and later found out that she was pregnant. Concomitant therapy included DOCUSATE SODIUM + minerals (unspecified) (+) OMEGA-3 marine triglycerides (+) succinic acid (+) vitamins (unspecified) (PRIMACARE)). At the time of the report the patient was 6 months gestation. The patient's estimated conception date was approximately 21-NOV-2007, last menstrual period was approximately 30-NOV-2007 and her estimated delivery date was 14-AUG-2008. The patient sought unspecified medical attention. Blood work was taken and the results were not reported. On 24-APR-2008 an ultrasound was performed for an anomaly screening/dating and the results were were within limits. It was reported that it was too late to perform a Maternal Serum Alpha-Fetoprotein Screening (MSAFF). At the time of the report, the outcome of the patient was unknown. Additional information was received from the physician's office stating that the patient delivered a normal infant without congenital anomalies. Additional information was received from a registered nurse concerning the patient who on 14-AUG-2008 (weeks from LMP: 40+) delivered a female normal infant without congenital abnormalities and complications or abnormalities. The infant weight: 7# 7 oz. length: 21". "Apgar scores: 8/10, and 9/10", head circumference : 34cm. It was reported that the patient presented late entrant to care at 25 weeks. In May 2008, the patient was diagnosed with with head lice. In "mid-May" 2008, the patient was treated with RID. The patient experienced maternal fever during labor/delivery. The patient was GBS (+) and was treated with antibiotics in labor. Additional information has been requested.

Other Meds: PRIMACARE; PYRETHRUM EXTRACT

Lab Data: diagnostic laboratory, blood work; ultrasound, 04/24/08, reason-anomaly screen/dating; result-within normal limits

MedDRA PT Anaemia, Drug exposure during pregnancy

Symptom Text: Information has been received from a health professional for pregnancy registry for GARDASIL concerning a 16 year old female with no relevant medical history who on 27-JUN-2007 and 24-APR-2008 was vaccinated with a first and second dose of GARDASIL intramuscular injection (lot number and injection site not reported). She also received her first dose of PEDVAXHIB (MSD) on 27-JUN-2007, the second dose on 27-2007, and third dose on 27-MAR-2008. There was no concomitant medication. Then it was discovered that she was pregnant. No adverse effects reported. The patient had her first prenatal care visit this week and an ultrasound was scheduled for 26-JUN-2008. Follow up information was from a registered nurse reported that the patient had no previous pregnancies history. On 26-JUN-2008 ultrasound (checks fetal development late prenatal care) was performed and result was within normal limits. The patient's LMP=14 FEB-2008 and the estimated delivery date = 20-NOV-2008. Follow up information was received from a registered nurse (R.N.) who reported that during this pregnancy, the patient was on placed on ferrous sulfate for the treatment of anemia, globulin, immune (RHOGAM) for treatment of rhesus antibodies negative and prenatal vitamins as supplementation. On 25-JUN-2008 the patient underwent ultrasound. The patient was late in receiving prenatal care (30 weeks). On 23-JUL-2008, 39 weeks from LMP, the patient delivered a normal female baby whose weight was 6 pound and 6 ounce, length 19 inches, head circumference 13.5 inches and Apgar score 9/9. There were no congenital anomalies or other complications or abnormalities. Additional information is not expected.

MedDRA PT Drug exposure during pregnancy

Symptom Text: Information has been received for the pregnancy registry for GARDASIL from a registered nurse concerning a 15 year old female with no pertinent medical history and no drug reactions/allergies, who on 14-JAN-2008 was vaccinated with the first dose of GARDASIL 0.5 mL, IM. On 26-MAR-2008, the patient received the second dose of GARDASIL 0.5 mL, IM. There was no concomitant therapy. The patient is pregnant (positive pregnancy test). At the time of report, the patient was 31 weeks gestation (last menstrual period approximately 20-DEC-2007, estimated delivery date 25-SEP-2008). The patient did not seek medical attention. No other symptoms were noted. Follow-up information was received from the nurse who reported that the patient had a history of asthma and positive PPD. The nurse reported that the patient delivered a normal healthy female baby on 19-SEP-2008 with no congenital anomalies and there were no other complications. The Baby weighed 2810 grams, and APGAR score was 9/9. There were no birth defects and no complications with the infant. There were no infections or illness during the pregnancy. The nurse reported that during the pregnancy on 18-JUL-2008, the patient's ultrasound test resulted normal for fetal anatomy. During the pregnancy, the patient took prenatal vitamins for pregnancy and ferrous sulfate for anemia. The patient had not had any previous pregnancies. Additional information has been requested.

Other Meds: Vitamins (unspecified)

MedDRA PT Drug exposure during pregnancy, Urinary tract infection

Symptom Text: Initial and follow-up information has been received from a physician and a medical assistant for the pregnancy registry for GARDASIL concerning a 19 year old female with no drug reactions or allergies and with a history of papanicolaou smear abnormal and vaginosis bacterial, who on 15-SEP-2008, was seen in the office for symptoms of painful vaginal discharge. During her appointment she was vaccinated with her first dose of GARDASIL (lot#661046/0381x), 0.5 ml, IM. On the same date, she was placed on therapy with amoxicillin 500 mg, three times a day, for urinary tract infection. It was later found prenatal forte. On 22-SEP-2008, ultrasound was performed and results were normal with comments that estimated delivery date was 03-APR-2009 and the patient had been pregnant for 12 weeks and 3 days. The patient sought medical attention in the office. Additional information is not expected.

Other Meds: Amoxicillin; Metronidazole; vitamins (unspecified)

MedDRA PT Abdominal pain, Abdominal pain upper, Appendicitis, Back pain, Dizziness, Dyskinesia, Headache, Irritable bowel syndrome, Nasopharyngitis, Otitis media, Pharyngitis, Pharyngitis streptococcal, Rash

Symptom Text: Information has been received from a consumer concerning her 10 year old daughter with oesophageal acid reflux who on 24-JUN-2008 was vaccinated with the first dose of GARDASIL vaccine along with varicella virus vaccine live (Oka/Merck) (MSD). Concomitant therapy included (PREVACID). On the week before second dose, the patient experienced cold symptoms and strep throat. On 26-AUG-2008, the patient got a strep throat test, and the outcome of strep throat test was negative. So, on 26-AUG-2008 the patient was vaccinated with the second dose of GARDASIL vaccine. On 08-SEP-2008, the patient was taken to the ER with signs of appendicitis. Since then, she took the CT scans, bloodwork, endoscopy, colonoscopy, and X-rays, and the outcome of those tests turned out normal, but her condition is getting worse. On 09-SEP-2008, the patient developed rash on her belly and left eye. The patient experienced stomach pain, abdominal pain, back pain, headaches, dizziness. It hurts the patient to lift her arms above her head, cross her legs due to pain during sleep. The patient was given DICYCLOMINE (manufacturer unspecified) "in case she had irritable bowel", but this therapy resulted in dizziness. Patient's adverse events persisted. The patient sought medical attention in the ER. Additional information has been requested. 12/11/08 Received PCP medical records. FINAL DX: none provided Records consist of Neuro consult done 10/28/08 for HA, dizziness & abdominal pain which started approx 10 days after HPV#2. Had gone to ER for abd pain on 9/8/08, w/u WNL. 9/19 RTC w/bilateral serous OM. 12/12 RTC w/pharyngitis. GI consult for endoscopy, colonoscopy, CT & US. Had psych eval which was WNL. Ophtho eval. No further records available.

MedDRA PT Asthenia, Bronchitis, Cough, Erythema, Headache, Oedema peripheral, Peripheral coldness, Pruritus, Urticaria

Symptom Text: Information has been received from a consumer concerning her 16 year old daughter with penicillin allergy, asthma and some allergies who on 17-JUL-2008 was vaccinated with the first dose of GARDASIL and with the second dose on 04-Oct-2007. Concomitant therapy included FLOVENT, Albuterol and a prescription drug cough medicine. On 21-JUL-2007 the patient experienced itchiness, redness and swelling of hands and feet. On 05-OCT-2007, after second vaccination the patient experienced hives all around both knees with causes itching and redness. The hives subsequently spread to her feet, and then to her entired body including her face. The patient subsequently developed bronchitis, felt weak all the time and had "never ending headaches". At the time of report, the patient was doing better but she had "no stamina" and she continued to experience coughing spasms and brochitis periodically. Also, whenever her extremities, such as her hand or feet are subjected to coldness or cold temperatures, they turn red and she experienced itchness. The patient was recovering. No additional information is expected.

MedDRA PT Acarodermatitis, Blister, Erythema, Pruritus, Weight increased

Symptom Text: Information has been received from a physician concerning a 13 year old female who is daughter of a nurse. The patient was with seasonal allergy and no drug reactions/allergies and a history of anaemia as an infant. On 02-MAY-2008 the patient was vaccinated with her first dose of GARDASIL vaccine and on 23-JUL-2008 her second dose. Concomitant therapy included CLARINEX, VISTARIL and DIPROLENE. The patient experienced itching in the left arm "about 1-2 weeks after the first injection". The family physician treated the patient's symptoms with ZYRTEC; however, the patient's symptoms did not improve. A dermatology specialist diagnosed and treated the patient for scabies (treatment Unspecified). The patient's rash was described as intermitted with red spots on the abdomen and breasts. Raised blister like spots developed on the palms of the patient's hands by the end of August, 2008 (date unspecified.) The family physician prescribed MEDROL DOSEPAK and the symptoms resolved until the dose pack was completed. The patient was currently prescribed an unspecified dose of prednisone. The patient gained 14 pounds since beginning the methylprednisolone on 04-SEP-2008. The patient was scheduled for an evaluation with another dermatologist on 09-OCT-2008. No other symptoms and treatment reported. No other information available. The patient had not recovered from the adverse events at the time of the report. Lab diagnostics studies performed included blood work (complete blood count, liver function studies). Additional information has been requested.

MedDRA PT Injection site mass

Symptom Text: Information has been received from a pharmacist concerning a college age female, who on unknown dates, received her first two dose of GARDASIL without adverse symptoms noted, and then in June 2008, was vaccinated with her third dose of GARDASIL, 0.5 ml, therapy route unspecified. Subsequently, the patient developed a 4 cm lump at the injection site, no pain or erythema. The doctor feels it is calcification. Laboratory tests included X-ray, result unspecified. And no treatment has been performed. The patient's lump at the injection site persisted. Additional information has been requested.

MedDRA PT Rash generalised

Symptom Text: Information has been received from a physician concerning an 18 year old female who on unspecified date was vaccinated with a first dose of GARDASIL vaccine. On 17-JUL-2008 the patient was vaccinated intramuscularly in the right shoulder with a second dose of GARDASIL vaccine. Concomitant therapy included MENACTRA which was vaccinated intramuscularly in the left shoulder and ADACEL at the same visit on 17-JUL-2008 at different injection sites. On approximately 20-JUL-2008 the patient experienced generalized rash all over her body. The patient spoke to the physician about the rash. At the time of reporting the patient's generalized rash all over her body persisted. No further information is available.

MedDRA PT Cold sweat, Convulsion, Crying, Dizziness, Dyskinesia, Eye movement disorder, Heart rate decreased, Memory impairment, Musculoskeletal stiffness, Pallor, Skin discolouration

Symptom Text: Information has been received from a physician concerning a 15 year old female who on 25-NOV-2008 was vaccinated with her first dose of GARDASIL (lot number 661530/0575X, route and site not reported). On 25-NOV-2008, after vaccination the patient experienced seizure-like episode and within a few minutes the patient was clammy, pale and lightheaded. The patient then was placed in the floor by the nurse who administered the vaccine to lay her down and the nurse noticed the patient's pulse was going down and her color turned from colored pale to shade gray. Patient eyes started fluttering and there was stiffening of her left arm and left leg and at one side of the body. There was a gargling sound coming from patient's throat and later her whole body started jerking. Patient woke up and didn't know where she was and started crying and they observed the patient for 20 more minutes and the patient came back to normal and was sent home. The office is not positive if the patient had a seizure or a severe fainting spell. The patient had previous vaccinations at their office without problems. Seizure-like episode was considered an other important medical event. Additional information has been requested.

MedDRA PT Arthralgia, Hypersomnia, Incorrect route of drug administration, Myalgia

Symptom Text: Information has been received on 27-NOV-2008 from a Health Authority (reference number ES-AGEMED-430377340) regarding a 15 year old female patient who on 10-JUN-2008 was vaccinated with the first dose of GARDASIL (batch # not reported), by subcutaneous route (site of administration not reported). In September 2008 (exact date not reported) the patient started with hypersomnia, arthralgy and myalgia in arms and legs. On 30-JUL-2008 the patient received another dose of GARDASIL (batch # not reported) by subcutaneous route (site of administration not reported). The reporter did not consider the dose administered on 30-JUL-2008 as a suspected drug for the adverse events. The reporter felt that hypersomnia, myalgia and arthralgia were an other important medical event. Other business partner numbers include E2008-11125. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Blood pressure decreased, Condition aggravated, Confusional state, Dizziness, Heart rate decreased, Hyperhidrosis, Loss of consciousness, Pallor, Peripheral coldness, Pulse absent

Symptom Text: Information has been received from a physician concerning a 19-year-old female patient, who on 09-OCT-2008 received a third dose of 0.5 ml GARDASIL (lot # 660618/0572X, injection site not reported) via intramuscular route. Concomitant vaccination included a dose of FLUZONE (preservative free). The patient had previously received her first dose of GARDASIL (lot # 658556/1060U), together with a dose of MENACTRA and DTAP on 22-FEB-2008; and her second dose of GARDASIL (lot # 658556/1060U) on 13-APR-2008. On 09-OCT-2008, within 5 or 10 minutes after administration of the third dose of GARDASIL, the patient reported that she felt dizzy and lightheaded and sunk to the floor. Loss of consciousness was suspected. She was very "confused, pale, color poor and limbs cold." The patient was placed on exam table. She did not have a palpable pulse; her heart rate was in 40's via stethoscope and her blood pressure was 80/50. She was diaphoretic. The patient was given some apple juice and condition monitored. According to the patient, she had not eaten breakfast. After given more juice, the patient's heart rate improved and her blood pressure rose to 90/60. After being observed for a while she was sent home. The patient also had a similar episode a few weeks ago after running at a track. On a follow up phone call from the doctor on 10-OCT-2008, the patient was fine. Additional information has been requested.

MedDRA PT Abdominal pain upper, Nausea, Night sweats

Symptom Text: Information has been received from a health care worker concerning a 17 year old female patient with penicillin allergy who on 23-SEP-2008 was vaccinated with the first dose of GARDASIL (lot # 660555/0279X), 0.5ml intramuscularly. There was no concomitant medication. The health care worker reported reported that the patient had experienced nausea, epigastric pain and night sweats after receiving the first dose of GARDASIL. It was noted that as 10-OCT-2008, the nausea had not subsided. At the time of the report, the patient had not recovered. The patient sought medical attention, was seen by the physician. Additional information has been requested.

MedDRA PT Arthralgia, Asthenia, Drug administered at inappropriate site, Injected limb mobility decreased, Musculoskeletal pain, Tendon disorder

Symptom Text: Information has been received from a nurse on 30-SEP-2008 concerning a 20 year old female with penicillin and sulfa allergies, and a gynecological history of pap smear in 2005 who was vaccinated with a third dose of GARDASIL vaccine by a pharmacy. Subsequently the patient experienced pain in left shoulder, radiates down to the arm, increases with movement, aggravated by sleeping on the same side, weakness, started after vaccination one month ago and has not gotten any better. The patient's family history included both parents' kidney/blader problems. Assessment of this event was joint pain, shoulder-719.41 (primary). An X-ray in left shoulder was performed. Follow up information has been received on 02-OCT-2008. It was reported that the patient continued to have pain in it shoulder with ROM and is painful at rest. Medications for the event included ibuprofen 600mg 1 tab (s) QID, VICODIN 500mg-5 mg 1 tab(s) Q4H. Assessment were joint pain, shoulder-719.41 (primary), and disorder of tendon of shoulder region NOS-726.10, left intraspinatus partial tear. A MRI in left shoulder was performed. Follow up information has been received on 10-OCT-2008. It was reported that the patient has pain and difficulty in rotating the arm and difficulty in movement. the nurse and the patient felt had an intrasupra splintus tear due to the injection being given in a tendon rather than the deltoid. At the time of the report, the outcome was unknown. The reporter reported that it believed to be mechanical injury on 20-OCT-2008. Additional information has been requested

MedDRA PT Dizziness, Headache, Injected limb mobility decreased, Nausea, Oedema peripheral, Pain in extremity, Vaccine positive rechallenge

Symptom Text: I experienced dizziness, nausea, and headache about an hour after my third Gardasil injection. My left arm was sore and swollen. I had all these symptoms, but much less severe after the first and second injections. I contacted my doctor's office after the third and they instructed me to come in if I felt it were an emergency or take OTC medication for the pain and swelling and see if the symptoms resided. I took 600 mg of ibuprofen which helped mildly with the pain. The dizziness and nausea were gone within 24 hours. My arm continued to be sore to the touch and difficult to move for about 14 days post injection; longer than I have ever experienced after a vaccination.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Anxiety, Burning sensation, Chest pain, Dehydration, Hyperventilation, Oesophagitis, Tremor

Symptom Text: On 6-26-08, pt presented for immunizations as follows: GARDASIL #1, Tdap #1, MENACTRA #1, and Hepatitis A #1. She was seen in the ER on 6-30-08 after experiencing chest pains, shakiness and tremors. At the time her symptoms began, she was lying on a couch, watching TV. Earlier that day, she had been working in the hot sun and symptoms were attributed to dehydration and anxiety accompanied by hyperventilation. The tremors continued in her legs and to a lesser extent in her arms intermittently for several days. She was seen at clinic on 7-01-08 due to the continued tremors. Doctor agreed with the Emergency Room physician's assessment, that the symptoms were due to dehydration, anxiety and hyperventilation. Pt returned for her second GARDASIL on 9-03-08. That evening, she experienced tremors in her legs and to a lesser extent in her arms throughout the following day. These symptoms were not reported at that time since they had not lasted as long and since the family had not connected the two episodes with the GARDASIL vaccine. When the family called to schedule her third GARDASIL vaccine, it was brought to our attention that she had a similar experience following the first two vaccines. With this information being brought to light, the third GARDASIL will not be given. 12/17/2008 ER record received for 7/1/08 with Impression Esophagitis, Tremors. Pt presented with c/o leg shaking and burning in chest. PE WNL. D/C to f/u with PCP.

MedDRA PT Decreased appetite, Dysgeusia, Fatigue, Feeling abnormal, Immediate post-injection reaction, Injection site pain, Nausea, Pyrexia

Symptom Text: Information has been received from a medical assistant concerning a 22 year old female who on 06-OCT-2008 was vaccinated with GARDASIL (lot # 660612/0229X). Concomitant therapy included YAZ. It was reported that the patient experienced numerous adverse reactions following vaccination with GARDASIL. The patient experienced pain at injection site immediately following vaccination, but it was described as "not that bad". The next day (07-OCT-2008) the patient felt very tired and by Wednesday (08-OCT-2008) the patient felt tired, had a fever of 100.1, experienced nausea with a "fill feeling", taste disturbance. The rest of the week the tiredness and fever continued with no mention of nausea. The patient would get a fever around 3 or 4 in the afternoon. ALEVE was taken for the fever. On Sunday (12-OCT-2008) the patient felt better, but Monday (13-OCT-2008) the patient called complaining again of tiredness and fever, but no nausea. The tiredness on Monday (13-OCT-2008) was described as not as bad. The patient sought medical attention. At the time of this report, the patient was recovering. Follow-up information has been received from a health professional concerning a 22 year old female with no known drug allergies who on 06-OCT-2008, at 14:00, was vaccinated IM with the first dose of GARDASIL (lot # 660612/0229X) in the left arm. On 08-OCT-2008, at 8:00, the patient started feeling bad, feeling tired, fever of 100.1, nausea, not able to taste food, pain at injection site, and was not able to eat. Additional information has been requested.
